METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box. CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dizziness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the facsimile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1s. 1d., 2s. 9d., and family packets at 11s. each.

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1s. 1½d., and 2s. 9d. Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

THE BEST REMEDY FOR INDIGESTION.

"NORTON'S" CAMOMILE PILLS are confidently recommended as a certain remedy for Indigestion, Sick Headache, Bilious and Liver Complaints, Heartburn, Acidity of the Stomach, Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, &c. They also act as a powerful tonic and gentle aperient; are mild in operation, safe under any circumstances, and thousands can bear testimony to the benefits derived from their use. Sold in bottles at 1s. 1½d., 2s. 9d., and 11s. each, in every town in the kingdom.

CAUTION.—Be sure to ask for "NORTON'S PILLS," and do not be persuaded to purchase any of the imitations which have sprung up in consequence of the success of "NORTON'S CAMOMILE PILLS."

HOLLOWAY'S PILLS, FOR THE CURE OF COUGHS, COLDS, AND ASTHMATICAL COMPLAINTS.—These admirable Pills are the most efficient remedy ever discovered for the cure of Colds, Coughs, and Asthmas. Some of the most obstinate cases of diseases of the Lungs and affections of the Chest have yielded to their curative power. They speedily remove any accumulation of phlegm, whereby the respiratory organs are permanently relieved, and ultimately a sound and perfect cure effected; therefore the Asthmatic, or those suffering from a tightness of the Chest, a difficulty of breathing or bad Cough, should have recourse to these well-known Pills to insure a radical cure.—Sold by all Vendors of Medicines; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

VERY IMPORTANT SALE OF NURSERY STOCK, GREENHOUSES, &c., at
FAIRFIELD NURSERY, LONDON-ROAD, LIVERPOOL, THE PROPERTY OF THOMAS WHALLEY.

MESSRS. PROTHEROE AND MORRIS are instructed by the Proprietor to sell by public Auction, without reserve, on MONDAY, the 20th October instant, and following days, the Site of the Nursery being sold to a Building Society, the whole of the large NURSERY STOCK, covering upwards of 12 acres of Land, consisting of Evergreen Shrubs, including many superb Specimens of Scarlet Hybrid Rhododendrons, Ornamental Trees and Shrubs, standard and trained Fruit Trees, standard and dwarf Roses, Hothouse, Greenhouse, and Herbaceous Plants, &c. This Stock is well worthy the attention of Gentlemen and others intending to plant this season, as it is well grown, has been repeatedly removed, and is in fine healthy condition. Also, a large Conservatory, three Hothouses, a large Nine-light Brick Pit, Frames, Hand Glasses, &c., full particulars of which will be in the Catalogue, which may be had at the Nursery; at the Seed Warehouse, 12, St. George's-crescent; from the Auctioneers, Leytonstone, Essex; or free by post on receipt of six postage Stamps.

N.B.—Arrangements may be made to leave the Purchases on the Ground for some months, free of expense, to suit the convenience of parties who may not be prepared for planting.

NURSERY STOCK.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the Nursery Ground, adjoining Yorkplace, Stoke Newington, on MONDAY, October 27, and following day, at 11 o'clock each day, FINE ORNAMENTAL AND DECIDUOUS TREES, EVERGREENS, and FLOWERING SHRUBS, consisting of Aucuba, Portugal and Common Laurels, Variegated and Green Hollies, Arbor-Vitæ, Bays, Ivies, Lilacs, Arbutus, Box, Limes, Acacias, Poplars, Evergreen Privets, &c. A fine assortment of Fruit Trees, comprising Standard and Dwarf Trained Peaches, Apricots, Nectarines, Cherries, Plums, Pears, Gooseberries, Currants, choice Grape Vines, &c.—May be viewed prior to the sale. Catalogues had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO TULIP FANCIERS.—THE CELEBRATED COLLECTION OF MONS. TRIPET, OF PARIS.

MR. J. C. STEVENS has received instructions to offer for Sale by Auction, in Lots, at his Great Room, 38, King-street, Covent Garden, on TUESDAY next, at 1 o'clock precisely, without reserve, the COLLECTION OF TULIPS made during the last 80 years by the Tripet family, and celebrated throughout Europe. It contains upwards of 1200 varieties, including most of the known gems, and some that are unique. May be viewed on Monday, and Catalogues had.

AZALEAS, RHODODENDRONS, &c., FROM MR. J. B. SMITH, NORBITON NURSERY, KINGSTON.

MR. J. C. STEVENS is instructed to sell by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, October 24, at 1 o'clock precisely, 175 Yellow Rhododendrons, from 1½ to 2 feet; 50 Hybrid Rhododendron arboreum, 1½ feet; and 16 large specimen Azalea indica, well deserving the attention of noblemen and gentlemen, being from the celebrated raiser of these plants, Mr. J. B. Smith, of Norbiton Nursery, Kingston, Surrey. Also 120 Standard Roses, and some Camellias, and other Greenhouse Plants.—May be viewed the day before the sale, and Catalogues had.

WANDSWORTH COMMON.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND PUBLIC COMPANIES ENGAGED IN PLANTING.

MR. J. RAWLINGS will submit to public competition, by Auction, on the premises, Wandsworth Common (five minutes' walk from the Clapham station, and a quarter of an hour's walk from the Wandsworth station, on the South-Western Railway), on MONDAY, October 20, 1851, and ten following days, at 11 o'clock each day (by order of Mr. Robert Neal, in consequence of the ground being immediately required for other purposes), the whole of the valuable NURSERY STOCK, consisting of a considerable quantity of very fine Evergreens, Fruit and Forest Trees; New, Ornamental, and Deciduous Shrubs, &c.; many thousands of American plants, comprising fine scarlet and other Rhododendrons, Azaleas, Kalmia, Andromeda, Magnolia, &c.; a fine collection of Pinus, Standard and Dwarf Roses, and well-established plants in pots, of Clematis azurea grandiflora and flammula, Irish Ivy, Virginian Creeper, Bignonia, Choice Camellias, Chrysanthemums, &c. Also a large new 17-light Pit, 12,000 Bricks, a quantity of useful Timber, Paving Stones, and excellent Stone for Building, 400 loads of Rich Mould, a quantity of Garden-pots, &c.—May be viewed prior to sale. Catalogues (1s each, returnable to purchasers), may be had on the premises, of the principal Seedsmen, and of the Auctioneer (post paid on application), 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.—The whole of the Nursery Stock is in excellent condition, and having been planted within the last three years, may now be removed with the greatest safety.

TO FARMERS, BUTCHERS, AND OTHERS.

MR. JAMES CAIN will sell by Auction, on the premises, St. Margaret's, Isleworth, on THURSDAY, the 30th of October, at 1 for 2 o'clock precisely, 150 Southdown fat Wether Sheep; 150 half-bred and Southdown Ewes, in lamb; a fine thorough-bred Alderney Cow, an Ayrshire Cow (both in calf); two Tups of the Duke of Richmond's pure Southdown breed; also a very superior Donkey.—May be viewed the day preceding the sale, and Catalogues had on the premises; at the principal inns in the neighbourhood; and of the Auctioneer, Richmond, Surrey.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, ON LEASE, at a Corn Rent, by Tender, and entered upon at Lady Day next, a most desirable FARM, situate in the parishes of Coleshill, Berks, and Inglesham, Wilts, the property of the Right Hon. the Earl of Radnor. This Farm consists of 366 acres 3r. 1p. of very rich and valuable meadow, pasture, and arable land, and has upon it an excellent residence, &c. Any further information may be obtained from Mr. Moore, Coleshill, Highworth, who will appoint a person to show the Farm, and by whom tenders will be received, on or before the 22d November next. The corn rent will be calculated at a seven years' average on the prices of Wheat, Barley, and Oats, variable from year to year as under the Tithe Commutation Act. The tender should specify the length of lease for which the tender is made. The highest tender not necessarily accepted. Regard will be paid to the character, skill, and capital of the persons tendering, respecting which unquestionable references will be required.

N.B. Inglesham is situated near to the market towns of Highworth, Farringdon, and Swindon, and about six miles from the Shrivenham Station on the Great Western Railway.

On the First of November will be published, price 2*s.* 6*d.*,

# PUNCH'S POCKET-BOOK FOR 1852.

With a Coloured Plate (PROGRESS OF BLOOMERISM) by JOHN LEECH, and numerous Wood Engravings by JOHN LEECH and JOHN TENNIEL.

Punch Office, 85, Fleet-street.

TO MARKET GARDENERS AND FLORISTS.

TO BE LET, in a provincial town, about 60 miles from London, a good Walled-in GARDEN, containing about Four Acres, well stocked with Fruit Trees and Shrubs; House and Shop in the town, and Gardener's Cottage on the premises. The Gardens contain three extensive Vineries, replete with the choicest collection of Vines, Macphail Pits, &c. —For terms, apply to O. R., Mr. Osborne's Nursery, Fulham, near London.

TO BE DISPOSED OF, with immediate possession, an old-established NURSERY and FRUIT GROUND, the proprietor retiring from business. Its locality is in a flourishing neighbourhood, six miles from London; the ground most excellent for Shrubs and Trees, also for producing the finest Fruit.—For particulars, apply to J. C. Hardy, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

PARTNERSHIP.—The Proprietor of an old established, extensive, and increasing business in the NURSERY and SEED TRADE, in the principal town of the South of England, contemplating retirement, is desirous of taking an active partner; one acquainted with the business would be preferred, and from whom a less premium would be expected. Not less than 2000*l.* would be required, for which an immediate return from the proceeds of the business of the forthcoming season would be guaranteed. None but persons of responsibility need apply, or will be treated with.—Apply to T. M. Cattlin, Esq., 39, Ely-place, Holborn, London.

Just published, dedicated to Jenny Lind, price 6*s.* 6*d.* cloth gilt; 7*s.* 6*d.* elegantly bound,

FAVOURITE SONG BIRDS; containing a popular description of the Feathered Songsters of Britain, with an account of their Habits, Haunts, and Characteristic Traits, interspersed with choice Passages from the Poets, and quotations from eminent Naturalists. Edited by H. G. Adams, Author of "Flowers; their Moral, Language, and Poetry." With 12 Coloured Illustrations on Stone.

"One of those laudable attempts to popularise Natural History, which we must always hail with pleasure, when, as in the present instance, accuracy is not sacrificed to popularity." —*The Naturalist.*

"A volume no less instructive than attractive."—*Englishman's Magazine.*

London: W. S. Orr and Co., Amen Corner, and North John-street, Liverpool; J. M'Glashan, Dublin; and J. Menzies, Edinburgh.

Albemarle Street, October, 1851.

MURRAY'S READING FOR THE RAIL: OR, CHEAP BOOKS IN A LARGE READABLE TYPE. To be published occasionally, and varying in prices from One Shilling and upwards.

The aim and object of the Publisher, in this series, is to disseminate sound and entertaining information and innocent amusement, instead of the trivial, and often immoral, publications, which are for the most part offered to the notice of Railway Readers. He designs to introduce a class of works at once cheap, valuable, and instructive, not merely to be read on the Railway, and thrown aside at the end of the journey, but such as shall deserve a permanent place on the shelves of the library.

It will thus form an appropriate sequel to the Home and Colonial Library.

GOLIATH STRAWBERRY.—A Post-office order for 5*s.* will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TAOLLOP'S VICTORIA, 4*l.* per 100, and any of the old varieties at very low prices. The usual allowance to the trade.—JAS. KITLEY, Lyncombe Vale Nursery, Bath.

DUTCH HYACINTHS for Forcing, 3*s.* 6*d.* per dozen; Best do., for Glasses, 6*d.* to 1*s.* each. Double Roman and Paper-white Narcissus, 4*s.* per dozen; Single and Double Duc Van Thol Tulips, 2*s.* per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. COBBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

ROSES.

WILLIAM WOOD AND SON will be happy to forward Copies of their New ROSE CATALOGUE GRATIS on application.
Woodlands Nursery, Maresfield, near Uckfield Sussex.

DUTCH FLOWER ROOTS.

RENDLE'S LIST OF DUTCH BULBS will be found in the columns of this Paper, front page, in the number for September 27, 1851. The prices are very low. Descriptive Catalogues on application to WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

*The Hyacinths are particularly large and handsome. Most excellent kinds can be had at 6s. per dozen.*

RENDLE'S LIST OF NEW GERANIUMS will be found in the columns of this Paper, page 578, in the Number for September 13, 1851.
WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

TULIPS, HYACINTHS, LILIUM LANCIFOLIUM, AND DUTCH BULBS GENERALLY.
This being the season for planting these Bulbs,

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to state that he supplies the above FLOWERS of the finest quality, at very moderate prices. His Catalogue may be had on application.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

PLANTING SEASON.

W. H. ROGERS, NURSERYMAN and LANDSCAPE GARDENER, 130, High-street, Southampton, begs to offer any quantity and description of finely grown and well-rooted NURSERY STOCK, including Forest and Ornamental Trees, Evergreen and Flowering Shrubs, American Plants, Fruit Trees, Roses, Herbaceous Plants, &c., &c., at a very reduced price. Planting contracted for to any extent, engaging to replace failures. Gardens and Pleasure Grounds laid out and planted in the best taste.—All communications addressed to W. H. ROGERS, as above, will meet with immediate attention.

SAFFRON WALDEN NURSERY.
SUPERB SEEDLING HOLLYHOCKS OF 1851.

WILLIAM CHATER begs to inform his patrons that he has arranged with Mr. PARSONS for his Seedling Hollyhocks, which were exhibited at Shacklewell Horticultural Show, and took the first prize; also at the National Floricultural Society, where they obtained three first class Certificates.
W. C. is now prepared to send out a few Sets of these unequalled varieties, for prepayment only. A separate priced list may be had on application by enclosing a postage stamp.
Post-office Orders payable at Saffron Walden.
N.B. This advertisement will not be repeated.

SUPERB HOLLYHOCK SEED.—Well ripened Seed, warranted to be saved exclusively from Rosea grandiflora, Delicata, Comet, Model of Perfection, Elegans, Formosa, Gem, Belladonna, Bicolor, Queen, Fireball, Aurantia, Rosea alba, and Sulphurea perfecta. A good mixture of the above, in packets, containing 200 Seeds, will be forwarded, post free, upon the receipt of 2*s.* 6*d.* worth of postage stamps, by R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk.

F. WOOD, Tothill, Plymouth, respectfully informs the admirers of floral beauty, that they may now enrich their collection by the addition of a superb White Geranium, named "BRIDE OF ABYDOS," raised by him. The ground colour of this beautiful flower is a pure white; the top petals are densely blotched with deep maroon, shading off to a rich claret, leaving a pure white margin; the flower is of exquisite form, a very free bloomer, and of dwarf habit. Plants now ready, 15*s.* each. The usual allowance to the trade.
Agents for London:—Mr. EDWARD G HENDERSON, Wellington Road Nursery, St. John's Wood; and Messrs. Low and Co., Clapton Nursery; and Messrs. VEITCH and SON, Nurserymen.

IMPORTANT TO ALL WHO HAVE A GARDEN.

CHALLENGE COMPARISON AND COMPETITION. CARRIAGE PAID.
All orders above 5*l.* carriage paid to London, Liverpool, Birmingham, and Edinburgh, and all the intermediate Stations within 150 miles of the Nurseries, upon any line of Railway whatsoever. To those ornamenting their Gardens or Grounds, this is an advantage seldom offered.

SELECT HARDY HERBACEOUS PLANTS AND ALPINES.
100, own selection, two of each kind, 30*s.*; or our selection, in 100 varieties, 42*s.*
100, purchaser's selection, one of each kind, 42*s.*
100 Alpine or Rock Plants, 42*s.*
The above extends over 1000 species and varieties, selected from the choicest collections in the country, warranted second to none for beauty and display. Having an immense stock, they can be furnished at these low prices.

AMERICAN PLANTS, FLOWERING SHRUBS, ORNAMENTAL TREES, AND EVERGREENS.
Purchaser's, or our selection, from list, per 100, 2*l.* 10*s.*, one of each.
Own do. do. per 100, 1*l.* 10*s.*, two of each.
This Nursery has long held high celebrity for possessing a splendid stock of Flowering Shrubs and Ornamental Trees, extending over 800 species and varieties of the finest selection; and for quality, correctness in naming, and health, not equalled by any. To Gentlemen forming Arboretums, or adding desiderata, this is an opportunity never before offered.
HOLLYHOCKS.—No. 1, fine double kinds, all shades of colour, for exhibition, 9*s.* per dozen; 50*s.* per 100. No. 2, for border display, 6*s.* per dozen; or 30*s.* per 100. These are selected from the finest collection in the country.
COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or 10*s.* per 100, fine. 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*; or 12*s.* 6*d.* per 100.
PORTUGAL LAURELS, 1½ to 2 feet, 20*s.* per 100; fine, 3*s.* per dozen. 2 to 3 feet, extra fine and bushy, 30*s.* per 100; 6*s.* per dozen.
EVERGREEN PRIVET, fine, 2 to 3 feet, per 1000, 40*s.*; per 100, 5*s.* 3 to 5 feet, strong, 45*s.* per 1000; or, per 100, 6*s.*, healthy and fine grown.
LIMES, per 100, 4 to 5 feet, 30*s.*; 5 to 6 feet, fine, 40*s.* per 100, fine avenue trees.
HORSE CHESTNUT, 5 to 6 feet, 30*s.* per 100; 10 to 12 feet, 50*s.* per 100, splendid.
ROSES, 50 splendid sorts, Standards, fine healthy stuff, per 100, 5*l.*; or 18*s.* per dozen, own selection. 100 superb sorts of Dwarf Roses, in 100 fine varieties, 50*s.*; or 9*s.* per dozen, own selection; mixed, 30*s.* per 100, or 6*s.* per dozen.
MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.
50 first-rate sorts, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
50 do. purchaser's selection, 3*l.*; or 18*s.* per dozen.
ERICAS, 50 of the finest sorts grown, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
" " purchaser's choice from list, 3*l.*; or 18*s.* per dozen.
CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21*s.*; or 15*s.* per dozen.
" " purchaser's choice, 1*l.* 5*s.*; or 18*s.* per dozen.
The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.
HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25*s.*; 50 fine for 10*s.*; 25 for 8*s.*, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.
CINERARIA, from the choicest sorts, per packet, 2*s.* 6*d.*
PANSY, do. do. do. 1*s.* 6*d.*
HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1*s.* 6*d.*

FRUIT TREES.
GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4*l.*, in 100 varieties; or 10*s.* per 100, in 50 varieties.
A selection of the choicest description for show, 9*s.* per doz.
The stock extends over 50,000, and is fine and free growing.
CURRANTS.—MAY'S Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25*s.*; or per doz., 4*s.*
Black Naples, the finest black (no other sort grown), 12*s.* per 100, 2*s.* 6*d.* per doz.
Red Grape and Champagne, fine, 10*s.* per 100.
White Dutch, large and fine, 15*s.* per 100, 3*s.* per doz.
APPLES.—Fine clean Standards, 10*s.* per doz., 70*s.* per 100.
" " Dwarfs, 8*s.* per doz., 50*s.* per 100.
" Dwarf trained superior kinds, 2*s.* 6*d.* each, or 24*s.* p. doz.
The collection is very choice, from the Horticultural Society.
PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.
PLUMS and CHERRIES.—All the leading sorts, standards, 18*s.* per doz.
" " Dwarfs, fine, 9*s.* per doz.
" " Dwarf trained, 3*s.* 6*d.* each, or 36*s.* per doz.
APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5*s.* each, 50*s.* per doz.
RASPBERRIES.—Fastolff, 3*s.* per doz., 16*s.* per 100.
" Antwerp Red, 2*s.* per doz., 12*s.* per 100.
" Monthly, or Double-bearing, 12*s.* per 100, 2*s.* per doz.
STRAWBERRIES.—Early and late kinds, in 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3*s.* 6*d.* per 100.
An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, and Evergreens. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.
tion, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to JOHN MAY, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.
N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.
Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON AND Co., have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21*s.* each.
Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are of a fine deep black having a fine rich flavour, and very juicy.
It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

Horticultural Gardens, Norwich, October 25.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.
York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. Early Oxford do., 10*s.* 6*d.* do. Early Ebrington Kidney do., 10*s.* 6*d.* do. Early Ash-leaf Kidney do., 10*s.* 6*d.* do.
Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking,

NEW STRAWBERRY AND DOUBLE DAISIES.

JOHN SALTER, F.H.S., is now sending out his STRAWBERRY, "ATHLETE," at 4*l.* per hundred, or 12*s.* per dozen. It is a very large, handsome fruit, of good flavour, early, enormous bearer, and has been ordered by many persons who saw it growing.

DOUBLE DAISIES.—Twenty-five finest sorts (chosen out of 150 varieties) for 15*s.* They are perfectly double, of fine form, very distinct and pretty, and were awarded a Certificate at Chiswick in the summer.

FANCY PANSIES.—Twelve curiously-striped varieties, quite new in character, and very attractive. The set, 1*l.* 10*s.*

NEW CHRYSANTHEMUMS.—Fifty fine new varieties of 1851, pompous and large show flowers, at 18*s.* and 24*s.* per dozen. His unrivalled collection, containing about 400 vars., is now coming into bloom, and may be seen every day except Sunday; also, some fine seedlings, which he will send out next spring.

Versailles Nursery, William-street, Hammersmith Turnpike.

NEW FORCING CARNATION.

GAINES'S "FLORABUNDA" rose flake, large flower, will bear stove heat and expand well. This flower will be a great acquisition to the bouquet in the spring.

N. G. begs to announce that he can supply good strong plants of the above at 2*s.* 6*d* per pair. His descriptive list of Show Pelargoniums and fancy varieties, &c., is just published, and can be had by applying at the Nursery, Surrey-lane, Battersea, near London.

MESSRS. DICKSONS AND CO. beg to call attention to the following NEW PANSIES, which took the first prize for the best one, the best two, and the best three Seedlings of 1851, at the Competition held in Glasgow, on the 27th ult., open to all Scotland, viz.:—

* "BRITISH QUEEN."—White, with various belt, and top petals of fine bluish purple; 5*s.*

"GOLDEN EAGLE"—A yellow self, with a large and striking blotch, great substance, and fine form; 5*s.*

* "GLIFF."—Yellow, with broad belt, and top petals of rich bronze purple, very large, fine show flowers; 5*s.*

"PEACOCK."—Gold, and rich maroon belt, and top petals, extra form; 5*s.*

"ROYAL STANDARD."—Pure white, with rich purple belt and top petals, exquisite form, and fine blotch; 5*s.*

* "VICTORY."—Yellow and deep maroon belt and top petals, the three lower petals beautifully laced with gold, blotch large, constant, a superb show flower; 5*s.*

Those marked * are now ready. Usual allowance to the Trade.

Edinburgh, Oct. 25.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, near London, informs his kind patrons that his new ROSE AND FRUIT CATALOGUE FOR 1851 AND 1852 is now ready for circulation, and will be sent on receipt of a twopenny stamp. His Stock of Roses, Fruit Trees, Evergreen Shrubs, and Ornamental Trees, are of the finest growth, of all sizes.—Gardens and Pleasure Grounds tastefully arranged and planted on the lowest terms.

E. D. informs his friends that he has no Seed Shop in London.

BASS AND BROWN'S AUTUMN CATALOGUE is now ready, containing—

PART I. The New Geraniums, Fuchsias, Petunias, Verbenas, and other new and select Plants, at reduced prices.

PART II Roses, select Evergreen and Flowering Shrubs, Climbers, Hardy Herbaceous Plants, &c.

PART III. Flower Roots, embracing splendid collections of Ranunculi, Gladioli, Early and Late Tulips, Iris, Lilies, imported Dutch Hyacinths, &c., &c.

Copies supplied on application, published complete with the newspaper stamp, to go free.

Seed and Horticultural Establishment, Sudbury, Suffolk.

JOHN HENCHMAN is now ready to send out a few sets of his six choice Seedling CINERARIAS, saved from above 4000 varieties at 15*s.* the set. A few stout Seedling CINERARIAS, raised from very choice seed, at 6*s.* per dozen, or 40*s.* per 100. Stout healthy Seedling CALCEOLARIAS, raised from his best varieties, well known for their half shrubby free blooming habit, and large showy blooms, at 6*s.* per dozen or 40*s.* per 100. Choice named PANSIES, by the best growers, at 6*s.*, 9*s.*, and 12*s.* per dozen. A few packets of choice Pansy Seed, at 2*s.* 6*d.* each; Choice Calceolaria Seed, 2*s.* 6*d.* per packet; Hollyhock Seed, warranted, from Chater's superb named varieties, at 5*s.* per packet. Superb African Marygold, lemon and orange, and dwarf French Marygold, at 1*s.* per packet, or 2*s.* 6*d.* the set. Remittance requested from unknown correspondents.—Edmonton, London, Oct. 25.

THE MOUNTAIN OF LIGHT, a new variegated GERANIUM, of dwarf habit, and free growth. The centre of the leaf is deep green, with a broad margin of pure white. The truss is of medium size, the pips very round, and the colour the most intense scarlet. It is a very free bloomer.

First-class Certificates have been awarded to it by the National Floricultural Society, and the South London.

JOHN AND CHARLES LEE intend sending out this desirable variety (which eclipses all former introductions in this class), on the 31st instant. Price 10*s.* 6*d.* each. Early orders are requested, as the stock is limited.

Nursery, Hammersmith.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1¼ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Oct. 25.

TWENTY GERANIUMS FOR ONE POUND.

TWENTY CHOICE NAMED GERANIUMS FOR TWENTY SHILLINGS, can be selected by the purchaser from the following list:—Foquett's Magnificent, Topping's Brilliant, Hoyle's Crusader, Arnold's Virgin Queen, Falstaff, Lyne's Forget-me-not, Delicatissima, Rosy Circle, Nourmahal, Desdemona, Sir Robert Sale, Hebe's Lip, Centurion, Negress, Cassandra, Pluto, Symmetry, Gustavus, Gulielma, Sunrise, Duke of Cornwall, Grandiflora, Orion, Black Prince, Mercury, Star of the West, Lady Ebrington, Jenny Lind, Scarlet Defiance, Flora's Flag, and Emilia.

SCARLET GERANIUMS.

Flower of the Day, Excellence, Glendinning's Perpetual, Magnum Bonum, Queen of Summer, Fire Queen, Royalist, Commander-in-Chief, Resilium, Hendersonii, Monarch, Britannia and General Tom Thumb.

*All Orders above 2l. will be delivered Carriage Free to any Station on the Great Western, Bristol and Exeter, or South Devon Railways, or to Cork, Dublin, or Belfast.*

Apply to WILLIAM E. RENDLE, Union-road, Plymouth, adjoining the terminus of the South Devon Railway.

EXOTIC NURSERY, KING'S-ROAD, CHELSEA.

We have a fine stock of ARAUCARIA IMBRICATA, CEDRUS DEODARA, RHODODENDRON PONTICUM, in remarkably well-grown plants, of various sizes. This being the best time of the whole year for planting them, we beg respectfully to recommend them in an especial manner, to those who intend embellishing their estates and gardens by ornamental planting, and shall be happy to furnish size and price when applied for. KNIGHT and PERRY.

H. LANE AND SON, GREAT BERKHAMPSTEAD, HERTS, are now ready to forward to applicants their CATALOGUE OF ROSES.

" " TREES AND SHRUBS.
" " FRUIT TREES.
" " INDIAN AZALEAS AND CAMELLIAS.

Black Hamburgh and Sweetwater Vines, in pots, fruiting plants, fit for forcing, 5*s.* each. Discount to the trade.

Nurseries, Kingston, Surrey, Oct. 25.

EDWARD GEORGE HENDERSON is now ready to send out his new CINERARIAS and FANCY GERANIUMS, for which he solicits early orders, as the stock of some of the varieties is very limited.

NEW CINERARIAS.

PRIMA DONNA (HENDERSON'S).—Large dark blue, fine broad petal, good form, and very dwarf habit. 10*s.* 6*d.*

MRS. SIDNEY HERBERT (HENDERSON'S).—White, with narrow carmine margin and carmine disc. A new and distinct colour, of good habit, and a handsome variety. 10*s.* 6*d.*

MARIANNE (HENDERSON'S).—Clear white, with a regular margin of rosy crimson, and black disc; first-rate form; a very handsome and striking variety. First class Certificates have been awarded to this flower. 10*s.* 6*d.*

ROSY MORN (HENDERSON'S).—Rosy crimson, with a white ring round a dark disc; good habit. 7*s.* 6*d.*

ST. CLAIR OF THE ISLES (HENDERSON'S).—White, with medium rosy lilac margin, and of dwarf habit; exquisite form. 7*s.* 6*d.*

MRS. CHARLES KEAN (HENDERSON'S).—White and bright deep rose, light disc; fine form and good habit. 7*s.* 6*d.*

MR. SIDNEY HERBERT (HENDERSON'S.)—Shaded purple, of fine form. 7*s.* 6*d.*

NONSUCH (HENDERSON'S).—Crimson plum; fine large flower, good broad petal. 7*s.* 6*d.*

CATHERINE SEATON (HENDERSON'S).—Bright rosy carmine, with a circle of white round a carmine disc. Gratis to purchasers of the set.

Price of the set, 3*l.* 3*s.*—The usual discount to the Trade.

NEW FANCY GERANIUMS.

BRIDE (HENDERSON'S).—Brilliant rose, with small white margin, and pure white centre; very free bloomer. 10*s.* 6*d.*

BEAUTY OF ST. JOHN'S-WOOD (HENDERSON'S).—Upper petals bright violet carmine, with a regular clear white margin; a regular belting of carmine runs through the under petals; good truss, and an excellent grower. 10*s.* 6*d.*

OTHELLO (HENDERSON'S). — Rich dark maroon upper petals, with smooth light margin; light blush under petals, with a belting of rich crimson in the centre of each; fine form. 10*s.* 6*d.*

PRINCESS ROYAL (HENDERSON'S).—Upper petals bright rosy carmine, with clear white margin; under petals clear white, with regular carmine markings, and clear white centre; good truss, and a very free bloomer. 10*s.* 6*d.*

AMBASSADOR (HENDERSON'S). — Large bright rose self, with a white margin; fine truss, good form and habit. 10*s.* 6*d.*

ANNETTE (HENDERSON'S).—An improvement on "Alboni;" very large truss, and an abundant bloomer. 10*s.* 6*d.*

The set, 3*l.* 3*s.*—The usual discount to the trade.

Wellington-road Nursery, St. John's-wood, London, Oct. 25.

STANDISH AND NOBLE, NURSERYMEN, Bagshot, Surrey, solicit attention to the following List of ORNAMENTAL PLANTS, selected from their general Nursery Stock. The greater portion are growing in the open quarters; and, from being periodically transplanted, their safe removal may be relied on. Every Plant sent out will be a healthy, robust specimen; the heights given afford but a slight criterion of their general character. To those having a star prefixed they invite special attention, as being remarkably fine, and fit for producing immediate effect. Gentlemen about to plant extensively would be repaid by making a visit to the Nursery.

All kinds of Ornamental Trees and Shrubs supplied A fine Collection of Roses selected with reference to late autumnal blooming. Also of the best kinds of late-flowering hardy hybrid Rhododendrons, to the cultivation of which especial attention is given.

*** Gentlemen requiring assistance in laying out, or improving their grounds, may procure the services of a competent person, by applying to the advertisers.

With the exception of such names as are printed in italics, the whole of the plants in this list are perfectly hardy.

The number of inches named refer to the heights, unless otherwise stated.

Abies Brunoniana, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*, each.
" Jezoensis, one year's seedlings, 21*s.* each.
This is one of the last novelties in Conifers. It forms a noble tree of 120 feet in height, and of very distinct character.
" Douglasii, 20 to 36 ins., 5*s.* to 10*s.* 6*d.* each.
Araucaria imbricata, 6 to 9 ins., 1*s.*; 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.*; 24 ins., 5*s.*, each.
*Azalea, "Glory of Sunning Hill,"* 2*s.* 6*d.* to 5*s.* each.
The best double variety in cultivation.
" ovata a hardy evergreen, 6 to 9 ins., 2*s.* 6*d.* each.
" *vittata*, a specimen of this unique variety was awarded a Knightian medal, when exhibited last April at the rooms of the Horticultural Society. The ground colour of the flowers is white, which is beautifully striped with purple, after the manner of a Carnation. It is a very free bloomer. 9 ins., 21*s.* each.
Abelia uniflora, new and distinct. A very free bloomer, 10*s.* 6*d.* each.
Buxus sp., from north of China, round leaved, 10*s.* 6*d.* each.
" " " long leaved, 15*s.* each.
Berberis Fortunii, 9 ins., 1*s.* 6*d.*; 12 ins., 2*s.*; 18 ins., 3*s.*; 24 ins., 5*s.* each.
" Darwinii, 7*s.* 6*d.* to 21*s.* each.
* Cedrus africana, 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 30 ins., 5*s.*; 36 ins., 7*s* 6*d.*; 48 ins., 10*s.* 6*d.* each.
* " Deodara, 2 to 5 ft., 2*s.* 6*d.*, to 10*s.* 6*d.* each.
* Cryptomeria japonica, seedlings, very robust plants, will require no support from stakes. Plants 4 to 5 ft. high have stems as many inches in circumference. 6 ins., 63*s.* per 100. 24 ins., 2*s.* 6*d.*; 36 ins., 3*s.* 6*d.*; 48 ins., 5*s.*; 60 ins., 7*s.* 6*d.* each.
" japonica nana, seedlings 9 to 12 inches through, 10*s.* 6*d.* to 21*s.* each.
*Cupressus funebris, seedlings, very robust plants, from the open border, nearly as wide as high, very handsome plants, 12 ins., 5*s.*; 18 ins., 7*s.* 6*d.*; 24 ins., 15*s.*; 30 ins., 21*s.*; 36 ins., 31*s.* 6*d.* each. Cuttings, 6 to 8 ins., 2*s.* 6*d* each.
* " elegans, a rapid grower, and a most graceful tree, 12 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 36 ins., 5*s.*; 48 ins., 7*s.* 6*d* each.
* " Goveniana.—This is one of the most beautiful plants of its class. It has the merit of preserving its beautiful green colour during the most severe weather. 9 ins., 2*s.* 6*d.*; 12 ins., 3*s.* 6*d.*; 18 ins., 5*s.*; 24 ins., 7*s.* 6*d.*; 30 ins., 10*s.* 6*d.*; 36 ins., 15*s.*; 48 ins., 21*s.* each.
* " Lambertiana, forms a noble tree, rivalling even the Cedar of Lebanon, and succeeds well in very exposed situations. 9 to 12 ins., 1*s.* 6*d.*; 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.* each.
Grafted beneath the surface of the soil, 30 ins., 2*s.*; 36 ins., 2*s.* 6*d.*; 42 ins., 3*s.* 6*d.*; 48 ins., 5*s.* each.
Cephalotaxus Fortunii, male var., long leaves, seedlings, 21*s.* each.
" " female var., short leaves, seedlings, 21*s.* each.
Chamærops sp., a hardy Palm from the north of China, a decided acquisition to our hardy ornamental evergreens, 21*s.* to 31*s.* 6*d.* each.
*Clerodendrum fœtidum.*—The only species of this beautiful genus which can be successfully cultivated in a cool greenhouse, a situation in which this succeeds admirably. It forms its large heads of rosy lilac flowers in great profusion. Strong plants, 21*s.* each.
Cerasus illicifolia, 7*s.* 6*d.* each.
Daphne japonica, 12 ins., 2*s.* 6*d.* each.
" hybridum, 12 ins., 1*s.* 6*d.* each.
Forsythia viridissima.—This plant is not sufficiently known. It is an early spring flowering plant, producing its yellow blossoms in great profusion. But it rarely flowers, or but scantily when young. The plants offered are well set with flower-buds. It forces well. Bushy plants, 24 ins., 1*s.* 6*d.*; 36 ins., 2*s.* 6*d.*; 48 ins., 3*s.* 6*d.*; Standards, 10*s.* 6*d.* each.
Ilex dipyrena, 9 to 12 inches, 3*s.* 6*d.* each.
" microcarpa, 21*s.* each.
" latifolia, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.*; 24 ins., 5*s.* each.
" furcata, 21*s* each.
Juniperus argentea, new and very beautiful, 12 ins., 5*s.* each.
" phœnicea, 12 ins., 1*s.* 6*d* each.
" chinensis, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d.*; 24 ins., 2*s.*; 30 ins., 2*s.* 6*d.* each.
" tamariscifolia, 12 ins., 1*s.* each.
" flaccida, 12 ins., 1*s.* 6*d*; 24 ins., 3*s.* 6*d.* each.
" excelsa, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.* each.
" squamata, 12 ins., 1*s.*; 24 ins., 2*s.* 6*d.* each.
" Cracovia, 12 ins., 1*s.* each.
" macrocarpa, 12 ins., 2*s.* 6*d* each.
" repandens, 12 ins., 9*d.*; 24 ins., 1*s.* 6*d.* each.
" oblonga pendula, 6 to 8 ins., 2*s.* 6*d.* each.
" Bedfordiana, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d*; 24 ins., 2*s.* each.
Jasminum nudiflorum, strong blooming plants, 2*s.* 6*d.* each.
Ligustrum japonicum, 9 ins., 1*s.*; 24 ins., 2*s.* each.
*Lycopodium Wildenovii*, 5*s.* each.
Libocedrus chilensis, 7*s.* 6*d.* each.
Mitraria coccinea, 2*s*, 6*d.* each.
* Picea Pinsapo, very handsome specimens, 30 ins., 21*s.* each.
" Nordmanniana, 10*s.* to 15*s* each.
" ovata, 10*s.* 6*d.* each.
* Pinus insiguis, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 30 ins., 7*s.* 6*d.*; 36 to 42 ins., 10*s.* 6*d.* each.
" muricata, 9 ins., 10*s.* 6*d.*; 18 ins., 21*s.*; 24 ins., 31*s.* 6*d.* each.
" Montezumæ, 12 to 15 ins., 10*s.* 6*d.* each.
Quercus sclerophylla, 21*s.* to 42*s.* each.
" inversa, 21*s.* to 42*s.* each.
Rose, "Fortune's Yellow," dwfs., 2*s.* 6*d.* to 5*s.* each.
" " " standards, 5*s.* to 7*s.* 6*d.* each.
Rhododendrons.—Hardy late flowering Hybrids, varying in colour, from white to deep crimson. Dwarfs 31*s.* 6*d.* to 6 guineas per dozen; Standards, 21*s.* to 5 guineas each.
" Common ponticum, for covers, thrice transplanted, 12 to 18 ins. high, very bushy, 15*s.* to 21*s.* per 100.
Sikkim Rhododendrons.—We believe we may state, without fear of contradiction, that we possess the largest plants of these beautiful Rhododendrons in the trade. The heights of those we are offering vary from 2 to 9 ins. From the altitude from whence many of them were obtained, there is great probability of their proving hardy in this country. Collections of 24 distinct kinds at 3, 5, or 9 guineas.
Spiræa callosa.—An abundant and continued bloomer. It has large corymbs of rosy purple blossoms, and is a handsome addition to our shrubbery plants; 10*s.* 6*d.* each.
Salisburia adiantifolia (seedlings), 12 ins., 2*s.* 6*d.* each.
*Taxodium sempervirens. This and Cryptomeria japonica are amongst the most rapid growing Conifers. In situations where such are required they cannot be surpassed. 18 ins. to 5 ft., 1*s.* 6*d.* to 10*s.* 6*d.* each.
Taxus Dovastonii, standards, 3 to 4 ft., 7*s.* 6*d.* to 10*s.* 6*d.* each.
" adpressa, 12 ins., 2*s*; 24 ins., 5*s.*; 36 ins., 10*s.* 6*d.* each.
Taxus baccata (yellow-berried var.), 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 36 ins., 7*s.* 6*d* each.
" " (golden-leaved var.) 12 ins., 1*s.* 6*d.*; 18 ins. 2*s.* 6*d.* each.
Viburnum plicatum, 10*s.* 6*d.* to 21*s.* each.
*Weigela rosea.—This beautiful flowering shrub should be grown by every one. It forms a handsome object in the open borders in May. It also forces well. The plants here offered are as wide as high, and will flower abundantly in the spring. 18 ins., 2*s.*; 24 ins., 2*s.* 6*d.*; 30 ins., 3*s.* 6*d.*; 36 ins., 5*s.* each.

A Descriptive Catalogue of Hardy Ornamental Trees and Shrubs; to which is prefixed a Treatise on the Cultivation of American Plants, may be had free, by enclosing six stamps for postage.

THE STANWICK NECTARINE.—Fine young Trees, 4 to 5 feet in height, of this fine variety can now be supplied; also trees in pots, at 21s. each, packing included, and carriage paid to London.

As the proceeds of the sale of this valuable addition to our Fruits are to be applied in aid of the Gardeners' Benevolent Institution, prompt payment is requested, and prepayment from unknown correspondents.

Orders to be addressed to THOS. RIVERS, the Nurseries Sawbridgeworth, Herts.

WILLIAM HAMILTON, SEEDSMAN, &c., 156, Cheapside, London, will forward his CATALOGUE of BULBOUS ROOTS (of which he has a large collection), on application.

Gladiolus, Lilies, Jonquils, Amaryllis, Ranunculus, Anemones, and a number of other roots, for which see his Catalogue.

FANCY PELARGONIUMS.

W. P. AYRES begs to announce that his Descriptive Catalogue of Seedling Fancy and other PELARGONIUMS, CINERARIAS, CALCEOLARIAS &c., will be published in a few days, and will be forwarded upon prepaid application. His Seedling Fancy Pelargoniums will be ready for delivery on and after the 20th of October, but the stock of some of the kinds being limited, early orders are indispensable to insure the collection.

Brooklands Nursery, Blackheath, Oct. 25.

VIOLETS.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET (TRUE).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season, by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful Double Violet now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the Double Blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets, the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen, or 3l. per 100. Any quantity of the above will be sent postage and package free.

STRAWBERRY PLANTS.

The undermentioned first-rate varieties are now ready to send out:—

Myatt's Surprize, sent out first time last season, 1l. per 100, or 3s. per dozen.

Prince Arthur, do. do., 1l. per 100, or 3s. per dozen.

Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 5s. per 100.

Goliah, very fine ... ... ... ... 3s. per 100.
British Queen, do. ... ... ... 5s. ,,
Alice Maud, do. ... ... ... ... 3s. ,,
Black Prince, very early ... ... 5s. ,,
Prolific, very fine and early ... ... 5s. ,,

Cremont's Perpetual, or double-bearing Strawberry, 12s. per dozen, or 4l. per 100.

Trollop's Victoria, 12s. per dozen, or 4l. per 100.

The above are strong and well-rooted plants, such as will insure satisfaction. Any of the Strawberries that are priced, per dozen, can be sent free by post; also those priced, per 100, will be sent package free.

Fine Giant Scarlet Brompton Stocks, Plants that have been all pricked out, 2s. 6d. per 100.

Also, some fine Antirrhinums, all saved from striped and spotted varieties, such as will give every satisfaction, and bloom early next spring, 5s. per 100.

Fine Sweet Williams, such as will bloom next season, saved from 50 distinct varieties (the plants are strong and good), 5s per 100, or 1s. per dozen. Can be sent by post with any of the above.

WINTER CUCUMBER.

Lord Keynon's Favourite, the best variety for winter cultivation, 2s. 6d. per packet.

A remittance is expected by Post-office order, or the amount in penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

**The Gardeners' Chronicle.**

*SATURDAY, OCTOBER 25, 1851.*

THE approach of the planting season reminds us of the utility of pointing out a feature in some of our newly introduced plants, which, although of considerable importance, is rarely thought of. We look to the form of leaves, the manner of growth, the effect produced by a tree when in flower, but we forget that in their AUTUMNAL TINTS there is sometimes more to admire than in foliage, habit, or inflorescence. The red Maples, the scarlet Oaks, the crimson Sumach, are now familiar, and their effects in the landscape are not forgotten by the judicious planter, but of some of the more recently introduced plants little or nothing can be said to be generally known. To this point, then, we would draw a moment's attention.

First of the Funereal Cypress (*Cupressus funebris*). This plant, to its beautiful habit and delicate glaucous bloom in summer, adds in autumn a tender violet tinge, which we have sought in vain to match. It is evident that when the tree becomes large, this circumstance will be of importance in regulating its position with regard to other trees. In this respect it is essentially different from the true Cupressus torulosa, to which it nearly approaches. Of the latter, we may add that the Isle of Wight specimens in the late Mr. WARD's grounds are probably all spurious, the true plant having very small round cones, not at all larger than those of Cupressus funebris.

Next come some species of *Acer*. Among the best is the famous shaggy Sycamore (*Acer villosum*) of India, a fine tree, lately introduced by Messrs. OSBORN and Co., of Fulham, in its native country associated with Fir trees and Birches upon the highest mountains. Its great angular leaves, covered with velvet underneath, become a rich nankeen brown. It obtains its name from the woolliness of its young shoots and abundant flowers, which are said to be deliciously fragrant. Of less importance, but still a fine object, is the Hyrcanian Maple (*Acer hyrcanum*), a tree resembling our English Maple except in stature, whose leaves in autumn change to yellow before they drop off. Far more brilliant than these is the little circinate Maple (*Acer circinatum*), of Oregon, a bush producing in the spring myriads of dull purple flowers with long crimson bud-scales, looking like petals; in the autumn it puts on a mantle of rich crimson, unsurpassed by the brightest of those rich tints which constitute the Indian summer. Nor must we omit to mention the glaucous-twigged Lobel Sycamore (*Acer Lobelii*), towering, like a column, above the round-headed species of its genus, and still of the deepest green, while all around are changing to red or yellow, and are half unleafed by the recent frosts. These are the real novelties in arboriculture, whose autumn colours deserve notice.

But we must not forget that what is now familiar to us may be still but little known in the distant parts of the kingdom. We will therefore venture to add a word or two concerning a few plants that are not novelties, and yet are little diffused. Take the Holly-leaved Berberry (*Berberis aquifolium*) for example; what can be more admirable than the warm brown crimson of its leaves, wherever they are exposed to the air and sun? What a charming contrast they form to the ever-verdant sameness of Laurels and Bays, and other evergreens to which our gardens trust for winter ornament. The moment the delicate bloom of the berries of this plant is gone, the rich colours of the foliage succeed and endure till spring returns. If with this we combine the Indian Chitra (*Berberis aristata*), with its dark-brown wood, crimson leaves, and scarlet fruit, and a few of the yellow waving plumes of the French Tamarisk (*Tamarix gallica*), groups may be formed which it would baffle the painter to imitate, especially if they become a foreground to the hoary branches of the sweetest of Thorns (*Cratægus odoratissima*), and its piles of succulent Apricot-coloured haws.

One glance at London gardens at this season is, to the planter, worth the closest inspection of them at Midsummer; a thousand unexpected suggestions now occur to the eye of taste, and it is instantly remarked, that our winter shrubberies teem with capabilities which have never yet been developed. In truth, winter decoration is infinitely more important than that of summer. Bounteous Nature, in the latter season, scatters her charms with marvellous profusion over even these northern latitudes; but in autumn and winter she gives us Thorns, Oaks, Hollies, Yews, and a few other insignificant trees and bushes. It is for these that we want substitutes; it is in autumn and winter that we need that infinite variety of tree and shrub which the industry of man has gathered together in these favoured isles. But we want something more than to possess them; we require to know how to avail ourselves of all which they are capable of yielding; how they branch, how they die off, in what form they remain as skeletons, and in what compact masses of never dying leaves. It is here that the English gardener is deficient; it is to these points that he should give his whole attention. For summer effect trees are never planted wrong; for winter they seldom stand aright.

THE following paragraph, which has gone the round of the papers, though evidently exaggerated in some of its details, has excited the fears of many consumers of MUSHROOMS, to such an extent as to threaten material injury to the cultivators of these general favourites. Though no great speculators in edible fungi, the whole experience of the innocence of the common Mushrooms, when properly distinguished, and not in a state of decomposition, is so highly satisfactory, that we think it right to do our part towards allaying any alarm which may at present exist on the subject. We will, however, first give the paragraph at full length, and then append such observations as may seem needful.

"POISONING BY MUSHROOMS.—Two highly respected officers of the Belgian cuirassiers, quartered at Bruges, died on Tuesday week, under circumstances which ought to be made known as publicly as possible. They dined in their quarters, and ordered some Mushrooms dressed in some favourite sauce for dinner, of which they both partook. A few hours afterwards, they were both taken ill of a horrible and agonising colic, which, before night, became so alarming that medical assistance was sent for, when it became the opinion of the doctors that they had been poisoned by the Mushrooms. Every effort was made to save them, but without effect. After suffering the most horrible agonies the whole night, during which one of them broke his back from the violence of his convulsions, they both expired towards morning. The most fearful circumstance connected with the case is, the declaration of several medical men and chemists, that poison is really contained in the true *Agaricus campestris*, or common Mushroom, after a certain stage of growth; and Professor ORFILA has hinted at the same in his 'Book on Poisons.' This, if a fact, ought to be generally made known at this season of the year."

The symptoms here described are evidently such as frequently occur in cases of poisoning by fungi, though they vary considerably, under different circumstances. In a report of VITTADINI, on a disastrous instance, in which *Agaricus vernus* was accidentally eaten, instead of *Ag. mouceron*, the symptoms were, continued nausea, extremely acute pain in the stomach and intestines, frequent fainting fits, convulsions, &c.; and the *post mortem* examination exhibited large inflamed patches of an intense livid rose colour, in the neighbourhood of the pylorus. This agrees with a report of Professor PUCCINELLI, where extensive ulceration of the mucous coat of the intestines was observed after death, caused by some poisonous BOLETUS; and Dr. BADHAM, who has had many opportunities of observing the symptoms peculiar to such disasters, accords perfectly with these authorities, and others which might be quoted to the same effect. There is nothing, therefore, in the symptoms to throw any positive doubt upon the matter, or to suggest the possibility of the presence of some mineral poison; it is, however, to be remarked that neither is there any sufficient information as to the particular species of fungus consumed, the condition in which the fungi themselves were, nor whether some mistake may not have arisen, as in the case quoted above from VITTADINI. It is quite true that *A. campestris* is rejected in Italy by the inspectors of the markets as poisonous, while *A. arvensis*, probably a mere variety, and esteemed far less wholesome in England, is largely consumed; but there is no evidence to show that this exclusion is rational, especially as it is greatly esteemed in Tuscany, and as VITTADINI, one of the best authorities respecting Italian fungi, inserts it in the list of edible fungi of Milan and Pavia; though there is so much prejudice against it amongst the common people, that it does not find its way into the markets.

One or two scattered notices are to be found in authors as to the supposed unwholesomeness of *A. campestris*, but nothing of sufficient precision to overthrow the almost general consent as to its good qualities when in a state fit for food. Even bread when mouldy or decomposed may become a deadly poison. Individual constitutions may indeed suffer, especially where decay has taken place, to a greater or less extent, from the use of Mushrooms, as is the case with certain shell-fish, but such isolated instances are of no more value in the one case than in the other; we need not, however, suppose anything of this kind in the history before us. It is far from probable that two persons should at once suffer from the use of fungi from any peculiarity of constitution; but even taking into due account the fact that Mushrooms vary in their quality, according to different circumstances of climate or locality, and estimating at their proper value the circumstances of the different cases, which have been alleged of fatal effects produced by the use of the common Mushroom,* we cannot help concluding that there is no sufficient evidence to deter the most timid from its use, or indeed to convince us that any effect has been produced, other than may arise from the use of the most wholesome viands, either in excessive quantities, or in a state unfit for consumption. *M. J. B.*

WE are happy to mention, among the last arrivals from India, that of Mr. FORTUNE, after bringing to a successful issue the important duties confided to him by the East India Company.

ARTIFICIAL BREEDING OF FISH.—No. II.

[IN my last paper on the "Artificial Breeding of Trout and Salmon," I stated that it was desirable to destroy the water-lice and aquatic larvæ in any spring where it was intended to try the experiment; and I suggested a little quick-lime for the purpose, but I omitted to state that it was essential to get all this lime washed out of the watercourse (or neutralised with sulphuric or carbonic acid), otherwise the lime would be far more prejudicial to the roe of the fish than either lice, aquatic larvæ, or small fish—in fact, it would destroy the roe entirely; and lime preserves its causticity for a much longer period under such circumstances than many people are aware. I have seen the horses' heels sore from plough

* Instances of bad effects from the use of *A. campestris* may be found in PICO's Meletemata, and WILDENOW's Prodromus Floræ Berolinensis.

ing on land six weeks after the lime was put on. I also omitted to mention that where there is not a spring available, for the purpose of trying this experiment, the next best plan, in my opinion, is to lay a 1½ to 2 inch pipe into a brook, and take the water by it into an artificial watercourse (selecting, of course, such a situation as will give you the necessary fall), taking care to slope down the sides to a low angle (as in the section), and sodding the sides of it very carefully; without this precaution, the erosion of the

water and the disintegrating action of the frost, are apt to bring down the banks, and choke the spawning beds; for want of forethought on this point, I have known very promising beds entirely spoiled.]

But though trout and salmon could be bred in this manner, if this were the true theory (which I by no means believe), there would be no means of breeding hybrids between them, which I take to be a far more important thing to achieve, and to which I will now refer.

Ever since my attention was turned to the artificial breeding of fish, it has always appeared to me exceedingly desirable and important to breed hybrids between the trout and the salmon. The fry of the salmon (which, by the bye, is perhaps the most delicate flavoured fish that exists in this country), although it lives and thrives in fresh water for two or three years, if kept in a locality where it cannot escape to the sea, yet if kept longer than that time pines away and dies. If, therefore, we could obtain a cross between the river trout and the salmon, we should probably produce a fish which, being a hybrid, would be always in good condition; being crossed with a river fish it would probably never require a visit to salt water to keep it in good health. Being crossed with a salmon, it ought to get to a good size in a comparatively short period; and if it would rise at the fly or the minnow, ought to afford good sport to the angler. There does not appear to be a greater specific difference between the trout and the salmon than there is between the horse and the ass, the mallard and the musk duck, or a Cabbage and a Turnip; but in all my experiments hitherto, I have never yet succeeded in producing a hybrid between the trout and the salmon, yet I do not despair of doing so;* for there was always a something to complain of and to doubt about, in every one I tried, and I still think I shall succeed by perseverance. Even if I succeed, the result may not prove quite so favourable as I anticipate, but may turn out as unfortunately as the marriage of the gentleman in the story, which relates that, being good tempered but ugly himself, he married a handsome but bad tempered wife, hoping that his children would have his good temper and their mother's good looks; but when they grew up they were as ugly as the father, and as ill-tempered as the mother. So it may prove with these hybrids; they may not thrive in fresh water, they may not get to a good size, they may not rise at the artificial fly, they may be worthless for the table; nevertheless it is desirable, if possible, that this should be ascertained. The progeny of a male salmon and a female trout may be much better or much worse fitted for a continued residence in fresh water, than the descendants of a male trout and a female salmon; but this can only be determined by experiment. Mr. Lindley says, in his introduction to the "Guide to the Orchard, &c.," that in the cross fertilisation of fruits, &c., the seedling always partakes more of the character of the male than the female parent. But I believe that in breeding mules it is found more desirable that the father should be an ass than a horse. In my poultry yard, I breed hybrids between the musk duck and the common duck, and I find that I have a much better progeny from the male musk duck and the common duck, than from the common drake and the female musk duck; in the latter cross, although the mules are fine birds, the females are not larger than widgeons, and fly about almost like wild ducks; this may not always be the case, but has proved so with me. But to return to the fish. If any gentleman interested in such matter does me the honour to read this paper, and wishes for further information on the subject, I shall be happy to give it as far as I am able; very sure I am, that the sportsman who once fairly starts as a fly fisher, and is so fortunate as to hook a salmon or a large trout, will thenceforward despise or lightly esteem corks and floats, ground baits and trimmers, punts and perch fishing, and will fairly wish them all exchanged for a nice stream well stocked with trout. As a gentleman lately said to me, "Fly fishing is a perfect infatuation;" he was quite right—the extreme avidity with which it is followed by the thoroughly initiated can only be explained on that supposition. To the casual observer there does not appear to be any strong excitement in it, but that is a great mistake; let me get to the bank of a river well stocked with trout in a good humour, early in the morning, and I feel neither hunger, thirst, nor fatigue, if I fish until dark without tasting anything; and the excitement of hooking a 10 or 12 pound salmon is not much inferior to that produced by a long run after the hounds.

I cannot conclude without calling the attention of all interested, and able to render assistance, in remedying the evil, to the great falling off there is in all the salmon rivers in England (with those in Scotland and Ireland I am not acquainted, but believe that matters are not in a much better state there). I believe that the unsatisfactory state of the law has a great deal to do with this decline in the value of the fisheries, and I also believe that is quite possible so to alter the law, as to very greatly improve them, without interfering improperly with what is of far more importance, I mean the manufactories of the country. As the law stands at present, the proprietors of the upper parts of the rivers have not the slightest interest in the preservation of the fish in the breeding season; for, as they are seldom allowed to see a fish during the season, why should they look after the poachers in close time? why should they be put to much expense and trouble, as well as risk the lives of their keepers, merely to breed fish for the proprietors of stake nets and estuary fishings who do not spend a farthing in the preservation of the fish when breeding, and yet reap all the benefit? I had occasion some years ago to examine the evidence given on this subject before the House of Commons in 1825, and was exceedingly amused at the schemes resorted to, to evade the law, moderate and inefficient as was that law. Since then the law has been altered both in Scotland and Ireland, but I do not know what are the provisions nor what has been the effect of the new law; it required that there should be a free passage for the salmon through all the traps, weirs, nets, or devices, that were used to catch or detain them, from sunset on Saturday night to sunrise on Monday morning. One man said he paid 7000*l.* a year for his fishing, and therefore if he allowed them to pass on Sundays he should lose one-seventh of his catch; another said he allowed a free passage on Sundays, but would not allow any one to go and examine for themselves! A third proved that he allowed the fish a free passage on Sundays, but his neighbours proved that he placed in the gap a crocodile painted red! and a fourth was convicted of breaking down the stake nets in the estuary of a river, at the same time he had a net stretched entirely across the river above, both night and day; and so with many others, every one striving with all his might to kill the goose that laid the golden eggs.

This is not the way to improve the salmon fisheries; to do this effectually, the upper proprietors must have a strong interest in the preservation of the breeding fish; and in order to give them this interest, they ought to have an ample supply of them when in the best condition; and to give them this supply, the law ought to be altered. At present I believe the law does not require a free passage for the fish (in English rivers, at least), except from Saturday night to Monday morning. In many of them, I believe, even this is not insisted upon, whereas the law ought to prohibit fishing for, or obstructing the passage of, the fish every night from sunset to sunrise, and this regulation ought to be rigorously enforced; this would give the upper proprietors a chance of having good fish, and a corresponding inducement to take care of them; but nobody would be so much benefited as the owners of fisheries at the mouths of rivers; they would be the first takers, and would still get the lion's share of all the fish that ascended the river. If this were enforced, the expenses of conservation might be defrayed by levying a small tax in the shape of a license for angling, which all true sportsmen would be glad to pay, if it gave a reasonable prospect of a well-stocked river. Now, matters are getting worse every day, and notwithstanding the enormous fecundity of the female salmon (a large one producing 25,000 ova in a season), they are now extinct in some rivers where they used to be found in my recollection, and in others, where they used to be abundant, they are now become quite scarce. Nobody need to wonder at this, when he is told that gangs of poachers are on the look-out for them all through the spawning season; and in one winter, some years ago, as I am credibly informed, 200 salmon were taken in one stream, within 500 yards of the place where I now write. It is nobody's business, and nobody's interest to prevent this, and therefore it goes on openly night and day. Are there no influential gentlemen in the House of Commons who will take up this matter, and endeavour to get an equitable and comprehensive law passed, for the preservation and increase of the breed of salmon? It is a matter of almost national importance; and if duly provided for, and properly attended to, I see no improbability in the supposition that salmon would again be as abundant as they used to be, when the apprentices on the banks of the Ribble, stipulated that they should not be compelled to eat salmon more frequently than three days in the week. The apathy of the country gentlemen in this matter is to me unaccountable. I have some reason to believe, however, that Government have at all times been so far from lending their influence to the promoters of any attempt to amend these laws, that they have obstructed rather than assisted them, most probably from an idea that the preservation of the fish would interfere with manufactories. If I thought that this would be the case, I would not say a word on the subject; but I am very far from holding such an opinion. So far from this being the case, I assert, without hesitation, that weirs need form no obstruction to the free passage of fish, and this without impairing the efficiency of the water power. With the poisonous and filthy mixtures sent by some manufactories down the river, it is far different; and where such are to be found, the case is hopeless. Salmon trout will very rapidly disappear from such rivers never to be seen there again, so long as these noxious contaminations are permitted to flow into them. And I know of instances where the salmon trout were killed for miles, by the refuse of some chemical works being turned into the river. *T. G., Clitheroe.*

* When I commenced this paper, I had no doubt but hybrids had been artificially produced between the sprod (sea trout?) and the common trout; since then, having seen and examined the progeny so said to have been produced, and making some further enquiries on the subject, I find there is some doubt whether the female was a *sprod* or merely a white trout, and therefore I cannot confidently assert (as sometime ago I believed I could), that hybrid fish had already been produced. As some of your readers may not know what a sprod is, it may be necessary to explain. In the Ribble, we have a fish which comes up from the sea in July and August, weighing from six to ten ounces, which, in appearance at least, is a miniature salmon (I believe the same fish is called a whitling in Scotland); besides this, we have a similar but larger fish, which ascends the river a little earlier, at least, which begins to ascend a little earlier, for they run up with every flood from June to September, and which weighs from one to three pounds: this in the Ribble is called a *mort* (in Scotland sea trout), both these fish, if they are two species, afford splendid sport to the angler, who can never consider them beaten, until he has them fairly in his landing net. They are also very delicate eating.

## ROSES.

Brother Amateurs! the catalogues are out; and very shortly, "Now, gentlemen, give your orders," will be the order of the day. Why should not we compare notes in the interval? and each, out of his "bower of Roses by Bendermere's stream," sing something about 1851? At all events, like Cassius, I will plunge in, and bid you follow.

"Uprouse ye then, my merry, merry men!"

And come down with me (in imagination, I mean, not in your dressing-gown) some morning, about 4 A.M., the first week in July last. He who has not seen his favourites,

"With their rosy faces washed with dew,"

has indeed a treat, when

"Jocund day stands tip-toe on the misty mountain top,"

and when

"Morn, in the white wake of the morning star,
Comes, furrowing all the orient into gold."

What a great exhibition! Aye, and "of all nations"—Ayrshire and Austria, the Prairies and Persia, China and sunny France, have sent their representatives, saying "Go, lovely Rose; go to the land whose emblem is the queen of flowers—go, do homage to your sister, 'the bonnie English Rose.'"

But, "hist! I hear footsteps" (as they say on the stage). A gardener approaches, bearing a huge green box; it is filled with the freshest and brightest green moss, the which is studded with zinc tubes. Oh! day of triumph or of tears (Rose-water, of course) to the florist! It is the day of the Rose Show at N——! "Courage, thou foolish, fluttering heart;" and, "gardener, give me the Rose-nippers." "Whither shall we go first?"—"Why, to that glorious, glowing meteor which gleams the brightest in our floral firmament—to Géant des Batailles, and the Hybrid Perpetuals! (By the way, was "Géant des Batailles" the name sent from France; and if so, what does it mean? "Champ de Bataille" would be far more appropriate to the Rose, for crimson is its colour—as the blood of heroes.) At all events, it will be long ere any competitor shall win the proud title of "Jack the Giant Killer;" and justly does it merit the praise bestowed by Messrs. Wood—"quite unsurpassed." But now, "*place aux dames!*" Let the Duchess of Sutherland, Baronne Prévost, and Lady Alice Peel, attend as ladies-in-waiting upon La Reine. Shall we cut these blooms of William Jesse, Madame Laffay, and Dr. Marx? No; they will expand too rapidly in water, and at 2 o'clock will do no credit to the pan. Standard of Marengo—thou art beautiful in colour and in shape, but I dare not trust thee, for I know that in a few hours thine interior would be visible to the public. Comtesse Duchatel, Duchesse de Montpensier, Madame Aimée, Robin Hood, ye have charms of tint and form, but (like Lord John Russell in *Punch*), "you're not quite big enough for the place." Baronne Hallez—thou art full of promise, but this is thy first season with us, and thou art—we will not say of a lady, "no better than thou shouldst be," but—not so good as thou wilt be. Madame Trudeaux, thou must stay at home, for we perceive "the *green* in thine *eye*."

We have lingered so long among the Hybrid Perpetuals, of which, says Rivers, "No Roses are so well worthy the attention of the lover of flowers," that "*brevis esse laboro*" must now be our motto, and we must give the remaining favourites, which complete our pan of 24, *en masse*; Paul Ricaut (were he a Perpetual the Giant himself might feel uncomfortable), Las Casas, Comte Bonbert, Coupe d'Hébé, and Comtesse Molé, from the Hybrid Bourbons; from the Gallicas, Ohl, Comte Boula de Nanteuil, and Shakspere—(Messrs. Rivers and Lane include both Kean and Shakspere in their lists, but are not Messrs. Paul and Wood correct in declaring the two to be identical? And, being on the subject of discrepancies, the modern "war of the Roses," "can any one tell us"—to quote the language of certain concise and caustic articles in this Paper, called 'Trade Memoranda,'—"can any one tell us who is General Allard?" Hybrid China, say Rivers and Paul. Hybrid Perpetual, cry Lane and Wood. I look at a splendid bloom of it on the table before me, this 21st day of October, and give my vote with the latter. And, again, what is "Fortunes' Yellow?" "Gold, of course," says some funny friend; but we mean to what class does it belong? The authorities have declared it a Tea, a Noisette, a Sempervirens—which is it?—but to our pan of Roses); General Jacqueminot ("rich, velvety crimson, a superb show Rose," Wood), Leopold de Bauffremont, and Juno from the Hybrid Chinas; Princesse Clementine (Emerance is beautiful indeed, but somewhat small where only single blooms are shown), from the Hybrid Provence; Madame Zoutman (cut when not too fully expanded), from the Damask; Queen of Denmark, Alba; Souvenir de la Malmaison, Bourbon; Devoniensis!

(the English growers can boast, perhaps, of but one really great Rose as being of their "own composing," but they can say of it, as the lioness of her single offspring, "it is a lion!") Comte de Paris, and Souvenir d'un Ami, from the Tea-scented Chinas; Cloth of Gold, Noisette. These well-grown and well-grouped (remember to take a few duplicates in a spare box, for the toilette of some of your belles may be disarranged by the journey) will, if they gain not the first prize, elicit as many "well I nevers!" and "did you evers!" as your floricultural pride could desire.

May I ask, in conclusion, some more enlightened amateur to tell us, out of his "love among the Roses," something about the novelties; of the merits, for instance, of such Roses as Auguste Mee, Beranger, Caroline de Gansal, Chéreau, Comte Odart, General Brea, Noemi, Queen Victoria, &c. (H. P.); of Aurore du Garde, Souvenir d'un Frere, and Vorace (B.); and of Madame Willermorz (T.). Fain would I exchange thoughts with my brethren on the subject of autumnal bloomers, now that we have them around us, but already

> "The expedition of my violent love
> Outruns the pauser reason."

And so, farewell! *S. R. H.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 35.)

No. LI.—Since we first announced our intention to define the difference between Instinct and Reason, as applied to animals and ourselves, we have received from a variety of quarters "hints" that we have undertaken more than we can prove. As this intimation has reached us from persons whose opinions we highly respect, we approach the subject with all becoming diffidence,—yet nothing daunted.

The columns of a newspaper, wherein the proper discussion of so important a matter in detail would occupy very much space, will not admit of our introducing a metaphysical disquisition, the ramifications of which would easily fill a large volume. We will therefore confine ourselves to a lower flight, and by clipping our wings attempt a popular analysis.

Men of science tell us, and we admit the fact, that where there is "brain" *there* must exist "thought;" *ergo*, where there is thought, *there* also is "reason." To this latter, we demur. According to the definition of Dr. Johnson, Instinct implies "a natural desire." *This* is perfectly comprehensible; for it is the innate, or natural desire, that actuates all the so-called irrational creation; and this desire impels them to perform all those various acts and duties for which they were sent into the world.

If we carefully watch any particular bird or animal in a state of freedom, we shall find that, for the most part, every one of the same tribe are actuated by precisely the same feelings, instructed by precisely the same teaching, and in all things obey the dictates of one and the same nature. All this—whether as regards their habits, their haunts, their habitual tameness or wildness, confidence, or suspicion—aye, even to building their nests in the same manner, and choosing nearly the same kind of holes and localities for their reception.

If the brain here induces volition, or is in any way connected with the intuition of the bird, it is evident that the bird's foresight is very limited. He has just as much "thought" to guide him, as will suffice for the purpose of his self-preservation and the rearing of his family; no more. And why, let me ask, do all birds, when a hawk is seen to hover over them, immediately cower down and show extreme fear? They do this, from the youngest to the oldest. What is it tells them that the hawk is a natural enemy? What *can* it be—but instinct? They cannot "reason" upon the matter, but act from an impulse implanted in all the lesser feathered tribes by the Creator of the universe. We may see the same alarm caused by the sudden appearance of a cat, or indeed any other noxious animal; and herein we view one branch of the "harmony" of Nature.

All our best writers on natural history agree in characterising the lower order of animals as "irrational," in contradistinction to "rational;" and we think that they prove the position they have taken up very cleverly. All this we shall consider as we go gently on. No sane person would attempt to deny that the *degree* of instinct observable in some particular birds far exceeds that of others; but we shall show there is a necessity for this, and that every animal is endowed with as much sagacity or instinct as will be needful both for his security and his happiness. There is no doubt that, by kind treatment, many of them are brought to exhibit proofs of affection and attachment perfectly remarkable. Still, we cannot recognise that "reason" is here called into exercise; it is merely a natural consequence.

In confirmation of this, I would refer to the case of the robin,* whose docility and "finished education" I dilated upon in our 49th Chapter. My remarks on this bird have, I find, caused quite a sensation among the naturalists of the "old school." They acknowledge it to be (to them) "a new fact;" and so, doubtless, it is. This only shows us, how necessary it is for there to be some medium of communication between all persons searching after truth. Everybody has it in his power to reveal *some* curious discovery; and having it in his power, it is wrong to withhold it from the inquiring world. And yet in the education of the proficient robin, there is nothing "marvellous," strictly so called. He imbibed "early impressions;" and not being allowed to mix with society, his early notions became so familiar and "natural" to him, that they formed part of himself. Is it not so with ourselves? "Reason" and good sense might get us partly out of our acquired habits (if bad); but the bird being "instinct"-ively taught, could make no progress whatever in an opposite direction. It would be against his nature. Whoever watches narrowly the habits peculiar to any and every particular tribe of birds, will find them all to closely assimilate. There is a "universal law" in these matters, which it is delightful to recognise:—

> "Whom Nature's works can charm, with God himself
> Hold converse; grow familiar, day by day,
> With His conceptions; act upon His plan;
> And form to His the relish of their souls."

All who steadily join in these pursuits, with an inquiring mind rightly directed, *must* become wiser men; nor need I hesitate to add, that they must also progressively become "better" men. *William Kidd.*

* It is curious, but still more pleasing, to notice the spirit of inquiry that marks the present time. Nobody can now say "We are not a progressing people." The 'principle' involved in the anecdote we furnished of the "educated robin" has, it would seem, so attracted the world, that we are told it has been appropriated (and the source handsomely acknowledged) by nearly four-fifths of the newspaper press. We confess to having ourselves recognised it in very many channels.

## ORCHIDS FOR THE MILLION.—No. XXI.

By B. S. Williams, gr. to C. B. Warner, Esq. Hoddesdon.

Climate Cool.—Plants on Blocks, with Moss.

*Lælia anceps.*—An elegant plant from Mexico, which blossoms in December and January; the flowers are rosy lilac, the lip varied with crimson and yellow. It keeps three or four weeks in perfection. It succeeds best on a block with sphagnum, suspended from the roof. It should be kept in a cool house, and requires plenty of water when growing; but afterwards it may be kept rather dry.

*Lælia autumnalis.*—A fine species, from Mexico; blooms in January and February, and lasts three weeks in beauty. It does best on a block with sphagnum, suspended from the roof; it should have plenty of water when growing; but afterwards it should be kept rather dry.

*Lælia majalis.*—This beautiful plant also comes from Mexico, and blooms from May to June; the flowers are very large, and, if kept dry, will last a long time in bloom. It does best in a basket, or block, suspended from the roof in a cool and airy part of the house; when growing it requires plenty of water, afterwards it should be kept cool and dry.

*Lælia acuminata*, comes from Oaxaca, and produces white blossoms in January and February, which remain three weeks in perfection. It does best on a block, with moss, suspended from the roof; when growing it should have plenty of water; afterwards it should be kept rather dry.

*Lælia superbiens.*—This beautiful species from Guatemala, flowers from November to February; the blossoms are of a rosy purple, remaining a long time in perfection; it succeeds best fastened on a block hung up in a cool part of the house.

*Lælia albida*, comes from Mexico. It flowers from November to January, and succeeds on a block, suspended from the roof; it lasts long in perfection, and requires the same treatment as the last.

*Odontoglossum leucochilum.*—A fine species, which flowers at different times of the year; it does best fastened to a block, with sphagnum, suspended from the roof; it likes a good supply of water at the roots while growing.

*Odontoglossum Cervantesii.*—This beautiful species flowers from January to April. It does best fastened to a block, with moss, suspended from the roof, with a good supply of water when growing. It will last five or six weeks in flower.

*Odontoglossum membranaceum*, a beautiful little Orchid, from Mexico; the flowers are white, marked with brown on the inside, and they will last five or six weeks in perfection. This does best on a block, with moss. It likes a good supply of water when growing; and it should never be allowed to get very dry.

## Home Correspondence.

*Samples of Seeds.*—The hint given by your correspondent, at page 646, is worthy of consideration; and if Messrs. Wrench, as one of the oldest and most respectable firms in England, could supply samples of seeds of genuine purity, they would confer a great favour upon the gardening community generally, and do that which I believe no other establishment in the country could do. The truth is, the seed-trade and seedsmen's catalogues want a thorough purging; and if some rules, similar to those applied to flowers by the National Floricultural Society, could be exercised over seedsmen's novelties, a real benefit would be conferred upon all purchasers of seeds. We are inundated annually with novelties, at least in name, if not in substance; but how many of them turn out worth cultivating, it would not be difficult to calculate. How many varieties, and so-called improvements, has the Early Frame Pea stood sponsor to? And how many more will it represent, if the present system of multiplying kinds is not put a stop to? Answer ye Prince Albers, Emperors, Racehorses, Railways, &c. &c.; but still the trick succeeds, and it would be nonsense to sell a thing for sixpence per quart, when a flaring label, with a new name, and a little of the shopman's "soft sawder" would make from five to ten times the amount of it. This is only a trick of trade, and no worse than tricks practised by other people; but it is simply dishonest, and ought to be treated as such. If a seedsman is fortunate enough to originate a new Pea, a new Broccoli, or a new Potato, he certainly would lose nothing by taking the same course which the florist takes in submitting it as much to public scrutiny as possible before sending it out. We find our account in so doing, and plants which have been well exhibited, always command double the sale to those simply recommended, and no doubt the same result would attend the proper exhibition of new vegetables. Say, for example, Messrs. Novelty have a new Pea which they believe to be earlier than any other Pea in cultivation; let them send sufficient of it to the Horticultural Society to sow a row, say 30 feet long, and there let it be tried against the known early kinds, and if it proves superior to them, they may, backed by such a certificate, charge what they please for it. I am quite convinced there is abundant room for improvement in culinary vegetables, and that they will well repay any attention that may be devoted to them; but the interminable lists of names of articles which have no existence except in the pages of the seedsman's catalogue, are an interminable nuisance, not to say a fraud upon purchasers. A few years back, we heard a native of modern Athens expatiating upon the wonderful collection of seeds which a certain firm in Edinburgh had, the list enumerating names of Peas to the extent of 70, extending from the time of Abercrombie down to the present time; when a north country nurseryman, more remarkable for his love of plants than polished manners, interjected, "Ah, now I ken something more wonderfu' than that, and that is how they manage to supply so many kinds out o' half a dozen sacks." This is a problem which almost every seedsman in the country could readily solve, and though they may be blamed for their knowledge, there are two sides to the story, and purchasers are not wholly blameless. The writer was present at a conversation in which a gentleman of high literary and scientific attainments entered a shop and requested to be served with a quart of "Hotspur Peas." The proprietor remarked he had not a Pea of that name; but, as he supposed, he wanted a good early Pea he should recommend the Early Frame or Warner's Emperor. "But," said the *savant*, "Abercrombie is my authority in gardening matters, and he recommends the Hotspur; I am going to town, and no doubt I can get it there." And no doubt he did; for the London seedsmen can readily manufacture novelties for such customers. Thus, Mr. A. purchases a quart of Hotspur Peas for half-a-crown; and Mr. B., his neighbour, has a quart of Early Frame from the same shop, and out of the same sack, for 9*d*. Mr. A., having paid dearly for his whistle, sows the Peas properly upon good ground; but Mr. B. merely scratches a drill in some badly dug ground, and hence the "Hotspur" prove the best Peas; and the next year every one in the neighbourhood cries out for "Hotspur," for "Mr. A. last year had a most marvellous crop." Thus do synonymes get multiplied, and thus are the means afforded for nefarious persons to victimise the unwary. If one of the great London houses was to send out a seed list, say of 10 kinds of Peas, four French Beans, four broad Beans, six Broccolies, four Onions, four Turnips, and other things in the same proportion, it would probably pay the penalty of its honesty in the "Bankrupt's Gazette," by the end of the year 1852; but let them with the same articles publish a long list, and they will reap annually a golden harvest; and thus is dishonesty bribed. The reform therefore of these abuses, and the curtailments of long catalogues, does not rest with tradesmen, the public must be true to itself and discourage all novelties unless properly certified by competent authorities. The time, I hope, is not far distant when the Horticultural Society, in imitation of the French Government, shall form a board of practical men to investigate such matters as these; and upon whom the responsibility should rest. To defray the expenses of such a board, my guinea or two guineas, annually, is ready at any time; and I doubt not there are scores in the trade who would subscribe a similar amount. *A Florist and Seedsman.*

*Durmast.*—In the article on Oaks in the "Penny Cyclopædia," it is stated that the *Durmast* Oak is the Q. sessiliflora.—Will any of your correspondents be so good as to let me know what Durmast means, and where the term comes from? *T. S. P.*

*Musa Cavendishii* (See p. 661.)—Your correspondent need not expect his fruit to ripen perfectly under six months. I had a plant which showed fruit last April twelve months, and the first fruit was not ripe before November. It will continue ripening a month or six weeks. Do not cut the spike until all are nearly arrived at maturity. If your correspondent has more produce than he can consume, allow me to inform him that it makes a famous ice. Do not withhold water until symptoms of ripening are at hand. I do not permit suckers to grow more than a few inches in height before they are separated from the parent plant. If "J. R." can succeed in getting one or two off without injury to the plant, they may be potted immediately, and forwarded in heat. After the plant has done fruiting, he may provide himself with as many suckers as he chooses. *W. B. Merevale.*

*Tarred Walks.*—Have no fears for the endurance of your tarred and sanded walk. I can assure you that it will last many winters. When I was a stripling I walked for years, winter and summer, to and from one of our most ancient northern cities. On a portion of the foot-path immediately adjoining the suburbs some tar was spilled. I noticed the tar the first evening on

which I passed over it. It was then quite soft. I observed it during the whole of the time I remained in the neighbourhood, at least five years, and I could detect neither flaw nor crack in the coat of tar. It was always smooth and clean in wet weather, and dry in winter and summer. It may have been that the open unshaded position and the constant tread of passengers preserved it from weeds—and herein lies the difference between your case and the one I have mentioned. *W. R. Carter, Eel Moor Farm, Cove, Bagshot.*—I have already made precisely the same experiment with walks that you have made, and it has proved perfectly successful. About seven years ago, I had a small part of one of my garden walks coated with gas tar, which was first boiled, and then laid on hot with an old whitewasher's brush, in sufficient quantity only to saturate the surface of the walk, which was then sprinkled over with as much fine gravel as would prevent the tar from appearing through it when pressed down, and smoothed over with the back of a spade. When set, and before becoming hard, the whole was rolled with a garden roller. The only previous preparation the walk received was, scraping off the loose gravel. A space of about three inches was left between the tar and the Box-edging. Every subsequent year a further small part of the garden walks has been treated in the same manner, until now all, or nearly all, are covered. It was found however, to be an unnecessary trouble to boil the tar and lay it on hot; and therefore, for several years it has been merely poured out of the barrel and allowed to run over the walk, and spread with the back of the end of the square pointed spade, until it was of proper thickness; keeping a clean spade for the smoothing process—and a little coarse gravel has been scattered on the tar before applying the fine gravel or sand. This it was conceived would increase the durability of the covering. Now, the effect has been, that nothing has since been done to these walks, except giving them here and there a very slight sprinkling of sand or very fine gravel, and weeding the spaces between the tar and the Box edging, and (to be precise) one or two small places which the tar had missed; for no weeds or moss have, since the tar was laid on, made their appearance on any part of the walks it has covered, except that on that part done seven years ago a little moss has appeared when bare of gravel; but this is in consequence of a little soil having collected on its surface, and its being under the shade of a tree. All the walks are yet quite hard, and neither rain nor frost affects them; the former runs quickly off, and the latter never perceptibly swells or breaks them. Their appearance has been much admired, and great comfort has been derived from the process, as it has entirely subdued weeds and put an end to the teazing, unremitted and inglorious warfare which it was before necessary to wage against them. I have found no process that has been recommended for preventing weeds on gravel walks, and which I have tried, at all equal to the one above described. I may state, however, in conclusion, that I have found the next best means to be hot water and salt, dry salt next, and the next hand-picking, when these are persevered with. *S. T., Whitehaven, Oct.* 21.

*Cherries and Peaches in perfection now.*—I have sent for inspection a Peach taken from a plant in a pot. This fruit when gathered weighed 6½ ounces, and measured 9½ inches in circumference. I have been induced to send you a specimen, only because I have felt much surprise in finding young trees producing such fine fruit in 11-inch pots, without having at all rooted through the pots into the border. These trees have been potted two seasons, and this year bore abundantly. From six to 10 and 12 fruit were suffered to ripen, many of which were equal in size to the specimen sent, which will also, I trust, serve to illustrate a great advantage gained by the culture of Peaches, Nectarines, Apricots, &c., in pots under glass. The Peach is a new variety, from France, called Reine des Vergers; it ripens on walls, under ordinary circumstances, about the same period as the Royal George, *i. e.*, the first week in September; but by placing the trees out of doors, towards the end of June, if the weather be not under a north wall, and letting them remain there till the middle or end of August, and then placing them in the orchard-house, the fruit, as in the present instance, is retarded; so that Royal George, and Noblesse, and other Peaches that ripen in crowds early in September, may be supplied till the middle or end of October. In like manner, Moor-park Apricots may be retarded a month or six weeks; they ripen slowly, and retain their juice and flavour remarkably well. I ate of some this season, the last week in September; they were slightly shrivelled, from the dry atmosphere of the orchard-house, but they were full of juice, and rich beyond description. It will, I think, be at once apparent to every gardener how advantageous this simple method of retarding Peaches, &c., may be made for a long supply; for if forced Peaches are ripe early in June, and a succession kept up till those from the walls are ready, by retarding the melting Peaches till the end of October, the dessert may be furnished with Peaches and Nectarines for five entire months. This seems a step in the proper direction, and I am sure may, and will be, carried out to an extent beyond all present probabilities. Along with the Peach, I send three branches full of fruit of a new late Cherry (Jardine de Mons), remarkable for its resisting our autumn rains and mists; they have been taken from a tree in the open air; it is a most productive variety, and will be probably the parent of some valuable late sweet Cherries. One of the branches is enclosed in Haythorn's muslin net—it is, I find from experience, the very best material for protecting Cherries from flies and wasps, and "such small deer." *Thos. Rivers, Sawbridgeworth, Oct.* 20. [The Peach weighed, within a trifle, 6¼ ounces. It was large and handsome, red next the sun, melting and delicious. The Cherries looked like White-hearts, highly coloured. They were not large; but fresh, and nearly as well flavoured as Cherries in June. A piece of branch, a foot long, had upwards of 30 fruit on it.]

*Disease in Cucumbers.*—I am glad to see that Mr. Errington has asked for information as to the extent, cause, and remedy of this unaccountable malady. In reply to the first item, I beg to say that in 1849 and 1850 it was exceedingly bad in some places in Kent, and to a less extent some one or two seasons before that; it has not been so destructive this year, and at the place from which I write it has scarcely showed itself at all. In regard to its cause I differ entirely from Mr. Errington, who supposes it to be the effects of fungi. I imagine that the fungus succeeds the cause, otherwise the disease here must be different from the one he speaks of; with me it first shows itself in the shape of a gummy substance of a nearly transparent character, which exudes from the places in the fruit from which the spines ought to grow. These excrescences become attacked with a fungus, of the mould or mildew kind, which soon spreads to the body of the fruit, now rendered unable to resist its ravages, being in fact a mass of running sores. This is the form in which it shows itself here; the foliage, though not of a luxuriant character, is nevertheless not so much affected as to prevent the plants from bearing healthy fruit, provided all other things were favourable. Now this must be different from Mr. Errington's disease; for he speaks of the ends of the shoots looking as if seared with a hot iron, whereas mine is confined (or nearly so) to the fruit, but I can assure him that it is not the less virulent on that account, as the greatest part of the fruit I grew last year was unfit to send to table; and when it was allowed to remain some time on the plant the running sores collected into transparent lumps, varying from the size of a pea to that of a marble or larger, and nothing could have a more loathsome appearance. I had them growing under different circumstances, and all were alike affected; hot water heated pits, dung beds, and the open air ridge, seemed equally unable to resist its influences; and in regard to its period of duration, it showed itself in the winter ones fruiting in the autumn of 1849, and spring of 1850, and throughout the whole of the summer. Repeated trials of new plants, different soils, water and treatment, all resulted in the same thing; so that I did not attempt to cultivate any winter plants in the autumn of last year, but determined to try various experiments on them this season, by adopting every variety of compost I could think of—as peat, mortar-rubbish, brick-rubbish, soot, charcoal, ashes, &c. At planting time I turned my plants out in hills, composed of materials differing widely from each other; the result was, that I have scarcely seen a symptom of disease. I do not, however, attribute this to the means I used for preventing it, as I employed nearly the same last year; but by some of those unaccountable occurrences which are beyond the scope of my comprehension, the crop was tolerably good, certainly quite equal to what might have been expected from the extreme character of the composts used in some of the cases, as I expected the disease again, and made my preparation more with a view to combat it than to give a healthy growth to the Cucumber. I may remark that those planted out-doors in the ordinary rich garden soil likewise escaped, except at the very last, when something resembling it showed itself; but the season was almost expired, and they had done pretty well the whole summer. Now, having detailed the facts of my case, I venture to give an opinion which I once held as to the cause of the disease, but which the issue of the past season has somewhat staggered. "Does not the disease proceed from the plant imbibing food of an improper kind, which not finding any other way of discharging itself than through the spines of the fruit, produce those excrescences we speak of." Certainly that must be the cause, as with me the other necessaries to a healthy state of things, "heat, moisture, shade, or sunshine," were varied in every possible way, with little or no effect; and what makes me rather dubious of even admitting the opinion above given to be correct is, that last year I tried so many different mixtures, from which I expected the plant would draw nourishment of different kinds, and they all proved abortive; nevertheless I venture it, and if I be no more troubled with the pest, I certainly confess that the cause of its capricious appearance and departure is alike unknown to me. If some of your readers can discover any better reason I shall be happy to have it; at the same time let me caution them against taking credit to themselves for having expelled this insidious foe, because, after using some peculiar means, they saw no more of it, the following season. "Who has cured the Potato disease?" or may I ask, is there much more known respecting it than in 1846, when it first made its appearance; and though this disease in Cucumbers may never assume the virulence of the Potato blight, yet it seems equally uncertain in its attacks. *An Old Gardener.*

*How to Crop a small Kitchen Garden.*—The land intended for Cauliflowers in 1853 should be well manured during the coming winter, and trenched as recommended in "Paxton's Cottagers' Calendar," which is the same plan as that practised by market gardeners. In the latter end of February, or beginning of March, plant with Potatoes, 20 inches row from row, and 8 inches from set to set, wintering them as recommended by Mr. Cuthill; rake level, sow Turnip Radishes thinly, and rake them in, they will be off by the time the Potatoes require earthing; let them be all taken up by the first week in August. Put on a little well-rotted dung and dig it in; mark into beds 4 feet 6 inches wide, with 1 foot for an alley between the beds, the same on the outsides; take 2 inches of soil out of the alleys and place it on the beds; rake level, and sow with Winter Spinach, cast a little soil over the seed, and again rake level. Thin at first to 3 inches apart, when large enough thin as required for use, leaving the plants 9 inches apart. Keep the earth well stirred with a small hoe, and the alleys forked at times during winter. The Cauliflowers should be sown about the 20th of August, and wintered in the usual way. About the second week in March, clear away a little Spinach from the edge of the beds, and fork some wood ashes into the alleys; lift the Cauliflowers with a trowel, and plant them with the same implement. Plant a row up each alley at 30 inches apart. Then as the Spinach is required for use, cut a space 18 inches wide along one side of a bed; when one side is cleared, fork it and plant a row of White Cos Lettuces at 18 inches from the Cauliflowers; serve the side of each bed in the same way. When the Cauliflowers require earthing, draw some from the side of the bed, making the alleys the same height as the beds. Clear the middle and fork in some wood-ashes, draw a deep drill, and water it if the weather is dry; plant a row of spring-sown Cauliflowers in each drill, at 30 inches apart. As soon as a Cauliflower is cut, take up the stump, and fill the space with White Cos Lettuce, at 1 foot apart, keeping 15 inches from the second crop of Cauliflowers, by which process the Lettuce will come in, in regular succession. Sow a little seed from February to August, to keep up a succession of plants. When all is off, ridge trench without dung, and sow with Parsnips the following spring. By the above process, I have cut Cauliflowers this season weighing 5½ lbs., when trimmed ready for boiling. *J. Steel, Clitheroe.*

*The Mocking Bird.*—I am obliged to your correspondent, "T. G.," who, at page 661, calls my attention to a little "inadvertence" with respect to my description of the "Mocking Bird," in a former Number. It seems that in this case, however strange it may appear, we are *both* right, and *both* wrong! *I* was applied to for a description of the American Mocking Bird, and "drew his portrait" to the life; whilst "T. G.," under the same title (Mocking Bird), was drawing, with equally-graphic skill, the portrait of another bird, a "warbler"—gifted with imitative powers, and a first-rate *songster*. I would, however, remind your correspondent, in the same kindly tone, that there is *still* some little misapprehension. The bird quoted as being known in Ireland under the designation "Sylvia salicaria," is called by us, in our southern latitudes, the "Sedge Warbler." I confess my ignorance most willingly, as to the truly-wonderful imitative powers of this bird, never having had an opportunity of hearing anything approaching to such excellence as is described by "T. G." at page 613. I love the little fellow much, and have kept company with him often, both in and out of doors; and I have heard him sing sweetly, long after "the shadows of evening have been stretched out." I failed, however, in noting his remarkable imitative powers as applied to so wide a range of different voices. As I never allow myself to be behind-hand when apprised of any "singular fact," I shall duly repair my error, *D. V.*, next spring. I shall seek, carefully, to find out all that I should so much like to know; and as "Cap'en Cuttle" says of certain discoveries, I shall, "when found, make a note 'on." I see "T. G." is treating in a most masterly manner on the "Artificial Breeding of Fish." I know something about this, practically; and if your correspondent will favour me with his name and address, in confidence, we may perhaps, hereafter, be of mutual service to each other. The subject is one of extreme interest, and in "T. G.'s" hands it is likely to be made extensively popular. *William Kidd, Hammersmith, Oct.* 25.

## Societies.

Botanical of London, *Oct.* 3.—The Treasurer in the chair. The Secretary stated that the Council had appointed Mr. J. T. Syme, Curator, and that the rooms would be open every Monday, Wednesday, and Friday, from 10 till 5. The Curator reported that a large collection of duplicates of European plants, mostly those not found in Britain, had been labelled for the Society by Mr. Hewett C. Watson. Lists of the species (amounting to nearly 100, and including many of the rarer Arctic and South European plants), will be sent to the members who desire foreign specimens, in order that they may in rotation select their own desiderata, instead of merely securing parcels looked out for them by the Curator alone, and thus unavoidably selected without reference to the contents of their own herbaria. A specimen of Grammica suaveolens (Schultz), discovered by Mr. E. G. Varenne, growing on Lucerne, near Witham, in Essex, in September last, was exhibited. On inquiry, it was ascertained by Mr. Varenne that the field had been sown with imported seeds, and that the Dodder had proved very injurious to the crop. The Grammica suaveolens is identical with the Cuscuta Hassiaca (Pfeiffer), of Koch's "Synopsis Floræ Germanicæ." It

may be readily distinguished from the other Dodders found in England, by its pedicellated flowers, bright orange-yellow stems, and sweet scent. The conclusion of Mr. D. Stock's paper, "On the Botany of Bungay, Suffolk," was read.

## Notices of Books.

*What shall we have for Dinner?* By Lady Maria Clutterbuck. Bradbury and Evans. 12mo.

THE best account we can give of this useful trifle is that which the authoress herself has furnished in her preface.

"The late Sir Jonas Clutterbuck had, in addition to a host of other virtues, a very good appetite and an excellent digestion; to those endowments I was indebted (though some years the junior of my revered husband) for many hours of connubial happiness.

"Sir Jonas was not a *gourmand*, although a man of great gastronomical experience. Richmond never saw him more than once a month, and he was as rare a visitor to Blackwall and Greenwich. Of course he attended most of the corporation dinners as a matter of duty (having been elected alderman in 1839), and now and then partook of a turtle feast at some celebrated place in the city; but these were only exceptions, his general practice being to dine at home; and I am consoled in believing that my attention to the requirements of his appetite secured me the possession of his esteem until the last.

"My experience in the confidences of many of my female friends tells me, alas! that others are not so happy in their domestic relations as I was. That their daily life is embittered by the consciousness that a delicacy forgotten or misapplied; a surplusage of cold mutton or a redundancy of chops; are gradually making the Club more attractive than the Home, and rendering 'business in the city' of more frequent occurrence than it used to be in the earlier days of their connubial experience; while the ever-recurring inquiry of 'What shall we have for Dinner?' makes the matutinal meal a time to dread, only exceeded in its terrors by the more awful hour of dinner!

"It is to rescue many fair friends from such domestic suffering, that I have consented to give the world the bills of fare which met with the approval of Sir Jonas Clutterbuck, believing that by a constant reference to them, an easy solution may be obtained to that most difficult of questions — 'WHAT SHALL WE HAVE FOR DINNER?'"

*Railway Literature. Murray's Reading for the Rail. Longman's Traveller's Library.*

WHEN we consider how much time is now necessarily consumed in railway carriages, and the tedium of journeys repeated over and over again—where there are no views to amuse the imagination, and no refreshing breezes to invigorate the frame—the necessity of providing some occupation for the mind becomes self-evident. The piles of books, pamphlets, and newspapers, heaped up at every great railway station, testify to the fact that what travellers find the best occupation is reading. It becomes then a point of great public importance that the works furnished for this particular purpose should be of a high class as regards intelligence, tone, and social tendency; qualities of which, it must be owned, we find very little in some of the works currently sold on railway platforms. Messrs. Longman and Mr. Murray have therefore performed a great public service in providing works like those which have hitherto appeared, as substitutes for the rubbish to which we have alluded; and we sincerely trust that they will long continue to do so. Macaulay's Essays and Laing's "Norway" are what the former have commenced with; while Mr. Murray has selected those admirable essays in the *Times*, upon men and things, which every reader of that great journal has grieved to see confined to the fleeting columns of a daily paper. Both are clearly printed; but we are obliged to add that the "Travellers' Library" bears no comparison with Murray's "Reading for the Rail," as regards printing and paper, matters of no small importance to those whose eyes begin to lose their power. The last is a beautiful example of typographical skill.

## FLORICULTURE.

PINKS.—Plantations of these should be made about this season; and the sooner the better, in order that they may be well established to withstand the vicissitudes of the coming winter. My present object is not, however, to write a treatise on the cultivation of this favourite florist's flower, but rather to endeavour to bring it more generally into notice than it seems to be at the present time. Few will be disposed to question the lively interest which Pink growers took in this flower in days of yore; but this has somehow much abated, and the flower has all but stood still; for the past two or three seasons very few new varieties have been offered to the public; we look in vain for those annual novelties which, as regards almost every other florist's flower, are on the increase; all exhibit an onward movement, the Pink alone is stationary. I have just returned from planting Pinks, and in choosing my pets from a somewhat large collection, I find that I am constantly in difficulties, having to contend against treachery, over-fulness, roughness, and sundry other characteristics, which at present seem likely to remain with us, unless prompt measures be adopted for their removal. Are we to allow the glories of the Pink to decline? Will such long-tried patrons as Messrs. Smith, Maclean, Young, Looker, Hale, Creed, White, &c., quietly rest with matters as they are? We want a criterion of every shade known in Pinks; one tier more petals would leave little to desire. This improved criterion of all shades, of purple, of red, of maroon, and of rose, will no doubt be obtained in time. Jenny Lind is too small for general exhibition purposes; Harkforward is of intolerably bad habits; Lady Mildmay, Harriet, and some others, although they must be grown, are rough. Narborough Buck ranks with the full varieties, and thus may we dissect the choicest enumeration from existing sorts. These remarks must not be construed into fault-finding; they are to show how much attention the Pink requires at our hands. By another season let us have reason to give a list, "to avoid" even from those now set down as the few good sorts of 1851. We have at some trouble, and no little anxiety, appended a list of those Pinks most suitable for pot culture; those marked thus * may be depended on as possessing the following qualifications, viz., free growth, early, and plenty of colour; these are all necessary requisites for this kind of cultivation, for exhibition. Those varieties with ** affixed to them are expressly introduced for pot-culture.

Antagonist (Looker)
** Achilles (Looker)
** Alfred Morrison (Carter)
Bob Tickler (Craiggy)
** Benjamin (Bell)
** Brilliant (Ellis)
Clio (Smith)
* Criterion (Maclean)
Countess Rossi (Read)
Dianthus (Smith)
Duchess of Kent (Harris)
** Diana (Smith)
* Goliath (Hillyer)
George Glenny (Bragg)
Great Britain (Ward)
Hark Forward (Smith)
* Harriet (Ker)
Huntsman (Smith)
* Hon. Mrs. Herbert (Keynes)
Julia (Keynes)
Jenny Lind (Giddy)
* Jenny Lind (Read)
King of Purples (Harris)
* Kate (Read)
Kossuth (Read)
* Lola Montes (Costar)
* Laura (Willmer)
* Lord J. Russell (Young)
Lady Teazle (Smith)
Lord Valentia (Kirtland)
* Morning Star (Turner)
** Mrs. Fry (Walters)
Mrs. Judd (Turner)
Mr. Edwards (Turner)
* Narborough Buck (Maclean)
* Optima (Turner)
** Pinder (Colcut)
Queen of England (Hale)
* Rubens (Henbrey)
** Susannah (Mead)
** Surpriser (Costar)
* Sappho (Colcutt)
** Tom Long (Hastings)
** Tywford Rival (Young)
** Winchester Rival (White)
* Whipper-in (Smith)
X X (Young)

GLASGOW.—A Pansy competition took place on the 27th ult., open to all Scotland, for the best one, the best two, and the best three seedling Pansies of 1851, when the whole of the prizes were gained by the Messrs. Dicksons and Co., nurserymen, Edinburgh. The best one was a yellow-ground flower, with rich maroon belting and top petals—the under and side petals beautifully laced with gold, blotch large and dark, form perfect, style of Youell's Supreme, named "Victory." The best two: 1st, a pure golden yellow self, with a beautiful large and dark blotch, outline perfectly smooth, of good substance and form, named "Golden Eagle;" 2d, a beautiful primrose ground, with rich lively bluish purple belt, and top petals. The belting being narrow, and blotch large and very dark, gives it an imposing appearance; fine show flower, named "British Queen." The best three: 1st, a yellow ground, with dark maroon belt and top petals, style of Youell's Supreme, but quite distinct, an improvement on that fine old flower, and named "Peacock;" 2d, a pure white ground, with rich purple belt and top petals—the ground colour meeting in the under and side petals so very exactly, together with a large dark blotch, produces an admirable effect in a stand, and was considered the finest flower of any class brought forward on the occasion, named "Royal Standard;" 3d, a yellow ground with dark bronze purple belt and top petals, of great substance, very large and circular; a striking show flower, named "Gliff."

HENLEY.—A flower show was held here on the 19th ult.; but we have only been furnished with a list of the rewards, without the names of the subjects for which they were given.

CATALOGUES received from Mr. E. Rendle, Mr. C. Turner, of Slough, and Mr. W. P. Ayres, of Frooklands, Blackheath.

PINKS: *Dianthus.* In the preparation of your beds, you can hardly use too much manure; but we never apply it till the last time of digging over, when, being thoroughly buried a full spit deep, it only comes in contact with the fibres at the proper season. You need not entertain the least fear of making the colour run. One thing attend to—and do it well—raise your bed 3 or 4 inches above your ground level, by adding sound and sweet loam, two-year-old hotbed manure, and some sharp sand, and make the surface well rounded, in order that heavy rains may be more quickly thrown off. Our system is to make the beds 4 feet wide, and to plant six plants in each row, 6 inches apart, beginning at 9 inches from the edge of the bed. The second row should be 6 inches from the first, and so continue to the end. We would recommend you to plant the two adjoining rows with the same variety—making six pairs; and being thus brought together, each sort is more readily operated on, according to its particular requirements. The plants will then stand 6 inches apart every way, and at blooming time the buds of four plants may be easily protected with a small, say 6-inch square hand-light. Top dressings, an abundance of liquid manure in the blooming season, and refreshings with copious waterings in day time, together with disbuddings, carding, and shading, are the routine of Pink growing for exhibition. We have a few spare plants, which are at your service, if you choose. Norman was a first-rate grower, but he has been compelled to relinquish his favourite pastime on account of more important duties. You can get supplied from Woolwich, but we never recommend dealers. For choice of varieties, see above. *J. E.*

SEEDLING FLOWERS.

FUCHSIAS: *W J E.* All stout and well contrasted; we fail to appreciate the double corollas: the variety not so favoured has but one drawback, viz., the want of greater obtuseness of its sepals; tube short, surface smooth; colour coral red; corolla dense royal purple, stout, smooth, and well formed.*

PELARGONIUMS: *R F.* Rich crimson, with dark blotch on top petals, margined with a narrow band of bright crimson; bottom petals painted in the style of "Centurion." The bottom petals are too small to be proportionate with the top petals, hence not of good form. At this late season it is impossible to say what the flower may become. Admirably packed.*

## Garden Memoranda.

ROYAL GARDENS, CLAREMONT.—Bonapartea juncea, now called Littæa geminiflora, has been flowering here for these three weeks past, and it promises to continue in that condition for some time yet to come. The stem, which is at least 15 feet high, is clothed three-parts of its length with flower buds and flowers, which, although wanting in gay colours, are nevertheless far from being uninteresting. They are produced in pairs, all round the flower spike, and are pale greenish yellow in colour; they begin to expand near the bottom of the stem first, and continue opening upwards by slow degrees till they reach the top. The plant has been grown in a moist stove, where, however, little fire-heat is applied, except in winter, and it has received no treatment different from that given to the other occupants of the house, except, that while it has been in bloom it has been more liberally supplied with water. The stately flower-stem, issuing from a comparatively small tuft of gracefully weeping rush-like foliage, has a truly imposing effect, rendering the plant, in its present state, a worthy companion of the handsome Palm trees with which it is associated. Among the latter, Caryota urens has lately flowered here. Plumbago capensis every winter adorns the pillars of the house just alluded to, with multitudes of its charming sky-blue flowers. If pruned "hard in" after it has done blossoming, it is found to be not only an exceedingly ornamental pillar, or wall plant, but to afford a lasting supply of flowers for cut bloom. Beaumontia grandiflora, planted out in the bed, also blossoms satisfactorily here during the months of June and July. It is, however, difficult to keep clear of the mealy-bug, which seems to have an especial affection for it. Bignonia grandiflora flowers beautifully in a cool glass porch at the entrance of this stove. Although it is stated to be one of the best "Vines" for cottage drapery in the middle States of America, it is not found to flower well in the open air near London, while B. radicans blossoms in the greatest profusion. A plant of the latter trained against Mr. John Waterer's house at Bagshot, was (when we saw it in 1849), quite a mass of deep orange cup-shaped flowers. A coral tree (Erythrina Crista-Galli) is now in flower at Claremont, in front of the stove we have just been mentioning. The stems are cut down every winter to the roots, which receive such protection as is usually given to Fuchsias, and like the latter it pushes in spring and flowers every autumn as well as if it were in a greenhouse. Close to the front walls of the different glass-houses were numbers of Belladonna Lilies, which were in lovely condition, as were also plantations of Japan Anemone, than which there are few gayer border plants in autumn. The Californian Zauschneria has proved sufficiently hardy to withstand the last two winters out of doors here unprotected, and we believe Plumbago Larpentæ has done the same; but the latter certainly occupies a sheltered situation. The different flower-beds and borders have been very gay; but their beauty is now very much cut off by the cold weather we have lately experienced. Rollisson's Unique and Diadematum rubescens Geraniums had made most effective beds; and a group, consisting of Tom Thumb Geranium and Mignonette in the centre, with lilac Oak-leaf Geranium round the margin, had been much admired. Ageratum Mexicanum was still a good blue bed, and a large mass of the better kinds of Gladioli had been wonderfully fine. They are planted every spring, taken up when the foliage has died off in autumn, and wintered in a loft above the fruit room. Some have, however, been planted about three weeks ago, in order that they may come into flower early. They receive a slight covering of leaf-mould to keep them safe during severe weather. The Cloth of Gold Rose has flowered here this summer on a south aspect: all the blossoms it produced, however, were upon the very strongest shoots, which would seem to indicate what we believe is now pretty generally known, that rich soil and close pruning are the means by which this desideratum is most likely to be effected. The different borders were still tolerably gay, the plants, Pine-apples, and other subjects under glass were in excellent order, and the establishment generally was in good keeping.

## Miscellaneous.

*Chinese Horticultural Exhibition.*—It is perhaps too well known to require mention, that the various merchants, traders, and mechanics in Shanghae, as in most other Chinese cities, are formed into associations or guilds, similar in many respects to the mercantile associations and trades' unions in civilized countries, and for like purposes. These guilds each have their hall or place of meeting, where they assemble to consult on matters affecting their mutual interests, whenever occasion requires; also to celebrate certain holidays, and occasionally to have dinners. The halls of 10 guilds are situated in and about the Ching-wong-miáu—more familiar to the foreign community as the "Tea gardens." From their general resemblance to temples in outward appearance, they are quite liable to be mistaken for these edifices. Seeing one open some days ago, and crowds of people passing in and out, I was informed upon inquiring what was going on, that it was the hall belonging to the money brokers' association, and that the occasion was a floral fair of rather a singular character, from the fact, that but one kind of flower was brought for exhibition, and this was a rare and highly prized species of the Epidendrum, called by the Chinese, Hwui-lan-hwá. From its costliness it is possessed only by the wealthy, who value it at tens and sometimes hundreds of dollars. Though very fragrant, it is not particularly remarkable for beauty, and it is somewhat difficult for us "barbarians," to discover why the mere fact, that the petals of the flower approximate, in their light green, to the colour of the leaves of the plant, should impart to it such an extraordinary value. More common varieties of the same plant, nearly, if not quite as fragrant, and to our dull perception, fully as beautiful as their more highly esteemed sisters, are abundant, and may be purchased at any time for a few cash. The display on this occasion seemed to arise from a sort of pride on the part of the exhibitors, in being the owners of a plant so rare and

valuable, and a desire to have this fact known to the "million." The flowers were in plain pots, each placed upon a high stand by itself. They stood about in different parts of the hall without any reference to order in the arrangement, having the names of the several owners written on a slip of paper attached to each, and a man standing near to protect it from injury. It is well understood by the natives that it is an unpardonable offence to smell the flower, and if, in your simplicity, you approach it for this purpose, you will be told it is inadmissible, and that, if thus insulted it will die. However, their fragrance fills the air, so you get a portion in common with the multitude jostling to and fro about you, and you will be ready to admit that even this is better than nothing at all, to counteract an odour, not quite so sweet, arising from a dense crowd of Chinese on a warm day. An image representing the guardian deity of the city—Ching-wong-kiu-yé—occupies a seat against the wall in the main building, near the entrance, and on a table before it are offerings of various fruits and flowers, in 12 small cups, in three rows of four in each. As you pass through this large hall, you come to a garden, *á lá Chinoise*, consisting of artificial pools and piles of rocks, with paths winding about up and down among them. There are three other small buildings where the flowers are "on exhibition" as in the first. Besides these, the garden contains several curious and beautiful trees and plants. The premises altogether, have rather a crowded appearance, as the whole occupies a comparatively small space, and this effect was greatly increased by the number of people present. In one of the pools are many specimens of gold fish, some of them more than a foot in length. This hall and garden is open to the public but four times a year, except in the year during which the Emperor's birth-day is celebrated by the people generally, when it is open five times. This occurs but once in 10 years. The place is well worth a visit, and admission can probably be obtained at any time, upon application to some of the money brokers, who are in constant intercourse with the foreign merchants. It is called Tsín-liáng-ting, or more commonly Tung-yüen. *North China Herald.*

'*How to get rid of Cockroaches.*—Mr. Tewkesbury, of Nottingham, in a letter to the *Manx Sun*, says:—"I forward an easy, clean, and certain method of eradicating these insects from dwelling-houses. A few years ago my house was infested with cockroaches (or 'clocks,' as they are called here), and I was recommended to try Cucumber peelings as a remedy. I accordingly, immediately before bed-time, strewed the floor of those parts of the house most infested with the vermin with the green peal, cut not very thin from the Cucumber, and sat up half-an-hour later than usual to watch the effect. Before the expiration of that time the floor where the peel lay was completely covered with cockroaches, so much so, that the vegetable could not be seen, so voraciously were they engaged in sucking the poisonous moisture from it. I adopted the same plan the following night, but my visitors were not near so numerous—I should think not more than a fourth of the previous night. On the third night I did not discover one; but anxious to ascertain whether the house was quite clear of them, I examined the peel after I had lain it down about half-an-hour, and perceived that it was covered with myriads of minute cockroaches about the size of a flea. I therefore allowed the peel to lie till morning, and from that moment I have not seen a cockroach in the house. It is a very old building; and I am certain that the above remedy only requires to be persevered in for three or four nights, to completely eradicate the pest. Of course it should be fresh Cucumber peel every night." *Builder.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

Take advantage of the present season, when potting and similar operations are almost suspended, to wash carefully with soft soap dissolved in warm water, all plants which are or have recently been infested with insects; as by so doing, the gummy matter which attaches their eggs to the branches is loosened, and they are more easily removed. The latter part of the business should be managed by syringing the plants with water at a temperature of about 120° or 130°, which will also destroy any living insects which may be lurking about them. Much more good is done by carefully cleaning plants in this way, at this season, than many are aware of. Let any necessary pruning, especially amongst creepers, be done before the cleaning commences, as it is injudicious to waste time in cleaning shoots which are afterwards to be cut away. Let all dirty pots be washed, and their surface soil loosened, and examine carefully any of which the surface has a green or sodden appearance, which is an evident sign that water has been too liberally used, or that the drainage is inefficient; if the latter, it should be immediately examined and rectified, as considerable damage is soon done at this season, when the soil gets in an unhealthy state. Many of the greenhouse Geraniums, and other plants of similar texture, which are in the course of preparation for next spring and summer, will require repotting. In this do not allow the time of year to be any impediment, as nothing in the successful cultivation of such plants is more indispensable during their period of growth than shifting them into larger pots before their roots become too much matted. Greater care in watering is necessary after repotting at this season. In the Heathery, the plants must be carefully watched and dusted with sulphur upon the first appearance of mildew. Keep these plants as hardy as possible by a free circulation of air, and by removing the lights every fine mild day. The stock of plants usually denominated "forcing" or winter-flowering plants should be carefully examined, and compared with the estimated wants during the next five months, that any deficiency may be supplied in the most eligible manner. Lifting and potting of hardy shrubs, as Rhododendrons, Lilacs, &c., may still be done; but it is advisable not to use hese too early, as their blossoms are finer and more lasting when they are not forced until very nearly their natural period of blooming. Amongst the plants which it is not yet too late to procure a stock of, we may particularly mention Tea-scented, China, Moss, and Provins Roses; Belgian and other Azaleas, with Anna Boleyne Pinks, Perpetual Carnations, tree and Neapolitan Violets in pots, Lily of the Valley, &c. These must be brought forward in successional lots by placing them in situations somewhat warmer than those in which the main store is preserved. The most congenial of all forcing pits is a bed of leaves, the heat in which is maintained by means of a hot-water pipe passing beneath them. By plunging the plants in such a medium, their roots are kept in advance of the tops, and plenty of air can be given, thus preventing the lanky etiolated appearance so commonly seen in forced plants. While upon the subject of plants for forcing, we may mention a few, which, though admirably adapted for the purpose, are not so generally in use as they deserve to be; amongst these are the Magnolias conspicua, Soulangeana, Hammondi, and their congeners; Laburnums, Ribes atrosanguineum, and Wistaria sinensis, grown as standards; double Peach, and double Cherry; Weigela rosea, Jasminum nudiflorum, tree Pæonies, and Forsythia viridissima.

### FORCING DEPARTMENT.

Pineries.—As the power of the sun declines, so also must our artificial temperatures be somewhat decreased; and in exact accordance with the latter, must the amount of moisture be regulated. Take care that the quantity of moisture is not so excessive as to condense in quantity upon the glass, &c., close up the laps, or run down into the heart of the plants. To prevent this, the evaporating troughs should be more sparingly filled, and the open tanks closed with moveable tops, giving you the power to confine the vapour or permit its escape. In fine clear weather, when a greater quantity of air can be admitted, the amount of moisture should also be slightly increased. Watering should be performed with great care; and syringing is only admissible on the mornings of very fine days. It should be done with a very fine rose, and driven, not into the plants, but into the atmosphere of the house or pit, with such force that the plants may receive it in the shape of very fine dew. Vineries.—In the anxiety to keep those houses containing fruit sufficiently dry, be careful to avoid the extreme, even in that direction. If the houses are kept too dry by fire heat, the berries will shrivel, an evil nearly as bad, with regard to some kinds, as decay, the result of opposite management. It is easy to comprehend what is wanted, viz., a dry but not an arid atmosphere; but to regulate it to this nicety requires more care and judgment than is generally found, except in a very experienced practical gardener. Let all spare time be now devoted to cleaning the sashes of the different structures, pits and frames included, from the dust and dirt accumulated upon them during the summer. Nothing conduces more to the health and well-being of their occupants than the free admission of light.

### FLOWER GARDEN AND SHRUBBERIES.

Pits and Frames.—Cuttings which are only partially rooted should be kept warm, and as close and moist as is possible, without running into the dangerous extreme of damp. The additional warmth and moisture here recommended is to encourage them to make a little growth, both at top and bottom, before they are hardened off; and that more time may be afforded for the latter purpose, the former should be effected with all consistent speed. Cuttings which were propagated earlier, and are now fairly rooted, should be gradually hardened, that they may retain their health and strength during winter, in a comparatively cool temperature. This should be managed by keeping them quite cool at night, and by exposing them fully in all dry open weather, when not too cold; taking care to exclude frost from the more tender plants, both by night and day. During the hardening process, the very little water that is necessary should be supplied in the morning; and as increase of size is not the object aimed at, but sturdiness of plant, growing points should be stopped, and all flower-buds carefully removed. Aphides or other insects must be destroyed; and upon the first signs of mildew, the plants so affected should be syringed on a dry morning, and dusted over with flower of sulphur.

### KITCHEN GARDEN.

Proceed with the final earthing of Celery with all possible despatch, as the season is too far advanced to admit of longer delay. The same remark applies to Cardoons, the earthing of which should be completed, if possible, by the end of this month. If there is a pretty good quantity of autumn Broccoli or Cauliflowers ready for use, a part of them should be taken up and laid in under the shade of a north wall, where they will be retarded, and may be protected by some covering in severe weather. Carrots are now nearly as large as they will be, and, unless in sandy soils, they had better be taken up now, to prevent their being spoiled by worms.

State of the Weather near London, for the week ending Oct. 23, 1851, as observed at the Horticultural Gardens, Chiswick.

| Oct. | Month's Age. | Barometer. | | Temperature of the Air. | | | Temperature of the Earth | | Wind. | Rain. |

| Satur. | 1 | 54.6 | 38.9 | 46.7 | 14 | 0.38 | 2 | 1 | 4 | 1 | 3 | 5 | 7 | 2 |

The highest temperature during the above period occurred on the 29th and 30th, 1843—therm. 67 deg.; and the lowest on the 29th, 1842—therm. 23 deg.

## Notices to Correspondents.

Beetle Traps: *B.* One of the best consists in making a hole in the floor, and sinking a basin in it, half filled or so with water or beer. But if your floor cannot be pierced, then procure one of Marchant's traps from Regent's-circus, Oxford-street. See also a paragraph in col. *a* of this page.

Birds: *Josephine.* Your bird, it would seem, has been halt from his birth. The malformation of his foot took place in the egg. He is in no pain. You say "he is always singing;" let this convince you of that fact.—*Letitia.* Try a little German paste and sponge cake, for a change.—*William T.* No; Hemp-seed is bad for these birds; it injures their plumage, and makes them too fat.—*John C.* Put a little sliced Liquorice root in his pan of water for two or three days.—*Maria.* His doleful looks are caused by the "agitation" already spoken of. He will smile on you in a few weeks.—*J W L.* The market price varies, according to the scarcity or abundance of the supply.—*H B.* A long narrow cage is most suitable, and hang him moderately low.—*B M* We cannot recommend wicker-work. Wood, painted, is far preferable.—*Jane.* As we have before said, we cannot sympathise with any persons who *will* keep birds and cats, when the former are devoured, or lacerated by the latter. Your canary is vitally injured, and you will, by his death, learn a practical lesson. May it benefit you hereafter!—*Inquirer.* Either the red-pole or the goldfinch can be readily taught to draw up water in a bucket. You may complete their education in a single day. *Eliza.* By no means. *Never* sift the sand. The small particles of gravel materially aid the digestion of your little prisoner. Keep the sand *quite dry. W. K.*

Camellia Leaves: *A N.* They are covered with the soot fungus (Torula fumago). The only remedy is washing clean with soap and water, and then giving the plants a good syringing. ‡

Charcoal: *New Forest.* We will inquire about it.

Colchicums: *A S.* Transplant them as soon as the leaves are dead in the summer, and at no other time. They are not particular in their soil, provided it is well drained and never water-logged in winter.

Emigration: *J W.* Every day tells us, in louder and louder tones, that it is imprudent for an editor to advise people on this delicate point. Each case requires to be considered separately, and with reference to a hundred personal questions, concerning which the editor of a newspaper can have no information. We know nothing of the Colonisation Assurance Association; but this we know, that the colony in question has been hitherto very unprosperous; and we cannot take upon us to say that its destiny will be improved by the new plan of introducing convict labour; although we readily admit that the measure is better calculated than any other to assist the struggling colonists.

Flower Gardens: *W J R.* You do not seem to be aware that we have already published, at great length, all the more important matters connected with M. Chevreul's arrangement of colours. If you will turn to our volumes for 1849 and 1850, you will find ample comments on the subject. ‡

Fruit Trees: *W H M.* The division comprising one-third of your 220 feet of covered wall, will admit of four trees in front, and four at back. This division being intended for late sorts, the following will be proper:—Two Walbertons, two Barringtons, two Chancellors, two Late Admirables.—*Newtown.* The Newtown Pippin is a large Apple when grown to perfection, as in Long Island, New York, and New Jersey. But in Britain it generally attains but small size, and somewhat resembles the London or Five-crowned Pippin. In both there are five distinctly-prominent projections round the eye. It requires a deep warm soil, and a good situation as regards climate; and unless you can command these, you need not attempt its cultivation. ‖

Fountains: *T G.* We do not see how an answer can be given to your inquiry. The proposition sounds well, but everything as to success will depend upon the elegance and power of the contrivance. Fountains are generally sad trash in this country. A little jet is no better than a boy's squirt.

Grapes: *J C.* Your seedling was noticed in our No. of Oct. 11, p. 648. ‡

Greenhouse Climbers: *S.* Mandevilla suaveolens, white; Kennedya Marryatæ, red; and Hardenbergia macrophylla, purplish blue. *Persevere* in beheading the Dandelions in the way you have been doing, and you will extirpate them. ‡

Names of Fruits: *J H D.* Your seedling Apple is handsome, but it has not sufficient briskness of flavour. It is sweet, but not rich ‖

Names of Plants: *Jane.* Little seedling Ferns, not recognisable in the state in which they are sent. The black substance is Racodium cellare.—*Enquirer.* Lastrea affinis, *J. Sm.*; Nephrodium affine, *Lowe. S.*—*J White.* Miltonia candida.—*Sub* Mesembryanthemum coccineum; it is impossible to name the other wretched morsels.—*A Scott.* 1, Asclepias cura-savica; 2, Billbergia pyramidalis; 3, some kind of Dioscorea or Yam.

Pick-foe: *Reader.* It is figured and described in our volume for 1849, p. 403. ‡

Ringing Fruit Trees: *Falcon.* Perform this operation in spring, when the bark runs freely, and take care that the wounds are not more than half an inch wide. It is better to ring several shoots as thick as the thumb than one limb common to the whole.

Seeds: *C E A.* None require bottom-heat. All are hardy. We have never heard of a plant called Demerary. We must have answered your first enquiry, if we ever received it.

Misc.: *Godstone.* Complain to your news agent. We do not send the paper out folded, but supply the *trade* in sheets.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—Private instructions in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificates may now be obtained, on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

THE ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

KESSINGLAND WHEAT.—Persons desirous of cultivating this productive and new variety of Wheat, can obtain it by applying to WILLIAM GRIFFIN, Eydon, Daventry, who is sending it out in quantities not less than half quarters, at the rate of 6s. per bushel, including bags. Carriage paid to London. Orders accompanied by post-office orders will be punctually attended to.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

THERMOMETERS.

HENRY BAKER'S (90, Hatton Garden, London). List of Prices. Every instrument made by him warranted accurate.—Vertical self-registering THERMOMETER, for heat and cold, of the best construction, and not liable to get out of order, 14 inches high, in copper case, 1l. 5s.; in japan case, 1l. 1s., and 1l; 10 inches high, in copper case, 1l. 2s.; in japan case, 18s. Horizontal Thermometers for registering the extreme of cold only, 4s. 6d; Hot-bed Thermometers, in oak frames, 1l. 1s; copper frames, 1l. 5s. Thermometers for Brewing, Baths, &c., in copper cases, 14 inches, 7s. 6d.; 10 inches, 5s. 6d.; 8 inches, 4s. 6d.; in japan cases, 14 inches, 5s.; 10 inches, 3s. 6d.; 8 inches 2s. 6d. Dr. Mason's Hygrometer or wet bulb Thermometer, for showing the humidity of the air, with tables, ivory scale, 1l.; wood, 15s. An invaluable instrument in Hothouses, Sick Chambers, &c. Wheel Barometers from 1l. 1s. each, sent, securely packed, without fear of getting out of order.

The Agricultural Gazette.

*SATURDAY, OCTOBER* 25, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Oct. 30—Agricultural Imp. Soc. of Ireland.
THURSDAY, Nov. 6—Agricultural Imp. Soc. of Ireland.

NOTWITHSTANDING all that has been said and done by the various Agricultural Societies, both national and provincial, there are yet many anomalies in the practice of various districts, which strike an observer as being strangely at variance with the customs of other portions of the country. Every one who has had the good fortune to pass along the Great Northern Railway, must have admired the splendid farming and magnificent crops in Lincolnshire. Such crops and management might be supposed to include every farm requisite in a similar style. This, however, is far from being the case, particularly with regard to the farm buildings. Strange as it may seem, we believe there is no portion of England so much behind as some parts of Lincolnshire are in this respect. Many of the farms are almost destitute of stables for the farm horses, the poor animals having no shelter, except a large shed and open yard. And as for fattening cattle, we were often surprised to observe no other accommodation than an open yard without any shed whatever, the sides of the yard being formed of thorns wattled into rails, the rakings of the stubbles being built up along one or more sides, partly for shelter, but more for the sake of convenience for litter.

It would seem as if the district had burst at once into a condition fit for producing corn and feeding cattle, without going through the long intermediate stages during which, in other portions of the country, farm buildings have been gradually erected. Still it will strike a farmer accustomed to the noble farm buildings of the north of England and Scotland,—and even the holders of the mud-built farm steadings of Wiltshire, Somerset, or Devon, will be astonished—to see land that produces such crops of Wheat as we see this season in Lincolnshire, so ill provided with the first necessaries of farming.

Having mentioned Wiltshire, we are reminded of a practice followed to a great exent in that country. The sheep are at a certain hour every evening brought home and enclosed in as small a space as possible, by means of hurdles on the *bare fallows*, for the purpose of manuring them. If this be the best means to effect the latter purpose, it cannot possibly be the best method of fattening the unfortunate sheep. We have often expressed our hesitation in finding fault with the established practice of any district; but, surely, in this day of artificial manures and green crops, some other plan of manuring the land might be devised.

Our north country friends often express surprise at seeing so much work still done by means of bullocks. It does seem strange that the superiority of horses should be regarded as a settled question at one end of the kingdom, and yet remain a disputed point at the other.

One of the most influential periodicals of the day has expressed great surprise at learning that 6000 horse-power is the extent to which portable steam threshing-machines are now employed. To a Scotch farmer, the idea of being obliged to hire a threshing-machine, instead of having one of his own, would be insufferable; and we apprehend there would be no difficulty in finding more than 6000 horse-power in fixed machines in a very few of the Border counties. Can this striking difference in practice have arisen from the sense of insecurity, arising from the riots and incendiarism, which a few years ago disgraced the southern counties, and of which threshing-machines were always the first object of attack?

The method of securing the hay is as different in the south of England from that universally practised in the north, as it possibly can be? and nothing would excite greater astonishment on the part of a north countryman, than to see the Barley cut down like hay, as is done in Devonshire. There can be no doubt but these opposite practices depend in a great measure upon the more settled weather of the southern counties. The harvest customs of these districts have sometimes been recommended for general adoption, but as the weather, though of serious importance in out-door operations, does not appear to have been considered by the parties making these recommendations, the trials have been unfavourable to the spread of the south country practice, both in respect of hay and corn harvest.

It is very singular that Wheat succeeds so well after Clover in the south, whilst it is only on the very best description of soils that this plan can be followed in the north. We also observe beautiful crops of Wheat on mossy land in Lincolnshire, where nothing but Oats could be successfully grown in Scotland. The climate must be the cause of this difference—but to which of the climatic agencies are we to attribute the difference. Is it the greater or less fall of rain? Can it be the slight difference in the annual temperature? Or can the greater amount of sunshine and clear weather be the cause?

We have often been struck with the practice of giving sheep a run over perhaps 10 acres of Turnips at one *break*, as is frequent in Scotland; whilst in the southern counties, these Turnips would have been doled out in small portions, at two or three tons a day. The latter must be the more economical plan, and why it is not universally adopted by the intelligent farmers of Scotland, we are at a loss to understand.

As we have intimated, some of these different practices must originate in the difference of climate, soils, and situations; but still there are some of them for which this reason cannot be assigned. Those errors in practice, which have arisen from the isolated position of our farmers, must fast disappear before the information which is forced upon them by the many opportunities they have of meeting together. And in this way, there can be no doubt but the superior facilities afforded by railways will benefit agriculture, at the same time with every other branch of industry in the kingdom.

WE pointed out, in a former article, the varied sources from which the materials must have been derived which form the alluvial soils deposited by the Severn. The rock formations which have contributed to the soils of the Humber, are not less various. The Hull unwaters the thick argillaceous deposit of *Till*, or boulder clay, which forms the lower portion of the erratic tertiaries, northern drift, or diluvium, and which covers the chalk, in Holderness to the depth of more than 100 feet. It also drains the thin film of sandy loam which is the general covering of the same rock in the Wolds of Yorkshire. The Derwent, with its upper tributaries, rises among the siliceous, calcareous, and argillaceous strata of the lower, middle, and upper oolites. It crosses the lias for something more than five miles, and flows through the new red for nearly five times that distance before its confluence with the Ouse, below Selby. The head waters of the Ouse have their origin among the strata of the lias and the new red. The springs of the Swale, the Yare, the Lidd, and the Wharf, issue from the carboniferous limestone, and traverse the millstone grit, the new red sandstone, and the coal measures. The coal measures, with the other rocks above named, occupy a large portion of the area drained by the Aire and the Dove. The Dove and the Trent issue from the carboniferous limestone; the Dove having been derived from a portion of that formation associated with basalt and green stone. Both rivers flow through the millstone grit, and the new red sandstone, and receive some contributions from the coal measures. The course of the Trent, from Nottingham till it falls into the Humber, lies through the new red; but the ancient alluvium on its banks, formed under a different system of levels, and beyond the depositing influence of the present stream, though within the reach of its eroding action, is of a mixed composition, very different from the new red on which it rests. On the west, tributaries bring detritus from the magnesian limestone; on the east from the lias. From such varied sources is the fine detritus derived, which is brought down by the rivers which fall into the estuary of the Humber; but neither the modern warp, with which the industry of man causes the muddy waters of the Trent and the Humber to enrich the barren tracts which border the estuary, nor the similar alluvial deposits formed naturally more than two thousand years ago, are composed wholly of matter brought down by those rivers, and derived from the waste of the rocks through which they flow, nor even from that of the erratic deposits which are spread, more or less, over their catchment basins. A large portion of the materials which compose the sediment thrown down in the process of warping was traced, long since, by Professor PHILLIPS, to the wasting cliffs of Holderness, whence it is brought up the estuary by the flood-tide. He inferred this from the fact that a larger quantity of sediment is deposited in the summer than during the season when these rivers are in flood. More

recently, microscopic researches have revealed the astonishing fact, that a very considerable portion is not detritus of any kind; but consists of the siliceous coverings of infusoria, so minute, that, according to Ehrenberg, a cubic inch would contain 40,000 millions of them, and 147 millions of them would not weigh more than one grain.

Of the rivers which fall into the estuary of the Wash, the Witham, the Welland, the Nen, and the Ouse drain the siliceous sandstone of the lower oolites, and the Oxford clay of the middle oolites. The Ouse flows, not only through these, but through the Kimmeridge clay of the upper oolites; and receives tributaries which have traversed the green sand and the chalk. The deposits, however, which border the estuaries of the Humber and the Wash, must be regarded as parts of one alluvial tract. By the operation of tides and currents, each must have contributed to its neighbour a portion of the sediment brought down by its rivers; and tidal action must have diffused through both the fine detritus derived from the wasting cliffs of Holderness.

We come now to the father of British rivers, the "hoary Thames," and the streams "which swell with tributary urns his flood."

"First the famed authors of his ancient name,
The wandering Isis and the fruitful Thame."

The wandering Isis rises on the eastern declivity of the Cotswolds; and the dip of the strata has determined the course of the stream. These decline so gently to the east, that the waters which issue from the springs of Cricklade, traverse in their windings a distance of 150 miles before they reach the level of the tide at Richmond; while on the opposite side of the watershed, where the strata crop out, the fall is so rapid that the Severn flowing within 12 miles of these hills, is already a tidal river. The course of the Isis is chiefly through the Oxford clay, till it has passed Oxford, joined on its way by the Colne, the Lech, and the Windrush. All of these rise within the escarpment of the Cotswolds, composed of the Bath oolite, based on the inferior oolite. The Evenlode and the Cherwell have their sources in the lias, beyond that ridge, and would have flowed westwards, but for breaches or depressions by which they have been enabled to pass it. The country from which the Cherwell issues is remarkable for being the highest ground in the centre of England; pouring its waters in three different directions. The springs of the Cherwell, which flows southwards to the Thames; of the Leame, which passes by Leamington, into the Warwickshire Avon, and thence through the Severn into the Bristol Channel, and those of the Nen, which has an eastern course to the German ocean, through the estuary of the Wash, are all situated within an equilateral triangle, having sides of little more than a mile each.

Between Oxford and Abingdon, the Isis crosses the calcareous and argillaceous strata of the middle oolites, and the green sand, and is joined at Abingdon by the Ock, which has flowed through the same formations. From Abingdon to near Wallingford, it crosses the upper oolites, under their argillaceous form of Kimmeridge clay, and their calcareous form of Aylesbury limestone. The "fruitful Thame," which joins the main stream a few miles above Wallingford, has had its entire course through these rocks. Between Wallingford and Streatly the Thames flows for about five miles through green sand, bordered by escarpments of chalk. At Streatly it enters a gorge of the chalk, through which formation it winds by Reading, Henley, and Marlow, to Maidenhead. At Reading it is joined by

"The Kennet swift, for silver eels renown'd."

The Kennet drains the chalk and the northern skirts of the western extremity of the eocene tertiary district, commonly called the London basin. Do the eels of the Kennet owe their celebrity to the strata through which it has flowed, or to the declivity of the bed and consequent rapidity of the stream? As a parallel case, we may mention two contiguous rivers which fall into the harbour of Poole, near Wareham, the Peddle, or north river, and the Frome, or the south river. The eels of the latter are considered superior to those of the former. The north river chiefly drains those portions of the eocene tertiaries which are the equivalents of the Bagshot sands; the south river has one-half of its course through the chalk. Leaving, however, this important question to the investigation of epicures, we resume the geological investigation of the course of the Thames. After winding through the chalk from Henley, it enters the London tertiary district at Maidenhead, and quits it no more till lost in the sea. Its northern tributaries have, for the most part, an exclusively tertiary course. The "Loddon slow" drains the middle eocene tertiaries or Bagshot series. The "dark Colne," and the "sedgy Lea," have their origin in the chalk; but the greater part of their course through the London clay, and the siliceous and argillaceous strata of the plastic portion of the series. The Rooding and the Brent are wholly tertiary in their course. If they have the misfortune to have been left unsung by Pope, they may console themselves with the reflection that the Medway, whose nuptials with the Thames were deemed fit theme of Spenser's verse, have experienced from the bard of Twickenham the same neglect of which they complain.

The southern tributaries of the Thames have their origin in the Weald denudation. All its waters, except those of the Rother, flow either northwards or southwards, through gorges in the escarpments of the chalk which bound it. The "chalky Wey" has less pretensions to "roll a milky wave" than the "blue transparent Vandalis," the "sullen Mole," and the "silent Darent." One half of its course lies through the green sand, the other through the tertiary strata. It is only for little more than a mile where it flows through a gorge in the chalk at Guildford, that it traverses that rock. The Mole rises near the junction of the Weald clay, and the Hastings sands, flows for about 10 miles through the green sand, and for five miles through the chalk, before it enters the tertiary district. The Medway flows eastward in Weald clay, between 20 and 30 miles, traverses the green sand for nearly 20 miles, and the chalk for something less than 10, and joins the Thames, where it is bounded by sands of the lower eocene strata. Such are the varied materials rolled down by the Thames and its tributaries, to form the alluvium of its estuary. That much of the matter deposited at its mouth is derived from the upper regions of the river, must be evident to any one who has seen the turbid waters rushing downwards, in time of flood, at Richmond, and knows the length of time which elapses, after heavy rains, before the land waters make their appearance there. The wasting cliffs of London clay in the Isle of Sheppy, like those of the till in Holderness, have, however, furnished large contributions, and to them may probably be due much of the argillaceous character observable in the alluvium of this district. We have only noticed the rock formations along the course of the Thames and its affluents. Like the rocks, however, which form the catchment basins of the Severn and the Humber, they are overlaid by erratic deposits; and some notion may be formed respecting the mixed materials of which they are composed, from the following facts. Fragments of red chalk, which could have been derived from no nearer district than Lincolnshire, have been found in the superficial deposits at Moreton-in-the-Marsh. They are accompanied by pebbles of quartz rock, derived from a conglomerate of the new red, forming the upper Lickey range near Bromsgrove. That conglomerate is itself derivative, composed of the wreck of some of the silurian strata of Caer Caradoc and the Wrekin. Its materials, dispersed in large quantities over the midland counties, have been traced down the valley of the Thames to the gravel of Hyde Park, which is composed chiefly of chalk flints resting on London clay.

At lower levels, and within certain distances of the Thames, is an ancient wide spread alluvium, 20 or 30 feet above the present stream, containing bones of extinct mammals and shells of the same species of molluscs as those which now inhabit the neighbourhood. It contains these Lickey quartz pebbles and pebbles of granite, and has evidently been reconstructed from the erratic deposits which are found at high levels, on the hills flanking the valley of the Thames. The Lickey quartz pebbles indicate transport from the north and west. There are others which indicate a drifting from the north and east. The deposit, for instance, at Highgate, abounding with the wreck of the oolites, forms the southern limit of the boulder clay, which is traceable from the coast of Yorkshire through Norfolk, Suffolk, and Essex.

On the whole we conclude, that the alluvial deposits of rivers are chiefly near their mouths; that amidst the variety of materials derived from the numerous rock formations through which any river and its affluents have flowed, he must be a bold man who will venture to trace each particle of the alluvial soil to its source, or to assign the influence of a given rock. We conclude, also, that this complexity has been further complicated by the presence of superficial deposits, containing matter transported from great distances, which produce, on every rock, a great variety of soils, not referable to variations in the composition of the rocks themselves, and that these superficial deposits are the most easily acted upon by those atmospheric agencies which form alluvial deposits, by the removal of matter from higher to lower levels.

## OPEN BOARDED FLOORS.

My experience in this matter (six years with sheep, and two years with pigs and bullocks) enables me to draw conclusions most decidedly in favour of the plan. I confess I watched it with much jealousy, especially after a whisper from the Rev. A. Huxtable; and so to resolve the doubt I divided a lot of bullocks placing half on clean straw, and the remainder on the boards. It is in vain to seek for any advantage on the soft straw bed; for neither myself, my bailiff, or my visitors can point out a difference, excepting that those on the open boarded, unswept, unstrawed floors are decidedly the cleanest, which seems odd and inconsistent enough. For pigs and sheep the advantage was always too unmistakeable to be doubted. The animals are all perfectly clean and unspotted, as much so as any taken from a clean pasture. During last season I weaned 50 calves, all of which I reared without sickness, and they have always been on the boards. I have also 36 weaned this season equally healthy. Some of last year's have been sold to the butcher as small beef for 8*l.* each, 15 months old. With regard to pigs I would not attempt to keep so many except upon boarded floors. I dare not pack them so close on straw, it being impossible to keep them healthy, whilst with 240 we never have or think of having disease of any kind, and they are so clean that I have often been asked if they had been washed or brushed. The whole question hinges upon having a sufficient space between the spars to allow the manure to pass. Experience has proved to me that for small pigs, ¾ inch; middling ditto, 1 inch; six months ditto, 1¼ inch; Down sheep, 1½ inch; larger ditto, 1⅝ inch; calves, 1½ inches; larger ditto and bullocks, 1¾ inch [intervals are sufficient.] 1¼ inch planks are quite thick enough for sheep and pigs; but I should recommend 2 inches for calves, and 3 inches thick for heavy bullocks. I find Fir too soft for bullocks, as their sharp edged hoofs tear away the edges of the Deal. I should recommend very hard Oak, or the African Oak, similar to the stairs of the Great Exhibition. It is also desirable to have a clamp at the end of the spars, to prevent their giving way to the wedge of the hoof.

There is no effluvia from the bullocks, as there can be no fermentation—air being excluded by the gravity and density of the manure. The sheep and pigs may also be kept sweet by dusting the floors occasionally with salt or gypsum. It is a good plan, after removing the manure, to place a layer of burned clay or carbonised ashes in the pits, in such proportions as will solidify the manure sufficiently to fill into the dung carts. Of course this manure is at once taken to the land, without the intervention of a dung-heap.

I apprehend that when a field is heavily folded, we do not regret the absence of straw or fermentation. But methinks I hear some practical man of the old school say:—"How are we to stamp our straw into manure?" I hope the time is coming when farmers will never have straw enough. It is too good to put under foot. I find practically that it enables me to dispense with poor Grass land. Cut up fine, sifted and mixed with a little meal, some Rape-cake, Turnips or Mangold, it affords my numerous animals ample food.

By the bye, it may be well to state that I never use hay for my horses. They have cut Wheat straw chaff, slightly watered with a watering pot, and 14 lbs. of Bean or Pea-meal mixed with it, and two ounces of salt daily. Their condition is unmistakeably good. They must have salt when they have no hay. The straw is cut very fine; Wheat straw is decidedly the most substantial.

I ought to mention that on open boarded floors you may pack animals very closely, there being always air under them. Take care, in cold weather, to diminish the ventilation, especially for pigs; they have but little hair, and if they huddle together, they want warmth, and will do no good. The thermometer is the best guide. The ventilator must be at the highest point, and a draught of air from each end and below. I would caution those who have bullocks in Warnes' boxes, or covered yards, never to allow the animals' feet to be wet with urine, which would give them rotten hoofs. Straw should be abundantly supplied, to prevent the animal being in any way soiled.

All my animals receive salt in their food, and I have no trouble or anxiety about their health. I have 10 cows on boards, but they go occasionally into a small pasture, as I consider moderate exercise beneficial to "breeding animals." They have often and successfully calved on the boarded floors. *J. J. Mechi, Tiptree Hall, Oct.* 13.

## SOLID VERSUS LIQUID SEWAGE.

The two modes of supplying sewage as a saleable commodity are:—

1st. The mode proposed by the late Mr. Smith, of Deanston, and partially carried out by the Metropolitan Sewage Manure Company, at Fulham; viz., to pump the sewage immediately from the sewers, through pipes, upon the lands requiring it. Though this mode, so far as it has been carried out, demonstrates the value of the liquid as a manure, yet it seems also to show that the system is applicable only to low lying grounds, and those in the immediate vicinity of the source of supply. The latter condition is, however, antagonistic to the great sanitary principle, which is to get rid of the noxious influence of sewer-water, either by chemical agency, or by preventing its exhibition, until removed by mechanical means to a distance sufficiently great to render its effects innoxious to the population of the town producing it.

2d. The mode proposed in 1845 by me, viz.—to effect, by means of proper depositing reservoirs and other contrivances, the precipitation of the fertilising ingredients; to dispose of the deposit either immediately from the reservoirs, or after drying it by long exposure to the atmosphere or to artificial heat, and compressing it into a form commodious for transit to the

proper markets. Hereinafter it will be seen that I *now* propose to dry it by my patent process, which obviates many of the serious objections to other processes.

In improvements of sewers already existing, or in devising a scheme for the construction of a new system of sewers, the first object should be to transmit the sewage from the locality where it is formed to that where it is to be deprived of the water, and converted into an article of commerce, as quickly as possible; and for this purpose to make a fall artificially, if not already so naturally, low enough to create a rapid current in the sewers. Although the evils of the present metropolitan sewers discharging their contents upon the shores of the Thames at low water is bad enough, in a sanitary point of view, nevertheless, the fact that the sewage is prevented from discharging itself for hours during every tide, thus converting what ought to be water-courses into reservoirs, from which noxious gases arise and contaminate the atmosphere, constitutes a much greater evil. The bad effects of such a system of sewerage, in comparison with the one I proposed, either in its sanitary or commercial effects, cannot, perhaps, be more clearly shown, than by the words of Professor Aikin, which I extract from a report made by him on this subject in 1845 :—

"From the facility with which the various matters discharged into the sewers undergo decomposition, when diluted with water, and at a favourable temperature, it is evident that the shorter time that they remain in the sewers, the more valuable they will be, because the less decomposed. It may therefore be confidently anticipated that a plan which by means of a constant current clears out these matters from the sewers in proportion as they are poured in, will furnish them in a state considerably more beneficial to the farmer, and nearly approaching to that of night-soil, which is considered as the richest of all manures."

The next object should be to extract the solid manure in as short a time as possible, or at any rate to fix the volatile salts and gases, and prevent their exposure to the air—and this the lime process effects most rapidly; for within a few minutes after the admixture of lime, which may be effected in the passage of the sewer-water to the reservoirs, the fixing of the gases and precipitation of the salts, and organic matter, and ammonia in the form of nitrogenous matter, commences; and when deposition has taken place, the supernatant water prevents atmospheric influence.

Next, it should be an object to prevent long exposure to the air and artificial heat. These, however, are the usual methods of desiccation in order to convert the manure into a marketable state, and are processes which, besides being very expensive, necessarily deteriorate its fertilising qualities. These objections are obviated by the adoption of my patent process, by means of which the manure can be extracted from the sewer-water, and packed in casks, like guano, or Roman cement, within 24 hours; and this without the aid of heat—the simple operation of drying being in fact a work of minutes, not hours.

Having now given my opinion as to what should be, generally, the principles upon which the construction of a complete system of sewerage and sewage manufacture should be based, I proceed to describe the nature of my invention, and to show that it is in accordance with these principles that the machinery is constructed, and the process of the manufacture carried out.

The arrangements having been made for separating large floating bodies, stones, &c., from the sewage-water received at the outfall, it is then pumped up continuously into the reservoirs, so as to preserve the necessary fall of water in the sewers; I then commence the deodorising process by mixing the sewage intimately with milk of lime, which is made by putting into a cistern a certain measured quantity of lime and adding thereto a definite quantity of water; both being mixed together, and kept in motion by an agitator.

A sufficient quantity of milk of lime is to be used to render the sewage-water clear and free from smell, and to ensure the precipitation. To effect the due admixture of milk of lime and sewer-water, I employ a pump of small bore proportioned to the quantity of the milk of lime required; and the arrangements are such that, while the sewage-water is flowing away from the large pump, it receives from the small pump, through a pipe branching on to the pipe conveying the sewer-water to the reservoirs, a stream of milk of lime commingling with the sewer-water in its passage. The strength of the milk of lime, or the quantity to be used, will vary with every different kind of sewage-fluid. An excess, however, is not prejudicial, as it subsides with the other solid matter.

The mixture of milk of lime and sewage-water then flows into the reservoirs, of which there may be any convenient number; thus the liquid may be passing into No. 1, while No. 2 is depositing, and No. 3 being worked off. When the precipitate produced by the lime has subsided, the deposit, while in a liquid state, is conveyed by a drain or pipe to a well, where it is again allowed a certain time for subsidence, and the superfluous water is drawn off. To cause the deposit to flow into the well without the fear of the drain choking, and to create a current, I apply a screw of one or more turns within the drain, which propels or draws the deposit through it. The deposit is then raised from the well by an endless chain of buckets, or other suitable elevating apparatus, which delivers it into a horizontal trough, from whence it flows into the drying machinery, the quantity being regulated by sluices in the trough.

The drying-machines themselves, and of which there must be a number proportionate to the quantity of sewage obtained and to be dried, perform the operation by means of centrifugal force arising from the machines being made to revolve with great rapidity. The construction of the machine, and its operations, are as follows :—A vertical shaft carries a horizontal plate, about 3 feet diameter, keyed upon its upper end; connected with this plate, and concentric with it, is a ring or drying-cylinder, about 18 inches diameter, of wire gauze or other perforated material. This cylinder retains the manure while the water is thrown out through the wire gauze by the centrifugal force caused by the rapid revolution of the shaft. If now the machine were stopped, the dried manure might be dug out by manual labour; but, to save this expense, and to economise the time required for stopping, I have adopted a contrivance by which the drying-cylinder can be raised up from the horizontal plate while both are in motion; and, as this cylinder is raised, the dried manure flies off through the space left between the cylinder and the plate. This refers to a single machine.

A double machine consists of the ring of 18 inches diameter already described, and another of a similar description, but of 3 feet diameter, upon the same plate and concentric with the first cylinder. In this machine the water, instead of flying from the inner cylinder against the inner surface of the outer cylinder, as it otherwise would do, is made to flow through channels in the plate to the outer edge of the same; but when the inner cylinder is raised to discharge the manure, this is allowed to fly against the outer cylinder.

After having in its turn performed part of the drying process, this cylinder, by a contrivance similar to that employed to raise the inner one, is also raised and the manure allowed to fly out upon the floor, or into a casing fitted to receive it. The means of effecting the raising the cylinders can scarcely be made intelligible without drawings, but perhaps the general idea of the action is sufficient for the present purpose.

Motion having been given to the machine, the manure, in a state of very liquid mud, is introduced by a pipe from the horizontal trough before mentioned, into the inner drying cylinder, in which, by losing much of the water, it becomes solid, though still damp. This cylinder being raised, the manure flies out into the outer cylinder; after which the inner one is again lowered, to be ready for another charge. The drying of the first charge is now completed at the surface of the outer cylinder; and this in its turn is raised and discharged. Meantime a second charge has been run into, and is being partly dried by the inner cylinder; so that the drying operations is beginning upon one charge in the inner cylinder, while it is terminating on the previous charge in the outer cylinder.

The advantage of this process, in addition to that of economy of time is, that the inner cylinder provides a moderate velocity in the first stage of the process, when the mud is very liquid, and the outer cylinder finishes the same by the greater linear velocity of its surface. Moreover, the thickness of the ring of manure will be less in the outer cylinder than that in the inner; so that the moisture from this cause will suffer less obstacle to its outward progress, which is a matter of great moment, inasmuch as the finishing of the drying is the part most difficult.

In order to break up or divide the manure while flying from the inner cylinder, a wire grating or riddle is interposed between the two cylinders; thus, as it were, exposing a fresh surface of the manure to the drying action of the outer cylinder. These machines are arranged in lines, so that one shaft may drive several machines.

The dried sewage as it falls from the machines slides down a sloping board, or is scraped into a trough in which revolves a long screw or creeper, by which it is conveyed to a chamber, where it is packed at once or retained in store.

It will thus be seen that very little manual labour is required in the manufacture, which may be wholly, or nearly so, accomplished by steam or other power. The economical advantages of my system may be thus enumerated :

1st. That as the sewage of towns will probably become very much more diluted, not only from the increasing demand for water for manufacturing and sanitary purposes, but also for the express object of reducing the offensiveness of sewage by increased dilution; if the system of distribution by pipes were to be adopted, an enormous outlay would be required to lay down larger pipes to convey these increased quantities of water, and yet with no greater benefit to the farmer, or revenue to the company; inasmuch as the sewage, though larger in quantity, would be of proportionably diminished strength, and would have to be sold at a proportionably diminished price per ton. Whereas, in the system I propose, the only increase would be the comparatively trifling expense necessary for simply lifting the water into the reservoirs; while the solid manure obtainable would be equally strong with that produced from the less diluted sewage. This is very important in a sanitary point of view, as there can be little doubt that the sooner, after its formation, the sewage is diluted with an abundance of water, the less chance there is of the evolution of noxious effluvia.

2dly. There is an economy in compensation; for, in cases where the water for the sewers is abstracted from a mill-stream, proportionate compensation would have to be made. While, in the pipe scheme, this water is abstracted and not returned; in my system it is returned.

3dly. That the artificial fall allows of the sewers being made of less dimensions, in proportion to the velocity obtained; so that while it involves the expense of providing machinery for pumping, yet this expense is counterbalanced, if not much reduced, by the saving in the cost of the sewers.

4thly. That the artificial fall produces an economy in a sanitary point of view, in the improvement of the health of the town population, the rapid current not allowing time for decomposition, and of evolution of noxious gases from the sewage.

5thly. That, for the same reason, the manure is improved in value; the prevention of effluvia being, in fact, prevention of the escape of fertilising matter, and, of course, an addition, *pro tanto*, to the value of the manure.

6thly. That an economy arises from the use of the lime process, which has this peculiar advantage over other deodorisers, that it adds to, instead of diminishing the value of the manure, because it is precipitated and forms a component part of the manure, which is of greater value than the lime itself.

7thly. That there is great economy of manual labour in the patent manufacturing process, as also in the short period allowed for decomposition, the absence of long exposure to the atmosphere in drying, and the entire superseding of all danger of deterioration of the value of the manure from the application of artificial heat; and of the heavy expense of fuel consequent thereon.

To those who are aware of the condition of the rivers Irk, Irwell, and Medlock, at Manchester; the Aire, at Leeds; the Soar, at Leicester; and other rivers receiving the drainage of manufacturing towns, the subject of the foregoing pages cannot fail to be one of the greatest interest; exhibiting, as it does, not only a process of easy and cheap application, whereby these rivers may be purified, by allowing none but clear water to flow into them, but also a method of converting the product of the drainage which now pollutes them into a profitable article of sale; more especially profitable in these and other manufacturing towns, where the refuse of dyeing, scouring, and other like establishments, contributes large quantities of most valuable animal and vegetable matter.

The system I advocate is applicable to all towns, large or small; and for the purpose of enabling those who are interested to form an approximate estimate of the expenditure and profits, appertaining to towns of various magnitudes, I append the following table, with the qualification, however, that the estimates can be only approximate, as they must vary in each instance, according to local circumstances, and the nature of the trades carried on.

*Table.*—Column 1 : Amount of Population. Column 2 : The Annual Quantity of Patent Manure obtainable from the Population. Column 3 : Cost of Works, or Capital required. Column 4 : The Annual Cost for Deodorizing and Manufacturing the Manure. Column 5 : The Net Income, after deducting the Cost of Manufacture, providing that the Manure be sold at 2*l.* a ton. Column 6 : Lowest Cost per Ton of the Manure to ensure 40 per cent. interest upon the Capital :—

| 1. Population. | 2. Tons. | 3. Cost of Works. | 4. Cost of Manufacture. | 5. Net Income at 2*l.* per ton. | 6. Price of the Manure, to yield 40 per cent. |
|---|---|---|---|---|---|
| | | £ | £ | £ | *s.* *d.* |
| 10,000 | 1262 | 3000 | 1450 | 1074 | 40 5 |
| 20,000 | 2524 | 4500 | 2850 | 2198 | 36 10 |
| 30,000 | 3783 | 6000 | 4100 | 3472 | 34 4 |
| 40,000 | 5048 | 7500 | 5300 | 4796 | 32 11 |
| 50,000 | 6310 | 9000 | 6400 | 6220 | 31 8 |
| 60,000 | 7572 | 10,500 | 7500 | 7644 | 30 11 |
| 70,000 | 8834 | 12,000 | 8400 | 9268 | 29 11 |
| 80,000 | 10,096 | 13,500 | 9300 | 10,892 | 29 2 |
| 90,000 | 11,358 | 15,000 | 10,000 | 12,716 | 28 2 |
| 100,000 | 12 620 | 16,500 | 11,000 | 14,240 | 27 11 |
| 150,000 | 18,930 | 24,000 | 16,500 | 21,360 | 27 7 |
| 200,000 | 25,240 | 31,500 | 22,000 | 28,480 | 27 5 |
| 250,000 | 31,550 | 39,000 | 27,500 | 35,600 | 27 4 |
| 300,000 | 37,860 | 46,500 | 33,000 | 42,720 | 27 3 |
| 400 000 | 50,480 | 59,000 | 44,000 | 56,960 | 26 10 |
| 500,000 | 63,100 | 71,000 | 55,000 | 71 200 | 26 6 |
| 1,000,000 | 126,200 | 134 000 | 108,000 | 144,400 | 25 8 |
| 1,500,000 | 189 300 | 196,500 | 163,000 | 215,600 | 25 6 |
| 2,000,000 | 252 400 | 259,000 | 216,000 | 288,800 | 25 4 |
| 2,500,000 | 315,500 | 321,500 | 268,175 | 362,825 | 25 2 |

The foregoing table will clearly show that the subject of the manufacture of sewage manure is one which calls for the most attentive consideration from all parties interested in improvements of towns, or desirous of embarking in a profitable commercial enterprise. *From a Tract, by Mr. Wicksteed, M.I.C.E., published by J. Weale, 59, High Holborn.*

## Home Correspondence.

*Winter Tares.*—I have always been successful in growing a very heavy crop of Tares, simply by a heavy manuring of "pudding manure" from under my open boarded floors, applied on the Wheat stubble, ploughed, rolled, drilled with 2 bushels of Tares, and harrowed. It is a cleaning crop, for no weed, or black Grass, has the slightest chance, being completely overgrown by the Tares, which are either mowed for consumption in the yards, or folded with sheep. The latter is to be preferred, the Tares mowed and placed outside round the fold-hurdles. I have very fine crops of green round Turnips, succeeding the Tares. The Tare stubble being scarified, harrowed, rolled, manured with "pudding," and once ploughed, the Turnip seed drilled with

3 cwt. superphosphate of lime and a few clay ashes. Although all the land was well manured, both for the Tares and Turnips, I can see an immense difference in the Turnips where the Tares were folded with Rape-cake. I think the system of seven or eight ploughings for Turnips will soon be given up. An Essex friend told me, the other day, he had ploughed nine times for Turnips, and still missed a plant, which did not at all surprise me. Every day convinces me that the plough, although a good machine for turning over the earth, is a most inefficient cultivator. I find Bentall's broad-share, followed by Coleman's or Ducie's drag or cultivator, is a fine preparation for the plough, which would otherwise, in strong clays, turn over certain long and solid blocks, which will be possibly unaltered in form for 12 months. The necessity for drainage in heavy lands intended for Tares is too obvious to require comment. Eight years ago I sowed 2 bushels of seed Tares per acre on a 13 acre undrained heavy land field, which I rented, and had the mortification to see them perish during the winter, being a loss of

| | | | |
|---|---|---|---|
| Seed, at 12*s.* per bushel ... ... | £1 | 4 | 0 |
| Ploughing, harrowing, and rolling ... | 0 | 8 | 0 |
| Half-a-year's rent, &c. ... ... ... | 0 | 15 | 0 |
| | £2 | 7 | 0 |

I then, as a tenant, drained the land 4 feet deep and 30 feet apart, with 1-inch pipes, at a cost of 3*l.* 2*s.* 6*d.* per acre. We hear no more now of such losses and failures. It is ruin to farm such lands undrained, although I consider drainage a landlord's affair, charging the tenant an interest. *J. J. Mechi, Tiptree Hall, Kelvedon, Essex, Oct.* 13.

*The Value of Land.* — It must be acknowledged that agricultural distress is great; but there is no use in merely lamenting over a misfortune which can only be repaired by strenuous exertion on the part of the farmers, both owners and tenants. In order that some equitable arrangement may be made between landlords and renters, various statements should be published in your Paper, from different districts in each county, setting forth the description of land—its capabilities when in fair cultivation, present rent, rates and taxes, price of produce in the market-towns, facility of disposing of grain and animals, &c. Something of this sort is wanted to guide capitalists in investing their money in land; the uncertainty now hanging over the broad acres of England, as to what their worth will be a few years hence, frightens men who have cash to spare from risking it; there is so much doubt about the use land is to be put to when Wheat fails to remunerate. There can be no doubt that land in all counties, at least much of it, is not half tilled, and never will be, unless a better prospect is made clear to farmers of obtaining a fair average per centage for cash expended. Surely, a scheme might be hit upon to calculate the value of land, under free trade, by collecting data from all parts of the country. To get at the information required would be a laborious task for one or two men to undertake; but, if communications bearing on the point were forwarded to the *Gazette*, much important and interesting matter might be laid before the public. A farmer has to wait many months, even years sometimes, before he can expect to receive compensation for money sunk in the land; it is therefore not to be wondered at if the agriculturist is cautious, under the uncertainty what aspect free trade may assume each succeeding year. It is to be hoped a thorough investigation into the grain trade for the next seven years will exhibit farming at the lowest figure, with a tendency rather to rise than fall. Having accomplished a just valuation of the landed property, allowance being made for neglected improvements, let rents be based on such a foundation, which would give an impetus to agriculture, and induce farmers to invest their cash. Unless some arrangement takes place between landlord and tenant, founded upon practical knowledge of the future resources of the country, agricultural affairs will change from bad to worse, ending in ruin to thousands. *Falcon.*

*Draining.*—I have been much amused (and enlightened on many occasions) with the various opinions expressed in your Paper on the subject of "Draining." Many of the advocates of deep draining appear not to have been far from home for their experience in those matters, otherwise they would see that a knowledge of the soil they have to work upon must be the criterion of depth. I think it would be rather ridiculous to adhere strictly to any particular plan merely because Mr. P., or Lord Q., think it the best. The operator must have brains enough to judge for himself whether 2½ feet or 5 feet drains will most effectually rid the soil of its superabundant moisture; if the soil is of uniform substance, such as an alluvial deposit of sandy loam, then, of course, 5 or 6, or perhaps 10 feet deep, would be most proper; or even in clays that are all of one substance to the depth required, because the summer sun would, as Mr. Parkes said, rend it into "cracks and fissures" quite down to the pipe. But if Mr. P. come amongst us he will find such soils that would not crack down to a 5 feet deep pipe, well rammed round, during his life-time; neither will the force of gravity force the water into pipes so secured. We make tanks, or as they are called here "pools," to catch the rain-water, with about 1 foot of tempered clay, and cover it with another foot of soil and stones, and they will last a man's life-time; and how will the sun and air act on the well-tempered clay rammed close on the top of the drain-pipe at 5 feet deep? But to the point. In the beginning of the last year I undertook to drain a large field after a crop of Wheat (of less than 8 bushels per acre); one said "use Mr. Parkes' plan," another recommended Mr. Smith's plan, and another actually presented me with a couple of Mr. Mechi's papers, the first with the stones under the pipe, and the next to correct that error. After paying all due respect to the opinions of my friends, I thought I must experiment a little for myself, so the first thing was to have a dozen test holes dug. In the first I found the water rushed in at about 2½ feet from the surface; and though I continued to dig to 5 feet, the water came in at the same place and trickled down the sides of the drain, and continued to rise till within about 5 inches of the top in a few hours. The next hole drew at about 3 feet 3 inches, and the others varied from 2½ feet to 3 feet 9 inches, and in every case entirely refuted the opinion that the water "always came in at the bottom of the drain," the stratum under the vein of water being comparatively dry. I am not geologist enough to speak of the scientific names of the composition of the soil, which, by the bye, was very various. The principal portion of the field, however, was first a few inches of sandy dead loam, then a sort of pan of the same material, but hard as stone; this moultered on being exposed to the air. The next foot was a sort of yellowish loamy sand with veins resembling iron rust. The next was a sort of pipe-clay, in which is bedded some very hard stone, some being fit for tiles, and others being 10 to 12 inches thick, and some only a kind of slaty shale. Immediately under this layer is about 4 inches of yellow clay, and on this the water invariably drew, no matter what depth the drain. Now, in this case, whose plan was to be adopted? Certainly not Mr. Parkes' or Mr. Mechi's; because if the pipe was clayed in at 4 feet, and the water drew at 3 feet, the clay would effectually prevent the water from getting to the pipe, and the water would prevent the sun and air from acting on the clay. But Mr. Smith's system would not reach to the bottom of the evil, so I determined on applying my own system, which was to have the drains 4 feet deep with a conduit at bottom, and 20 inches of stone on the top of the conduit, thus embracing all the depths where I found that the water drew. These conduits were formed of some of the smoothest of the stones found in digging the drains as far as they would go with a sole, and act beautifully, the cost of laying and filling being 1½*d.* per rod. This, and some other experiments, have fully confirmed me in the opinion that a strict adherence to any plan is not universally practicable, if we wish to obtain the best results at the least cost; and I could point out instances where a blind fulfilment, to the letter, of a certain system of drainage, although having been done now some years, is far from realising the expected result; indeed, I have heard a first-rate farmer declare that it is actually in a worse state now than before. I have heard much about trusting to "stupid and blundering" stewards, for the due execution of draining work. But I think landed proprietors should be equally on their guard with high-sounding theory. *Henry Cox, Longford's-House.*

*Game.*—I am sure "friend Cuthill" has no need of such feeble assistance as mine in handling the subject of game with friend Wilkins; but I certainly think, if Mr. Cuthill has been a little too fast in his condemnation of game and his sympathy with poachers, Mr. Wilkins has gone much wider of the mark in his praises of game and his want of "pity" for those misguided men who are tempted by such enormous quantities kept in some particular spots (and often encouraged by those who ought to know better), to step over the just bounds of the law, in order to satisfy their appetite with what is all but impossible to get at otherwise; but I think they are at least entitled to our "pity" when torn from their families, and the demon haunting them with "the wife and children are starving." But to the other point: I think there are very few farmers who do not glory in a fine covey of partridges or a fair show of those beautiful creatures, "Phasianus colchicus," or enough of "Lepus timidus" for a good day's sport with either harriers, greyhounds, or guns; I say, most farmers are well pleased with a sufficiency of all these to allow his landlord a good day's exercise; but when a farmer sows his 20 acres of winter Beans and the pheasants clear the lot; when he walks over his glorious piece of Swedish Turnips, and find that 5 out of 6 have been tapped, and the water and frost have started decay in the crop; when every one of his Mangold Wurzel pits are broken into and a way made for frost and snow and rotten tubers; when he finds it utterly impossible to grow a few Carrots for his lambs or his horses; when, being an advocate of thin sowing, he is obliged to throw away 2 bushels more Wheat per acre than would be required for a crop; and when he finds the rabbits and hares have already made the crop much too thin, still, when his Wheat is in ear, these vermin should amuse themselves by nibbling it off at knee, laying bare acres by acres; when he shuts up a field of Grass, thinking to have a good bite for his cattle, but at a month's end finds it still bare; when he could drive a waggon and four horses round his fields of spring corn, without crushing an ear; when a farmer sees and feels all this, and sees the gamekeepers of his landlord sacking them at their leisure, to make a market of them, and his lease compels him not to take a license to shoot or kill game, and the law compels him not to kill them without—I say that man, if he get into trouble for destroying a head of game for his own family, deserves, at least, our pity. I am not one of those who would abolish the Game-laws, because I think those who can afford time to shoot and preserve are those who can best afford to contribute towards the support of the State; and I think if the Game-laws were abolished to-morrow, there would be as many convictions, only under a different name, as trespass, or stealing private property. In conclusion, allow me to tell Mr. Wilkins that it would be difficult to beat the farmers out of their dear-bought experience; there are few, I can assure him, who do not know of themselves that it is possible to be over-stocked with game, particularly as he has honoured rabbits and hares with his patronage, and has taken a brief for their defence. *H. Cox, Longford's-house.*

*Balance Sheet.*—I send you my balance sheet. Can you give me any hope that it is wrongly made out? The farm was very foul, and the ground has had nearly twice the usual amount of working and dressing. Capital: Live and dead stock, 800*l.*; machinery, 100*l.*; total, 900*l.*

—*Urban.* [Have you taken credit in 1850 for the value, at the end of that year, of the 100*l.* worth of machinery bought during it? and, at the end of 1851, for the 29*l.* worth of implements bought then? Does the 667*l.* in the one case, and the 760*l.* in the other, include these items?]

*Game.*—I have read with interest the letters of Mr. Cuthill and the Rev. Mr. Wilkins upon "the Preservation of Game," and I fully agree with the latter, that feathered game is more beneficial than injurious to the farmer, if not preserved to too great an extent. I would suggest to preserving landlords, that they should make it a *sine quâ non* with their keepers, that they should keep their tenants' ricks and barns free from rats; and this would not be tasking them too greatly, though they might not have so much time to spend at "the Plough," or "the Barley Mow." Let any one living in the neighbourhood of a "keeper," have ever so valuable a cat, it soon disappears, and all enquiring after it is vain; though its value in a barn is incalculable. I was in conversation with one of these men about two months ago, when he told me he had set a trap in the run of a stoat, and for five successive mornings he had caught a cat! Can it therefore, be wondered at, that rats are so numerous? Those gentry, however, do not generally talk of such things, their proverb being, "More ways of killing a cat than hanging it." *L. B.*

*The use of Winged Game to the Farmer.*—Permit me to add a word to what Mr. Wilkins has said in a late Number on the above subject. I am well acquainted with an estate in one of our eastern counties, on which the last proprietor had, for its extent, a very large number of pheasants; but the present owner, having given up preserving, has scarcely any. The former keeper, a superior man in his station, is now a tenant (and a good and successful one) on the estate, and rents the land nearest to, and intermingled with, the covers. This person must be, I think, from his past and present position, well qualified to judge; and he often expresses to the owner his regret at the scarcity of pheasants. "If we had the pheasants," he says, "we should not have the wireworms?" His present feelings are simply those of a farmer; he is, by age and the habits now of many years, divested of any sort of interest in sporting matters; and of his understanding and education, as qualifying him to form an opinion, an estimate may be formed from the fact that he was able to serve his former master in the capacity of magistrate's clerk. *W., Oct.* 15.

*Pigs.*—Pigs may be too fine bred, so as to become tender in constitution, and require more attention than is consistent with profitable farming at the present day. It is the fashion to praise up specimens of the porcine tribe which feed up remarkably quick; it may be a question whether such animals are as valuable as those which are longer in attaining flesh for the butcher. Can there be as much nourishment in pork or bacon fed up young as there would be if the animals had arrived at a more mature age? Wood which requires years to bring it to perfection is better adapted for furniture than the tree which springs up to an equal size in half the time. Muscle rapidly developed will waste more in cooking,

and so will the fat, than if they were allowed to increase at a natural rate, in character with the growth of the animal. A pig six months old will fatten quicker than one three months old, comparatively speaking, sorts being the same; and the former will prove the best speculation. Perhaps experienced persons will be kind enough to state their opinions, from observation, on this important subject. We find for general purposes, such as riding, driving, and for regular steady work on the road, or hunting, half-bred horses are the best, and show more condition under severe trials. For speed, where nothing else is required, thorough-breds carry the day. For pigs, where pampering is allowed at agricultural shows, the fine kinds will run away with the prizes; but for the pocket, good crosses are to be preferred. Discussing the merits and demerits of that most noisy but useful quadruped, a word about the old story of over feeding for exhibition may be touched upon. It has been proposed that the Agricultural Society of England should offer a prize for the best conditioned bacon and pork pigs, ready for the salting tub, fetching the highest price in the market, and showing by a Dr. and Cr. account the profit accruing to the owner. Protection can never return, so there is no use in farmers expecting it. Rents must come down to present prices, and the land must be made to produce crops that will pay, and Wheat may be left out of the list. *Falcon.*

*Embossed Bricks.*—There is no reason why, in building farm houses and cottages, gentlemen should not give them, now that the duty on bricks is removed, and their is no limit to their size, the simple decoration arising from embossed bricks; many old houses in Norfolk and elsewhere present a very pretty appearance, from the application of the application of this ornament. Designs, however, of this kind were utterly put an end to by the interferenee of the excise. As there is now no law to prevent their re-introduction, it is to be hoped that decorative art may again resume its place in buildings made of brick. In the late exhibition there was no illustration of embossed bricks, but there was a machine called an "Improved Brick-making and pressing machine," shown by Whitehead, of Preston, for making pressed bricks from untempered clay, which was admirably adapted, by the simple addition of an embossed plate, if fastened to the upper surface of the brick mould, for this purpose. This upper surface was similar to the thick cover of a book; it was made of iron, and worked on a close and solid hinge. Had the machine been used with an embossed plate, it could not have failed to have attracted much attention. *T. F.*

## Societies.

Gloucestershire Agricultural, *Oct.* 9.—Tortworth, the seat of Earl Ducie, was the scene of a most interesting gathering, the Gloucestershire Agricultural Society having been most liberally invited to partake of the hospitality of the mansion, and examine the stock and arrangements on the estate. The pleasures of the day were, however, greatly damped by the circumstance that the ill-health of his lordship prevented his personal attendance. Shortly after three o'clock, a party of nearly 130 gentlemen sat down to a sumptuous dinner. In the lamentable absence of Earl Ducie, Lord Moreton (his son) presided. The Chairman proposed "Success to the Agricultural Society, of Gloucester, coupling with the toast the name of Mr. Edward Bowly, of Cirencester." Mr. E. Bowly, after expressing his acknowledgments, said he could not pass on without adverting to the deep regret they must all feel for the absence of one to whom they were all so much indebted. What would have been their society if it had not been for Lord Ducie? He begged to say they should not have been a society at the present time, if it had not been for his lordship. But it was not only their society that his lordship had benefited, it was this county, it was all England. No man of his rank had mixed so much with the middle classes of society, and he knew their wants and feelings; and consequently, holding the position he did, he was calculated to do an immense amount of good to the country at large. He was sorry to refer to the bad times they were now suffering from; but they must remember they were times which were foretold. Every honest Free-trader had said they would have a time of transition—a time when the cloud would be passing over, after which they would have a bright sun before them. All he wished was that they might see this sun. He himself had long seen the folly of looking back,—he looked to what they were to do in the future to meet that future. What was this time of transition? It was this: the tenant farmer finds that his receipts are diminished, and that his outlay goes on the same, and that a good deal of it is not under his immediate control. He could directly control his labour where it was abundant; he could control the expenses of his household; he could not control his rates and taxes; his rent also was not under his immediate control. But he hoped there was a feeling among the landlords—and he believed there was—to come and meet the thing as a matter of business—to join the tenant, and get a reduction of those taxes and local rates which they must have if they were to go on in these times, and to meet the tenant in a business-like way in regard to rent. He asked no favour for the tenant, but to have things adjusted as pure business, and it must come to that. If any remnant of the feudal times remained, free-trade had sent it to the four winds of heaven—there was an end of it. Although there might be an end to the feudal system, he hoped the aristocracy of this country would all hold the position to which they were entitled. He considered the security of this country in a great measure was dependent on the aristocracy; and although the agriculturists were under a cloud at the present time, he thought that no reflecting man could look to the state of this country and compare it with foreign countries without feeling proud that he was an Englishman—and feeling a degree of thankfulness for the condition of this country, where we can all enjoy the fruits of our labour—where we have liberty and respect for the laws.—C. Hayward, Esq., proposed, "The Tenant Farmers of England." He spoke as a practical agriculturist, and he believed they would agree with him when he said that if good farming would not answer, unquestionably bad farming would not. But the difficulty they had to contend with in one respect was this—that if they all went on increasing their productions considerably, they would be increasing their home competition, and by that means they were absolutely contending against themselves. But lately a prospect had been opened to them, so that they might entertain some hopes that they might make profits of their fields unconnected with this sort of competition. Means had been opened to them of supplying our manufacturers; and he could not help hoping, although it might be a small hope, yet it was one for the farmer, that the improvements that had taken place in the preparation of Flax were such as would lead to a very considerable improvement in the position of the tenant farmers of this country. Because there was this difference between the competition that would ensue and that to which he had previously referred, that if they increased their production in green crops and also in grain crops, they were only competing in the same market with each other, whereas by the cultivation of Flax they were supplying an unlimited demand of our manufacturers, with which the food they raised did not come into competition. Facilities were now afforded for the cultivation of this crop by which the expectations that had been raised were fully realised; and he spoke as a practical man when he said there were no greater difficulties to be overcome in the production of a crop of Flax than in the production of any of the cereal crops they now cultivated. The obstacle which had hitherto been in the way was the finding a market for the crop after it was grown; but that was now completely removed, for immediately the crop was converted into fibre there was an unlimited demand for it, and at a price which offered a considerable premium between the price at which it could be grown at a profit, and that at which the manufacturer could make it at a profit. They only wanted a middle man to convert the straw into fibre for the manufacturer. If that were once supplied he felt satisfied there was a market for their crops, at a price which would be remunerative. He hoped there would be found public-spirited individuals who would enter into companies to supply that link; and when it was supplied he believed one crop at least would be offered to the farmer which would be a remunerative one; and if that was clearly remunerative it would assist him in producing other crops without the loss which he now suffered. After a few further remarks, he concluded by proposing the toast for which he rose, requesting Mr. Beman, as a very good specimen of the tenant farmer, to respond.—Mr. Beman, of Donnington, returned thanks. He agreed with Mr. Hayward as to the desirability of growing Flax. He had himself grown it, and he considered it would be remunerative. He referred to the disadvantages encountered in consequence of the lack of machinery in the vicinity of the crop, and the benefits likely to accrue when this want was supplied. He also named some parties who he knew had grown large quantities. They were much indebted to Mr. Brown, for the pains he had taken to make known the advantages of its cultivation. They were at a disadvantage in growing it upon the Cotswold hills, from the population not being thick, and the lack of machinery. The farmers in the neighbourhood of Leeds and other large towns where coal and machinery were on the spot, would of course have an advantage over them. Notwithstanding these drawbacks he believed it would be remunerative. If by growing a million acres of Flax instead of a million acres of corn they could obviate the necessity of importing 8,000,000*l.* worth of Flax, Linseed, and oilcake, it would be a great advantgge to them. He doubted not if the farmers prosecuted the cultivation, machinery would speedily be found to convert the crop into the proper material for the manufacturer.—W. P. Price, Esq., next gave "Agriculture, Manufactures, and Commerce." They were pursuits between which a most intimate relation always would subsist. He hardly knew what right he could claim to address a meeting like the present, he being only a small owner and occupier of land; but he had not spent his life in the country, making his own observations upon what was passing around him, without having learned to take great interest and form his own impressions concerning the condition of agriculture at the present day. He was sorry to be obliged to confess his opinion, and he spoke from his own experience as a farmer on a small scale, and also from his observation of others, that the profession of agriculture was not so profitable as other pursuits to which men in this country devote their lives. It was very much to be regretted that this was the case, because he thought the interests of the country required that it should be fairly and decently remunerative. He believed there would be very little difference of opinion that agriculture was not reasonably remunerative at the present time, although there might be great differences of opinion as to the causes to which this depression was attributable. He believed it was due to a great many causes. He did not think it was due to their having trusted too much to Providence, or their having trusted too much to themselves; but he did believe it was due to their having trusted too much to the State. They had trusted to the State to give a rent to the landlord and a living to the tenant out of the almost spontaneous produce of the soil. They had imposed burdens upon the State which no power on earth could bear; the State had broken down under those burdens, and had thrown them on their own resources. He would refer to another cause to which he believed their difficulties to be due, namely, the fact that they had not followed what he would call the commercial principle in their various proceedings. He meant to say that in the renting and stocking of their farms, keeping them in cultivation, and finding a market for their produce, they had not acted upon what he should call a purely commercial principle. He would endeavour to illustrate this. He had already stated that he was an owner of land, and also on a small scale an occupier of agricultural land; he was also an owner and occupier of land having a commercial value. Now, as an owner of land having a commercial value, he proceeded thus with it: he endeavoured first of all to find an eligible tenant, and having made with him the best arrangement he could, if he afterwards came to ask him to make an outlay upon the land likely to be advantageous, he said at once he had not the least objection, he was perfectly willing to do so upon the occupier paying an interest say from 5 to 7 per cent. according to the nature of the expenditure, and he never yet found a man objecting to those terms—he always acceded to them willingly. Applying this principle to agriculture, he would say that every landlord of agricultural land should at once agree to lay out upon his land any sum of money likely to yield a fair return to enable a tenant to prosecute his business more remuneratively. He was bound, however, to say that he had not found agricultural tenants manifest the same readiness to avail themselves of such outlays as he had ordinary tenants. As an occupier of land having a commercial value he would in the same way, first of all, ascertain whether a certain piece of land suited his purpose, forming his own estimate of its value for that purpose; when he had taken it, while complying with the terms of his lease, he considered himself absolute master of it, so long as he did not waste or spoil it. And he did not see why the agricultural tenant should not place himself in the same position. But, as far as he had observed, no sooner was a farm vacant than 50 or 100 applicants were ready to take it, running a sort of race, and adopting all sorts of expedients to obtain a priority, without regard to its value at all. As a matter of course he did not propose that the owners of agricultural land should make their tenants absolute masters of the land, unless they were men of capital, enterprise, and skill, and fit to be trusted with full powers. He did not see why the same principle which was applied to commercial transactions should not be applied to agriculture. He could fancy an intelligent foreigner who had come over here to study and report on the condition of agriculture and manufactures, at some English seaport observing a house in a dilapidated condition, contrasting most unfavourably with those around it, asking how it came to pass that such was the case? He would be told that the house was in Chancery. Proceeding with his inquiries, he would find almost every farm house in so dilapidated a condition that he would conclude they also were in Chancery.

East Cumberland, *Sept.* 19.—The annual meeting of this Society was held at Carlisle, this day. At the dinner, in the course of the evening, Mr. P. H. Howard, M.P., referred to the American reaping machine, as one of the products of that ingenuity fostered by such societies as he was then addressing; and Sir J. Graham, who occupied the chair, spoke on the same subject as follows:—"In point of numbers, the exhibition, compared with previous shows, was deficient; but what was wanting in quantity was more than counterbalanced by the superior quality of the stock displayed. These remarks apply more particularly to the live stock. In some of the other departments we did not find that extent or variety we have been accustomed to see. The implements comprised some interesting and novel specimens of ingenuity, the invention and workmanship of parties residing in the neighbourhood of Carlisle. There were other articles from a distance which claimed more or less attention, according to their respective merits. First and foremost came the simple and effective American reaping machine. There was a large show of capital ploughs, Young and Co.'s anti-metallic churn and lever cheese-press, iron corn-rick stands, &c. &c. Mr. Howard has alluded to the reaping machine, which, I dare say, most of you saw in operation on Wednesday. Among the many advantages to be derived from the Great Exhibition, I know none that will contribute more to general improvement in every branch of agriculture than the display of these new and improved implements. From what I saw yesterday, I should say that the reaping machine is susceptible of improvement, and yet is undoubtedly an instrument of great promise. I doubt not that the present threshing machine was subject to as much adverse comment when first introduced, and yet see how universally it is now applied. It is true it was made on the other side of the Atlantic, and for that very reason I think it is entitled to especial attention in England. I think that the experiment of yesterday was a very severe trial to the machine. In the first place, the crop upon which the cutter was employed was not such a crop as would lead me to suppose that the Agricultural Society of East Cumberland had done all for the benefit of the agriculture of the neighbourhood. In the first place it was not one of the cleanest of crops—it was certainly not one of the richest of crops—and judging from the appearance of the soil it struck me that it was very much exhausted. If we look at it as exhibited in the second field, we find it operating upon ground in still worse condition than the other, from recent alterations. It was full of stones and old hedges whose roots had not been eradicated. This was the land set aside upon which to test the power of the machine, but after all its working was not unsatisfactory. I think there are imperfections in that machine, and no doubt the skill of the English, their knowledge of mechanical science, and never-failing industry in improving every invention, whether native or foreign, will overcome these difficulties. I think upon the

whole the cutting of the machine was clean and excellent. I do not think the mode of delivering the sheaf satisfactory; and I should be glad to see some device for superseding the raker, the second man, and I do not despair. Notwithstanding these what I call imperfections, I think upon the whole it is a very useful implement—I think it is a very promising implement, and I am glad I had an opportunity of attending and seeing it at work. With reference to the rearing of stock, I must say I saw the show to-day with extreme satisfaction. According to my view, which I stated before on a similar occasion, and it has been since a subject of much adverse comment—I say, and say it deliberately, that there is a tendency in this county to plough too much and to graze too little. The rearing of sheep is in my opinion the key-stone to further improvement in this county. Our climate is not particularly well adapted for the growth of grain but it is for green crops, and Grass; and my own experience would lead me to think that upon the best land in this county it would be very desirable if a larger portion of each farm were laid down in permanent Grass. I speak on the experience of my friend Mr. Teather, with whom I am proud of having been connected in early life. Twenty years ago he tried the experiment of growing Wheat after lea. At that time, as the science of agriculture then existed, the experiment did not succeed; but now I have living witnesses that the finest crops of Wheat have been produced out of Clover lea, which only laid for a year. What does this do? If you have a larger portion of Grass you get an additional crop. I say that any farmer sure of a good Turnip crop, and sheep to eat it off, is greatly improving his farm. I am talking to men who understand the matter. I will challenge any man to show a greater amount of reclaimed bad land than Mr. Ferguson, of Harker Lodge. I have seen no improvements anywhere like his. I have endeavoured to trace how he has accomplished this wonderful change, and I find he has done it by the feeding of sheep, the growing of green crops, and the liberal use of guano. With plenty of sheep, guano, and green crops, you may be sure of improvement on the very worst of land. Again, let us look at the present artificial state of society. These little islands are densely inhabited Two of the raw materials used in our manufactures are beyond our reach; cotton and silk we cannot produce; but we can and will produce Flax; and I say it is worthy the consideration of the agriculturists of this country to adapt its growth to the wants of the country. In this section, however, we are exclusively dependent on foreigners for the supply of the raw material. The right hon. bart. then went on to recommend the growth of Flax, observing that it was certainly the duty of the landlord rather than the tenant to try the experiment in the first instance. He pointed out the difficulties which attended it, suggested remedies for the removal of those obstacles. It was only necessary that the agriculturist should be assisted, and it became the duty of landlords to lead the way in respect to all these experiments and improvements. If the landlords would only assume their proper position, then he might say,

"England herself will never rue,
If England to herself will rest but true."

The Secretary, Mr. Thomas Donald, of Linstock, then read the Inspectors' Report, which was as follows. Mr. Donald remarked that some gentlemen had thought the awards of little interest, but he believed them to be highly interesting, especially to those who had been successful candidates:—

*"To the Chairman of the Committee of the East Cumberland Agricultural Society.*

"Sir,—We have carefully inspected the Turnip crops of the different competitors for premiums of your society, and have found them all well cleaned and thinned, and generally of very superior quality, and, altogether, such as in our opinion would do credit to any county. After full consideration we have awarded the premiums as follow:—To the occupier of a farm of more than 150 acres; two competitors; to Mrs. Baxter, of Fauld, near Longtown. To the occupier of a farm of less than 150 acres; four competitors; to Mr. Lamb, of Brisco, near Carlisle. Mr. Jobling's premium for the best crop of Turnips grown with guano; no competition; to Mr. Wood, of Howrig—very deserving.—W. Bell, T. Gibbons, W. Chris. Forster Thompson."—*Abridged from the Carlisle Patriot.*

## METEOROLOGICAL REPORT.—October.

*(Continued from p. 670.)*

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|

* The continuation of the preceding storm, which had come from the south, passing to the westward of England, and which (at p. 670) I conjectured to be curving to the eastward over Scotland. This conjecture is confirmed by the chilliness of the air during the succeeding days, the body of the storm being then to the northward of us.

† A storm coming from the south, passing to the westward of England, but travelling northward, being deflected in that direction by the easterly and northerly wind of the left hand and rear (*i.e.* northern and western) quadrants of the preceding storm.

‡ This storm travelled eastward up channel (or perhaps further south, over France,) towards the German Ocean; there would probably ensue a fog over London on the 22d—23d, being the effect of the reflux current in the hinder quadrants of this storm.

Dorchester Oct. 22. *F. P. B. Martin.*

*(To be continued.)*

## Notices to Correspondents.

Agricultural Education: *H Bennett.* We can confidently recommend the Cirencester College to any young man *desirous* of instruction, as the cheapest and most efficient agricultural seminary in the kingdom.

Australian Guano: We are unable to give a report from analysis, but will just make the general statement, that it has the appearance which a specimen of somewhat decomposed peat would present, if it were well mixed with small crystals of a similar colour, and if it possessed a slight ammoniacal odour. The fibrous matter about it, however, of course, is not vegetable, but consists of feathers, &c. The crystals are those of some potash salt. It is an interesting specimen, and would probably repay the expense of analysis. Is it found in large quantity?

Bass's Pale Ale: *Senex* says, "In these days Bass's Pale Ale, and scarcely any other ale, is prescribed by all our head physicians and surgeons, as a dietetical beverage; may I beg the favour of your asking your numerous correspondents, through the columns of your Paper, for a receipt for brewing Bass's Pale Bitter Ale? and any other kind of approved bitter ale?"

Boussingault's Works: *Anon.* His "Rural Economy," published by H. Baillière, London.

Butter: *T J H.* The quantity of milk yielding 1 lb. of butter varies from 18 to 20 lbs., *i. e.* 9 or 10 quarts.

Cabbages: *Discipulus.* As we have not had experience of them as food for milch cows, we have inquired elsewhere for the information you ask for.

Feeding Pigs on Boards: *An Old Subscriber.* We should prefer the use of litter on a stone floor, or box-feeding on any floor.—We are not aware of any lately published works on Farm-buildings, except one by Mr. Ewart (Longman and Co.), which we shall shortly review, and one by Mr. Donaldson.

Night Soil: *J J.* Add freshly-burned powdered charcoal.—About poultry next week.

Poultry: *C Pocklington.* There is nothing in your description of a Cochin China fowl which would interfere with perfect purity; but uniform buff, or nankeen colour, is preferable, though difficult to meet with. A Cochin China fowl should be well feathered to the toe, with a small upright serrated comb, the wing well clipped, the thigh much feathered and largely fluffed, especially the hens. A good Spanish hen is to be obtained of any dealer, at prices varying from 12*s.* to 25*s.*, according to quality.—*R G.* If number of eggs be required, the golden and silver Hambro' fowls are the best to keep, as they lay vast quantities and never set. If size be a desideratum, the Spanish are to be preferred, as their eggs are larger than those of any other fowls. The Cochin China fowls lay a great number of eggs, but they are not as large as those of the Spanish.—*Clericus Rusticus* The rule is that the hybrids between Muscovy and common ducks do not breed again. I kept some for a long time and had no produce, but I have been told there are exceptions. I never had one brought under my own notice. *J. Baily,* 113, *Mount street.*

Rape-Cake: *T L.* It is recommended by those who have no interest in the sale of it. Probably not so rich as oilcake per lb., it is a great deal richer per £'s worth, and that is the consideration for the farmer's guidance. You must get the sheep to eat it by reducing it to powder, and mixing it, in gradually increasing proportion, with something that will tempt them.

The Steam Plough.—The article headed thus in our last number should have been entitled "The Steam Cultivator." The whole reasoning of our correspondent, who has made this subject so entirely his own, has gone to prove the term "steam plough" to be altogether a misnomer.

Wheat: *H N.* It is not Wheat—but Darnel; Lolium temulentum.

# Markets.

## COVENT GARDEN, Oct. 25.

Peaches and Nectarines are over for a season. English Pines are large and fine. Grapes are abundant, and meet with a heavy sale, owing to the large importations of foreign ones. Pears are also brought from the Continent. The best English kinds are Gansel's Bergamot, Brown Beurré, and Marie Louise. These fetch from 2*s.* to 4*s.* a doz., and 8*s.* to 12*s.* per half sieve. Damsons are over. Oranges are coming in pretty plentifully. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are scarce and dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3*s* to 6*s* | Almonds, per peck, 6*s* |
| Grapes, hothouse, p. lb., 2*s* to 5*s* | — sweet, per lb., 2*s* to 3*s* |
| — Lisbon, per lb., 9*d* to 1*s* | Oranges, per doz., 1*s* to 1*s* 6*d* |
| Melons, each, 1*s* to 2*s* | — per 100, 6*s* to 10*s* |
| Apples, kitchen, p. bsh., 1*s* to 2*s* 6*d* | Nuts, Barcelona, p. bsh, 20*s* to 22*s* |
| Pears, dessert, p. doz., 2*s* to 4*s* | — Brazil, p. bsh., 12*s* to 14*s* |
| Lemons, per doz., 1*s* to 2*s* | Filberts, per 100 lbs., 70*s* to 90*s* |
| Walnuts, per bush., 12*s* to 24*s* | |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 8*d* to 1*s* | Artichokes, per doz., 4*s* to 6*s* |
| Cauliflowers, p. doz., 6*d* to 3*s* | Lettuce, Cab., p. score, 4*d* to 1*s* |
| French Beans, p. h. sieve, 2*s* to 4*s* | — Cos, per score, 3*d* to 1*s* |
| Peas, per sieve, 6*s* to 8*s* | Small Salads, p. punn., 2*d* to 3*d* |
| Potatoes, per ton, 45*s* to 80*s* | Horse Radish, p. bundl., 1*s* 6*d* to 4*s* |
| — per cwt., 2*s* to 5*s* | Red Beet, per doz., 1*s* to 2*s* |
| — per bush., 1*s* 6*d* to 2*s* 6*d* | Mushrooms, p. pot., 1*s* 6*d* to 2*s* |
| Turnips, p. bunch, 2*d* to 3*d* | — per bushel, 7*s* to 10*s* |
| Cucumbers, each, 1*d* to 1*s* | Sorrel, per hf. sieve, 6*d* to 9*d* |
| Radishes, per doz., 9*d* to 1*s* 6*d* | Tomatoes, p. half sieve, 3*s* to 4*s* |
| — Turnip, p. doz., 1*s* to 1*s* 6*d* | Fennel, per bunch, 2*d* to 3*d* |
| Celery, p. bundle, 6*d* to 1*s* 6*d* | Savory, per bunch, 2*d* to 3*d* |
| Carrots, per bunch, 4*d* to 6*d* | Thyme, per bunch, 2*d* to 3*d* |
| Spinach, per sieve, 1*s* 6*d* to 2*s* | Parsley, per doz. bun., 2*s* to 3*s* |
| Veget. Marrows, p. doz., 1*s* to 1*s* 6*d* | — Roots, p. bundl. 9*d* to 1*s* |
| Onions, p. bunch, 1*d* to 5*d* | Mint, per bunch, 1*d* to 2*d* |
| — Spanish, p. doz., 1*s* 6*d* to 3*s* | Basil, p. bunch, 3*d* to 4*d* |
| Leeks, per bunch, 1*d* to 2*d* | Marjoram, do., 3*d* to 4*d* |
| Shallots, per lb., 6*d* to 8*d* | Watercress, p. 12 bunch., 4*d* to 6*d* |
| Garlic, per lb., 6*d* to 8*d* | |

## COAL MARKET.—Friday, Oct. 24.

Hollywell, 15*s.*; Carr's Hardley, 14*s.*; Eden Main, 15*s.* 3*d.*; Hasting's Hartley, 14*s.*; Tanfield Moor, 13*s.* 6*d.*; West Hartley, 14*s.*; Wallsend Riddell, 14*s.* 3*d.*; Wallsend Hetton, 16*s.* 6*d.*; Wallsend Lambton, 16*s.* 3*d.*; Wallsend Stewarts, 16*s.* 6*d.*; Wallsend Tees, 16*s.* 3*d.*—Ships at market, 117.

## HAY.—Per Load of 36 Trusses.

### Smithfield, Oct. 23.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 72*s* to 77*s* | Clover ... ... ... | 70*s* to 85*s* |
| Inferior ditto... ... | 60 68 | 2d cut ... ... ... | 60 72 |

## HOPS.—Friday, Oct. 24.

Messrs. Pattenden and Smith report that the Hop market is active for all fine Hops. The duty is expected out in a few days, and is likely to fall between 128,000*l.* and 130,000*l.*

## POTATOES.—Monday, Oct. 20.

Trade at the waterside has commenced exceedingly heavy; up to this morning we have had no arrivals from Yorkshire or Scotland. Our market is amply supplied from Kent and Essex. Potatoes are of very good quality, and from every appearance prices will range lower this winter than usual. The following are this day's quotations:—York Regents, 55*s.* to 60*s.*; Shaws, 50*s.*, to 55*s.*; Essex Regents, 50*s.* to 60*s.*; Shaws, 45*s.* to 55*s.*

## SMITHFIELD, Monday, Oct. 20.

The supply of Beasts is moderate, and the trade rather improved. The mild weather is against the sale of big Shorthorns, but prime Scots have reached 3*s.* 8*d.* The number of Sheep is smaller, but there is very little alteration in price, the weather being so unfavourable. Good Calves are scarce, and readily disposed of at fully late rates. From Holland and Germany there are 1509 Beasts, 4720 Sheep, 198 Calves, and 76 Pigs; from France 60 Sheep; and 2600 Beasts from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Here- | | | | | Best Long-wools . | 3 | 6 | to 3 | 8 |
| fords, &c. ... | 3 | 4 | to 3 | 8 | Ditto Shorn ... | | ... | | |
| Best Short-horns | 3 | 2 | — 3 | 4 | Ewes & 2d quality | 2 | 8 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 8 | Ditto Shorn ... | | ... | | |
| Best Downs and | | | | | Lambs ... ... | 0 | 0 | — 0 | 0 |
| Half-breds ... | 3 | 10 | — 4 | 0 | Calves ... ... | 3 | 0 | — 3 | 10 |
| Ditto Shorn ... | | ... | | | Pigs ... ... | 3 | 4 | — 4 | 4 |

Beasts, 4682; Sheep and Lambs, 26,720; Calves, 267; Pigs, 520.

## Friday, Oct 24.

The number of Beasts is by no means large, yet adequate to the demand. There is a cheerful trade for good qualities, and Monday's prices are freely given for all kinds. The supply of Sheep is very small, and chiefly consisting of inferior descriptions. A clearance is effected at Monday's quotations. Trade is dull for Calves, but there is not much reduction in price. From Germany and Holland we have 415 Beasts, 810 Sheep, 218 Calves, and 10 Pigs; and 125 Mich Cows from the home counties.

| Best Scots, Here- | | | | | Best Long-wools . | 3 | 6 | — 3 | 8 |

## MARK LANE.

Monday, Oct. 20.—The supply of English Wheat to this morning's market was much smaller than of late; fine dry samples commanded the prices of this day se'nnight; but inferior conditioned parcels were disposed of at a slight reduction; foreign met a moderate retail inquiry on late terms. Floating cargoes of Polish Odessa continue in request for the Continent; but little remains unsold.—Barley is unaltered in value; the finest descriptions of malting sell readily.—Peas are scarce, and new white boilers bring an advance of 1*s.* per qr. In the value of Beans no alteration.—The Oat trade is firm.—Flour is in demand at former prices.

Friday, Oct. 24.—The arrivals of foreign Wheat this week have been good, but small of all other grain and of Flour. This morning's market was not numerously attended, and the demand for Wheat was limited, confined almost entirely to the finest and lowest descriptions, the latter for export.—Fine Flour continues to meet some inquiry at the rates lately current.—In the value of Barley, Beans, and Peas there is no alteration.—The Oat trade is very firm.—There is only one cargo of Polish Odessa Wheat afloat on the coast, and consequently nothing doing.

Liverpool, Tuesday, Oct. 21.—At our market this morning several large sales of foreign Wheat were made to a few country millers, but transactions in the general runs of foreign were by no means extensive, and the partial decline of 1*d.* per 70 lbs. noted on Friday, was fully confirmed for most descriptions to-day. Farmers' new Wheat, of which the supply was rather liberal, and the quality good, was taken at the extreme rates of this day week, and a tolerable clearance effected. Good new English malting Barley, being scarce, was held at 30*s.* to 32*s.* per qr., and grinding samples of foreign were quite as dear as last week. Beans and Peas in fair request at former rates. Oats and Oatmeal, attracting more attention, advanced slightly in price. Indian Corn in granary was more saleable, on rather better terms.—Friday, Oct. 17.—Although our market was tolerably well attended to-day, the Wheat trade opened rather heavily for the general runs of foreign, and in partial instances a decline of 1*d.* per 70 lbs. was conceded. Having no malting Barley prices are still uncertain; grinding samples move gradually at previous rates. In Malt and Beans no variation. Peas in demand and dearer. Oats obtained full prices, and Oatmeal an advance of 3*d* per load.

## GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO. beg to hand in their prices of SHEET GLASS for cash:

| Cut to order in Panes not above 40 inches long. | | Packed in Boxes of 100 feet each. | £. | s. | d. |
|---|---|---|---|---|---|
| 16 ozs. | 3d. to 3½d. | 6 by 4, 6½ by 4½ | 0 | 13 | 0 |
| 21 do. | 3½d. to 5d. | 7 by 5, 7½ by 5½ | 0 | 15 | 0 |
| 26 do. | 5d. to 7½d. | 8 by 5, 8 by 5½ | 0 | 15 | 0 |
| In Crates of 300 ft., 16 ozs. to the foot, 2¾d. per foot. | | 8 by 6, 8½ by 6 | 0 | 17 | 6 |
| | | 9 by 7, 10 by 8 | 1 | 0 | 0 |

FOREIGN SHEET GLASS, of very superior quality, packed, in cases of 200 feet, and in sizes varying from 36 by 26 to 44 by 30 inches, at 38s., 40s., to 42s. per case.

HARTLEY'S PATENT QUARRY GLASS.

Milk Pans, from 2s. to 6s. each, Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoy's Milk Syphons, Tiles and Slates, Wasp Traps, Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the Trade.

HORTICULTURAL GLASS WAREHOUSE, 116, Bishopsgate-street Without.

## GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

## GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | | |

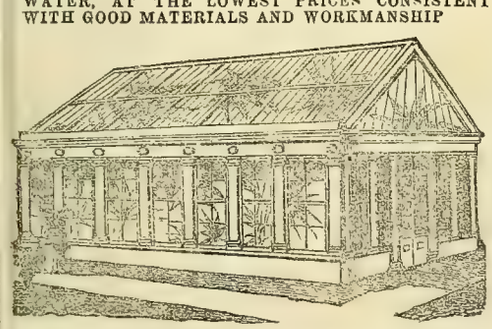
## HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

## HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

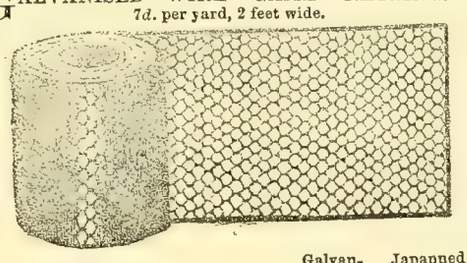
## THE ROYAL EXHIBITION.

FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, POTTER, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following:—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1¾ in. | 6 | 4¾ in. | 11 | 8¾ in. | 16 | 15 in. |
| 2 | 2¼ ,, | 7 | 5¼ ,, | 12 | 9¾ ,, | 17 | 16 ,, |
| 3 | 2¾ ,, | 8 | 6¼ ,, | 13 | 11 ,, | 18 | 18 ,, |
| 4 | 3¼ ,, | 9 | 7 ,, | 14 | 12¼ ,, | 19 | 20 ,, |
| 5 | 4 ,, | 10 | 8 ,, | 15 | 14 ,, | 20 | 22 ,, |

Saucers and Seed Basins the same width as the Pots.



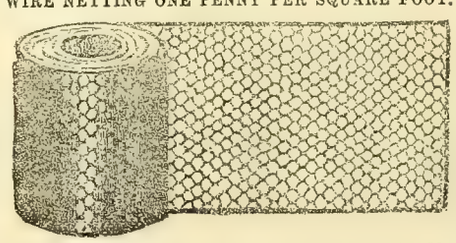
Persons visiting the Royal Exhibition can inspect CHARLES PHILLIPS's Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace. C. P deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Totnes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with. All orders for the above Goods will be promptly forwarded, CARRIAGE FREE, to any Railway Station within 150 miles of the Manufactory, either in dozens, casts, hundreds, or thousands. Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seakale Pots, Vases, Tiles, Bricks, &c.

Lists of Prices, Terms, &c., forwarded to any address.

Manufactory, Locking Road, Weston-Super-Mare, Somerset.

ESTABLISHED 1836.

## GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7d. per yd. | 5d. per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |

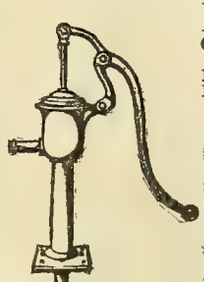
| 1⅝-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1⅝-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

## WIRE NETTING ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3d. per yard. | 30 inches wide | 7½d. per yard. | | |
| 18 ,, ,, | 4½d. ,, | 36 ,, ,, | 9d. ,, | | |
| 14 ,, ,, | 6d. ,, | 48 ,, ,, | 1s. ,, | | |

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each. Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

## FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | | | |
|---|---|---|---|
| Patent Pump | ... | ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing | ... | ... | 2 12 0 |

Larger sizes if required.

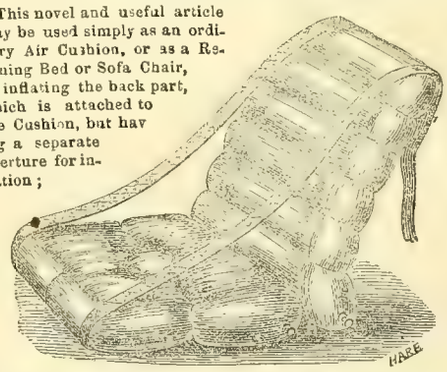
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

GREEN AND HOTHOUSE BUILDER.—Gree and Hothouses made by Machinery, sent to all parts o the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.



BIRMINGHAM CATTLE SHOW, 1851.—The CERTIFICATES of Entry, for CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and, with the PRIZE LISTS, may be had on application to Mr. EDWARD LATHBURY, at the Office, No. 2, Insurance Buildings, Union Passage. Intending Exhibitors are particularly requested to mention the nature of the Stock for which they require Certificates, as a separate form is necessary for each Entry. Attention is also requested to the regulations, as set forth in the Prize Sheets, that no entry can be received for Cattle in Classes 1 to 13 inclusive, or for any of the Classes of Sheep or Pigs, without the Breeder's Certificate, in all cases in which the Exhibitor is not the Breeder also. The Entries close on SATURDAY, the 15th of November.

Birmingham, Oct. 15. T. B. WRIGHT, Hon. Sec.

## THE GREAT EXHIBITION, HYDE PARK.

North-west Gallery—Class 28, No. 83.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part, which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

FOWLER'S PATENT DRAINING APPARATUS.—Stand 28 A, Class IX., Grand Exhibition.—As Mr. Lowcock's engagements with Mr. Fowler will terminate during the present month (the above Machine being now perfect and fit to come before the public), Mr. L. begs to inform the Landowners and Land Occupiers of the United Kingdom that he is now prepared to SURVEY any ESTATES requiring DRAINING, and to inform them whether the above Machine can be used with advantage, and also at about what cost per acre. The usual surveyor's charges will be expected, including travelling expenses; and the price of the Machine, or terms of letting the same, can be obtained of FOWLER AND FRY, TEMPLE-GATE FACTORY, BRISTOL, OR HENRY LOWCOCK, ST. PETER'S-STREET, TIVERTON, DEVON. Mr. Lowcock, is also about to Offer for Sale the patent right of his Patent Turn-wrist Plough—Stand 28, Class IX. Application to be made at St. Peter-street, Tiverton, where all letters must be addressed, post paid. As his engagements are numerous, an early application is requested in respect to the above advertisement.

## NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. The fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

## ROWLANDS' MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the human hair, is too well known and appreciated to need comment. For Children it is especially recommended, as forming the basis of a beautiful head of hair, and rendering the use of the fine comb unnecessary.—Price 3s 6d., 7s.; family bottles, equal to 4 small), 10s. 6d., and double that size, 21s. per bottle.

N B. Each bottle of the genuine article has the words—ROWLANDS' MACASSAR OIL, engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London;

IMPORTANT DISCOVERY.

CLARKE AND Co., GARDENERS, SEEDSMEN, and FLORISTS, Percy-cross Nursery, Walham-green, Fulham, are now sending out, in small sealed stone bottles, secured for travelling, on the receipt of 5s., a Mixture (which is both a remedy and preventive) for destroying those grievous pests, the White Mealy Bug, Scale, Thrip, and all other insects, without injury to the plants. This being the season for the more effectual remedy of all insects, C. and Co. recommend that their preparation be applied forthwith. Printed directions sent with each bottle.—Post-office Orders payable at Brompton, to CHARLES CLARKE.

CABBAGE PLANTS.—Fine Early Battersea, Early York, Early Imperial, &c. By T. WELLAND, Surrey Gardens, near Godalming, Surrey. Packed and delivered at Godalming station, 4s. 3d. per 1000. Drumheads, 3s. 9d. per 1000; crates free.

HOLLYHOCKS, PINKS, AND PANSIES.

J. CHATER AND SON'S Catalogue of the above Flowers, in which will be found most of the best varieties in cultivation, may be had on application to JOHN CHATER and SON, Nurseries, Haverhill, Suffolk. Also may be had, for 20s., carriage free to London, 12 pairs of new and choice Pinks; 12 new and choice Pansies; 6 fine show Hollyhocks; fine double mixed Hollyhocks, 30s. per 100; Hollyhock and Pansy Seed, 2s. 6d. per packet.

NEW GERANIUMS, &c.

HENRY WALTON, FLORIST, &c., Edge-end, Marsden, near Burnley, Lancashire, begs to offer the following new and select plants at the extremely low prices annexed:—

GERANIUMS.—Hoyle's Ajax, Ocellatum, May Queen, Nectar Cup, Flavia, Generalissimo, Isis; Bragg's Exquisite, Boule de Feu; Foster's Gaiety; Beauty of Montpellier, Major Domo, Sir R. Peel, Prince Arthur, Sir John Franklin, Lady Franklin, Walton's Village Maid, Walmsley's Teetotaller. Any 12 of the above 2l. 2s., package included.

Constance, Conspicuum, Christabel, Crispina, Falstaff, Field Marshal, Nandee Prince of Orange, Purity, Satisfaction, Abd-el-Kader, Belle of the Village, Crusader, Cassandra, Elegans, Forget-me-not, Gustatus, Gulielma, Honora, Junii, Jenny Lind (Foster's), Jenny Lind (Lynes'), Lamartine, Luna refulgens, Lady Ebrington, Meleager, Minna, Ondine, Plutarch, Prometheus, Rosa Mundii, Raphael, Sparkler, Terpsichore, Virgin Queen, Valgas. Purchaser's selection of 12 of the above, 18s.; H. W.'s selection of 12 for 12s., or 20 for 20s.

AZALEAS. — Alba pleno, Alba perfecta, Alba magna, Aurora, Albertii, Apollo, Beauty of Reigate, Coronata, Decora, Danielsiana hybrida, Excellens, Exquisite, Fulgens, Georgina, Hebe, Hon. Mrs. Herbert, Iveryana, Indica refulgens, Ignescens, Lateritia, Lateritia superb, Minerva, Nitida, Optimus, Phœnicea alba, Prima Donna, Prince Albert, Queen of Perfection, Refulgens, Semiduplex, Maculata, Splendens, Variegata Viricans, and Wadei. Any 12 of the above 18s., or 20 for 30s., package included.

NEW CINERARIAS.—Amy Robsart, Blue Perfection, Clara Mowbray, Clementine, Delicata, Diocletian, Effie Deans, Electra, Fairy Queen, Handel, King of Crimsons, Lady Hume Campbell, Lady Vernon, Madame Miellez, Madame Sontag, Margaretta. Any 12 of the above for 18s.

CINERARIAS.—Angelique, Annie, Beauty of St. John's Wood, Bessey, Calypso, Carlotta Grisi, Cerito, Coronet, Delight, Eleanor, Emperor, Fairy Ring, Flora McIvor, Gem of the Isles, Jenny Lind, Lady Gertrude, Madame Parodi, Masterpiece, Matilda, Newington Beauty, Nymph, Othello, Prime Minister, Resplendens, Sansparil, Sapphire, Satellite, Wedding Ring, and Wellington. Any 12 of the above for 12s. H. W.'s selection of 12 for 6s. and 9s.

Also strong plants of "Jenning's King Pansy," the best dark purple self out, 5s. 6d. each, or four to the trade, 15s.; strong well rooted plants may be depended upon, securely packed, so as to ensure safe delivery. Catalogues of the above, including Hollyhocks, Carnations, Pansies, &c., may be had for one stamp. It is respectfully requested all orders be accompanied with a Post-office Order, payable at Marsden, Lancashire.

FRUIT TREES.

THOMAS RIVERS begs to submit to the Public a SYNOPSIS of his FRUIT TREE CULTURE. The names of varieties, with descriptions and prices, are given in his descriptive Catalogue of Fruits, just published, sent post free for six postage stamps.

APPLES.—Standards for Orchards, and Pyramids and Dwarfs, on Crab Stocks; Pyramids and Dwarfs, and Dwarfs Trained, for Gardens, on Paradise Stocks.

APRICOTS.—Dwarfs, Dwarfs Trained, Standards, Standards Trained, and Dwarf Bushes in pots for culture under glass.

CHERRIES.—Standards for Orchards, Dwarfs, and Dwarfs Trained on the common wild Cherry Stock, Dwarfs for Bushes or for potting for culture under glass, Dwarfs in pots, and Dwarfs Trained on the Cerasus Mahaleb stock.

CURRANTS.—Bushes and Pyramids.

FIGS.—Dwarf Bushes in a bearing state in pots.

GOOSEBERRIES.—Bushes, 80 large Lancashire varieties, 20 small high-flavoured ditto.

GRAPES.—Vines, from eyes, in pots, for Vineries and Hothouses, fine and well ripened under glass; Ditto hardy kinds for walls, also from eyes growing in the open quarters; plants fine, 7 to 8 feet in height; Dwarf Bushes, in pots, for culture in orchard houses.

MEDLARS.—Standards, Dwarfs, and Pyramids.

NECTARINES AND PEACHES.—Dwarfs, Dwarfs trained, Standards, Standards trained, and Dwarf Bushes in pots in a bearing state for culture under glass.

NUTS AND FILBERTS.—Dwarfs and Standards for garden culture, grafted on the Spanish Hazel Nut. These form very prolific trees.

PEARS.—Standards for Orchards, Pyramids, Dwarfs, and Dwarfs trained on Pear stocks; Pyramids from one to six years old, 1s. 6d. to 3s. 6d. and 5s. each; the two latter descriptions capable of bearing a good crop the first summer after planting. Dwarf Bushes for potting and Dwarfs trained for espaliers or walls on Quince stocks. Many acres are devoted exclusively to the culture of Pears.

PLUMS.—Standards for Orchards, Standards trained, Pyramids, Dwarfs and Dwarfs trained for espaliers or walls. The Pyramids are nearly all in a bearing state, so as to be able to give fruit the first summer after planting. Dwarf Bushes in a bearing state, and Dwarf Bushes in pots for culture under glass.

QUINCES.—Standards of the common, and Pyramids of the large Portugal Quince, the finest and most abundant bearer, even when young, of all the Quinces.

RASPBERRIES.—Canes of all the select varieties.

STRAWBERRIES.—Plants of all the varieties worthy of cultivation.

MULBERRIES.—Standards and Dwarfs. Some fine Standards can be supplied 35 to 40 years old. These are 6 to 7 feet high, perfectly straight, and measure from 8 to 16 inches in girth, 5 feet from the ground. They have all been removed within three years, and will transplant with safety.

In connection with fruit tree culture, the following works can be supplied:—THE MINIATURE FRUIT GARDEN; or, the Culture of Pyramidal Fruit Trees. Fourth edition. Sent free per post, for 24 postage stamps. THE ORCHARD HOUSE; or, the Culture of Fruit Trees in Pots under Glass. By THOS. RIVERS. Per post, for 30 postage stamps.

VICTORIA REGIA.

J. WEEKS AND Co., King's-road, Chelsea, have great pleasure in announcing the complete success of this magnificent Aquatic, the Queen of the Lakes, GROWING IN THE OPEN AIR. The splendid flowers are now open every day, to the great admiration of all who see it. A few fine YOUNG PLANTS ARE NOW FOR SALE. Full instructions for its cultivation will be forwarded on application to J. WEEKS and Co., King's-road, Chelsea.

TO NOBLEMEN, GENTLEMEN, BUILDERS, AND GARDENERS.

LARCH FIR.—5000 LARCH FIRS for Sale, from 8 to 12 feet in height. These Firs are well adapted for Shrubbery, Lawns, or for forming Avenues and Pleasure Grounds; also for Planting around Newly-built Houses, being of a most flourishing kind. Price 1l. per 100, placed on the Rail at the Tonbridge Station, South-Eastern Railway.—Apply to FRANCIS WHITAKER, Esq., Mountain's Hall, Hildenborough, Tonbridge, Kent.

HOLLYHOCKS.

JAMES KITLEY having a large Stock of fine double HOLLYHOCKS, consisting of about 40 varieties of all colours mixed, begs to offer them at 4s. per dozen; named to colour, 6s. per dozen; best show varieties, 2s 6d each; fine double German varieties, very beautiful, 12s. per dozen. Hollyhock Seed, mixed, 2s. 6d. per packet, post free.

J. K. has also fine border Carnations and Picotees mixed, at 4s. per dozen; Single Russian Violets, 3s per dozen; double do., 4s. per dozen; Neapolitan do., 3s. per dozen. A Post-office order required from unknown correspondents.

Lyncombe Vale Nursery, Bath, Oct. 25.

PARTNERSHIP.—Wanted, an active young Man, as Partner in an established Florist's business He must have 250l. at command, and possess a good knowledge of Plant growing. Address, with age, and other particulars, to B., care of Mr. Field, 4, Coleman-street, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

TO BE DISPOSED OF, on very advantageous terms, 250), Greenhouse and Stove Plants, comprising large Azaleas, Camellias, Ericas, Epacris, Acacias, Cytisus, Geraniums, Cinerarias, Roses, Begonias, Gesneras, &c.—Apply to J. HOLDER, Florist, &c., Ampthill-square, Hampstead-road, London.

TO BE DISPOSED OF, with immediate possession, an old-established NURSERY and FRUIT GROUND, the proprietor retiring from business. Its locality is in a flourishing neighbourhood, six miles from London; the ground most excellent for Shrubs and Trees, also for producing the finest Fruit.—For particulars, apply to J. C. HARDY, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

TO BE LET, ON LEASE, at a Corn Rent, by Tender, and entered upon at Lady Day next, a most desirable FARM, situate in the parishes of Coleshill, Berks, and Inglesham, Wilts, the property of the Right Hon. the EARL of RADNOR. This Farm consists of 366 acres 3r. 1p. of very rich and valuable meadow, pasture, and arable land, and has upon it an excellent residence, &c. Any further information may be obtained from Mr. MOORE, Coleshill, Highworth, who will appoint a person to show the Farm, and by whom tenders will be received, on or before the 22d November next. The corn rent will be calculated at a seven years, average on the prices of Wheat, Barley, and Oats, variable from year to year as under the Tithe Commutation Act. The tender should specify the length of lease for which the tender is made. The highest tender not necessarily accepted. Regard will be paid to the character, skill, and capital of the persons tendering, respecting which unquestionable references will be required.

N.B. Inglesham is situated near to the market towns of Highworth, Farringdon, and Swindon, and about six miles from the Shrivenham Station on the Great Western Railway.

TO BE DISPOSED OF, A NURSERY AND SEED BUSINESS, in a Midland County. The Stock is young and healthy, consisting of Standard and Dwarf Roses, Evergreens, and Fruit and Forest Trees.—Apply to Messrs. NOBLE, COOPER, and BOLTON, Seed Merchants, 152, Fleet-street, London.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1s. 1½d., and 2s. 9d. Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

SUPERB NEW PEA.—THE "NOVEMBER PROLIFIC" supersedes all other varieties, yielding a crop of extraordinary abundance, stands the severe weather better than any others. It is of the richest flavour, and may be sown from November to July without missing a crop. Price 2*s.* 6*d.* per quart; to be had from W. HAMILTON, Seedsman, &c., 156, Cheapside, London.—A liberal discount to the Trade.

G. JACKMAN, NURSERYMAN, Woking, Surrey (1¼ mile from Woking Station, South-Western Railway) begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Nov. 1.

HYACINTHS.

GEORGE P. TYE'S REGISTERED BOTTLE and FLOWER SUPPORT should be seen by all growers of Hyacinths. Few inventions have met with such unqualified approbation (see *Gardeners' Chronicle*, May 10, 1851).

May be had wholesale of G. P. TYE, 114, Snow Hill, Birmingham; Mr. JOHN POWELL, Trentham, Staffordshire; or Messrs. EDMONDSON and Co., 61, Dame-street, Dublin; of whom also may be had G. P. TYE'S Registered Spring Label for Tree and Flower-pots (the best out).—Post-office Orders or a reference required.

JOHN AND CHARLES LEE beg to announce that they are NOW SENDING OUT their new variegated SCARLET GERANIUM, the MOUNTAIN OF LIGHT. Those subscribers who have not yet signified the number they will require are requested to do so without delay. Price 10*s.* 6*d.* each.—Nursery, Hammersmith, London.

PINKS.—"JULIA YOUNGS," extra fine quality, perfect rose, leaf very finely laced with deep purple; first-rate show flower, either for north or south, combining quality with size. A few pairs of this beautiful Pink may be had of JOHN KEYNES, Florist, Salisbury, post free, on receipt of 5*s.* per pair.

A fine collection of all the show flowers at reasonable prices.

VICTORIA REGIA.

J. WEEKS AND Co., King's-road, Chelsea, have great pleasure in announcing the complete success of this magnificent Aquatic, the Queen of the Lakes, GROWING IN THE OPEN AIR. The splendid flowers are now open every day, to the great admiration of all who see it. A few fine YOUNG PLANTS ARE NOW FOR SALE. Full instructions for its cultivation will be forwarded on application to J. WEEKS and Co., King's-road, Chelsea.

TO THE TRADE.

PEAR STOCKS, 3 years transplanted, strong and fine, 30*s.* per 1000.

CHERRY STOCKS, 3 years transplanted, 3 to 5 feet, fine, 30*s.* per 1000.

PEARS (Standards), all the leading sorts, fine.

ARBOR-VITÆ (Chinese), 2 to 3 feet, ditto.

LAUREL (Common), 1 to 2 feet, ditto.

RHODODENDRON PONTICUM, 6 to 24 inches, ditto.

YEWS (Common), 2 and 3 feet, ditto.

We have a large stock of the above, and will sell them cheap. Prices on application. Water and rail conveyance to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead Nursery, Newcastle-upon-Tyne.

ACER VILLOSUM.

OSBORN AND SONS, NURSERYMEN and SEEDSMEN, Fulham, near London, respectfully inform the public that they have for sale the above fine and distinct species of Maple at 15*s.* each. (See a notice of it by the Editor of the *Gardeners' Chronicle*, of Saturday, the 25th October).

EXOTIC NURSERY, CHELSEA.

KNIGHT AND PERRY beg respectfully to inform their Patrons, and particularly those who are interested in the introduction of NEW HARDY ORNAMENTAL TREES, that they have now a superb collection of those that are especially suited for the Park, Pleasure-ground, and even Hedge-rows, inasmuch as their judicious introduction there, instead of the too prevalent Elm and Ash, would speedily add much to the beauty of the British landscape. They are now preparing a list of them, and other hardy trees and shrubs, and will be happy to send it to those who apply for it.

Messrs. K. and P. avail themselves of this opportunity to observe that their WALL-TRAINED FRUIT TREES, for which their Establishment has been so long renowned, are now fit for removal. To insure such specimens as they should like to send out, they would respectfully solicit early commands.

KNIGHT and PERRY, Exotic Nursery, Chelsea, London.

H. LANE AND SON, GREAT BERKHAMPSTEAD, HERTS, are now ready to forward to applicants their CATALOGUE OF ROSES.

" " TREES AND SHRUBS.
" " FRUIT TREES.
" " INDIAN AZALEAS AND CAMELLIAS.

MESSRS. PLATZ AND SON, SEEDSMEN, ERFURT, Prussia inform the Trade that their CATALOGUE for 1851 and 1852 is now ready, and to be had only of their Agent, ROBERT KENNEDY, Bedford Conservatory, Covent Garden, London.—Nov. 1.

Double Roman and Paper-white Narcissus, 4*s.* per dozen; Single and Double Duc Van Thol Tulips, 2*s.* per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. COBBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

FOR SALE.—Large Handsome EVERGREENS, Viz., Chinese Arbor vitæs, from 3 to 6 feet; Green and variegated Hollies, 3 to 8 feet; Tree Box, 5 feet; Rhododendrons, 4 feet; Laurels, Arbutus, &c., *will move safely*, and may be had, by the single plant or hundred, at low prices.

CHANDLER and Son's Nursery, Wandsworth-road, Surrey.

VINES FROM EYES, in Pots.—The following select varieties of GRAPES have been grown under glass, and have beautifully ripe shoots from 4 to 5 feet long. All are 3*s.* 6*d.* each, except those priced.

| | |
|---|---|
| Barbarossa, 5*s.* | Hamburgh, The Pope, 5*s.* |
| Black Prince. | Hamburgh, Wilmot's Black. |
| Black Prince, Hamburgh, 5*s.* | Muscadine, Royal. |
| Chaptal, large white. | Muscat, Cannon Hall. |
| Chasselas Musqué, or St. Albans. | Muscat of Alexandria. |
| | Purple Constantia. |
| Chasselas, Rose. | Raisin de Calabre. |
| Frontignan, Black. | Saint Peter's, Oldaker's West. |
| Frontignan, Grizzly. | Shiraz, large black. |
| Frontignan, White. | Sweetwater, Dutch. |
| Frontignan Noir d'Angers. | Sweetwater, Prolific. |
| Hamburgh, Black. | White Nice. |
| Hamburgh, Mill Hill, 5*s.* | White Romain. |

The following varieties, in pots, are grown as dwarf bushes, for fruiting in pots, 3*s.* 6*d.* each.

| | |
|---|---|
| Chaptal. | Sweetwater, Prolific. |
| Chasselas Musqué. | August Muscat. |
| Chasselas, Rose. | Black Alicant. |
| Frontignan, Purple. | Cambridge Botanic Garden. |
| Malvasia, or Grove End Sweetwater. | Esperione. |
| | Knight's Sweetwater. |
| | Purple Fontainbleau. |

The above are all abundantly prolific when cultivated in pots.

THOMAS RIVERS, Sawbridgeworth, Herts.

VIOLETS.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET (TRUE).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season, by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful Double Violet now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the Double Blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse; and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets, the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s* per dozen; smaller ditto, 3*s.* per dozen, or 1*l.* per 100. Any quantity of the above will be sent postage and package free.

STRAWBERRY PLANTS.

The undermentioned first-rate varieties are now ready to send out:—

Myatt's Surprize, sent out first time last season, 1*l.* per 100, or 3*s.* per dozen.
Prince Arthur, do. do., 1*l.* per 100, or 3*s.* per dozen.
Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 5*s.* per 100.
Goliah, very fine ... ... ... ... 3*s.* per 100.
British Queen, do. ... ... ... 5*s.* "
Alice Maud, do. ... ... ... ... 3*s.* "
Black Prince, very early ... ... 5*s.* "
Prolific, very fine and early ... ... 5*s.* "
Cremont's Perpetual, or double-bearing Strawberry, 12*s.* per dozen, or 4*l.* per 100.
Trollop's Victoria, 12*s.* per dozen, or 4*l.* per 100.

The above are strong and well-rooted plants, such as will insure satisfaction. Any of the Strawberries that are priced, per dozen, can be sent free by post; also those priced, per 100, will be sent package free.

Fine Giant Scarlet Prompton Stocks, Plants that have been all pricked out, 2*s.* 6*d* per 100.

Also, some fine Antirrhinums, all saved from striped and spotted varieties, such as will give every satisfaction, and bloom early next spring, 5*s* per 100.

Fine Sweet Williams, such as will bloom next season, saved from 50 distinct varieties (the plants are strong and good), 5*s* per 100, or 1*s.* per dozen. Can be sent by post with any of the above.

WINTER CUCUMBER.

Lord Keynon's Favourite, the best variety for winter cultivation, 2*s.* 6*d.* per packet.

A remittance is expected by Post-office order, or the amount in penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

TO RAILROAD CONTRACTORS, NURSERYMEN, &c.

RICHARD HARTLAND AND SON, NURSERYMEN, Cork, will deliver, free in London, Bristol, Liverpool, or Dublin, any quantity (over a hundred thousand), of Thorn Quicks, at one to lowing prices, for cash:—

3 year-old, in beds (st out plants), per 1000 ... 2s. 6d.
4 do. ,, (transplanted), per 1000 ... 3s. 6d.
5 and 6 do. ,, ,, per 1000 ... 5s.

All orders addressed as above shall be promptly attended to.

---

TEN THOUSAND FRUIT TREES, all choice leading sorts, to be sold this autumn, at one-third the usual prices.—The public are respectfully informed that the remaining part of Mr. BELL'S STOCK OF CHOICE FRUIT TREES will be offered at the under-mentioned low prices, all warranted true to name, on his late Nursery Grounds, adjoining the New Church, Lakenham, Norfolk.

IMPORTANT DISCOVERY.

CLARKE AND Co., GARDENERS, SEEDSMEN, and FLORISTS, Percy-cross Nursery, Walham-green, Fulham, are now sending out, in small sealed stone bottles, secured for travelling, on the receipt of 5s., a Mixture (which is both a remedy and preventive) for destroying those grievous pests, the White Mealy Bug, Scale, Thrip, and all other insects, without injury to the plants. This being the season for the more effectual remedy of all insects, C and Co. recommend that their preparation be applied forthwith. Printed directions sent with each bottle.—Post-office Orders payable at Brompton, to CHARLES CLARKE

---

IMPORTANT TO ALL WHO HAVE A GARDEN.

CHALLENGE COMPARISON AND COMPETITION. CARRIAGE PAID.

All orders above 5*l* carriage paid to London, Liverpool, Birmingham, and Edinburgh, and all the intermediate Stations within 150 miles of the Nurseries, upon any line of Railway whatsoever. To those ornamenting their Gardens or Grounds, this is an advantage seldom offered.

SELECT HARDY HERBACEOUS PLANTS AND ALPINES.

100, own selection, two of each kind, 30s.; or our selection, in 100 varieties, 42s.

100, purchaser's selection, one of each kind, 42s.

100 Alpine or Rock Plants, 42s.

The above exteuds over 1000 species and varieties, selected from the choicest collections in the country, warranted second to none for beauty and display. Having an immense stock, they can be furnished at these low prices.

50 do. purchaser's selection, 3*l*.; or 18s. per dozen.

ERICAS, 50 of the finest sorts grown, own selection, 2*l*. 10s.; or 15s. per dozen.
,, ,, purchaser's choice from list, 3*l*.; or 18s. per dozen.

CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21s.; or 15s. per dozen.
,, ,, purchaser's choice, 1*l*. 5s.; or 18s. per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25s.; 50 fine for 15s.; 25 for 8s, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.

CINERARIA, from the choicest sorts, per packet, 2s. 6d.
PANSY, do. do. do. 1s. 6d.
HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1s. 6d. FRUIT TREES.

GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4*l*., in 100 varieties; or 10s. per 100, in 50 varieties.

A selection of the choicest description for show, 4s. per doz.

The stock extends over 50,000, and is fine and free grown.

CURRANTS.—May's Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25s.; or per doz., 4s.

Black Naples, the finest black (no other sort grown), 12s. per 100, 2s. 6d. per doz.

Red Grape and Champagne, fine, 10s. per 100.

White Dutch, large and fine, 12s. per 100, 2s. per doz.

APPLES.—Fine clean Standards, 10s per doz., 70s. per 100.
,, ,, Dwarfs, 8s. per doz., 50s. per 100.
,, Dwarf trained superior kinds, 2s 6d each, or 24s. p doz.

The collection is very choice, from the Horticultural Society.

PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.

PLUMS and CHERRIES.—All the leading sorts, standards, 18s. per doz.
,, ,, Dwarfs, fine, 9s. per doz.
,, ,, Dwarf trained, 3s. 6d. each, or 36s. per doz.

APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5s. each, 50s. per doz.

RASPBERRIES.—Fastolff 3s. per doz., 16s. per 100.
,, Antwerp Red, 2s. per doz., 12s. per 100.
,, Monthly, or Double-bearing, 12s. per 100, 2s. per doz.

STRAWBERRIES. — Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3s. 6d. per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to JOHN MAY, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

---

JOHN AND CHARLES LEE beg to offer fine plants, often transplanted, and warranted, of the following:

CEDAR OF LEBANON, 6 feet, clean and straight, 10s. 6d. each, or 35*l*. per 100.

COMMON HOLLIES, 5 to 6 feet, clean and straight, 5s. each, or 20*l*. per 100.

VARIEGATED HOLLIES, 8 feet, clean and straight, 25s. each.—Nursery, Hammersmith, London.

---

THE FINEST NEW ROSES OF THE SEASON.

HYBRID PERPETUAL QUEEN VICTORIA (PAUL'S).—This is unquestionably the finest New Rose of the season; it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly wax-like in appearance, and distinct from every other. Plants in November, 10s. 6d. each, with the usual discount to the Trade when three are ordered at once.

CLIMBING PERPETUAL ROBERT BURNS (PAUL'S.)—Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedolle in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants, in November, 7s. 6d. each.

N.B. Each of these Roses has obtained a 1st Class Certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.

*** Further orders for the Roses can only be taken for plants in buds.—A. PAUL and SON, Nurserymen, Cheshunt, Herts.

---

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2s 6d. per quart.

York Regent Potatoes, from prepared cuttings, 6s. per bush. Cambridge Radical do (a first-rate second early) 6s. do. Early Oxford do., 10s. 6d. do. Early Ebrington Kidney do., 10s. 6d. do. Early Ash-leaf Kidney do., 10s. 6d. do.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1s. 6d.; two-bushel, 2s. 6d. Sacks, 2s. 6d. each.

---

Larger sizes, not exceeding 40 inches long.

16 oz. from 3d. to 3½d. per square foot, according to size.
21 oz. ,, 3½d. to 5d. ,, ,,
26 oz. ,, 3½d. to 7½d. ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

---

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | |

Milk Pans, 2s to 6s. each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

---

GREEN AND HOTHOUSE BUILDER. — Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

FRUIT TREES.

THOMAS RIVERS begs to submit to the Public a SYNOPSIS of his FRUIT TREE CULTURE. The names of varieties, with descriptions and prices, are given in his descriptive Catalogue of Fruits, just published, sent post free for six postage stamps.

APPLES.—Standards for Orchards, and Pyramids and Dwarfs, on Crab Stocks; Pyramids and Dwarfs, and Dwarfs Trained, for Gardens, on Paradise Stocks.

APRICOTS.—Dwarfs, Dwarf Trained, Standards, Standards Trained, and Dwarf Bushes in pots for culture under glass.

CHERRIES.—Standards for Orchards, Dwarfs, and Dwarfs Trained on the common wild Cherry Stock, Dwarfs for Bushes or for potting for culture under glass, Dwarfs in pots, and Dwarfs trained on the Cerasus Mahaleb stock.

CURRANTS.—Bushes and Pyramids.

FIGS.—Dwarf Bushes in a bearing state, in pots.

GOOSEBERRIES.—Bushes, 80 large Lancashire varieties, 20 small high-flavoured ditto.

GRAPES.—Vines, from eyes, in pots, for Vineries and Hothouses, fine and well ripened under glass; Ditto hardy kinds for walls, also from eyes growing in the open quarters; plants fine, 7 to 8 feet in height; Dwarf Bushes, in pots, for culture in orchard houses.

MEDLARS.—Standards, Dwarfs, and Pyramids.

NECTARINES AND PEACHES.—Dwarfs, Dwarfs trained, Standards, Standards trained, and Dwarf Bushes in pots in a bearing state, for culture under glass.

NUTS AND FILBERTS.—Dwarfs and Standards for garden culture, grafted on the Spanish Hazel Nut. These form very prolific trees.

PEARS.—Standards for Orchards, Pyramids, Dwarfs, and Dwarfs trained on Pear stocks; Pyramids from one to six years old, 1s. 6d. to 3s. 6d. and 5s. each; the two latter descriptions capable of bearing a good crop the first summer after planting. Dwarf bushes for potting and Dwarfs trained for espaliers or walls on Quince stocks. Many acres are devoted exclusively to the culture of Pears.

PLUMS.—Standards for Orchards, Standards trained, Pyramids, Dwarfs and Dwarfs trained for espaliers or walls. The Pyramids are nearly all in a bearing state, so as to be able to give fruit the first summer after planting. Dwarf Bushes in a bearing state, and Dwarf Bushes in pots for culture under glass.

QUINCES.—Standards of the common, and Pyramids of the large Portugal Quince, the finest and most abundant bearer, even when young, of all the Quinces.

RASPBERRIES.—Canes of all the select varieties.

STRAWBERRIES.—Plants of all the varieties worthy of cultivation.

MULBERRIES.—Standards and Dwarfs. Some fine Standards can be supplied 35 to 40 years old. These are 6 to 7 feet high, perfectly straight, and measure from 8 to 16 inches in girth, 5 feet from the ground. They have all been removed within three years, and will transplant with safety.

In connection with fruit tree culture, the following works can be supplied:—THE MINIATURE FRUIT GARDEN; or, the Culture of Pyramidal Fruit Trees. Fourth edition. Sent free per post, for 24 postage stamps. THE ORCHARD HOUSE; or, the Culture of Fruit Trees in Pots under Glass. By THOS. RIVERS. Per post, for 30 postage stamps.

Sawbridgeworth, Herts, Nov. 1.

DUTCH FLOWER ROOTS.

RENDLE'S LIST OF DUTCH BULBS will be found in the columns of this Paper, front page, in the number for September 27, 1851. The prices are very low. Descriptive Catalogues on application to WILLIAM E. RENDLE, Florist to her Majesty, Plymouth.

*The Hyacinths are particularly large and handsome. Most excellent kinds can be had at 6s. per dozen.*

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their descriptive Catalogue, with the treatise on the "Cultivation of American Plants," can still be had by enclosing six stamps for postage.

Gentlemen requiring the services of a Landscape Gardener can procure such by applying to the Advertisers.

Bagshot, Surrey, Nov. 1.

SUPERB HOLLYHOCK SEED.—Well ripened Seed, warranted to be saved exclusively from Rosea grandiflora, Delicata, Comet, Model of Perfection, Elegans, Formosa, Gem, Belladonna, Bicolor, Queen, Fireball, Aurantia, Rosea alba, and Superba perfecta. A good mixture of the above, in packets, containing 200 Seeds, will be forwarded, post free, upon the receipt of 2s. 6d. worth of postage stamps, by R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, near London, informs his kind patrons that his new ROSE AND FRUIT CATALOGUE FOR 1851 AND 1852 is now ready for circulation, and will be sent on receipt of a twopenny stamp. His Stock of Roses, Fruit Trees, Evergreen Shrubs, and Ornamental Trees, are of the finest growth, of all sizes.—Gardens and Pleasure Grounds tastefully arranged and planted on the lowest terms.

E. D. informs his friends that he has no Seed Shop in London.

**The Gardeners' Chronicle.**

*SATURDAY, NOVEMBER* 1, 1851.

THE art of CHARCOAL BURNING is, perhaps, of less importance in this country than it is in those which are not so amply provided with mineral fuel; but even here, it is a matter well deserving of attention, not merely in relation to the manufacture of charcoal for specific purposes, such as the making of gunpowder, but taken in a more extended sense, as a means of obtaining a powerful and most valuable fuel. In making common wood-charcoal, various modes are adopted in different countries, and the practical method employed differs considerably, though theoretically the same object is effected in each. The wood, for the most part the thinnings of plantations, badly grown trees, and branches, is cut into billets of a convenient form, and either stacked in a heap, and covered with clay or sods before firing; or else it is burnt in a sort of kiln or oven, provided with suitable dampers. The object to be effected is to drive off the whole of the volatile matters, which the wood contains, by the action of heat; for this purpose it is set fire to, and just enough air is admitted to burn the combustible vapours given off, whilst care is taken not to let in enough to burn the charcoal itself. As soon as the wood ceases to give out inflammable vapours, that is to say, as soon as it ceases to burn with a bright flame, all access of air is shut off, and the charcoal is suffered to cool. In fact, the same kind of process is adopted in making charcoal as is used in charring coal, or making coke.

All forms of vegetable matter contain a large proportion of carbon, and are, therefore, more or less available as fuel; but some are naturally far more valuable than others. The close, dense parts of plants, such as wood, afford far better charcoal than leaves, or even twigs; this depends on two circumstances, namely, the small quantity of inorganic matter which wood contains, and the superior facility with which it may be thus charred, or partially burnt. In consequence of the spongy open nature of a mass of leaves or twigs, the heat requisite to char it, and the air necessary for its partial combustion, would not only drive off the combustible matter, and so char it, but also, at the same time, would cause the complete combustion of the charcoal then formed. Twigs, brushwood, and even Heather, make capital fuel, for they contain abundance of combustible matter, and are easily dried when made up into faggots; but it is very difficult to convert them economically into charcoal. Amongst the inventions shown in the Great Exhibition, was a process for obtaining charcoal from twigs, weeds, and all sorts of refuse vegetable matter, especially designed as a means of preventing the waste of fuel which occurs in thinning plantations, and clearing out the underwood of forests. This process, devised by M. POPELIN DUCARRE, has been honoured with the great medal; and it is therefore reasonable to suppose, that it is not only new but also good.

The mode of converting waste vegetable matter into solid charcoal, exhibited by POPELIN DUCARRE, consists of two distinct operations—one, by means of which it is charred and converted into charcoal powder; and a second, by which the powder thus obtained is formed into solid lumps or blocks. The process of carbonisation is carried on in an ordinary stifle oven or kiln, a good deal resembling a lime-kiln in form and arrangement, the whole being regulated and governed by suitable dampers above and ash-pit doors below; so that the access of air can be diminished or altogether cut off at pleasure. This part of the process is by no means new; the only feature of novelty about it is, that the oven is entirely made of iron, and is portable, so that it may be carried about from place to place; hence, instead of bringing the refuse brushwood to the oven, the latter is carried into the midst of the forest, and is in fact brought to the brushwood. The oven itself is precisely similar to those commonly used for charring peat, Heather, &c. The second process requires a good deal of machinery; in the first place the charcoal is reduced to powder by a kind of mill; it is then kneaded into a stiff paste, with a suitable quantity of tar; next pressed into moulds, by a kind of engine somewhat like a drain-tile machine; and, lastly, the cylindrical masses thus formed and strongly heated in an oven, enclosed in iron drums or canisters. By this last operation the bituminous matter is entirely driven off, but at the same time the charcoal powder is cemented together, and the cylindrical pieces, when they are taken out of the iron drums, are hard, and very like pieces of common wood-charcoal in appearance. The machinery employed for these different operations is ingenious, though somewhat too cumbrous, and probably not so simple as might be devised for the purpose. As regards the principle, however, there is little or no novelty, for it has formed the subject of a number of patents during the last fifty years, and, modified in different ways, it is the basis of at least a dozen of our best artificial fuels. There does not appear, then, to be any novelty either in the mode of carbonising the vegetable refuse, or in the process for forming the charcoal powder into solid lumps.

But there is another point to be considered, in examining the practical value of this process; and that is, the quality of the fuel thus produced. It is well known, that Heather and dried weeds, bound into faggots, make a very serviceable fuel for some purposes, one which gives a strong but not a lasting fire, well adapted for the brick-kiln, and similar operations; it is obvious, that in converting such matters into charcoal, a great deal of heat must be lost, because all the volatile and combustible part of the fuel is driven off and wasted, in the process of charring it. Now twigs, weeds, and leaves contain, even in their natural state, a large quantity of inorganic matter; and, as in the operation of carbonising them, a considerable part of the combustible matter is driven off, whilst all the inorganic matter is left, it necessarily happens that the charcoal powder thus obtained must contain a very large proportion of inorganic matter; in consequence of which it burns with difficulty, and leaves a very high per centage of ash. A great deal of combustible matter is lost during the process, and the result is a very inferior kind of fuel. It is true that the fuel so obtained may be used for particular purposes, and can be burnt in stoves, for which the raw material is wholly useless; and it is, therefore, quite possible that in some situations the process may be advantageously worked, but it is hardly probable that such would be the case in this country. If brushwood and Heather faggots were of no use, then no doubt any mode of converting them into fuel, however bad or inferior, would be of value; but as they form a very useful fuel themselves, it certainly does not appear worth while to burn one-half of them, in order to convert the rest into very bad charcoal.

It is very difficult to discover upon what principle the Council of Chairmen awarded a large medal for this process, which is neither remarkably new nor remarkably good. It might have merited a prize medal, though even that would have elevated it into an undue position, as none of the other different kinds of artificial fuel exhibited receive any medal whatever. We can only suppose that selecting it for the award of a great medal was a piece of good nature, intended as a compliment to a foreign exhibitor who had sent a pretty model.

Though this process cannot be recommended, as a mode of making fuel, yet there is one part of it which may perhaps be worthy of attention, with a different object; and that is, the portable iron oven, which might perhaps be advantageously used for burning weeds. In the ordinary mode of burning weeds, nearly the whole of the combustible matter is lost, and little but ashes are left; it might be worth while to try and save some part of the charcoal; and this might easily be done by the use of such an oven; there is no doubt whatever that whilst the weeds, &c., would be as perfectly destroyed as in the ordinary mode of burning them, the value of the ashes as manure would be considerably increased by the charcoal which would thus remain mixed up with them.

---

OUR readers know that we have always stood aloof from the disputes in which our florist friends are rather celebrated for indulging. We have never permitted our columns to become a vehicle for their learned arguments, which are generally of no use to any but the owners; and we have not the smallest intention of departing from what we believe is pretty generally regarded as a wholesome rule. But having lately devoted a portion of this paper to discussing florists' questions, the quarrels aforesaid being excluded, we are in a manner constrained to notice the proceedings of a little metropolitan coterie rejoicing in the modest name of the AMATEUR TULIP SOCIETY.

It is well known that the gentleman who is at present charged with the Floricultural department of this Paper is Mr. EDWARDS, of Holloway, the Secretary of the National Floricultural Society, a gentleman of the highest honour and character, and, till lately, a member of the Amateur Tulip Society. On the 28th of May, Mr. EDWARDS showed, before the Royal South London Floricultural Society, a certain Tulip called Pilot; and on the 29th of May the same variety before the Amateur Tulip Society, when he took their first prize. Shortly afterwards the Secretary of the last Society apprised Mr. EDWARDS that he was charged by somebody with having exhibited as of his own growth a "Pilot" which he did not grow; and further that two "gentlemen of unquestionable authority" were of opinion that the very Pilot referred to had been in fact shown the day before by Mr. TURNER, of Slough. Thereupon ensued a long correspondence, which we have taken the trouble to read, between Mr. EDWARDS and Mr. Secretary, the upshot of which was that a Mr. CLARK having had a private look at Mr. EDWARDS's Tulip bed, and not having seen there the Pilot in question, was of opinion that Mr. EDWARDS *must* have borrowed it of somebody else. As for "the two gentlemen of unquestionable authority" they did not show themselves: in other words, they skulked off. Mr. EDWARDS, in reply, gave ample proof that he had grown the Pilot and might have exhibited it; he asserted, and offered to declare upon oath, that he did exhibit what he had grown; and he produced the evidence of Mr. TURNER, of Slough, that the Pilot of the latter was never in Mr. EDWARDS's possession.

Notwithstanding this, which would have been enough to clear a man in any court of justice in the world, the Amateur Tulip Society declare Mr. EDWARDS's replies to be unsatisfactory, and, in their wisdom, call a special meeting, at which, as will be seen by referring to p. 647, their absurd proceed-

ings broke down, no evidence appearing to substantiate the charge.

The way in which the affair was managed was characteristic. In the first place, they refused our reporter admission; in the next place, they took the special business before the ordinary business, in order to prevent the election of a member who they had reason to think entertained a different opinion of Mr. EDWARDS's case from themselves. Nevertheless the plot failed, and its concoctors have ended by looking foolish, blustering a little, talking of expulsion, and doing nothing.

So much for the Amateur Tulip Society. We wish the members joy of their committee. Such of them as are exhibitors may think themselves lucky if more are not favoured, another year, with the critical inspection of some Mr. CLARK, with the accurate judgment of such another learned gentleman, and the sage opinion of the "two gentlemen of unquestionable authority" unknown. We need hardly add that Mr. EDWARDS thought the proceedings more entertaining than respectable, and like a man of sense shook himself clear of the Society.

## ARBORICULTURE IN SCOTLAND.

IN "Chambers' Edinburgh Journal," of the 5th of July last, there is an article on "Woods," giving an amusing report of a sale by auction of about 60,000 small trees, the thinnings of a plantation 25 years old. The writer of the article (the owner of the plantation) had evidently been unacquainted with the value of this description of timber; and from the circumstance of its being situated in an inland district, far from a regular market, and entirely dependent on a local demand, with the result of the sale of so large a number of trees, he of course was disappointed; and it appears to me that he has brought under the notice of his numerous readers an extreme case, accompanied with remarks which are not calculated to convey a correct idea of the value of arboriculture throughout Scotland, in point of direct revenue. Having had some practice in the raising and management of timber, and being acquainted generally with plantations throughout many of the best-wooded districts in this country, I beg to offer, as summarily as possible, a few remarks on this subject. In the article to which I refer, we are told that "overplanting" has placed various parts of Scotland in a position, as respects trees, analogous to "Canada and Norway." That in some situations, "trees of any sort are barely worth the expense of cutting down. Larch, Fir, Ash, Elm, Oak, all are nearly alike useless —positive encumberers of the soil." To support these statements, an example is given of the sale of thinnings, in a land-locked district, situated about 30 miles from a large town, and where timber has to pass through six toll-bars before it reaches a market. It is added that "facts of this nature are beginning to be painfully felt by the sons and grandsons of many great planters." I readily grant that the expense of carriage for 30 miles, with six toll-bars, would be equal to the value of timber in general, but, fortunately, instances of this sort are exceedingly rare—so rare, that throughout the north of Scotland I do not know a single plantation, of considerable extent, nearly so far from water conveyance. Half the length of road referred to is very unusual, and far beyond the average distance. The Scotch lairds, even during the most favourable periods for improvements, had sagacity and perseverance sufficient to form extensive plantations only where they are really valuable in their cubical contents. Looking over the face of the country, it is surprising to find so few plantations in situations of an opposite character, considering their beauty and effect, and that for a long time back, the cost of plants and planting moorland, with Larch and Scotch Pine in ordinary circumstances, would not have exceeded 15*s.* an acre. From the nature of arboriculture it is generally extremely profitable, its original outlay and subsequent cost being small, compared with its ultimate results. If here and there plantations are to be met with throughout Scotland, cut off from the regular timber markets by an expensive carriage, they are of a trifling extent; and it is uniformly found that if the sale of the property containing such plantations should take place, ample value is obtained for all the outlays incurred. Beautiful green trees, the embellishment of the landscape, towering on the hill sides, and affording a choice of solitary walks, deliciously fragrant and cool in the summer heat, will at all times, and in all situations, command the regard of men of wealth and taste; so that planters, even in the most remote situations, have been wise in their generation. I never yet heard of a solitary instance of a son or grandson lamenting the greatness of the extent of plantations he had inherited; their smallness, however, is not unfrequently brooded over, particularly on pocketing a few thousand pounds from a few acres of felled timber, bordering on land of a similar quality—moorland, which had remained barren for centuries.

In the example given by the Journal in question of the value of timber, not only is the distance from the market unusually great, but the timber, being only thinnings of Fir, Larch, and Oak, 25 years old, is unusually small, and the least valuable of forest produce, only suitable for coal-props, props for wire fences, sheep-flukes, and similar purposes. For such, the demand is always limited, except at shipping ports, where a constant demand for coal-props is generally met with, at various prices per dozen of 72 lineal feet, according to the girth of the trees. These props form the principal return cargoes of coal vessels at the ports in the north of Scotland. Within a few miles of a port, a plantation of Scotch Fir or Larch, 25 to 30 years of age, of ordinary growth, when cut down, generally yields from 25*l.* to 30*l.* per acre, after paying all expenses: while at a great distance from the shore the value of thinnings (the worst trees of course), is seldom expected to yield more than the expense of clearing them away. Such have served the purpose of shelter, in having promoted the growth and quality of the remaining trees, and were they worth less than the cost of cutting, it would be profitable to have them removed. As to the management and economy exercised in the operations, and in disposing of the produce of the thinnings of the plantation reported on in "Chambers," I would only remark that the barking of Larch trees is an unusual thing—I have never known it to pay anywhere; while the bark of the Oak, which is not stated to have been peeled, is generally profitable, if well harvested, even were it carried over 30 miles, passing through half-a-dozen toll-gates.

No one can read the article alluded to without admiring the graphic and interesting description given of the progress of the sale of trees by public roup (auction); but before enforcing the doctrines of the dead loss, and cruel disappointment arising from such plantations, I would have expected that the writer would have informed his readers of the value of the ground previously to its being planted; of the expence incurred in forming the plantation, and that of its subsequent management. Having disposed of the thinnings partly by auction, and the remainder privately, the result for wood and bark was 104*l.* 14*s.* 6*d.*, leaving a balance over outlay of 25*l.* 9*s.* 6*d.*, besides a lot of trees for home use. Thoroughly dissatisfied with the revenue yielded by 60,000 small trashy trees, cut down at one thinning, and disposed of in a remote district, dependant on a local demand, the owner, as if giving a fair example of Scotch Arboriculture, says: "The whole affair was amusingly absurd, and presented a fine instance of the fiddle-faddlery in which country gentlemen usually busy themselves!" So much for thinnings: now for the price of heavier timber. It is added, "To see how far the joke might be carried, we invited a country carpenter who wanted some good Firs, to inspect a lot of upwards of 40 years' growth. Capital sticks they were—not your thinnings. The offer which this judicious artisan made for them was threepence to sixpence each. Had he cleared the two acres of land which they covered, we should probably have pocketed somewhere under 30*s.*" Thirty shillings! This would certainly pay the price of the plants, and of planting two acres; but unless a value is put on the shelter and embellishment of the plantation, there is little left for the interest on the outlay, and for the rent of the ground for upwards of 40 years (supposing it to be worth rent). It is difficult, however, to understand by what calculation he arrives at the result of less than thirty shillings for two acres! I am aware that in this case we have a description of timber which yields only a small return. At about that age the trees stand thin on the ground, and in some situations timber is not much more valuable per acre at 40 years than at 30 years of age. This arises not only from thinness on the ground, but also from the circumstance of the Firs being beyond the size of prop-wood, paling, &c., and as yet unfit for the more important purposes of joisting, flooring, and carpentry in general; too large for some purposes, and too small for the next in ordinary demand. However, be this as it may, I am unable to see how two acres at threepence to sixpence per tree should produce less than thirty shillings! That space should contain at least about 1000 trees But, no doubt, the statement of less than thirty shillings is made for the purpose avowed—"To see how far the joke might be carried."

No one acquainted with the management of Scotch Fir woods, would fell them in a thriving state at the age of about 40 years. With Larch the case is different. In some districts in this neighbourhood, the Larch in many soils and situations is the most profitable timber that can be planted, although its price has lately fallen from 1*s.* 6*d.* to 1*s.* per cubical foot. In soil well adapted to its growth, and under proper management, a tree 40 years of age will produce 20 cubical feet. This is a common growth on some of the estates along the banks of the Findhorn. Here a plantation, composed of Oak and Larches interspersed, formed 40 years ago, was thinned last year; the thinnings were entirely Larches, and some acres, along the most favourable slopes, yielded 40*l.* Many of the trees measured 20 and some 26 cubical feet, and were disposed of by private bargain at 1*s.* per foot. Former thinnings had paid many times the expenses of forming and upholding the plantation. There still remains amongst the valuable Oak from 40 to 80 Larches per acre, advancing each at the rate of 1 to 2 cubical feet annually; therefore a similar return in a short period is anticipated again and again. The expenses of thinning, on the occasion last referred to, did not exceed 2½ per cent. on the revenue, and the operation was performed at the same time as the thinning of the plantation referred to in "Chambers' Journal." The plantation to which I refer on the banks of the Findhorn is situated in a district purely agricultural, 7 miles from Forres, and 11½ from the sea-port at Findhorn. To Forres there is one toll, and between the plantation and the sea there is one and a half toll. Now, be it observed, this is far from being favourably situated, in regard to transport of timber. Eleven and a half miles of road is far beyond the average distance of plantations throughout this country, from water conveyances or from some other ready market; and the time has long since gone past that Caledonia, in respect to her forests, can, with any degree of propriety, be said to resemble Canada or Norway. New purposes are constantly arising for the consumption of timber, the greatest of which of late years has been railways, for which the manufacture of sleepers threatened to dismantle the kingdom previously to the Government reduction of duty on foreign timber. The writer in the journal referred to, terms extensive planting a mania and a craze; but rely on it, country gentlemen see matters in a different light than that in which here presents "the grandeur of arboriculture." In the formation of their extensive plantations they will know that they are laying a foundation of national wealth and independence, and a source of individual prosperity and riches. I would not recommend any landowner to plant, for the sake of timber, land yielding an annual value of 10*s.* or 15*s.*, although it would, under some trees, in many situations be ultimately profitable. Generally speaking, land of that description is ill adapted for Scotch Fir and Larch; but there are thousands, and tens of thousands of acres, of barren wastes perfectly suited for these kinds of timber, that are not worth 2*s.* an acre per annum, far better situated for the transit of timber than the plantation I have referred to, on the banks of the Findhorn, where the expense of plants and planting would not exceed 12*s.* or 15*s.* per acre; and where the revenue, under proper management, even at the present low prices of timber, may be fairly presumed, at the end of 50 or 60 years, to surpass the revenue of a similar space under Wheat, at the present prices; even supposing Wheat to be grown every year during the period, and the produce that of an ordinary crop. I speak of plantations merely in relation to direct revenue; counting nothing on their advantages in embellishment, by converting the bare and dismal districts into rich and waving woodlands; giving rise to pasturage and cultivation, nullifying the bleak winds, tempering the withering frosts, and spreading over the surface a soil rich in vegetable deposit, advantages great in themselves to a country and to individuals. *John Grigor, Nurseries, Forres.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 36.)

No. LII.—We are reminded, whilst affixing the number to the present chapter, that we have positively been chatting with our good friends the public, 52 weeks—an entire year! To us, the time has appeared as it were but a few days, so greatly interested do we feel in the subjects under discussion; nor do we believe, if we may give utterance to our honest thoughts, that our readers have grown tired of our company. We have, indeed, delightful evidence to the contrary, and of a most voluminous nature.

Our good friends, the Americans, too, have fallen in love with our subject; and whilst quoting very largely from our writings, are pleased to speak in a most encouraging manner of the good, the "great moral good" we are likely to work in society, by the "undercurrent," as they term it, which pervades the *ensemble* of our remarks. They consider we aim as much at "men, women, and manners," as we do at the well-being and prosperity of the feathered tribe. Brother Jonathan is right. We have had, and *always* have, this end in view. We may be pardoned so trifling a digression, we trust, in virtue of this being our "first anniversary."

Let us now resume our subject. Instinct, as we have said, if it be at all allied to "reason," is so, no further than as regards "thought;" and that, very limited. Still, in some instances, instinct puts reason to the blush. A bird, a beast, or an insect, will eat as much as he requires, and will then be satisfied. They rarely eat to repletion. Is it always so with us? Some of our ventri-potential citizens, perhaps, will give us the answer. Then,—instinct teaches some birds to choose one spot; others, another.* Some live in woods and thickets only. Some are gregarious; others, solitary. Some tame; some shy. But in all tribes, *one and the same natural instinct prevails.* Just so will any flower, if not tampered with by our "modern improvements," produce unerringly *its own natural form*, growing up minutely correct in its proportions, and diffusing all its inherent excellences.

Again, all animals have a mode peculiar to themselves of understanding each other's language. Even a casual observer of Nature must have seen this, whilst watching the toilsome duties of a colony of ants. How often have we verified the fact of a labourer, wearied from exhaustion, and unable to get his burden up a hill, going direct for assistance to his neighbours, and of his

* The marvellous instinct inherent in *some* of the smaller tribes of birds, would almost exceed belief. The possibility of losing even one of their family, seems (at the season of incubation) to be ever uppermost in their suspicious, wary moments, and they provide against all invaders with an ingenuity far surpassing any "reasonable" plan that we could adopt—so amply does Nature "compensate" them for the want of any "greater gifts." The following illustration of my remark is furnished by the Rev R P. Alington, Swinhope Rectory, Linc ln, who, in the November No. of "The Naturalist," just published, says,—"Last spring, I was shown a nest of the blue titmouse, placed inside a wooden pump. The parent birds entered through the orifice made for the handle, and the nest was placed above a foot below it. It was built all round the piston rod of the pump, filling up the whole space inside; but the frequent working of the piston rod produced a large hole through the centre of the nest. The young were nestled up in one corner, but so near was the piston rod that it must have grazed the old bird, when in use. Notwithstanding this constant disturbance, she reared her young. *One* of her children, only, fell a victim,—being crushed between the piston rod and the nest." This is a pretty anecdote, and it neatly illustrates our subject.

immediately obtaining it—the said burden being carried up the hill, under direct orders from a superior, by several sturdy porters. Herein is a high order of "instinct." But we shall have again occasion to speak of the ant. I merely cite this particular case, to show that Nature implants in *all* animals an intelligible code of signals—known to themselves, and to themselves *only*. Nor can I, by observation, convince myself that this natural gift, or talent, indicates reason—seeing that it subserves but one great end, viz., the happiness and prosperity of the colony. As with the ant, so is it with every other animal of the lower order. There is no expansion of intellect. Their "talent" is given them at their birth, and is taken away at their death. They have done what their ancestors did before them, and no more. So that, if we admit the fact of animals possessed of brain, being also gifted with "thought," we yet find that it is always limited. Nature intended it should be so, as we hope to be able to prove.

Speaking of rational and irrational creatures, SOUTHEY remarks—"Animals go rightly, *according to the ends of their creation*, when they are left to themselves. They follow their instinct, and are safe. But it is otherwise with man. The ways of life are a labyrinth for him. His infancy does not stand more in need of a mother's care, than his moral and intellectual faculties require to be nursed and fostered; and when these are left to starve for want of nutriment, how infinitely more deplorable is his condition than that of the beasts which perish!" It is indeed so! Should any person urge against this, that some birds are taught to repeat words, and connect sentences, and thereby show powers of "reasoning," I would reply, that these birds are naturally endowed—born with this inherent talent of imitation, or mimicry. Hence their so-called "excellence;" but as for understanding what they utter, beyond the instinctive sagacity of their nature, that is totally out of the question.

If these, our premises, be correct, and we be acknowledged to have drawn our deductions logically,—we hope to be able to "complete the case" we have taken in hand. It is one of intense interest; and as we are aware that it has become a matter of public curiosity, we shall pursue the inquiry with all fairness. To understand these things properly, we must use a microscopic eye, and soar aloft for the "why and because" of the things which we want to know. What we daily witness in the animal and vegetable worlds, are ordinations of supreme intelligence, given for wise and good purposes; but, to use the words of an elegant writer, "we are blind, beyond thought, as to secondary causes. Admiration, that pure source of intellectual pleasure, is almost alone permitted to us." If we attempt to proceed beyond this, we are generally lost in the mystery with which the divine Architect has thought fit to surround his works. For my own part, the more interesting discoveries I make, the more distressingly do I feel the extent of my own ignorance. We only "begin" to grow wise, when we have begun to grow old,—and even then, *what* is our wisdom!

Give me the great, grand heart, as large as it was made to be,
That takes in GOD, and HEAVEN, and EARTH, like a deep and glorious sea;
That sees the stamp of Beauty broad and wide on everything,
And loves that beauty everywhere—and OWNS GOD as ITS SPRING.

If we keep close to this spring, we shall hardly go wrong whilst tracing the river in its various windings. At every turn, there lies before us a whole world of living wonders! *William Kidd.*

## ORCHIDS FOR THE MILLION.—No. XXII.

By B. S. WILLIAMS, gr. to C. B. Warner, Esq., Hoddesdon.

(*Concluded from page* 677.)

CLIMATE COOL.—PLANTS GROWN IN BASKETS, WITH MOSS AND PEAT.

*Odontoglossum grande.*—This magnificent Orchid comes from Guatemala. The flowers are large, mottled, and striped with brown and yellow, the lip is white, edged with light purple; they remain long in perfection. It will do on a block, or in a pot; but it succeeds best in a basket, with moss, peat, and potsherds, and should be grown in a fully-exposed part of the house, where it can have a little air.

*Odontoglossum citrosmum.*—This beautiful Orchid comes from Mexico; it flowers in May, June, and July; the blossoms are white, stained with rosy crimson, and they remain four or five weeks in perfection. It will do on a block, with moss, but it likes a basket, with sphagnum moss, peat, and potsherds, suspended from the roof; too much moisture, even in the growing season, does not suit it, and after it has made its growth it should be kept rather dry.

*Lycaste cruenta*, is a good species, which flowers from February to April, and comes from Guatemala. The blossoms are a deep yellow or orange, with a dark crimson mark in the centre; they remain long in perfection, and are very fragrant. This plant does well in a basket with moss and peat and potsherds; it likes a good supply of water in the growing season, afterwards it may be kept rather dry.

*Lacæna bicolor*, comes from Guatemala; it flowers in May and June. The blossoms are a dull greenish yellow, the petals having three violet-coloured streaks, the labellum is white, with a dark purple blotch in the middle; they remain long in perfection. This grows best in a basket filled with sphagnum and peat and potsherds; it requires a good supply of water in the growing season; afterwards it should be kept rather dry.

CLIMATE COOL.—PLANTS ON BLOCKS, WITHOUT MOSS.

*Barkeria spectabilis.*—A beautiful Orchid, from Guatemala, which flowers in June and July. The blossoms are rosy pink or bluish, dotted with deep crimson, and remain long in perfection. It succeeds best on a bare block of wood suspended near the glass, where it can have plenty of light, in the growing season; afterwards it should be kept rather dry and cool.

*Barkeria Skinneri major.*—This fine variety comes from Guatemala, and flowers from October to March. It is a difficult plant to cultivate; the best way to grow it is on a bare block of wood suspended near the glass, where it can have plenty of light and not too much heat. It likes a good supply of water when growing, afterwards it should be kept rather dry. It will continue flowering for three or four months.

*Barkeria Skinneri.*—This lovely species comes from Guatemala. It should have the same treatment as the former, and, like it, it will remain flowering for three or four months.

*Cattleya citrina.*—A fine Orchid from Oaxaca, which flowers in May, June, and July, and remains long in perfection; the blossoms are a deep brilliant yellow colour. This plant is best grown on a block of wood, with the leaves growing downwards, and it succeeds in a cool, airy part of the house. It likes a good supply of water when growing; afterwards it should be kept rather dry.

GREENHOUSE CLIMATE.

*Dendrobium speciosum.*—From New Holland, flowers from February to March. It is best grown in a pot, with fibrous peat and good drainage; during the growing season it should have plenty of water, but afterwards it should be kept dry. If this plant is kept in a hot place, it will not flower.

*Cypripedium insigne*, comes from Sylhet; it flowers from January to March. It is best grown in a pot, with loam and leaf-mould and good drainage; it likes plenty of water while growing, and keeps six weeks in flower.

*Calanthe bicolor*, a neat Japan Orchid, which flowers in April and May. It does best in a pot, with loam and leaf-mould and good drainage; when at rest, it should be kept rather cool and dry. Its flowers remain long in perfection and are very fragrant.

*Bletia patula*, flowers in June and July. This thrives best in a pot, with loam and leaf-mould, with good drainage, and plenty of water when growing; when at rest, it should have but little water; its flowers remain long in perfection.

## Home Correspondence.

*Some Remarks on the Breeding and Preservation of Fresh Water Fish.*—The preservation of certain kinds of fish from the unscrupulous depredations of unprincipled or ignorant people, is deemed of sufficient importance for legislative interference and enactment. Regarded as a valuable article of food, and no unimportant adjunct to the delicacies of the table, the propriety of precautionary measures for the protection of the most esteemed varieties of the finny tribe is sufficiently evident. But this obviously judicious protection, extended by interdicting the destruction of fish during the spawning season, is only efficacious in a limited degree, as the rapidly diminishing supply, of what is technically called "red" fish," in the London market attests. Independently of the edible value of fish, the question is interesting to a vast number of followers of the "gentle art." Can nothing be done even to restore the ancient supply, or at least to check the tendency to decrease, evidenced in the diminished returns from several of our famous rivers. The art of man has brought various wild creatures to subjection. How great the advantages accruing to us from the domestication of the common fowl! And how fortunate that the animal kingdom has afforded nature so tractable, and obedient. Seeing that the denizens of the air, and the earth, have multiplied under our care and tending, why should not a proportionate degree of attention be paid to the extension of the creatures of the waters? It cannot be said that they are utterly wild, and intractable; every one has heard or seen instances of tame fish—we have witnessed trout obey the familiar call summoning them to be fed. At Versailles the carp pursue the visitor round the margin of the pond, with the greed of pigs, for the customary morsel of biscuit; and not far distant from the place from which I write, may be seen perch which freely approach, and take the proffered worm from the hand that holds it. Arguing by analogy, we submit that we may advantageously interpose our protective power, and exercise an important influence in the preservation and increase of the finny tribe. The fecundity of fish equals that of many insects, whose extraordinary powers in that respect are so familiar to us. If the tenth part of the spawn usually deposited, by a trout for instance, attained its due development, and a tenth again of the young fry escaped the destructive inroad of ferocious enemies, we should have little cause to lament the scarcity of this favourite fish. The instinctive care of the parent fish would ensure security for the spawn by depositing it in places less frequented by its common enemies; but it rarely happens that this precaution is adequate to its entire preservation; the spawn is preyed upon by water fowl, rapacious fish, and aquatic insects, and often entirely destroyed by polluted waters drained into the river from highly cultivated districts; the law of might is the law within the water, young fish are preyed upon without compunction by the stronger; hence we find young fish from the first moment of existence endowed with all characteristic instinct, that of self-preservation especially; but neither their small size nor number are sufficient for their safety; but a small proportion in ordinary cases reach maturity. Seeing then that fish are not exempt from that equitable arrangement of Nature, which provides for the maintenance of every kind of creature in due proportion, by permitting destructive influences to check any undue increase, it must then be an object of primary importance to remove what fish we desire to preserve out of the reach of those influences. I am thus led to present the first practical exposition of my views. I have spoken of tame fish. I do not maintain that their tameness is altogether essential; but the advantage of a little familiarity would be to render them more manageable. The first proceeding towards the object in view is, to secure the separation of the fish we desire to protect from its enemies. To do this we must possess a piece of water artificially separated from the source of its supply, but with an adaptation of sluices, so that a suitable quantity of water may be secured, and an excess prevented. For preserving trout, I do not see why every important stream should not be provided with a breeding stew of this description. This stew, as I may call it, may be a branch diverted from the main stream, or a stream flowing from a spring; it should have three divisions, each division provided with a sluice-gate and close gratings. I should keep the breeding fish in No. 2 division from August until January, or until it might fairly be presumed that the depositions of the spawn had taken place; I should then drive them into No. 1 division; Nos. 2 and 3 would then remain for the young fry. These breeding fish should be regularly fed, and familiarised as much as possible. The advantage of sluice gates must be obvious; the water in any one compartment can be let off, and any filth or vermin likely to interfere with the fish destroyed; the bottom of the stream should be composed of sand and gravel—the spawn would be destroyed by mud. I am aware of the plan of collecting spawn artificially impregnated in boxes; but as two able and practical articles have just appeared in the *Chronicle*, fully describing the course to be pursued, I have no occasion to intrude my remarks on the subject. It has been said that "in the multitude of counsels there is wisdom." I trust that others may be induced to give their views and experience on this interesting and important subject; and on the result I hope that the disciples of the "quaint old cruel coxcomb" may count their gains by the dozen, where now they number them by the brace. *W. I., Hatfield.*

*How to Crop a Small Kitchen Garden.*—I have adopted the following plan, which I strongly recommend. At the beginning of the season I had my garden cleared straight through, and I marked it out to be planted, 1st, with a row of Cabbage plants, 2d, a row of Potatoes; 3d, a row of Peas; then plants, Potatoes, and Peas alternately through the garden. I found very great advantage in this plan, by having an immense yield, especially in Potatoes; and having the ground ready, I was enabled to put in the rotation crops without trouble. I propose next spring to follow the same plan, except that I shall plant, 1st, Peas; 2d, plants; 3d, Potatoes; by so doing I shall not of course have the crops again in the same spot of ground. *Vectis.*

*Terrestrial Orchids.*—I some time since inquired of your correspondents as to their experience in growing the more showy Orchids of the south of Europe, and what are the best kinds, and where to be procured. I have been disappointed at not finding any one willing or able to afford information on this subject. I have a small collection (made in Portugal by Dr. Welwitch) which I have potted and kept in a cool house, and most of which are beginning to grow; I suspect these should have been kept cooler or more dry, as I suppose the early spring is the proper time for their growth. *Dodman.*

*Preparation of Land for an Orchard.*—I shall feel obliged by a few words of advice on the following point. For orchards of dwarf fruit trees, should the ground be single or double dug? I am going to plant a large extent of land with dwarf Apple, Pear and Plum trees of choice kinds; and while they are young, to grow Gooseberries and Currants between the rows. I wish to do everything that is requisite for their successful cultivation, but not to expend money on unnecessary or even doubtful operations. The soil consists of 2 or 3 feet of strong brown loam resting on blue lias clay, both of which pulverise very freely on exposure to the air. The ground is being drained with pipes 4 feet deep at 10 or 12 yards apart, which answer extremely well; and up to the present time I have acted on the advice of experienced friends, and double dug it, at an expense of nearly 6*l.* per acre, which process I should have continued had not some other gardening friends also of great practical experience, told me that they not only thought it unnecessary, but even injurious. As far as I at present understand the question, the advantages of double digging are these:—1st, a greater depth of loosened soil, in which the roots may freely extend themselves to procure nourishment, and in dry seasons a more abundant supply of moisture; 2dly, more efficient and quicker drainage of the soil, with greater admission of air to the roots; and thirdly, the mingling together of the top and under soils. Against these, and in favour of single digging, it is said:—1st, it is not desirable that the roots should penetrate far into the ground, but be kept as near the surface as possible, except in very dry soils, which this is not. In illustration of this, the old practice of paving under trees is adduced; 2dly, that for purposes of drainage, deep digging is not necessary, as is proved by the successful results of draining land under ordinary farm culture; 3dly, that if the roots may without injury, or even with some advantage, be allowed to penetrate to a greater depth than a single spit, it need not, and probably would not be till some years hence,

and by that time the under soil would have become so cracked and minutely subdivided in consequence of thorough draining, as to offer sufficient access to the roots—perhaps to as great an extent as if it had been double dug; for in the latter case, the fine particles of the top soil would have been washed into the interstices left after the clods were expanded, and have so filled them as to leave only the same amount of fissures for the downward passage of rain as in the former instance. In matters of this kind extremes are generally bad, and 3 or 4 feet of loosened soil may be as much in excess of the requirements of the case, as 3 or 4 inches may be deficient. I consider it is a matter of degree, resolving itself into a choice between 10 or 12 inches on the one part, and 18 or 20 on the other; and as such I venture to ask the opinion of any of your practical readers, who will oblige me with the result of their experience in similar cases; kindly bearing in mind it is not large standard trees I require, but small prolific bushes. *Richard Varden, Lansdown House, Worcester.*

*Forest Trees and Underwood.*—Having missed seeing your Number of September 20th, and that of the previous week having left my custody, I was quite at a loss, on perusing the communication of "G. L." (September 27th), to call to mind any observation or remark I had made calculated to offend him in the least degree. My remarks, as far as I can recollect, alluded chiefly if not entirely, to those advanced by "Expertus." If I have said any thing unfairly in reference to "G. L." I cannot but regret it; and if he will allow me, I will, with heart and good-will, offer him the right hand of fellowship, as an opponent of pruning, as he seems satisfied himself of its injurious tendency. As my last note referred chiefly to what "Expertus" had advanced, as to modes of pruning being injurious to timber when grown, I had intended to supplement my former observations by endeavouring to show, that all pruning systems are also injurious, in retarding instead of facilitating growth, as their advocates would make us believe. Upon consideration, however, that the subject had been discussed so amply (I may almost say to exhaustion) in your pages formerly, I thought it hardly worth while to re-open it, but meant to make a remark or two upon the practice (or rather neglect) visible in some otherwise beautiful places, of suffering fine, ornamental specimens of various kinds of trees to be crammed up, and greatly injured by overgrown underwood and self-propagated rubbish that have sprung up around them. It may seem invidious to point by name to any spots where this is the case, as proprietors may (adopting the late ducal maxim) say they have a right to do as they please with their own. Nevertheless, there can be no harm in naming Claremont as an example of the evil to which I have alluded. The fine specimens in the pleasure-ground there were formerly quite obscured and injured by rubbish that had sprung up around them; and the walks hemmed in by close hedges of tall Laurel. Some years ago Mr. M'Intosh, much to his credit, had it completely renovated, clearing away the rubbish, and bringing the fine specimens into view; the beautiful slopes becoming covered with Laurel, Rhododendrons, &c., over which one could see in walking round. In fact, the improvement was such that it could hardly be appreciated but by those who were previously acquainted with the place. I may also mention a place of public resort, where the beautiful, well-kept walks are considerably obstructed; and the many fine specimen trees hid by useless, not to say injurious, undergrowth. I allude to the Wilderness at Hampton Court; a word to the wise is enough. In conclusion, I am glad to hail Mr. G. L. as an anti-pruner, and hope he will not accuse wrongfully *Quercus.*

*Zauschneria californica, Plumbago Larpentæ, and Agapanthus umbellatus.*—Observing that the Californian Zauschneria has stood the last two winters out of doors at Claremont, I beg to state it did the same with me in my last situation, which was low and damp; it grew and flowered very freely, without the slightest protection. Where I am at present I have plants in full flower, which doubtless stood out last winter and probably the one before. There is also a fine plant of the Plumbago Larpentæ here, which has been finely in flower for the past month, on a piece of rock-work, where I have no doubt that it has stood the test of two or three winters; although there are not many of the pips, generally five or six, expanded at one time on the same head, still, as the shoots are very numerous, and most of them produce a head of flower, it forms a very beautiful little bush. I may mention that an Agapanthus umbellatus planted here, on the lawn, some two or three years since, flowers beautifully in the summer, without any protection during winter. *E. Sanders, Kingswood Lodge, Englefield Green.*

*Tarred Walks.*—As some of your readers so strongly advocate tarred walks, on the score of their utility and durability, and mention instances in which they have withstood the wear and tear of ordinary traffic for a considerable time, I beg to remind them that there are cases in which they have stood a much more severe test than that of wheelbarrows, carts, carriages, or even waggons, however heavily laden they may have been; as I remember some years ago, on walking by the side of the river Medway, that several places along its banks which had broken away were repaired with the identical mixture you recommend for walks. In certain places the ground was raised, and its top, and the side next the water, protected by a coating of the material in question, the whole being used (I believe) as a towing-path; but the preparation of tar, &c., was supplied in order to protect the bank from the ravages of floods. Now any one acquainted with the latter can easily tell how difficult it is to check their devastating career by any simple, cheap, or effectual means; yet I believe, in the case I speak of, that was effected: but then, I may remark, the tar was not used with a sparing hand; on the contrary it was (mixed with shingle) several inches thick, and had evidently been boiled, as it was as hard as metal, and even in places where the stream had partially undermined it, it stood like a body of cement. Now, having detailed its capabilities in this situation, I suppose some one will be asking what I think of it for garden walks. I at once unhesitatingly say that I do not like it, except in special cases. Certainly, it may be made to assume a hard, smooth, level surface, and that ugly dark surface may be rendered more agreeable looking by a thin coating of fine gravel; but it is this gravel that makes the walk so disagreeable; suppose that it is passed through a three-quarter-inch sieve or screen, still the small stones left in it are very unpleasant to walk upon, resting as they do on a bottom which does not give way to them. If we have the gravel so fine as to be free from such small stones, then it is no better than street mud in wet weather, and the blackened look of the walk is such as to render some coating necessary where appearance is an object. Having said so much against its general adoption, I am not insensible to its merits in some cases, as on steep hills crossings, where there is much wheeling or other dirty traffic, and about door-ways, &c., but beyond that I am unwilling to admit its anti-weed-growing qualities as a compensation for its other inconveniences. *An Old Gardener.*

*Disease in Cucumbers.*—My Cucumbers have been affected this year in exactly the same way as those described at page 678; every fruit exuding gummy granules, some as soon as they were set, others at a later period, immediately succeeded by an olive-green mould, in consequence of which I have had but three Cucumbers from one of Mills's pits, out of which I have been, in former years, well supplied with from 30 to 40 brace, from 12 to 18 inches long—even parts of these three were not fit to be eaten, being brown and hard beneath and round the gum. I made a drawing of the mould which the accompanying woodcut represents. It appears to belong to the genus Dactylium, and is, I think, a new species, which may be called "D. gumminosum." Viewed *en masse* it is olive-green, but as a transparent object it has a whitish gelatinous appearance, stems long and slender, some with short moniliform branches, others bearing at their summits from one to three shuttle-shaped sporidia, which are septate. It may be doubted whether this fungus be the cause or result of the disease. If we only look to the first outward appearance, we should say the latter; but what, then, caused the gummy exudation? The plants were healthy, even to luxuriance, and produced abundance of fine young fruit; and your correspondent says, "Heat, moisture, shade, and sunshine were varied in every possible way, with little or no effect." I did not examine the gum as soon as it appeared, in order to detect a mycelium, if it existed; but the mould appeared, I may almost say, so simultaneously with the gum, that I am of opinion it was there, and that the gum was forced through the skin by the irritating action of the mycelium upon the tissue. "An Old Gardener" asks if much more is known of the Potato disease than in 1846. If he looks into the Horticultural Society's Journal for that year, and the Royal Agricultural Society's Journal published in the end of last year, I apprehend he will not desire to know much more about it unless it be to cure it; indeed, most people are now satisfied that it is caused by the fungus Botrytis infestans. *F. J. Graham, Cranford.*——I observe that information is solicited respecting the spot on Cucumbers and Melons; and as I have combated that enemy twice during these last 14 years, I beg to offer a few remarks on the subject. My first acquaintance with it was in 1837. I was then living at Sandy Place, Bedfordshire. On examining my plants with a magnifying glass, I found a very minute insect, very red and shining, but quite different to the red spider. I have discovered as many as eight or ten of them in a hole in the Cucumber, where the gum had oozed out, and the part had become dry. It is generally to be found on the fruit and on the undersides of the leaves. The three years during which I was troubled with it in frames I had it equally bad on ridges. Towards the close of the third year I had all my frames painted, and the lights dressed with hot lime-wash, and the following season I was quite free from it, both in frames and ridges. I sent several specimens of the insect to Mr. Curtis, who said it was a species of Ixodes. I moved into Norfolk in 1842, where I have seen nothing of the insect or spot, although the former was rigidly looked for. In 1844 the spot and insect paid me another visit. The latter set me at defiance till the autumn of 1846, when I finally conquered it in the following way,—I put a large tablespoonful of arsenic into a gallon of water, and well washed all my frames with it, particularly the joints, which I filled full of the mixture, turning the frames up on their sides and ends, in order that every part might be well saturated. This being done I had the frames whitewashed inside and out with hot lime and water. I had the lights washed with the arsenic water, which I applied with the syringe, and I afterwards whitewashed them the same as the frames; but it must be washed off before it becomes dry, as it will be troublesome to remove. It is worthy of remark that when I had the spot in frames I had it likewise on ridges, and after being freed from it in the former I saw no more of it on the latter. Whether the insect is the cause of the spot or not I leave to others to judge, but my own belief is that it is the cause of the spot. *Thomas Webster, Shouldham Hall Gardens, Norfolk, Oct. 29.*

*Cherries and Raspberries in perfection now.*—As regards the Cherries described by Mr. Rivers at p. 678, I should mention that I have two if not three kinds of Cherries, small standards, which I had about two years ago from Mr. Rivers, and which were netted in the summer, and the fruit is now quite ripe and sound. Two of the kinds are small and sweet, without much flavour; another was large and dark, and is a rich fine fruit. Last year it had been gathered for tarts in the summer. The names under which these trees were sent out are lost, but the latter sort my gardener called a Flemish Cherry. These, and the late bearing Raspberry introduced by Mr. Rivers, which I noticed in your Paper last year, I consider to be great additions to the autumn dessert. The Raspberries are now in full bearing, and if sheltered with canvas, or glass, will continue to yield through November. I have, in addition to the common Morello Cherry, the Buttner Morello against pales, netted; but though it is a good bearer, the fruit, in size and flavour, is far inferior to the common Morello. *Dodman.*

*Samples of Seeds* (see p. 677.)—Your correspondent is quite right in his complaints respecting the multiplication of seeds, and I wish him success in his endeavour to correct an evil which, I regret to say, we gardeners have been the means of fostering. I might go further and include the plant trade as well as that of seeds; but suppose we confine ourselves to the latter at present, and let some one well versed in the qualities of the various kinds of culinary vegetables step forward and give us a list of what is really good, and let the rest be dispensed with. I think much good might be effected by discussing the merits of various things. For instance, let us say Broccoli; and what vegetable is of more consequence to the gardener than a regular supply of nice heads from October till May. Now to meet this case we have a formidable array of names, and all "said" to be good; nay, more than that, some seedsmen go so far as to tell us the exact time in which each individual kind will come into use. Now this seems all very fine; but I have more than once seen (in June) a tuft of long leaves flourishing on the end of a long timber-like stalk that ought (according to print) to have been a beautiful white head of Broccoli in January. Now these things are not uncommon, so let us select say three or four of the best kinds, such as will prolong the season, and dismiss the rest. And as a beginning, I will venture to recommend the Cape, Walcheren, when true, and either the Wilcove or Bowles' Sulphur, for late spring Broccolies. In addition to these three, I would have the old hardy sprouting, and, if the number might be increased, "Chappell's Cream," which comes in before the Wilcove. Now, like many others, I have indulged my *penchant* for novelties for many years, and, perhaps to a little extent, may do so again; but amongst a host of kinds I have found these to be the best Broccolies. If others will come forward, and name what they have likewise found to be good, we may then get to know the very best. What we want in this way is a regular supply from the time the autumn Cauliflowers cease to be useful until the spring ones come in. I have paid a good deal of attention to these things, and for more than two years I have never been without either Cauliflower or Broccoli fit for table. *An Old Gardener.* [We should be glad of information of this kind; but our correspondents will see that in such a case they must give their names and address. We must also add, that the "trade" can take no part in the discussion.]

*Figs and Grapes.*—As connected with the subject of Mr. Rivers' communication, at page 678, viz., retardation, I should wish to propose a question. I am desirous of obtaining late Figs. I have glass, but no artificial heat. Would it be better to retard the first crop according to Mr. R.'s plan, or by stripping off the first crop, and by accelerating the second (by keeping the house much closed) to depend on a late second crop? The trees are in pots. From the Brown Turkey I get a good first crop fruit, but the Nerii seems to throw all its energies towards the second crop. I may here mention that I tried this year a plan recommended by one of your correspondents, viz., to keep slightly open, day and night, the top sashes of a Vinery, and not to admit front or side air. This plan which I continued until the berries coloured (when a little front ventilation was added) succeeded perfectly, and the Grapes ripened at least a fortnight earlier than under the old system. *S. B.*

*Cure for Weeds on Walks.*—To assist this investigation, I may mention that the refuse from one of the lead mines in this neighbourhood (Newton Stewart, N.B.), forms excellent walks, and some made of it 50 years ago remain until now without vegetation of any kind, or even moss, on them. The refuse of other lead mines in the near neighbourhood, I am told, is not fatal to vegetable life, and that the reason is the presence of sulphur in the former, and not in the latter. I cannot myself vouch for this, but analysis would settle the point, and might indicate a cure for weeds. I may add, that both gravels are fatal to fowls. *W. M.*

*Behaviour of Plants in the throat of a covered up Coal-pit.*—Allow me to tell you something about a plant,

hat may be nearly as surprising to some of your readers as toads and frogs living in confinement in stones and trees. It is no uncommon thing, when a coal-pit is old and worn out, for a crop of vegetables to take possession of the upper parts of it; even rare plants will sometimes be found in such places—but how they came there, I know not. It happened, some years ago, that an old pit, with an abundance of vegetation about its mouth, and also down part of its throat, had to be covered up; wood was laid over its mouth, and turf was laid over the wood; the object of the covering was to allow no current of air in the pit. After remaining in that state for some years, this season the mouth of the pit was uncovered, and all traces of the former vegetation had disappeared, except one plant, and it was so greatly changed in appearance, that it took a few minutes to ascertain what the strange-looking thing was or had been; but there it existed, living and growing rapidly, and, as it could not get upwards, it was making its way downwards as fast as it could, and when it was brought to light its extremities had reached nearly three fathoms down the pit. *Peter Mackenzie, West-plean, Stirling.* [This was, we presume, a Rhizomorpha; the woody mycelium of some Boletus-like plant.]

*Late Plums in Pots.*—I have been so much gratified with the ripening of late Plums in pots in my orchard houses, that I am induced to send you a few fruit of Coe's Golden Drop; they are reduced in size from shrivelling in the dry atmosphere, but they are highly saccharine and rich, and would, I have no doubt, have remained on the trees till November. *Thomas Rivers, Sawbridgeworth, Oct.* 22. [They were excellent in all respects.]

## Notices of Books.

*The Rod and the Line; or, Practical Hints and Dainty Devices for the sure taking of Trout, Grayling, &c.* By Henry Wheatley, Esq. With nine coloured plates. Longman and Co.

This is an exception to most of the modern books on fishing, for there is much original matter in it which is good and clearly explained. Brothers of the angle well know that spinning is one of the most difficult points to accomplish, because the principle is but little understood. This book explains it, and points out what to do and what to avoid; it gives clear instructions for making the proper tackle and the various artificial baits, with references to plates, so that the manufacture can be easily accomplished.

The work also gives information to fly-fishers for salmon and trout, and it is written in a free and pleasing style; but the spinning instructions are so good that we strongly recommend all anglers to study the pages of it, for those who do not know anything about it may thus readily learn, and those who perhaps fancy themselves tip-top fishermen may gain valuable information which will be new to them, and increase their chance of returning from a fishing excursion with a full pannier.

## Garden Memoranda.

Chelsea Botanic Garden.—A small plant of the Littæa geminiflora is now blooming in the Chelsea Garden. The flowering stem measures about 11 feet in height. The plant has been kept in a greenhouse temperature for the last two or three years, in the winter season being associated with Aloes and similar plants; and, though comparatively small, is in perfect health, and opening its blossoms very freely; the foliage is very perfect.

## FLORICULTURE.

Tulips.—As the season for planting has arrived, it may be well to offer a few observations on that subject, together with some remarks respecting the characteristics of certain varieties somewhat closely allied, not only in the collection under my immediate care, but also in that of others whose beds I have been privileged to inspect when at their best. I cannot boast of a 30 years' acquaintance with the Tulip, and, therefore, I have few old prejudices to forget in connection with it; yet with much care and a firmly fixed determination only to grow "selections" and not "collections," I find an occasional variety whose room proves more desirable than its company. I have ever been an advocate for the duplicate system of arrangement, *i. e.*, planting the two outside flowers of each row with the same variety; and so on with the second and sixth, and with the third and fifth, as the following example will show.

| *Row* 1. | *Row* 2. | *Row* 3. |
|---|---|---|
| 1. Rose, Cerise blanc | 1. Bybl., David | 1. Biz, Solon |
| 2. Bybl., Salvator Rosa | 2. Biz., Vivid | 2. Rose, Bijou |
| 3. Biz., Polyphemus | 3. Rose, Aglaia | 3. Bybl., General Bournaveld |
| 4. Rose, Magnificent | 4. Bybl., Thalia | 4. Biz., Duke of Devonshire |
| 5. Biz., Polyphemus | 5. Rose, Aglaia | 5. Bybl., General Bournaveld |
| 6. Bybl., Salvator Rosa | 6. Biz., Vivid | 6. Rose, Bijou |
| 7. Rose, Cerise blanc | 7. Bybl., David | 7. Biz., Solon |

| *Row* 4. | *Row* 5. | *Row* 6. |
|---|---|---|
| 1. Rose, Arlette | 1. Bybl., Byzantium | 1. Biz., Albion |
| 2. Bybl., Musidora | 2. Biz., Pilot | 2. Rose, Lac |
| 3. Biz., Fabius | 3. Rose, Triomphe Royale | 3. Bybl., Princess Royal |
| 4. Rose, Emily | 4. Bybl., Louis XVI. | 4. Biz., Platoff |
| 5. Biz, Fabius | 5. Rose, Triomph. Royale | 5. Bybl, Princess Royal |
| 6. Bybl., Musidora | 6. Biz., Pilot | 6. Rose, Lac |
| 7. Rose, Arlette | 7. Bybl., Byzantium | 7. Biz., Albion |

By this arrangement the different classes are regularly distributed throughout the bed, thus, the first flower in row 1 is a Rose; the first in row 2, a Byblœmen; the first in row 3, a Bizarre; and so the second, the third, and the fourth flowers in every row are varied in uniform order; the fifth, sixth, and seventh, corresponding with those already given in detail. Viewed from any point, the colours are thus so well divided and distributed, that I have ever failed to discover the least cause for variation, and therefore I cordially advocate the more general adoption of the plan. Some difficulty may, however, be found in carrying out the system through the entire bed, owing to the want of stock; nevertheless, that should not deter anyone from making the attempt. When purchasing, take especial care to have two bulbs of each of those you want; for instance, buy two of Magnificent (Marefield), 2 Bijou (Scarnell), 2 Vivid (Sanders), 2 Hamlet (Brown), 2 Lac (?), 2 Lacheses (Groom), 2 Salvator Rosa (Brown), 2 Victoria Regina (Groom), 2 Arlette (Dixon), 2 Thalia (Clark), &c., and of the less expensive sorts I find my original purchases varied from four to eight bulbs of each kind, such as Marshal Soult (Groom), David (?), Ponceau tres blanc (Dutch), Princess Royal (Gibbons), Pilot (Gibbons), &c. In the selection of varieties, however, much caution is required; for all that is true of dealers' seed lists equally pertains to Tulip catalogues. What is Rose Astonishing? Rose Matilda? Rose Heroine? Rose Triumphe Royale? Rose Lacheses? what Albion? Polyphemus? Sheet Anchor? Priam? Douzelli? Lord Strathmore? Hamlet? Ulysses? I do not say that these Roses are one and the same, but I do say that great authorities aver that any three of them are too nearly alike even for an exhibition of 12 blooms: so in Bizarres, Albion is said to be but a short-growing variety of Polyphemus; Priam (Wells) a good strain of the same; Sheet Anchor a tall-growing variety of ditto; Hamlet and Ulysses both Slough strains of the same flower; and similar cases might be multiplied to a great extent, but enough has been adduced to show that caution is at least requisite when making purchases, or what is perhaps a sounder policy, make those of whom you buy feel their responsibility, that is the way to raise and maintain confidence. How interesting would an enumeration be of our popular Tulips and their affinities! Surely, many of our cultivators could enlighten us on a subject so full of importance; and in so doing, would they not be conferring much benefit? No Tulip locality should fail to establish a register, the periodical publication of which would set the matter in a fair train for inquiry throughout the whole "fancy;" further, as a rule, I cannot but regret the omission of the raiser's name—this is a fault alone to be charged to the Tulip and Rose growers; for, taking the whole round of florists' flowers, Pinks, Pansies, Picotees, Geraniums, Dahlias, &c., the raiser's name is as perseveringly preserved as the variety itself.

Chrysanthemums.—The unusual mildness of the season is telling in favour of the Chrysanthemum, whose progress during the past week has been rapid. The earlier sorts (such as Princess Marie, Vesta, &c.) are well nigh expanded; and the late sorts, I have no doubt, will be in bloom by the 20th of November. As far as appearances go, a splendid bloom may be expected. Preparations should be made without delay for protecting both plants and blooms, so that they may be available at the shortest notice. Much may be done either for the purpose of retarding or forwarding the bloom by the means used for protection. Such varieties as Perfection, Campestroni, Two-coloured Incurved, King, and Dupont de l'Eure, should be housed first; not only because they are late varieties, but also from the fact that they take a long time fully to develope themselves. These remarks apply to plants grown in pots. When grown against a south wall, &c., other means of protection must be resorted to. Lights not in use may be made available for the purpose, also covering with oiled canvas; both of which, however, in some cases are objectionable, as, for instance, when the plants are grown against a wall in the pleasure-ground. The plan I adopt is simple and effectual, and it is not so unsightly as either of the foregoing; I use the cover or tops of my hand-lights, which are made of iron; I drive two nails into the wall just above the blooms, for one edge of the light to rest upon, and a third nail 2 feet above the others, to which the handle of the light is secured with a string. By this mode of fastening, the light is suspended over the blooms. If the latter are forward, this is sufficient; if late, by lengthening the cord, both edges fall to the wall, completely enclosing the blooms, and at the same time forwarding them considerably. One glass may be made to protect three or more plants, by drawing them to it. Among the more modern varieties, the Duke, Evarden, Cloth of Gold, Lyzzus, Dupont de l'Eure, will take a prominent stand. Nevertheless, our old favourites, Vesta, Annie Salter, Goliath, &c., will appear finer than ever. I have no doubt plants will be exhibited in fine condition. There will be some immense specimens. I have no hesitation in saying that the competition in plants and blooms will far exceed that of any previous year. Be careful in not housing the plants too soon, or loss of foliage will probably follow. *Wm. Holmes.*

Catalogue received from Mr. E. G. Henderson, St. John's Wood. *J. E.*

Pelargoniums: *W E R.* Two plants. *J. E.*

## Miscellaneous.

*Death of Mr. James Cunningham.*—We have to announce the death of Mr. Cunningham, Nurseryman, at Comley Bank, Edinburgh, which took place on Wednesday, the 22d October. Mr. Cunningham was long celebrated as a nurseryman, and was one of the most successful propagators of plants of the age. He was born at Carluke, in Lanarkshire, in 1784; at an early age his love for plants was such as to induce his parents to make him a gardener, and he was thereupon apprenticed to Mr. Loudon, at Lockhart Hall, now Carstairs House, in Lanarkshire. At the expiry of his apprenticeship he was sent to Woodhall, the seat of W. F. Campbell, Esq. of Isla, where he remained for several years, under the late Mr. Walter Henderson; he afterwards removed to London, and for sometime was engaged in the nursery establishment of Messrs. Jenkins, Regent's Park. Subsequently he was employed in the Royal Gardens at Kew, under the late William Aiton, Esq. In this Royal establishment, the late Mr. M'Nab and he were fellow-labourers, and both left for Scotland during the month of April, 1810. Shortly after his arrival in Scotland, he procured a small piece of ground at Comley Bank, to form a nursery, and which has been extended several times; it now contains a larger amount of pot plants than any similar establishment in Europe. During November, 1837, he was appointed Nurseryman and Florist to the Queen for Scotland. Mr. Cunningham did not excel so much in cultivation as he did in propagation; in this latter department he stood unrivalled, and many of the methods practised at Comley Bank were patent to himself. He was the first to take up the hybridisation of Rhododendrons in Scotland, and many excellent hardy standard varieties were produced by him. The celebrated Bryanthus erectus was likewise the result of his labours; and, strange to say, for several successive years the same variety was produced between the same plants without any perceptible change in the offspring. Mr. Cunningham through life was quiet and retiring, with habits peculiar and somewhat eccentric. His remains were interred on the 24th of October, in the parish church-yard of Carluke. *North British Agriculturist.*

*Pine Apples.*—In a copy of the "Hortus Medicus Amstelodamus," now by favour at hand, on the plate *Ananas* is entered the following MS. note by P. Collinson—the eminent F.R.S.:—"Sr Matthew Decker first brought the Ananas or Pine-apple into England to his garden at Richmond, where I saw them about the year 1712." In the "Horticultural Transactions," vol. i. (p. 150), we read:—"Lady Mary Wortley Montagu, on her journey to Constantinople, in the year 1716, remarks the circumstance of Pine-apples being served up in the dessert at the Electoral table at Hanover as a thing she had never before seen or heard of. Had Pines been then grown in England, her ladyship could not have been ignorant of the fact." *Quarterly Review.* [In Lord Waldegrave's collection at Strawberry Hill was a picture representing Rose, the Royal gardener, presenting the first Pine-apple to King Charles the 2d, in the Garden at Hampton Court. The Pine-apple must therefore have fruited in England before 1685.]

*New Style of Glass for Church, Chapel, and School Windows.*—A description of glass, termed "quarry" glass, has been recently manufactured by Messsrs. Hartley, which we think will speedily come into general use for the purposes above named. For these windows, small pieces of glass are generally used, fastened together with lead, which, from the amount of labour required, are rendered costly, and when finished are constantly liable to get out of repair; the wind and rain are soon found to penetrate the joints, and render adjoining sittings exceedingly uncomfortable. The great improvement afforded by the glass we refer to, consists in its being thick, of large size, untransparent, figured in imitation of lead, and presenting that chaste appearance so necessary for places of worship. In connection with these advantages, the quarry glass is so strong that no frames are required to support it; and though three times the thickness of crown glass, windows made of it will be less expensive, perfectly air-tight, of better appearance, and much more durable. To architects and builders the quarry glass will recommend itself as combining utility, beauty, and economy. *Sunderland Herald.*

*Vegetation of Borneo: Ascent of Kini-Balu.*—The following interesting remarks are from a letter received by a correspondent from Hugh Low, Esq., Colonial Secretary at Borneo, who has been the first to ascend the loftiest mountain of that island. The position of Kini-Balu is at the N.E. extremity of Borneo, in about 6° north lat., where it forms a most conspicuous feature from the ocean to the east, north, and south. It has hitherto erroneously been presumed to be volcanic, from its peculiarly steep summit, and the rugged crater-like ridges it presents on various sides, and probably as much from analogy, the lofty explored peaks of Java being invariably so. The discovery of its granitic structure is on this account the more interesting. To the botanist, Kini-Balu seems to afford a rival in Rhododendrons to the Himalaya, and in Pitcher plants to any known country. In the same communication, Mr. Low informs us that he intends again ascending the mountain, and, if possible, reaching a higher elevation. We wish this adventurous and intelligent explorer every success. Nothing is said of the difficulties and dangers that must have attended his journey from the coast to the foot of the mountain, they were doubtless many and severe, and we wait with anxiety for further particulars, which shall be laid at once before our readers. "Labuan, April 23, 1851. As, when I had the pleasuse of meeting you in England, you expressed a wish to know something of the mountain Kini-Balu, I have now the pleasure to inform you, that I have sent to Colonel Butterworth, the Governor of the Straits, a small collection of plants made there by myself, on a visit I paid to the mountain last month, of which I beg your acceptance. I enclose in the same parcel two or three small

pieces of the rocks from different parts of the hill, by which you will perceive that the mountain is granitic, and not volcanic, as has been generally supposed. The view of the hill by which it is best known gives it a conical form; but that, I am inclined to think, is from its having been principally observed from the westward, where the end only of the mountain is seen. I imagined I had gained the top of the south-west end, but such could not have been the case, as the height of the point I gained is by barometer only 8516; whereas the top, by triangulation had been found to be 13,500 feet. [Captain Sir E. Belcher, who visited this locality in the Samarang, in 1844, and published, in his 'Narrative' of that voyage, an admirable view of the mountain, drawn on the spot, by Lieut. Browne, estimated its height, from observations made at Labuan, Ambong, Tampassook, Mantanani, and other places in the vicinity, to be 13,698 feet. Its summit was enveloped with mist, and from the difficulties which its outline and surrounding scenery presented, Captain Belcher did not attempt the ascent.] The highest parts are bare granite, and the ridge very narrow, the side to the northward being sheer precipice. Two or three Orchids were growing on the rock at the extreme point I gained, when the thermometer stood at 52° at noon of a fine day. [By this observation, the elevation reached by Mr. Low might have been assumed as between 8000 and 9000 feet.] The whole of the ascent is exceedingly steep, but with no places of any great difficulty to surmount, as far as I went. I remained two or three nights at an elevation of about 8000 feet, encamped under an overhanging rock, with a pretty considerable torrent rushing past it; the ravine of which was densely clothed with vegetation, including a fine yellow Rhododendron, forming a large shrub or small tree. In the same ravine grew also a Phyllocladus, a small-leaved Dacrydium, and another curious Rhododendron, like a Heath. One of the most remarkable plants was a new Dacrydium, which looked so much like a Spruce Fir, that I, at first, thought it must really be a cone-bearing plant. Of four species of Pitcher-plant, one was of a very curious, and to me of quite a new form, and so large as to contain as much water as I could drink at a draught when thirsty, probably a pint; it was a strong-growing species, and after a rather long search, I found it in flower; but all my specimens of it, together with many others, were thrown away by my lazy followers, during the descent, which we found very severe work, aggravated as it was by being made in very heavy rain. This Pitcher-plant was not found high on the hill, not more than from 2000 to 4000 feet. In all, I saw thirteen species of Rhododendron, in a distance of about three miles; some of those on the lower parts of the mountain epiphytal, and all that were in flower exceedingly beautiful." *Literary Gazette.*

*Sale of Plants.*—Eighty-seven lots of Mr. Smith's (of Norbiton) yellow Rhododendrons, and 16 of his Azaleas, were sold the other day by Mr. Stevens. The Rhododendrons averaged about 6*s.* each, and the Azaleas, which were somewhat large and fine, about 8*s.* a plant.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Let careful consideration be given to the proper management of the stock of winter flowering plants, so as to secure an unvarying display, during the whole time in which they are most required; to accomplish which, the stock should be divided into a number of successions, and introduced at proper intervals. We do not, however, wish to recommend any one to attempt to make use of fewer plants than would be amply sufficient to answer the desired purpose; for we consider that no pains should be spared to make the display as great and as good at all times as the resources of the place will permit. But the thing should be managed so systematically as to allow of the different periods being put as much as possible on a par with each other. Chrysanthemums, scarlet Geraniums, Cactus truncatus, early Camellias, Cinerarias, &c., ought now to be making a fine display in the conservatory; and to ensure a continuance of this as long as possible, let them be freely supplied with water, and occasionally with weak liquid manure. Pits and Frames.—More careful attention will be daily necessary in these, to preserve the plants from the effects of cold and damp. Examine the plants frequently, and remove all decaying leaves or other impurities. Let them have every ray of light which our gradually shortening days will afford them; and whenever the weather will permit, let the sashes be removed. Even when it is too damp to admit of this, a free circulation of air should be ensured, by tilting the lights, which should always be done on the leeward side.

FORCING DEPARTMENT.

Pineries.—Do not allow the cold weather to seal up the ventilators of these houses; the admission of air must of course be gradually reduced, in accordance with the advancing season, but this is a very different matter to almost discontinuing it. We make it a rule to give our plants some portion of air night and day, independent of that which obtains ingress through the laps. Let water be very sparingly used during dull weather, but have an eye to those plants which stand near the flues or hot-water pipes, as they are liable to get dry before their neighbours. Vineries.—All the houses from which the fruit is cut will by this time be converted into greenhouses; the Vines require to be kept cool and dry, and the plants want nearly the same treatment; frost, however, must be carefully excluded. While the plants are in these temporary dormitories, particular care should be taken to keep them perfectly clean and free from insects of every description, or these latter will leave broods behind them, which will be very troublesome another season. If possible, avoid putting plants into those houses in which the fruit is still hanging; but if necessitated to do so, let them be of such kinds as require the smallest quantity of water during winter, such as Crassulas, scarlet Geraniums, or semi-succulent plants of any kind, Cacti and other succulents, with young Vines in pots, Fuchsias, and various bulbous and tuberous rooted plants in a state of repose. As the leaves of the Vines ripen, let them be removed; pinching them off at the apex of the leaf, and leaving the footstalk to fall off when its own time comes.

FLOWER GARDEN AND SHRUBBERIES.

If the perfect neatness usually expected in this department is rendered less imperative at this season, either by the temporary absence of the family, or by their permission, a very considerable saving of labour may be effected by cleaning the walks only, and allowing the leaves on the turf and amongst the shrubs to lay undisturbed till they have all fallen, when they may be cleared away from the turf at one operation, and those amongst the shrubs may be buried by slightly digging over the surface of the ground, thereby giving it a dressed appearance, and improving the condition of the shrubs by placing the decaying leaves in immediate contiguity with the roots. Another advantage in allowing one cleaning to suffice is, that much injury to the turf is thereby prevented, for nothing damages it more than continually sweeping or trampling upon it when wet or frozen. The time saved by the course here proposed may be very advantageously employed in progressing as fast as possible with any new work which may be in hand in any department. It must be borne in mind, also, that a flower garden with empty beds, however clean and neat, has a very bleak, chilling appearance, and falls far short of the idea of a pleasure-ground, according to an English taste. Such a state of things is inexcusable, as sufficient shrubs may be kept, in a very small space of ground, to make the garden during winter look at any rate cheerful. We adverted to this subject some time back, but not so fully as it deserved; and we hope that those who have not already done what is necessary, will lose no time in accomplishing it. It is not, of course, to be expected that the beds can all be filled with flowering plants, but they may be with dwarf bushy plants of handsome evergreens.

FLORISTS' FLOWERS.

The Dahlia has continued to bloom for an almost unprecedented period, but its glories must necessarily now be of short duration. When the tops are blackened by frost, the sooner they are out of the ground the better. Dry the roots gradually, and take particular care of seedlings, especially the weakest, as these often turn out the best flowers. Choose a dry day, and go over Pink and Pansy beds, loosening the surface soil, and bestowing on the plants any little attention they may require Auriculas must not be forgotten amongst the cares attendant on planting Tulips, storing Dahlias, or framing Carnations; but these earliest of our next year's favourites must have plenty of air, without being left exposed to drenching rains.

KITCHEN GARDEN.

Where the texture of the soil is very tenacious, all treading upon the ground while it is wet should be scrupulously avoided, as it is impossible to preserve it free and open, if it is compressed at such a time. The object should be to render it as pervious as possible to the winter frosts; for which purpose, advantage should be taken of favourable weather to manure and trench all vacant ground, leaving the soil as rough and loose as possible. Any full-grown Broccoli, Savoys, &c, that are occupying ground which it is desirable to trench, may be taken up, and laid in with their heads pointing to the north, on any spare piece of ground. Scotch Kale, Cabbage, or Brussels Sprouts, may be similarly removed, observing however, to plant these in their original upright position, for the sake of their sprouts.

## Notices to Correspondents.

Back Numbers.—Full price will be given for the following Numbers: 1846—9, 25; 1850—41, 42, 44, 45, 48, 49.

Berberis aquifolium: *J P M.* Keep your seeds in sand till February, and sow them then. Some of them will be two years in coming up.

Birds: *A Naturalist.* Yes; in some places, and under certain restrictions. The selection of the spot, however, requires *much* judgment.—*Alice.* As you acknowledge yourself to be "a novice," we will not be severe, but rather caution you for the future. Your bird's feet are diseased from the want of cleanliness on your part. His perches should always have been kept clean with a soapy flannel. Dirt is fatal to all cage birds. Read our former remarks about this.—*William F.* By some, he is called the "Ox-eye;" by others, the "Joe-Bent." He is a perfect "savage," and of no value.—*F L.* Try a meal-worm when he droops.—*A G.* All will be right, if you have patience. He has moulted well; his head, now bald, will be perfectly covered in a fortnight.—*Sarah J.* His claws require cutting. Use a sharp pair of scissors for this purpose, and perform the operation carefully but quickly; as the heat of your hand is objectionable to the patient.—*B T.* Try boiled milk, with a little crumb of bread soaked in it.—*Janette.* Now is the very time to purchase a canary, or a black-cap. *Both* are in full song. We have already said *where* the best birds are to be procured.—*Sophia Jane.* —It is too early in the season to purchase hen birds for the purposes of breeding.—*Captain F.* If we are to give the casting-vote, let it be a bat-folded blackbird, in preference to a nestling.—*Ninetta.* Your string of questions, if replied to here, would require more space than we can afford. Send your name and address (inclosing a postage-stamp), and we will write you per post.—*T G.* Your letter and its inclosure have reached us. Many thanks. *W. K.*

Books: *C K.* Apply to Mr. Beck, Worton Cottage, Isleworth. ‡ —*Lignosus.* Brown's "Forester."

Clematis montana: *C N R.* It will succeed perfectly planted out against a south wall without any protection. Its flowers are white.‡

Cupressus: *A E V.* The two names are synonymous.‡

Glass: *W.* We should not like to try the experiment with horticultural rough plate; it is too weak. Thick rough plate, now extremely cheap, is not in the least likely to break. The India-rubber glazing is described by us at p. 499. It is an ingenious plan, and may answer; but it demands a trial, which time alone will give.

Guaco: *Florentine.* According to Humboldt, this is a composite plant called Mikania Guaco. According to Hancock and others, it is an Aristolochia. The statements about it are conflicting; but it can hardly be doubted that it is a plant of great potency.

Insects: *A Sub.* The grub sent with the young Larch tree roots is that of the common cockchaffer. Is this really the culprit? The injuries appear rather to have been committed by the Hylobius abietis. If by the former, the ground ought to be turned up and the grubs picked out at once, before they bury themselves in their winter quarters. *W.*—*R G K.* The insects found about the stone jamb of the door of your plantation belong to a species of spring-tailed insects (Lepismidæ), scientifically known as Petrobius maritimus, generally found about stones near the shore. *W.*—*J B.* The blisters on the Pear leaves sent are caused by the minute larvæ of a little moth (Argyromyges scitella), burrowing between the two surfaces of the leaf. The perfect moth appears in the middle of the summer, sitting among the leaves, and flying off on being disturbed. Hence a cloth daubed with pitch drawn occasionally over the trees will catch the moths in numbers. If the leaves are afterwards blistered, they should be picked off and burnt before the larvæ have left them. *W.*

Names of Fruits: *S W L M.* 3, Crassane; 4, decayed; 5, Beurré Diel; 6, 12, Passe Colmar; 8, Beurré d'Aremberg; 9, Winter Nelis; 11, Glout Morceau; 13, St. Germain; 15, Easter Beurré. The Apple is the Yellow Ingestrie.‖—*Este.* 1, Margil; 4, Wyken, or Warwickshire Pippin; 5, Cluster Golden Pippin; 6, Brickley Seedling; 7, Franklin's Golden Pippin; 8, Cornish Gilliflower.‖—*Senex.* 1, Bedfordshire Foundling; 2, Blenheim Pippin ‖—*Verax.* 2, 3, Chaumontel; 4, Doyenné Blanc; 6, Swan's Egg; 7, Sturmer Pippin; 8, Aston Town; 15, Yorkshire Greening; 19, Minchall Crab; 20, Ribston Pippin; 22, Marie Louise; 23, Autumn Bergamot; 24, Red Streak; 25, King of the Pippins; 26, Wyken Pippin; 27, Old Golden Pippin; 29, Moorfowl Egg.‖—*A B.* 1, 8, Early Nonpariel; 3, Trumpington, or Eve Apple; 6, 12, 13, 19, King of the Pippins; 7, Reinette du Canada; 10, Downton; 11, French Crab; 17, Blenheim Pippin; 20, Bezi de Caissoy; 21, Glout Morceau. In reply to your inquiry respecting No. 7, it will sometimes keep till April. Whether you disturb the soil immediately round the boles or not is immaterial, but you will do well in carrying out your intention of adding fresh soil and manure towards the extremities of the roots.‖—*W West.* 1, Scarlet Nonpareil; 2, 3, Court of Wick; 5, Beauty of Kent; 7, 9, Golden Reinette.‖—*J Carter.* 1, Lemon Pippin; 4, Hollandbury. The seedling, No. 2, and the Cumberland Apple, No. 3, have no merit.‖—*T C, Tunbridge Wells.* Neither of your seedling Apples are worthy of cultivation.‖

Names of Plants: We have received from *J M R* a little packet of entangled, unnumbered morsels in a state quite unfit for examination. We think we distinguish among them traces of Veronica incana, Diplotaxis tenuifolia, and some sort of Teucrium like T. Chamædrys.—*C M—l.* You are aware that Brassiæ are among the most difficult of Orchids to determine from single flowers. As far as we can judge from a specimen crushed in the letter-stamping, yours is B. bidens.—*W A.* Ceriuthe major.—*H C.* Ligustrum lucidum, the Chinese Wax tree.—*H G.* Lycaste macrophylla.—*J W G.* Ageratum cœlestinum.

Potatoes: *Sylvanus.* The effect of autumn-planting has hitherto been, that Potatoes set then have generally escaped the disease; while others, under similar circumstances, but not planted in autumn, have not. This year's experience has, however, somewhat shaken the value of the plan. Nevertheless early planting of some kind is advisable, and, if you should determine on planting now, you had best bury the sets in leaves 6 inches deep. ‡

Vineries: *W S.* Make the border of good turfy loam and dung, with some broken bones or peat, from 2 to 2½ feet deep, on a good well drained bottom. You had better glaze the roof with Hartley's rough plate glass; for which, in your case, the frames need not be stronger than usual.‡

Wall Trees: *J E M.* The article in question is much too long for us to reprint it. We must, therefore, refer you to the book itself.

Zinnia elegans: *B K.* We are not aware that it makes any difference whether you save your seeds from the guard petals or from the cone.‡

Misc. *Debies.* Sir Joseph Paxton is an Englishman. What an idle question!—*Monica.* 1, use Alum. 2, pinch off every flower-bud except that at the end of the shoot. 3, your Orchids want more heat. We cannot have advised you to put Stanhopeas into a greenhouse. 4, give them good turfy loam well rotted down, and the rich stuff from an old Cucumber bed. If possible start them also in bottom heat. 5, don't know such a plant. 6, no *general* answer can be given to the question. For most plants Thames water is sufficient. Do your plants appear to *want* anything more? 7, you cannot give artificial colour to Roses.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificates may now be obtained, on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

THE ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

THE BIRMINGHAM CATTLE SHOW.—CLOSING OF ENTRIES.—The CERTIFICATES of ENTRY for CATTLE, SHEEP, PIGS, and POULTRY, may be had on application to Mr. E. LATHBURY, No. 2, Insurance Buildings, Union-passage, Birmingham. The Entries CLOSE on SATURDAY, the 15th of November.

WHEAT FOR SEED, KESSINGLAND and GIANT RED, two of the most productive varieties, at 5s. 6d. per bushel. New sacks, 1s. 6d. each. Grown by JAMES FAIRHEAD, Seed Grower, near Braintree, Essex. Delivered by Quarter to any Station on Eastern Counties Railway, carriage paid. Post-office orders expected from unknown correspondents.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

CUNDY'S PATENT PRIZE STOVE.—W. HODGES, 123, Oxford-street (late J. E. DOWSON), is the sole manufacturer of CUNDY'S patent open fire-place, pure warm air ventilating STOVE, which has been so long tested and approved by the public, and for which he received the large Silver Medal from the Society of Arts. It is admirably adapted for warming and ventilating churches, school rooms, and other public places, halls, dining-rooms, &c., &c. Also CUNDY'S Patent Dioko-Capnon or smoke-expelling register Grate, a perfect cure for smoky chimneys; together with a large assortment of Marble Chimney-Pieces, Drawing-room and other Grates, Fenders, Fire-irons, and Kitchen Ranges of the most improved principle, Wind-guards, &c.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

LONDON to DUBLIN (*viâ* HOLYHEAD) in THIRTEEN HOURS and a HALF.

Three communications daily on week days; two on Sundays. Sea passage Four Hours and a Half. First class, 3l.; second, 2l. Return tickets (available for a fortnight), first class, 4l. 10s.; second, 3l. Children under twelve, half-price.

For full particulars of the booking-through system between England and Ireland, see "Bradshaw's Guide," page 122; "Walsh's Irish Guide," page 20; "Fisher's Irish Guide," page 2.

THE ROYAL EXHIBITION.—A valuable, newly invented, very small, powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four to five miles, which is found to be invaluable for YACHTING, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly-invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

THE NEW VARI-COLOURED DIAMOND GRAVEL.—Specimens of this beautiful and novel importation, suitable for Garden Walks, Pleasure-grounds, Public Promenades, &c. &c., are now on view, and samples may be seen, and orders received, at the office of the *Weekly News and Chronicle*, 337, Strand. This Gravel contains the following valuable properties, independent of its extreme beauty. It prevents the growth of weeds or grass, and in the wettest weather will not soil the foot. It is perfectly free from all clayey matter, and beautifully variegated in colour, never binds, and will keep the surface for double the time of any other, and one-fourth of the compliment required of the common gravel will suffice. The advertiser feels satisfied that when the beauty, durability, and cheapness of the New Vari-Coloured Diamond Gravel is known, that no pleasure-ground or garden will be without it. Orders received for not less than three tons.

ADULTERATION OF FOOD.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, begs to call attention to his ACHROMATIC MICROSCOPES (warranted good) which wil be exchanged if not approved of. These Instruments will define the Circulation of the Blood in the Frog's Foot, the Saw in the Sting of the Wasp, the Comb in the Spider's Foot, the beautiful form and varieties of Pollen in Flowers and their Structure, the Scales of the Butterfly's Wing, and also in many instances Adulteration of Food. It is a very interesting companion, and will pass away usefully many a leisure hour, the fund for observation being inexhaustible. Price for No. 1, 3l. 12s.; No. 2, 5l 15s; No. 3, 9l. 10s. A descriptive Book, sent post free, on receipt of three postage stamps. Prepared objects, 12s.; injected do., 30s. per dozen.

EXHIBITION PRIZE—HYBRID WHEAT.

MR. RAYNBIRD begs to offer to Agriculturists a new variety of WHEAT, a Hybrid between the Piper's Thickset and the Hopetoun, at 10s. per bushel, including delivery to the Bury St. Edmund's Station.—Address, Mr. R. RAYNBIRD, Hengrave, Bury St. Edmund's, Suffolk.

**The Agricultural Gazette.**

*SATURDAY, NOVEMBER* 1, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Nov. 6—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 13—Agricultural Imp. Soc. of Ireland.

LIEBIG has stated in his chemical letters, that "water evaporates incessantly from the surface of the young plant; its quantity is in direct proportion to the temperature and extent of the surface." This, like many of his other statements, requires to be considerably qualified, inasmuch as temperature is merely one element. Heat is no doubt the prime agent in the vaporisation of water, but the quantity is regulated by other forces. The amount of moisture which exists in the atmosphere exerts another force, and lessens the quantity of water which might be evaporated with a given temperature. Water at the temperature of 80° would give vapour very rapidly from its surface, if its constituent temperature in the atmosphere only existed at 30°. But if the dew point was to rise to 80°, no further evaporation could take place, because the pressure exerted by this density of vapour prevents any increase of tension without an increase of temperature. The same principle in some measure holds in the atmosphere as in the boiler of the high pressure steam engine, where the boiling point of the water is regulated by the tension of the accumulated steam.

In what form, then, can we express most approximately the evaporative powers of the atmosphere, so that this force may be more readily fixed in our mind, and so far be of use in enabling us to have some conception of its effects on vegetation and the earth? The fundamental conditions which regulate the force of evaporation, other things being equal, is the temperature of the air and the amount of moisture which it may already have in mechanical mixture. The difference between the constituent temperature of the watery vapour—in the atmosphere and the temperature of the air, is an index of its evaporative powers. On this principle the amount of moisture in the atmosphere becomes matter of calculation by observing the difference between a wet and dry thermometer. The markings of the two thermometers only coincide when the air is saturated with moisture. In this case no evaporation and consequent absorption of heat from the bulb of the wet thermometer takes place. Plants are affected in the same manner, and will exhale moisture from their leaves in the ratio of the dryness of the air. Sunshine and the force of the wind exert a powerful influence in promoting evaporation from plants. HALE's well known experiment on the Sunflower need not be adduced in confirmation of this fact. Indeed, if the thermometer is noted, the quantity of moisture in the air can be very closely guessed at from our sensations of heat or cold. A moist air checks the perspirations of the skin, while a dry one promotes them; and in the latter case robs more rapidly of the latent heat, and the air then feels cool, though comparatively warm.

In a former Number we pointed out that there was a remarkable agreement between the mean minimum temperature in the shade and the mean dew-point of the vapour of water in the atmosphere. It must, then, be obvious that the force of evaporation must depend, in a great measure, upon the range of the thermometer through the day. Thus, a mean temperature of a summer-day, at 60°, would have a much less evaporating force composed of 66° and 54° as extremes, than of 80° and 40°; the one would evaporate .07 inch of water, and the other .25 inch. The composition of the mean temperature of any country becomes a most important element in many respects. It is a peculiarity of temperate latitudes that the thermometer differs much more in daily range than it does within the tropics. This, as we formerly showed, is evidently owing to the great amount of moisture which exists in the air near the equator, and this seems to be the chief element in tempering the force of solar and terrestrial radiation. In some of the southern states of North America the difference between the day and night temperature is greater in winter when the air contains less moisture, than in summer when there is more. But this is reversed in our latitude, because the sun has little power in winter; whereas, in summer, a powerful sun, with a comparatively small amount of moisture in the atmosphere, give us a wide range of the thermometer.

We see that Lord WHARNCLIFFE, in an able paper on drainage, in the last number of the "Royal Journal of Agriculture," has laid hold on the range of the thermometer as an index of the amount of evaporation. This can only be done, however, on the supposition that the minimum temperature corresponds pretty closely with the dew-point of the vapour. By the bye we think he has made a most unfortunate selection of two stations to illustrate this principle; and as the same error is very often committed, we take this opportunity of pointing it out. The difference between the annual temperature and the summer temperature at Bedford and at Derby is 6.7° (!) and 8.3° (!) respectively. Now we have no hesitation in saying that this difference principally arises from comparing observations which have been made under totally different schemes. If this very common practice is not carefully guarded against, one will be very apt to write a greater amount of heat or cold, as you go north or south, or in any direction whatever. The very best observations that can be got give but a very uncertain sound, which should make us rather fastidious of the materials which we select.

We are inclined to think that mere mean temperatures are of much less use as a basis for ascertaining the agricultural capabilities of any country than is usually imagined. For example, take the case of Great Britain; the eastern counties of England are very opposite in their effects on vegetation from the western, although their mean summer temperatures are almost equal, as well as where the amount of rain does not differ very materially in spring and summer. It is not in these elements that we are to look for their characteristics. The climate of East Lothian is much superior for ripening the Cereals to many districts in the west of England and Ireland, still the summer temperature is much less. Again, owing to a combination of circumstances, which will be afterwards detailed, Morayshire contains one of the finest Wheat and Barley districts in Britain, but its summer temperature, we have every reason to believe, is lower than in many other parts of Scotland, which are much inferior in corn-growing qualities. The mean summer temperature of London is 62.78°, that of Paris, 64.58° (MAHLMANN); the summer temperature of London will sometimes reach that of Paris, but vegetation in the surrounding country of the latter is, in so many respects, different from that of the former, which impresses us with the conviction that their climatic peculiarities are separated by a much wider boundary than our figures indicate.

In order that we may have some figures to assist us in rightly judging of the composition of our mean temperatures and their special effects on vegetation, we have selected observations which have been made under the same schemes and where every precaution has been used to ensure accuracy. The observations for the East of England may be taken as a type of the driest eastern counties. Those of the West of England for the south-western counties as well as the southern part of Ireland. The others as the temperature of the middle districts of the eastern counties of Scotland. The evaporation is calculated and stated in inches. It would be out of place to enter into the particular data from which

these are deduced. It must also be borne in mind that they are a mere approximation, and even liable to objections; but if we take the other elements into account which modify this force, we believe it will prove as correct a mode as can at present be suggested.

| | March. | April. | May. | June. | July. |
|---|---|---|---|---|---|
| East of England. | | | | | |
| Mean temperature ..... | 43.1° | 47.4° | 54.7° | 60.8° | 63.0° |
| Maximum temperature | 50 3 | 57.1 | 66 0 | 71.7 | 74.1 |
| Minimum temperature | 35.4 | 37.7 | 43.5 | 49 9 | 51.9 |
| Range of thermometer | 15.4 | 19.4 | 22.5 | 21.8 | 22.2 |
| Evaporation in inches | 1.6 | 2.5 | 4.0 | 3.7 | 4.2 |
| West of England. | | | | | |
| Mean temperature ..... | 45 3 | 49.2 | 54.2 | 59.4 | 61.9 |
| Maximum temperature | 50.7 | 54.6 | 60.6 | 67.5 | 68.9 |
| Minimum temperature | 39.9 | 43.9 | 47.9 | 51.4 | 54.9 |
| Range of thermometer | 10 8 | 10.7 | 12.7 | 16.1 | 14.0 |
| Evaporation in inches | 1.2 | 1.2 | 2.0 | 3.0 | 2.5 |
| Eastern Counties of Scotland. | | | | | |
| Mean temperature ..... | 39 3 | 43.2 | 50.1 | 56.2 | 58 5 |
| Maximum temperature | 45.3 | 50 8 | 58 0 | 64.7 | 66.6 |
| Minimum temperature | 33 3 | 35 7 | 42.3 | 47 8 | 50.5 |
| Range of thermometer | 12.0 | 15.1 | 15.7 | 16.9 | 16.1 |
| Evaporation in inches | 1.0 | 1.8 | 2 0 | 2 9 | 3.0 |

The evaporation is calculated on the supposition that the mean dew-point is 2° higher than the mean minimum temperature. It will be observed that the evaporation is not in the exact proportion to the range of the thermometer, because the force of the vapour increases in a greater ratio with the increase of temperature. It will be found that 10° of dryness of the air, with a mean temperature of 80°, would evaporate as much as 32° of dryness when the mean temperature is 46°. In this case we have supposed the minimum temperature and the dew-point to be equal. It must be apparent that the force of evaporation is just as important an element as the amount of rain which falls; for, when the earth is watered by the rains of heaven, and as plants must have a certain quantity to sustain their growth, the effects of this combination of the atmospheric condition becomes a most important inquiry. The amount of evaporation is very different in the east and west of England; but it will be seen the latter agrees more closely with the cyphers for Scotland. In regard to their indications, we might point out many farm practices which are similar in the west of England and in Scotland, but which do not obtain a place in those of the eastern counties. But our object is to show its specific effects on vegetation, which form the foundations of our system of agriculture.

We do not attach any undue value to meteorological figures, for they must be made use of with much caution. There are so many elements in the question that are very apt to be overlooked, some of which we are entirely ignorant of their special effects. But the progress which this subject has already made, and is rapidly making, gives us hope for still greater advances. It is entirely out of the question to look for a correct theory of agricultural chemistry, until we master some of the meteorological aspects of the subject which lie before us exposed on the very surface of our agricultural systems. Let us, then, as far as possible, seize with a firm grasp the facts which are provincially well known, but do not hold where other circumstances interfere as disturbing elements. The analysis of these circumstances may enable us to judge whether our new guide, the chemist, is always working in the right direction, and taking the shortest way to arrive at a sound system of theoretical agriculture. *R.*

---

The Commissioners of National Education in Ireland have issued a copious and very interesting report of their proceedings for the year 1850. With the general subject of it we, in our capacity of agriculturists, have no immediate concern; but in that portion of it, which embraces agricultural education, we have a direct legitimate interest. We shall therefore notice—succinctly, however—that division of the able report (presented by Dr. Kirkpatrick, the inspector), which supplies information respecting the agricultural schools which the commissioners have introduced, and are progressively establishing in Ireland.

The tabular statistics exhibit three classes of schools, viz., model agricultural, ordinary agricultural, and workhouse schools.

Of the first class, there are 17 in full operation, five in partial operation, and three in course of formation.

Of the second class, there were 37 in operation (April 1, 1851), and of the third class three.

The aggregate number of pupils in these schools is 1064, exclusively of 173, who are under instruction in the industrial classes of minor schools. The area of land under culture by the combined agencies of all these schools, is under 1000 acres, of which 127 are in connection with the model training school at Glasnevin, near Dublin. The quantities attached to the other model schools vary from 64 to eight acres; to the ordinary agricultural schools, from 16 to about two acres, and to the workhouse schools, from 37 to three acres.

Compared with the present depreciated value of land in Ireland, the rents of these farms are, in many instances, very high; but, probably, leases were entered into by the commissioners and patrons of schools, in times more favourable to the landed proprietary than now; and the proximity of farms to cities or thriving towns will satisfactorily account for the high scale of rents, which range from 4*l.* 8*s.* 10*d.* to 10*s.* (in a few cases lower), per acre.

On the farm at Glasnevin only are any horses kept: the total of beasts of labour on the other farms is two mules and 23 asses; and only in two cases is there more than a single ass on the farm. Spade labour—possibly in some instances occasionally hired horse work—is to be assumed as the *modus operandi*.

There is also another class of model agricultural schools, whose establishment was suggested by Lord Monteagle, as likely to be productive of peculiar advantages, where local circumstances permit: these are called *central* Model Agricultural Schools, being designed to afford opportunities of instruction to the pupils of national schools within the range of a convenient distance. Lord Monteagle has established one at Mount Trenchard, his Limerick estate, and the others have been formed in Cork and Galway, on the properties of J. R. Barry, Esq., and Sir Thomas Burke, Bart.

These model schools are of a two-fold description: "Those under the immediate control of the Commissioners, and those conducted under the superintendence of local patrons or managers. To the former class belong those of ———, in which the agriculturists act merely in the capacity of stewards, being paid a certain salary per month, with furnished apartments in the establishment. They are supplied with the necessary live-stock, seed, implements, &c., and are required to furnish weekly farm reports, and monthly accounts of all receipts and disbursements on account of the farm, certified by proper vouchers. In addition to the management of the school farms on the most approved principles, and the practical instruction of the pupils, they are required to give scientific instruction in agriculture to the resident pupils, and those composing the agricultural class in the school. In the second class, where the establishments are under the direction of local managers, the teacher holds the land as tenant, and farms on his own account, having all the profit that remains after payment of rent and other charges. This class consists of two divisions,—1st, school farms of from 6 to 12 acres, where both the agricultural and literary departments are conducted by the same person, who receives 10*l.* per annum in addition to his class salary as a literary teacher; and 2dly, school farms of 12 acres and upwards, in which the literary and agricultural departments are under the management of separate persons. In those cases the literary teacher is paid at the usual rate, and receives the school fees of the children. The agriculturist receives a fixed salary of 30*l.* per annum, together with the profits of the farm, and 12*l.* per annum for each resident agricultural pupil who may be placed under his instruction."

These are very moderate salaries. To the teachers of ordinary agricultural schools the commissioners pay 5*l.* per annum in addition to his class salary for giving agricultural instruction, and with a stipulation that 3 acres, at least, be in connection with the school. In an economical point of view the system of allowing the master to farm on his own account, and merely paying him 12*l.* a year for the board of each pupil, is unobjectionable. It is the principle acted upon in the French departmental colleges, where the master is paid the sum of 300 francs with each of 20 pupils—the department paying for six, and the Government for the remaining 14. But there is great difficulty in finding a first-rate farmer who combines in himself all the requisite qualifications, among which must be included firmness, and yet liberality and mildness of disposition, with an enthusiastic love of his profession, moderated with prudence. At the death or retirement in any way of *a tenant* teacher of this kind, it is easy to conceive the confusion that must affect the whole school which he kept together, and the difficulty that might arise in reorganising it.

There is difficulty in finding a qualified teacher, and so disinterested as often to forego certain and immediate profit, in order to pursue and illustrate a system which may require time for its completion and development—and free from the penuriousness which would tempt him to overwork and underfeed his pupils. Yet, on the other hand, a well qualified teacher, subject to the control of any committee of men, whose collective wisdom might be very inferior to his own good judgment, might find his movements sadly impeded. To compare little things with great, he might be tortured, impeded, and prevented from doing what his intuitive knowledge would suggest as the best course, as the Duke of Wellington was thwarted and perplexed by comparatively ignorant and feeble minds, on his taking a subordinate command on the soil of Spain.

The Commissioners are quite right in having the one grand establishment under their control, at Glasnevin. The principle of centralisation being to a certain extent most desirable in the system of education, as in other things; we therefore concur in the reporter's sentiment, that "the different agricultural schools throughout the country may form nurseries from which the Glasnevin establishment shall derive a supply of youths, well fitted by their previous training for the large sphere of agricultural instruction and practice which there opens to them." Acting on this principle, it is intended to endow a *free scholarship* in each of the great model schools for the most deserving pupil in each of the industrial classes which have been formed in several of the agricultural schools. In these a few selected pupils are paid about 1*d.* a day for at least two hours' work; and this has been found a very effective stimulus to industry. The sordid and short-sighted parents have been occasionally known in Ireland to object to the employment of their children in the culture of school-fields and gardens without pecuniary recompense. If the local supporters of a model or ordinary agricultural school pay a class of four or six boys, the Commissioners will pay a corresponding number—1*d.* to each individual; and the prospect of being promoted from the industrial class to a free scholarship will be a still stronger incentive to good conduct and energetic industry.

A considerable portion of Dr. Kirkpatrick's report is occupied with very important extracts from the reports of her Majesty's inspectors of schools in England, which tend to demonstrate the beneficial results likely to arise in some English parish schools (agricultural and horticultural) for combining industrial with literary education. The system about to be pursued in this respect at the Battersea training-school and at Kneller-park, are specially referred to; and an answer to those heartless people who dislike the notion of instructing the labouring classes—beyond the merest shadow of elementary education—is thus given in the words of the Rev. M. Michell:—"The only method of overcoming this feeling, it seems to me, is to make the schools really practically efficient, by teaching in them such subjects only as may conduce to form the mind of a labourer, and fit him for his future career. And it should be borne in mind that the education required for a town boy is widely different from that needed for an agricultural labourer. The object to be pursued is to fit the child for his *present* occupation and status in society, not to *raise* him out of it. If he wishes to rise he must elevate himself. He must look to his own or his parents' exertions, not to the help of the State or charity, to place him in a more advanced position in life. I am, therefore, led to think, that if it were possible to attach land to every school, for the scholars to be trained in agricultural pursuits, it would be a very great improvement. The employers of labour would then see that a positive advantage was attained, and the parents might also be induced to make some further sacrifice to procure an evident worldly benefit, which, however, it may be regretted, is to most of them the only, or at least, chief object why they send their children to school."

If much may be said in favour of connecting farms and gardens with the English workhouses, in order to train up pauper children to pleasing and beneficial labour, more may be urged in regard to the Irish workhouses in this particular; for the plain reason that Ireland is pre-eminently an agricultural country, and that an immense portion of her agricultural labourers have already emigrated, or sunk under the wasting influence of famine and poverty. Every poor-house child, then, practically taught what belongs to the successful cultivation of the soil, may be rendered valuable to the State, happy and independent in himself; the well-paid labour of such a one will, assuredly, be required in Ireland, when that country settles down to the serious work of self renovation. We wish God speed, then, to the Commissioners of National Education in Ireland, in their efforts to foster that system of agricultural instruction which, in the words of Professor Johnston, "will make the schoolboys of our days the agricultural improvers of the future." *M. D.*

---

## INDUSTRIAL EXHIBITION.

It is not the quality only of agricultural produce that ndicates the suitability of the circumstances under which it was grown—for the attainment of agricultural profits: that depends upon the quantity as well as the excellence of the produce; upon the former even more than upon the latter: and therefore, while describing the samples of colonial produce shown in the Exhibition

---

* 'A Word in Season.' Ridgway, Piccadilly. *Eighth Edition.*

building, we shall take the opportunity of adding such information as we possess, regarding the climate and other characteristics of the different localities to which an intending emigrant will look.

1. *Canadian Produce.*—In reference to Canada we have all the information that can be desired on these points, in Professor Johnston's valuable report on the Agricultural Capabilities of the adjoining Province of New Brunswick.* We have not hitherto referred to this report, but would do so now to point out to the agricultural or geological student where he will find the model of a geo-agricultural review of the capabilities of a district. We had occasion some weeks ago to refer to Professor Johnston's "Notes on North America," as a valuable work for the intending emigrant. If any one shall have considered from its perusal that New Brunswick offers as likely a reward for his labour and capital as any other of the provinces referred to in that work, he will probably desire further information regarding it; and we now assure him that he will find all this in full detail in the work we now refer to.

The details regarding climate are to be considered as a rather too favourable account for Canada—where the winters are, no doubt, severe: but the general agricultural methods and results may be held to be pretty nearly alike in both provinces: and on these subjects Professor Johnston's report is particularly full and explicit. We hardly know how to present its statements in a sufficiently brief manner by extract: but, perhaps the following will be the most valuable pieces of information, when taken in connection with an examination of the produce in the Crystal Palace:—

"*Climate.*—If we suppose the year to consist only of a summer and a winter, and that the length of the summer is very nearly represented by the interval between the earliest sowing and the latest reaping, we obtain from the preceding Table the following data and deductions:—

1st. Earliest sowing in the province..... 17th March.
Latest ploughing in the province ..... 1st Dec.
Longest summer from these data, 8 months and 14 days.
2d. Latest early sowing ..... 15th May.
Earliest late ploughing ..... 1st Nov.
Shortest summer from these data, 5 months and 15 days.
3d. Mean length of the summer from these two results, 6 months and 22 days.
4th. Average interval between the earliest sowing and latest ploughing—or mean length of summer—deduced by combining all the returns in the preceding table, 6 months and 22 days."

The following is a portion of the returns relating to the seedtime and harvest of the three chief corn crops:—

TIMES OF SOWING AND REAPING THE DIFFERENT KINDS OF GRAINS AND ROOTS IN THE SEVERAL PARTS OF THE PROVINCE.

| COUNTIES. | No. | Wheat. | | Barley. | | Oats. | |
|---|---|---|---|---|---|---|---|
| | | Sowing. | Reaping. | Sowing. | Reaping. | Sowing. | Reaping. |
| St. John ... | 1 | April 15 to May 15 | ... ... | ... ... | ... ... | Apr. 15 to May 15 | Aug. 15 to Sep. 15 |
| Charlotte ... | 2 | April 20 to May 10 | ... ... | ... ... | ... ... | Apr. 20 to May 10 | Aug. 20 to Sep. 10 |
| Ditto ... ... | 3 | April 25 to May 10 | Aug. 20 to Sep. 1 | May 15 | Sept 1 | Apr. 25 to May 10 | Aug. 20 to Sep. 1 |
| Ditto ... ... | 4 | April 20 to May 1 | Sep. 1 | May 15 to 25 | Aug. 25 to 30 | May 1 to 15 | Aug. 28 to Sep. 15 |
| Ditto ... ... | 5 | May 1 to 10 | Aug. 20 to Sep. 1 | May 20 to Jun. 10 | Aug. 20 | Apr. 20 to June 20 | Aug. 20 to Oct. |
| Ditto ... ... | 6 | May 1 | Sept. 1 | ... ... | ... ... | ... ... | ... ... |
| Westmoreland | 7 | April | August | June | September | May | August |
| Ditto ... ... | 8 | April 1 to May 30 | Aug. 10 to Sep. 20 | May 10 to June 6 | Aug. 20 to Sep. 20 | Apr. 1 to May 30 | Aug. 10 to Sep. 20 |
| Ditto ... ... | 9 | May 1 to June 1 | Aug. 30. | June 1 | Sept. 1 | May 1 | Sept. 1. |
| Ditto ... ... | 10 | May 1 to 20 | September | June 1 to 20 | September | May 1 to 20 | September |
| Ditto ... ... | 11 | April and May | Aug. and Sept. | June | Ditto | April and May | Aug. and Sep. |
| Ditto ... ... | 12 | April 15 to May 15 | Aug. 20 to Sep. 20 | May | August | May | September |
| Ditto ... ... | 14 | May 1 to 31 | Aug. 15. | June 15 to 30 | September | May 1 to 31 | Aug. 15. |
| Ditto ... ... | 16 | May 10 to 30 | Aug. 10 to Sep 10 | June 1 to 25 | ... ... | Apr. 20 to June 1 | ... ... |

Now, the following result arises out of a comparison of these two extracts:—

| | Months. | Days. |
|---|---|---|
| The average duration of summer ... ... ... | 6 | 22 |
| The average period of growth of crops from the above Table ... ... ... ... ... ... | 3 | 17 |
| Leaving for the spring and autumn ploughing, &c., before seed time and after reaping ... | 3 | 3 |

"It must be confessed that these periods are short compared with the length of time for out-door labour which the English and more southern Scottish farmers possess. The effect of this, if other things were equal, would be to impose upon the New Brunswick farmer the necessity of employing a larger force of men and cattle to perform the work of a farm of equal extent than the British farmer needs to do. If this be so, the effect must be to increase the comparative outlay of the New Brunswick cultivator, and to diminish in a proportionate degree his profits.

"Two points, however, have been brought under my notice as in some measure palliating or countervailing any evil which may arise from this cause; thus—1st, the number of days during which rain impedes the operations of the British farmer is notoriously very great. But in New Brunswick the climate is more steady and equable.

"I am informed that the severe frosts in winter generally penetrate so deep into the ground, especially when it is not covered with Grass, as to raise up and separate the particles from each other to a considerable depth; so that when the thaw comes, it is already so loose and open as scarcely to require ploughing at all, or, if ploughed, to be done with little force and great speed."

The subject of climate, in all its details of temperature and rain, is described in full detail, and its effects on agriculture discussed, both as regards the modes of practice which it necessitates, and the resulting produce which it yields. On this last point we extract one more passage:—

MAXIMUM, MINIMUM, AND AVERAGE PRODUCE OF WHEAT, BARLEY, AND OATS PER IMPERIAL ACRE, IN EACH COUNTY IN THE PROVINCE.

| COUNTIES. | Wheat. | | | Barley. | | | Oats. | | |
|---|---|---|---|---|---|---|---|---|---|
| | Maximum | Minimum. | Average. | Maximum | Minimum. | Average. | Maximum | Minimum. | Average. |
| Saint John ... ... ... | 20 | 10 | 15 | ... | ... | ... | 40 | 30 | 35 |
| Charlotte ... ... ... | 33 | 10 | 20¼ | 35 | 10 | 24 | 60 | 25 | 32½ |
| Westmoreland... ... ... | 25 | 15 | 18¾ | 40 | 20 | 26⅔ | 45 | 30 | 35¼ |
| King's ... ... ... ... | 30 | 10 | 20⅝ | 50 | 15 | 28⅓ | 60 | 25 | 37¼ |
| Queen's ... ... ... ... | 20 | 8 | 14¼ | 18 | 18 | 18 | 60 | 13 | 29 |
| York ... ... ... ... | 32 | 15 | 22½ | 64 | 19 | 34½ | 60 | 32 | 38⅝ |
| Sunbury ... ... ... | 30 | 12½ | 19¾ | 40 | 20 | 30 | 50 | 30 | 38⅓ |
| Carleton ... ... ... | ... | ... | ... | ... | ... | ... | 30 | 30 | 30 |
| Albert ... ... ... ... | 25 | 15 | 19½ | 40 | 16 | 22⅝ | 40 | 25 | 28 |
| Kent ... ... ... ... | 40 | 15 | 21 | 20 | 20 | 20 | 35 | 25 | 30 |
| Northumberland ... ... | 25 | 15 | 18½ | 35 | 25 | 29¾ | 40 | 25 | 31⅔ |
| Gloucester ... ... ... | 30 | 15 | 22½ | 35 | 25 | 30 | 40 | 28 | 34 |
| Restigouche ... ... ... | 28 | 28 | 28 | 60 | 60 | 60 | 50 | 50 | 50 |
| Maxima, Minima, and Averages for the whole Province ... ... ... | 40 | 8 | 19 1/12 | 60 | 10 | 29 | 69 | 13 | 34 |

In the following table these results are compared with the similar results published by authority, as characteristic of the State of New York:—

AVERAGE PRODUCE PER IMPERIAL ACRE.

| | State of New York. | New Brunswick. |
|---|---|---|
| Wheat ... ... | 14 bushels. | 20 bushels. |
| Barley ... ... | 16 ,, | 29 ,, |
| Oats ... ... | 23 ,, | 34 ,, |
| Rye ... ... | 9½ ,, | 20¼ ,, |
| Buckwheat ... | 14 ,, | 33⅔ ,, |
| Indian Corn ... | 25 ,, | 41⅔ ,, |
| Potatoes ... ... | 90 ,, | 226 ,, |
| Turnips ... ... | 88 ,, | 460 ,, |
| Hay ... ... | — ,, | 1¾ tons. |

The above facts, and especially those relating to climate, will prepare our readers for the information that few of the samples of agricultural produce, exhibited by Canada, in the Crystal Palace, were remarkable for excellence of quality.

The specimens which come within the scope of our remarks are included between Nos. 27 and 71 in the Catalogue. Among these the barrels of Peas, exhibited by Messrs. Jones, of Sydney; and Limoges, of Terrebonne; the flour exhibited by Messrs. Simpson, of Bournanville; the Hops shown by Mr. Smith, of Stanstead; and the maple sugar shown by Mr. Fisher, of Ascott, have received prize medals: and the Buckwheat shown by Mr. Trenholm, of Kingsey; and the Red Clover seed shown by Mr. Jeffries, of Burodan, are honourably mentioned. Excepting the Peas and the Buckwheat, and the flour (a manufactured article), none of them indicate the more general agricultural capabilities of the country. The specimens of Wheat, Barley, Oats, and Beans, to which one looks as indices on this subject, have not been held deserving of reward; and indeed, excepting the Beans and the Kidney Beans—especially the specimens shown by Mr. Fisher, of Rivière du Prairie; and by Madame Lamere, of Montreal; and C. Fournier, of Longueville—none of the specimens came up to the character of a first-rate sample of English growth. The Oats were not so clear and short and plump as are not uncommonly seen at English markets; and the Wheats, for selected specimens, were not creditable to the growers. In so far as their character was the unavoidable consequence of climate, of course nothing can be said in disparagement of it; but the specimen shown by the Provincial Agricultural Association was *mixed*, evidently containing more than one variety of Wheat, and it contained Oats as well, and certainly it ought not to have been sent to the Exhibition. For the rest we would add, that the samples of Peas and Beans were the redeeming features of the series.

* Published at Frederickton.

## FARMING CAPITAL.

Repeatedly reading statements in the *Gazette* upon this subject, many of them so extravagant as to frighten or deter anyone from entering the business of farming; such as the article called "A Bull-breeding Farm," in No. 39—I do not mean to say there is anything false in those statements—I am induced to send an estimate, and plan of proceeding, to encourage persons of small means, point out the best plan to economise, and endeavour to show that a few hundreds on a small farm of good land, well managed, will prove as profitable as thousands on a large one. I am quite sure we must see, as one of the principal remedies for "present prices," farmers concentrating capital and energy. I therefore, by your permission, enclose an estimate of a 60 acre farm. I have been as concise as I can; but should any of your readers wish it, I shall be most happy in giving detail of practice, but I would strongly advise amateurs to go on a farm for a year or two before commencing for themselves, thereby combining, if only a little, "practice with science," without which I should despair of their success.

1. *Going into Farm.*—We will suppose it entered at Lady-day, 1852, with the usual privilege of going in to till Wheat and Vetches in the autumn of 1851, for which you can generally hire the out-going farmer's horses, &c. Should there not be any corn "seeded out" with Clover, you should also till the quantity named in the rotation. You need not spend more than 20*l.* for implements for a year or two, until you "turn yourself round." Attend the farm sales, and there you will get very good useful ones for a trifle. You can also purchase good working horses for about 10*l.* each; but these, as well as implements, should be replaced as soon as possible for young horses, and the most improved machines.

ROTATION OF CROPS.

| | 1st Year. | 2d Year. | 3d Year. | 4th Year. | 5th Year. | 6th Year. |
|---|---|---|---|---|---|---|

EXPENDITURE.

| | £ | s. | d. |
|---|---|---|---|
| Purchasing stock, &c.—You should purchase 2 sows ready to litter in March, 3*l.* each ... ... ... | 6 | 0 | 0 |
| In May, 10 fresh calved cows, with heifer calves, 15*l.* | 150 | 0 | 0 |
| 2 horses ... ... ... ... ... ... ... | 20 | 0 | 0 |
| Implements ... ... ... ... ... ... ... | 20 | 0 | 0 |
| In October, 5 yearling heifers, 5 do. steers, 5*l.* ... | 50 | 0 | 0 |
| 10 ewes ... ... ... ... ... ... ... | 20 | 0 | 0 |
| | ‡£266 | 0 | 0 |

* The 3 acres Turnips must be after Vetches or early Cabbages. The Potatoes should be all early sorts, none later than York Regent's; but would advise earlier, to come up in July, when a good crop of Turnips can be got after.

† I would strongly advise early Potatoes and Mangold Wurzel to grow together, the former 1 yard between the rows, thereby giving you 10 acres of Potatoes, and quite as heavy a crop of Mangold Wurzel per acre, making an addition of 125 tons more roots. This double cropping I find answer exceedingly well. I grew a good crop of Carrots, under Barley, last year; and three crops off another piece, viz., Potatoes 1 yard apart, two rows of Carrots between; after Potatoes, good crop of Turnips. This year I have got two crops of Turnips on the same ground 24 inches between the rows; also have a good crop of Carrots between Mangold Wurzel, at 27 inches between; also a promising crop of stubble Turnips. These would be valuable additions to my estimate, but require peculiar treatment.

‡ You will not require immediate cash for yearling heifers, steers, ewes, oilcake, and half for labour, or implements

With your own, 14 six months' pigs and 14 suckers will be your winter stock; but these will not be sufficient to consume all your food, you should therefore purchase some extra cows or steers to make fat, and part with them as your own stock comes on; or fat the whole of your own pigs, the six months as baconers, the autumn litters as porkers.

## Home Correspondence.

*Hussey's American Reaping Machine.*—On the 16th of October I went over to Sydenham, to see this wonderful machine; had it been mine, I certainly would not have risked its reputation upon such poor and half dried up Clover of various heights, from 2 inches to 8 inches high. When viewing it, before it started, it looked a very humble affair. At last a couple of dancing post-horses were yoked to it, and a sort of postillion got up in the saddle. Thinks I, you look more like going to a wedding than shearing. The first bout this machine cut all that was high enough for the clippers; the rush after it completely crushed the piece of Clover down, and in the second attempt, from the pressure of people and the Clover together, the machine failed—this highly pleased a great many, the fate of it was sealed in their minds. An old farmer, in order further to work out its disgrace, halloed out, "Can it cut Rushes?" "Yes," says Hussey. Away we all went to a swampy piece of ground, full of humps and bumps and Rushes; it started, and at the rate of four miles or more an hour, down came every Rush, and doing its work quite to the satisfaction of all. Now if it can cut down nearly ripened, hard, wiry Rushes, what chance can corn stand? What a glorious machine, thought I; for many a back-ache had I in my young days at reaping. *James Cuthill, Camberwell.*

*Game.*—What has become of all the hares and rabbits round Manningtree and Wix? Has my reverend opponent snared them all? They are not even mentioned in his reply to me. He says, the sources of my information are not trustworthy. Now, on the subject I have received no information from any living person. I have lived in too many counties in the United Kingdom not to observe and see the bad effects of the vermin called game, in some places, especially in England, deteriorating the land by one-half its value. This is an opinion long formed by many: Mr. Smith, of Deanston, 30 years ago, was of that opinion; Mr. Mechi, Mr. Davis, the reverend author of the "Word in Season," and, dare I say my reverend opponent, in his own mind, thinks the same; but don't let me be told that this does not depend upon hares and rabbits, but upon high cultivation. Pray who can cultivate highly, when so many vermin exist, destroying all one's prospects, and the cultivator hardly dare look at them? I know one estate in Kent, where the landlord lets his beautiful loamy deep soil for 5*s.* an acre, and the farmers on the estate made all as poor as church mice by these hares, rabbits, and pheasants; and these breeding hedges thickly studded with all sorts of bushes, breeding every destructive insect, by far too numerous for the partridges to keep down, and breeding slugs by the million, that they cannot eat. Not with all the assistance of that winged bird, called the sparrow, can they keep down these insects. By the way, is it not rather odd that that bird was not made game also? I know a farm, where, up to a few years back, the tenants were allowed to kill all the game; they are now forbidden, and the whole estate is let out every year by its noble owner to gentlemen to shoot over; the tenants dare not shoot one. What use was the law of '48 here? and those tenants get no drawback whatever, after feeding a numerous and destructive flock of game at their own expence. Why not give up the farm, says my reverend opponent. The idea! after a man has spent his all in his land. No! he must try and reason with his landlord, and struggle with his difficulties until those laws are entirely abolished. But I must go a little further back. I lived upon a farm, when a lad, where game was preserved, not by the landlord of the estate, but by the neighbouring landlord, to whom it was let, which was ten times worse. I candidly own that every one of the servants, tenants and all, were in the sight of the law downright poachers. And is not this very bad education for the young? the tenant thought it no crime to have part of his own rearing, and it was more his than it was the absent landlord's. After that I was head keeper and head factotum to my lamented friend James Smith, of Deanston; we had a large tract of land given to us to preserve and shoot over, but when shooting time came on we had to travel a few fields before we could get a shot, showing that I was a bad keeper. This estate was well farmed, as the farmers cared little for me, and Mr. Smith knew too well that they could not farm well and have too much game preserved on their lands at the same time. I thought the other day that I would recommend bantams to a large market gardener. "Bantams! what do I want with them?" says he; "we never suffer with insects; it is only bad and slovenly gardeners that breed insects. We have no broad hedges nor ditches. Deep digging and continually burying insects' eggs; all cleanliness keeps a garden free of insects; and so does high farming." Now, this is a positive fact that, high farming, without winged game, have but few insects. Certainly not; if all hedges are kept tidy, ditches filled up, long Grass kept down, shrubs and headland rubbish done away with, the wireworm in time gets scarce. They proceed from a moth. Insects cannot breed if there are no breeding places. "Have you any game upon your very large garden?" "No, no; they won't do." I go down into Kent every year where they only pay 10*s.* a year rent. Now, I shall finish with another bad case that Mr. Wilkins, perhaps, may not have considered, but which proves how practical men regard the subject of game. I have known bailiffs that were anxious men, and desirous to crop the home farm well, and give satisfaction to their master, encourage poachers, and wink at their visits; they were as blind as bats when they saw men poaching. And those game-preserving landlords are of course as desirous of a good crop of corn as any one, and I have known several bailiffs discharged because they did not show a better example to the tenants. How unreasonable was this. My reverend opponent will tell me that those bailiffs were dishonest. I say, no; for, like me, they look upon hares and rabbits as nothing but wild animals, the destruction of which is a great blessing. My very humble advice to game-preserving landlords is, to turn their attention to energetic agriculture, to take the noble example of our London market gardeners, turn all their keepers into whatever they are fit for, turn all their home farms into example farms, buy machinery, drain their land, down with all those broad breeding hedges, turn their two and three acre fields into fields of 10 or 20 acres, fill up their ditches, plough up or dig up to the very roots of the hedges, turn their minds to noble industry, and try and beat one another in good cultivation; give schooling to the rest of their tenantry; better exercise this than shooting, and talking about how many head of game they have. Let them do all this before they starve themselves, their tenantry, and their country at large by adhering to an unprofitable practice, that one day, sooner or later, circumstances and necessity will force them to give up. *James Cuthill, Camberwell.*

*Rental of Land.*—"S. T. H." says, "I let all my farms 16 years ago come next May, and the average rental during that time has been 15*s.* 3*d.* per acre. I am now letting them for the same term; what rental should I value them at? They all lie together, are tithe free, and local rates very small; all the circumstances attending the farms are the same." [As the price of farm produce during the past 16 years is to the price which may be expected during the next 16—so is 15*s.* 3*d.* per acre to the rental you may claim. That is one way of putting the case, though of course it is a very meagre one, and does not hold true in the case of a series of years, during which more economical methods of farming arise, and the value of land may thus possibly increase, notwithstanding the fall in the price of produce.]

*Game Preserving.*—I should have been tempted to reply at once to Mr. Cuthill's observations on the evils attendant on the preservation of game, had I not thought that Mr. Wilkins would most probably save me the trouble, by transmitting to you a more complete answer than I was, perhaps, capable of writing. Now, however, that the latter gentleman's reply has appeared, I observe that he has omitted what I consider the strongest argument in favour of the preservation of game, which is this: if gentlemen were obliged to discharge their gamekeepers, how would they in future prevent their land being trespassed upon by every vagabond who chose to try his luck in shooting or netting his neighbour's game? It might be said, in reply, that without game laws and gamekeepers there would soon be no game to kill, so that the evil would effect its own cure. But, remark, is it desirable that game should be entirely eradicated? Why should we lose so plentiful and wholesome an article of food? It would, however, be a long time before the game was destroyed, and, in the mean time, how is the evil I have alluded to, to be prevented? It can only be done by a very stringent trespass act; and, if so, how will the much pitied, much wronged poachers be benefited? They will still be liable to be caught and punished, and for the same crime too, though perhaps under a different name, viz., trespassing in pursuit of game—for trespassing in pursuit of game it still will be, call it by what name you please. I can write from experience, as almost my only reason for employing a gamekeeper was to prevent my land being used as the common shooting ground of all the neighbourhood, as whenever any of my kind neighbours wanted a bird, they knew there was nothing to prevent their killing one in my Turnips, if they chose. Now, all that has ceased, and though I have no greater quantity of game than before, except as regards pheasants, still, what there is goes into my larder instead of that of any poacher who chose to come for it; the fences are less broken down, poaching is checked, instead of encouraged, and the morals of the neighbourhood, therefore, certainly not deteriorated, and all through employing a keeper. *W. F. G. F.*

*Australian Agriculture.*—With regard to your enquiries respecting farming in this country, I fear I cannot give you any very flattering information. Mr. H. has never directed his attention much to cultivation, further than 8 or 10 acres of Wheat for our own consumption, so it would not be fair to judge from what he can say on that subject. At the same time he tells me to say that he can form no idea what a person might do, without knowing what amount of capital he was likely to possess. A man might do well, provided he is fortunate enough to get good land, and sufficient of it to carry on cultivation to any extent. With care and attention the crops are generally abundant; but there is not the same routine of crops as in England. It is a great advantage when two brothers join, and keep together, so as to dispense with hired labour as much as possible, for that is the great drawback. They must also forget all the little comforts of home, have a large share of energy and perseverance, and be able to put up with many disappointments and privations; such a person may make himself comfortable, but a fortune is out of the question. As to cattle and sheep, there is no good to be done with them, unless a good run can be procured, and that is a difficult matter now, so many feeders having come to the colony, that a large portion of the land which used to be for grazing is now purchased. We have been obliged on this account to lessen our number considerably, so that cultivation seems more likely to suit your brother, provided he can put up with what I have represented; but recollect I have drawn the dark side of the picture, and I doubt not but you could meet with some who might throw more sunshine over it. I can assure you that ever since we left the shores of old England, we have had a very hard and severe struggle, and have had to contend with depreciating prices ever since we commenced. We purchased cattle at 8*l.* to 12*l.* per head, and now they fetch 2*l.* or perhaps 3*l.* if very fat, and then there is the cost of getting them to market, for they become so wild and unmanageable. If any one had told me of all we have had to undergo, during the first four or five years of our sojourn here, I should have said it was impossible; and when I look back I wonder how I did it. However, I must indeed be thankful that I have had health and strength to contend against all discomforts, and that my home is in a slight degree becoming more civilised, but can never be like the one memory holds so dear. *Jane H.*

these can be purchased after Wheat is sold in autumn, also the tradesmen's bills—making 155*l.* Rent and other expenses will be paid from the summer produce of the 10 cows, Barley, &c., so that the sum actually required is but small, viz.—

| | | | |
|---|---|---|---|
| 10 cows ... ... ... ... ... | £150 | 0 | 0 |
| 2 sows ... ... ... ... ... | 6 | 0 | 0 |
| 2 horses ... ... ... ... ... | 20 | 0 | 0 |
| Halt implements ... ... ... | 10 | 0 | 0 |
| Do. labour ... ... ... ... | 25 | 0 | 0 |
| Manure ... ... ... ... | 20 | 0 | 0 |
| | £233 | 0 | 0 |

Of course, if extra stock is purchased the first year, that must be added.

## Review.

*Notes on the Agriculture of Lancashire, with suggestions for its improvement.* By Jonathan Binns. Simpkin, Marshall and Co., London.

THIS is an admirable collection of facts, descriptive of the past condition of local agriculture, for the encouragement of Lancashire farmers, and of its present condition, for their instruction; and the agriculturists of other counties will find much useful matter in its pages. We would gladly extract and publish one-half of its contents—for they are just the sort of matter in which our readers would delight; but, in justice to the author, we must endeavour to satisfy them with a few selected portions—or they must satisfy themselves by the purchase and perusal of the pamphlet. The illustrations are well chosen—chiefly plans of farm-buildings actually erected in the county: including, however, one—a portion of the map of the ordnance survey, showing the marl pits in the Fylde—which illustrates beyond anything we ever saw the utter want of system which formerly prevailed in the business of agriculture.

The work speaks of the geology and soils of Lancashire; of the climate, farming, draining, farm-buildings, and orchards; agricultural labourers and servants; embankments, Larch and coppice woods; implements; the cultivation of Turnips, Grasses, and other crops; the manures used; the cattle, horses, sheep, pigs; summer stall-feeding, dairy management, Gorse, haymaking, Flax, agricultural societies, education, and rents and prospects of the farmer. On all these subjects it is descriptive as well as suggestive—each being treated of in the form of a distinct, useful, read-

able essay—the whole, however, mingled in a somewhat ill-arranged manner. All this is included in 100 octavo pages. Other 60 pages are devoted to descriptions of the districts into which Lancashire is divided—High and Low Furness, Cartmel, Ireby, Borwick and Warton, Foxholes, Bleasdale, Quernmore, &c.; Poulton-by-the Sands, the Fylde, Preston, Darwen, Wigan, the Earl of Derby's estates, Warrington, &c. On the whole, the work is of far more than merely local interest; and we hope it will accordingly obtain a more than local circulation. We extract a passage descriptive of the former and present condition of Lancashire farming:—

"Forty years ago, whilst the drill, the iron plough, and other improved implements, draining, and the breeding and economical feeding of cattle, were receiving the requisite attention in various parts of England and Scotland, Lancashire, with very few exceptions, remained, so far as her agricultural interests were concerned, in a state of ignorance and indifference.

"Implements of the rudest construction were in general use: four or five horses, one before another, might be seen dragging a heavy wooden implement attended by two men, even in ordinary ploughing; and the practice which already obtained in some other counties of ploughing with a pair of horses abreast was here considered a dangerous innovation. The land which had grown grain in successive crops till the produce from it was not remunerative, was left to Nature without any Grass seed being sown, and from its stiff texture and worn-out undrained condition, the Grass which Nature supplied was scanty, and of very inferior quality: this land was roamed over summer and winter, by cattle ill bred and worse fed; and where the prejudice against ploughing up these worthless pastures still remains, the effects of the system are visible at the present day. At the same period the practice of marling was very general; from 100 to 150 cubic yards per acre were laid upon the land (generally sward) in summer, and by this means after remaining on the surface in masses till the land was ploughed in winter or spring, heavy crops of grain, principally Oats, were frequently produced for several years in succession, and when the land was exhausted the operation of marling was repeated; it consequently became stiff and intractable; for, as the calcareous portion of the marl (varying from 15 to 20 per cent.) diminished, and the inferior clay only was left, the land was found, in a few years, to be less fertile and more difficult to cultivate than before; and although this may be remedied to some extent by the application of lime, yet a serious and permanent evil has resulted from the practice of marling, particularly in a level part of the county, by creating a large number of pits in the middle of the fields, which, from the retentive nature of the subsoil, soon became filled with water. The extent of mischief entailed upon the land by these obstructions to ploughing and cultivation, the loss of land, the injury to the adjoining land as well as to the climate, may be conceived by casting the eye over the accompanying small plan of a portion of the Fylde district, copied from the Ordnance map. That the owners should have been willing to allow such irremediable injury to their property must ever be cause of surprise and regret. The cheapness of guano, along with the annually increasing supply of other manures from manufacturing towns, and the extension of the growth of Turnips, have since operated to check this expensive and troublesome mode of cultivation. At the period to which I allude the usual rotation of crops was, 1st Oats (after Grass); 2d, frequently Oats; 3d, summer fallow; 4th, Wheat; 5th, Beans (broadcast) or Barley; then Oats repeated if the land were not quite exhausted; the land was then left without any Grass seeds. Some sowed Red Clover amongst the Wheat, and after two crops of Clover followed by a crop or two of Oats, the land was allowed to lie a few years, but without any Grass seeds being sown. Some few better managers sowed Barley with Grass seeds after the Wheat. Shallow stone drains, across the slope, were sometimes made in the wettest part of the land, the landlord allowing a shilling for every rod of 7 yards, the tenant providing the carting and labour, often without any but his own inspection; and from his uncertain tenure, the drains were very imperfectly executed. Leases (seldom exceeding seven years) were not uncommon, but were encumbered with awkward clauses injurious to both parties. The tenant, in many cases, was bound to bestow all the manure of the farm upon the meadow land; he was allowed to plough only certain specified fields, and not permitted to break up any pasture; the plough was kept going year after year on the same land, and it was by no means uncommon to hear of certain parts of the farm having been in grain crop, with an occasional fallow, beyond the memory of man.

"The tenant was also bound to the precise management of each field during the term of his lease, without consideration of the uncertainty of seasons and the occasional failure of crops; heavy penalties were provided for the infringement of the clauses, and to insure the owner against retaliation for arbitrary proceedings, I have known the following clause inserted:—'That if the taker shall consider himself aggrieved by any of the penalties aforesaid, he shall have no redress either in law or equity.'

"Having described the condition of farming in the county at the commencement of the present century, I proceed to state my views of its present condition, and the causes which have combined to retard its advancement amongst a numerous class of the present occupiers of the soil. Some individuals there are, who, combining skill and industry with a judicious application of capital, are gradually diffusing, in their immediate neighbourhoods, the knowledge of a better system of management; and many landowners, by a judicious relaxation of their injurious restrictions, by the encouragement of draining, the granting of longer leases to men of sufficient capital, and by their own examples as practical farmers, are successfully endeavouring to raise the character of Lancashire as an agricultural county; still a considerable portion of its extent, consisting principally of the undulating slopes between the moors and the low lands, is occupied in farms varying from 50 to 150 acres by a tenantry not possessing sufficient knowledge or capital for their profitable cultivation. A farmer possessing a couple of hundred pounds considers himself qualified for a farm of as many hundred acres, and generally depends upon the sale of his produce for his first half year's rent. Thus, the time of entry being the 14th of February, and the rent, according to the agreement, being due on entry, or on the 1st of June afterwards; by the permission of his landlord, the payment is generally delayed till November, when he is enabled, by the sale of his cheese and other small produce, to raise the necessary sum; the second half year's rent (paid in February or May following) is provided by the sale of his grain. With a fair price for his farm produce he manages, by the exercise of great economy in his household, and by the hard labour of himself and his family, to obtain a living and to pay his way: beyond this result his expectations rarely extend; an increase of his capital or a provision for his family being beyond even his hopes. From this description of the small farmers of Lancashire, it must be evident that without an increase of capital and intelligence on the part of the tenant, or a decrease in the size of the farms, little improvement can be expected in the system of farming which still obtains in the extensive districts I have described. As tenants possessing the necessary capital and skill can rarely be met with, it becomes the duty of the landowners to consider the propriety of reducing these farms to an extent more suitable to the means of the occupiers; and by a judicious system of instruction and encouragement, to raise them from their lethargic and almost hopeless condition. I would not be misunderstood as advocating small farms in preference to those of greater extent, where sufficient capital can be commanded for the latter; but in the present state of the small farmers of Lancashire, I am confident that a reduction of their farms to one half their present extent would be a great step towards the ultimate benefit of that class and of the whole community."

## Miscellaneous.

*The Farm of Galson, Island of Lewis.*—The following report by a member of the Lewis Farming Society was read at the late meeting of that Society by Sir J. Matheson: "Permit me shortly to state the following facts as regards the farm of Galson, when I took the lease of it. I found a portion under small tenants. I gradually laid the ground under green crop, manured with stable-yard manure mixed with seaweed, and a little guano, which produced a good crop, equal to any I have seen on the mainland. I then sowed Barley mixed with Grass seeds, in the proportion of 10 lbs. of Clover seeds, 8 lbs. of Timothy, and 1 bushel of Rye-grass to an acre, which yielded the following year at the rate of three tons of hay of excellent quality, which was stacked in the first week of August. Generally, however, I have found it more beneficial to pasture, the grounds being far from markets. I may here state the feeding capabilities of the Galson Grass—a field of about 16 acres yielding excellent pasture for 18 Highland stots throughout the season, which are feeding for the Castle, and will weigh on an average 450 lbs. The sheep are pastured partly on natural and partly on sown Grass. They are a cross breed between black-faced sheep and Cheviot tups, and weigh usually about 68 lbs. each. The fields referred to were drained on the late Mr. Smith of Deanston's plan. The success of any improvement depends upon the after-treatment, and great care should be taken in not allowing the cattle to poach the fields during winter and spring." *North British Agriculturist.*

*The Birmingham Cattle and Poultry Exhibition.*—We have been requested to call the attention of our agricultural readers to the advertisement announcing that the certificates of entry for all the classes at this great annual show are now being issued, and to urge them to make an early application for the required forms, in order that the entries may be properly completed. We understand that the promises of support to the approaching Exhibition are already so numerous as to leave no doubt that it will surpass, both in extent and general excellence, the two which have been previously held in Birmingham; while the arrangements in Bingley Hall for the accommodation of the stock are such as cannot fail to be entirely satisfactory. The space appropriated for the show of domestic poultry will this year be considerably enlarged; and extraordinary as the exhibition was in this department last year, we are assured that a much finer collection will be brought together in December next, and fully demonstrate the zeal and intelligence which have recently been brought to bear upon a highly-attractive branch of rural economy, and one that, a few years ago, was almost entirely neglected.

## Calendar of Operations.

### OCTOBER.

SEPTEMBER and October are busy months with the sheep farmer, being the time for disposing of his draft ewes and wedders, and selecting rams for the coming season. We had intended making a few remarks on the results of the past year's returns from the former, but there being still a few of the large markets for the sale of Highland sheep, we postpone these for a little; and with regard to rams—without a tempting to detail all the points whose combination constitute the model of our mountain sheep, either Cheviot or black-faced, we would only advert to a few of the absolutely necessary qualifications—disposition to fatten combined with a hardy constitution, and abundance of wool of the best quality. The question of size is one which may be safely left to a man's knowledge of his particular locality, who should be best able to determine the standard most suitable for him, and will take care not to aim either at one above what his lean pasture will maintain, or one which, in a well sheltered and comparatively fertile situation, is manifestly below what he is able to produce. It is generally a sign of good management when the stock on a farm are increasing in size, but the reverse when they are growing less. From 40 to 60 ewes, according to the nature of the ground, being the number allowed to each sheep, it can hardly be expected, where the breeding stock is large, that all the rams should be first-class animals as this would imply a larger outlay of money than is either prudent or necessary. Hence most breeders make a practice of rearing a proportion of their own rams, and so saving a considerable annual outlay, without, at the same time, running into the dangerous system of over-close breeding. Though generally admitted that the produce of shearlings is more vigorous than that of four or five-shears, the difference is not so great as to render it necessary to part with a good sheep because he has been used one or two seasons; both because there is considerable difficulty in procuring a sufficient number of good shearlings, and also because, until their produce is grown up, it is almost impossible to say whether or not they will become good breeders. Hence, whenever practicable, one or more first-class rams should be selected from some stock of known celebrity, and put to a picked lot of ewes; and as mountain sheep vary much in their appearance at different stages of their first year's growth, we would strongly recommend that the whole of the produce, except a few which may be glaringly defective, be kept entire, and the final selection deferred until they are shearlings. We have often been struck with the difference between Leicesters and our Cheviot and black-faced breeds in this respect; the eye of the experienced breeder of the former being able to select, with almost unerring precision, the very day they are dropped, those animals which, for figure and quality, are likely to suit his purpose; while what appear the most unexceptionable specimens of the latter, as lambs, too frequently give anything but satisfaction when grown up; and the reason we believe to be simply this—that whereas in the one case the greatest attention has been paid to the perfecting of the breed since the days of Bakewell; the others, though boasting of as honourable, and a more ancient ancestry, have, until a comparatively recent period, been very much the creatures of chance, or, when attempts at superior culture were made, these were conducted on no fixed principle. But better days have now dawned; the true principles of breeding are being better understood—our hill farmers have got some definite idea of what is wanted; and, with something like a true standard to go by, we have no fears of a successful result. While on this subject, we cannot conclude these desultory remarks, without referring to the stimulus given by the Highland Society of Scotland, as one great cause of the growing improvement so observable in the mountain sheep of that country, both by the handsome prizes offered at the annual shows, and by the example set, and the substantial assistance tendered to the numerous local associations in various districts. As another step towards the improvement of mountain sheep, we are watching with much interest, the determined efforts at present making to introduce the Scotch breeds into many of the rich pastoral districts of Ireland. Though we have not had the pleasure of a personal inspection, the accounts given by practical graziers are such, that if there be any truth in the saying, that "it is the ground which makes the sheep," these new colonies will very soon rival if not outstrip the parent stock. Of late such large importations of the best blood (especially Cheviot) have been taking place, that in the course of a few years we may expect a keen competition at the three national agricultural societies' annual meetings, when it will be no matter of surprise if the "green island" claims the palm of victory. The last of our annual cast of lambs were disposed of some weeks ago, and the remainder of our draft ewes will be sent off in the course of a few days. Considering it better, in many respects, to sell at home, than drive stock to a public market, we always endeavour to avoid the latter alternative, and have been fortunate to make all our sales this year at "our ain fireside." We are now laying in a supply of materials, and purpose beginning this laborious and unpleasant work in the course of a week. The past is the latest harvest we have had in this district for some years. The weather at the commencement was very unfavourable, though towards the end the frequent showers were counterbalanced by drying winds. Still we fear that on most farms late sown grain is but imperfectly ripened; and after the beginning of October it is almost in vain to let it stand, without any good prospect of improving. Whiter it may become, but seldom much riper, while the quality of the straw is deteriorated for fodder. Turnips, though inferior to last year, are growing and promise to be an average crop. We observe more "fingers and toes" than usual. *A Lammermuir Farmer.*

## Notices to Correspondents.

ABORTION IN COWS: *Reader.* You will find on consulting the best authorities, that nothing certain is known on the subject. Ergot in the Grasses has been supposed one cause.

ALLOTMENTS: *Spr.* No act has been passed relative to allotment grounds. One was brought in some years ago by Mr. Cowper, but it did not become law. We do not know if the publication called the "Labourer's Friend" is still published. Apply to any bookseller.

CATTLE: *M H.* We do not know that there is any difference of hardiness between these two, *i. e.*, whether bullocks or heifers stand the cold and inclemency of winter with least injury to their growth.

FLEAS: *P P Q* says, "I am sadly vexed, and my neighbours and work-people annoyed by fleas in a farm-yard where I have had pigs fatted. Can you tell me how to destroy them?" [Could you not drown them? Keep the yard soaked for a week. The weather will soon remove them for you.]

KOHL RABI: *Tonbridgiensis.* The leaves may be stripped and given to cattle; also the roots may be stored, as in the case of Mangold Wurzel.

NETTLES: *F.* You must fork them up, and sow the places with Grass seeds again.

POULTRY: *E P.* It is impossible to say of what disease the chickens die, unless some description of it is given. You should state the symptoms and the time of year at which the mortality is greatest. Half the diseases of chickens are caused by the filthy water they are obliged to drink.—*J T.* Many people have very good Malay fowls, but some are of course more perfect than others; early chickens of such are worth from 30*s.* to 50*s.* the pair.—*D.* The principal difference between the white and grey Dorking is in size, the former being much smaller; the points are the same. In grey Dorking fowls the comb is not considered, being single or double, as fancy may be, but in the white a double comb is always preferred, and by many considered essential. *J. Baily*, 113, *Mount street.*

SHEEP MANAGEMENT: *A B.* The ewes may be folded on the stubble Turnips and young Barley. If they are too succulent, and should scour the sheep, give a little hay with them. —Dr. Newington's dibble is a very good and efficient instru-

mend. We should not like to dibble Tares, or any other seed, excepting where a seed crop is desired.

TIMOTHY GRASS: *C M I.* It is usually sown in mixture with other Grasses; but if you wish to propagate the species by itself, you may sow it on a surface of soil in good tilth, and clean early in April, and bush harrow it in.

TURNIP CUTTER: *L.* Moody's Turnip crusher reduces the root to smaller portions than Gardner's, and it is then more adapted for mixing with other food.—Maiden Bradley, Wilts, will find him—M'Cormick's reaping machine has been beaten, according to a Yorkshire jury. Neither it nor its rival are to be considered as yet in a fit state for employment on a farm.

TURNIPS: *A Young Sheep Farmer.* We suppose you could not grow them year after year continually, except for a few years. Could you not alternate with Mangold Wurzel, Rye, and Rape, &c.?

METEOROLOGICAL REPORT.—OCTOBER.

(*Continued from p.* 686.)

‡ Continuation of storm which had travelled eastward, and to the reflux current of the hinder quadrants I attribute the foggy and gloomy appearance of the 22d.

The season of November fogs is now approaching; these on the west of England ought to accompany *a rising barometer*, if the theory proposed in the previous paragraph be correct.

§ I imagine this to be a storm travelling northward and passing to the eastward of England, *i.e.* over Spain, France, and Germany; had it passed to the northward of these islands it would have produced cold, and had it come from the westward it would have been accompanied by rain.

* So great and rapid a fall of the barometer with so litt'e wind is unusual, but the front quadrants of this storm being lifted up, probably as the barometer rises, we shall have increasing wind, with snow, as the centre of this storm has passed, and the hinder quadrants are to the northward of us.

Dorchester Oct. 30. *F. P. B. M.*

(*To be continued.*)

# Markets.

## COVENT GARDEN, Nov 1.

English Pine Apples are plentiful, large, and fine. Grapes are also abundant, and meet with a heavy sale, owing to the large importations of foreign ones. Pears are also brought from the Continent. The best English kinds fetch 2s. to 4s. a doz., and 8s. to 12s. per half sieve. Oranges are coming in pretty plentifully. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Almonds, per peck, 6s |

### HOPS.—FRIDAY, Oct. 31.

Messrs. Pattenden and Smith report that the demand continues good for all choice Hops The duty is daily expected to be officially announced, and the general opinion is that it will fall between 129,000*l.* and 131,000*l.*

### POTATOES.—MONDAY, Oct. 27.

We have had several arrivals from Scotland since our last report, and a few from Yorkshire, which, with a liberal supply from Kent and Essex, has stocked our market quite equal to the demand. Trade is exceedingly heavy, and very low prices are submitted to. The York Regents arrived so late in the week that none have yet been sold, therefore we cannot quote the price. The following are this day's quotations:—Scotch Regents, 40s. to 50s.; Kent and Essex do., 50s. to 60s.; ditto Shaws, 45s. to 55s.

### SMITHFIELD, MONDAY, Oct. 27.

The number of Beasts is nearly as large as of late, but there is a falling off in weight. Consequently, the best descriptions are readily sold; in a few instances our top quotations are exceeded. The supply of Sheep is short; buyers are very unwilling to advance, owing to the state of the dead markets during the past week. However, the number being small, prices generally are better. There is a brisk trade for good Calves, but prices are very little better From Holland and Germany there are 1278 Beasts, 5630 Sheep, 192 Calves, and 140 Pigs; from France, 80 Sheep; and 2350 Beasts from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 6 | to 3 | 8 |
| Best Short-horns | 3 | 4 | — 3 | 6 |
| 2d quality Beasts | 2 | 6 | — 3 | 0 |
| Best Downs and Half-breds ... | 4 | 0 | — 4 | 2 |
| Ditto Shorn ... ... | | | | |

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools . | 3 | 6 | to 3 | 10 |
| Ditto Shorn ... | | | ... | |
| Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Ditto Shorn ... | | | ... | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 2 | 8 | — 3 | 10 |
| Pigs ... ... | 3 | 8 | — 4 | 8 |

Beasts, 4546; Sheep and Lambs, 24,870; Calves, 242; Pigs, 570.

FRIDAY, Oct. 31.

The supply of Beasts is tolerably good; the weather being very favourable they are readily disposed of at fully Monday's prices. The number of Sheep has rather increased; however, the demand is larger, and we are enabled to retain Monday's quotations. Good Calves are scarce, and they are readily disposed of at an advance of about 2d. per 8 lbs. From Germany and Holland we have 322 Beasts, 1850 Sheep, 193 Calves, and 8 Pigs; from France, 7 Beasts; 450 from the northern and midland counties; and 132 Milch Cows from the home counties.

| Best Scots, Herefords, &c. ... | 3 | 6 | to 3 | 8 |
|---|---|---|---|---|
| Best Short-horns | 3 | 4 | — 3 | 6 |
| 2d quality Beasts | 2 | 6 | — 3 | 0 |
| Best Downs and Half-breds ... | 4 | 0 | — 4 | 2 |
| Ditto Shorn ... ... | | | | |

| Best Long-wools . | 3 | 6 | to 3 | 10 |
|---|---|---|---|---|
| Ditto Shorn ... | | | ... | |
| Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Ditto Shorn ... | | | ... | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 3 | 0 | — 4 | |
| Pigs ... ... | 3 | 8 | — 4 | 0 |

Beasts, 1181; Sheep and Lambs, 5740; Calves, 318; Pigs, 620.

### MARK LANE.

MONDAY, Oct. 27.—The supply of English Wheat to this morning's market was small; the white was taken off on the terms of this day se'nnight; but red was difficult to quit, and generally disposed of at a decline of 1s. per qr.; the inquiry for foreign was most limited, but we observe no alteration in its value.—Barley and Beans sell readily at last week's prices. —White boiling Peas are 1s. to 2s. per qr. cheaper. In the value of the other sorts there is no alteration.—The Oat trade is firm, and new bring 6d. per qr. more money. There is still a fair demand for the best barrel Flour; all other descriptions are a difficult sale.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |
|---|---|---|---|---|---|

FRIDAY, Oct. 31.—This morning's market was moderately attended, and fine qualities of Wheat, either English or foreign, are inquired after at fully Monday's prices. The demand for the Continent has ceased, and 32s. 6d. per qr., cost, freight, and insurance, for Polish Odessa on the coast, has been paid for Ireland. Maize afloat brought 26s. 6d. per qr. for Galatz, freight and insurance included.—There is no alteration in the value of Barley, Beans, or Peas since Monday. Oats are a good sale at the extreme prices of that day.—The value of Flour remains as last quoted.

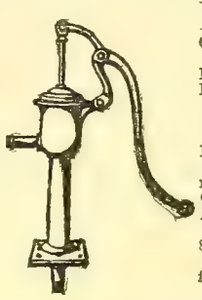
LIVERPOOL, TUESDAY, OCT. 28.—At our market this morning we experienced a slow limited demand for all descriptions of foreign Wheat at the decline noted on Friday, being 1d. per 70 lbs. under the rates of Tuesday last. The supply of homegrown Wheat was less plentiful to-day than heretofore, and supported the currency of this day se'nnight. Malting Barley and Malt, being in good request, were quite as dear as last week; grinding Barley was the turn cheaper. Beans, upon a limited demand, were unaltered in value. Peas dull and nominally lower. Oats, although in limited supply, hardly maintained our last quotations, and Oatmeal, losing the advance previously named, receded to the rates of Tuesday last. Of Indian Corn little was offered, and no change in price was observable.—FRIDAY, OCT. 24.—Our market was to erably well attended to-day by home and country millers, and with a few Irish buyers. Good runs of foreign Wheat were in moderately fair demand; in order to effect sales, however, sellers were obliged to submit to a decline of 1d. per 70 lbs. from Tuesday's rates: and English, though not quotably cheaper, was rather easier to purchase. Barley, Malt, Beans, and Peas in moderate demand, and steady in value. Oats supported late prices, and Oatmeal again improved 3d. per load.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |

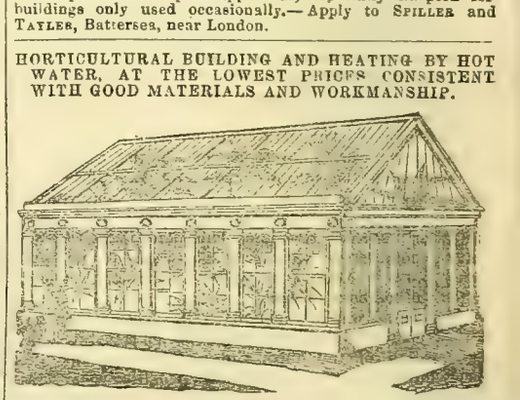
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREEN HOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8th, 6d.; 3-16ths, 9d.; ¼ inch, 1s. per foot, net.

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

TWO HUNDRED AND FIFTY STOVES, and THREE HUNDRED AND TWENTY-FIVE FENDERS, all differing in pattern, forming the largest assortment ever collected together, are always on Sale at the Show Rooms of WILLIAM S. BURTON. They are marked in plain figures, and at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s. Bronzed Fenders, complete, with standards, from 7s. to 3l.; Steel Fenders, from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s. Fire-irons, from 1s. 9d. the set to 4l. 4s. Sylvester and all other patent Stoves with radiating hearth plates; and Kitchen Ranges.

WILLIAM S. BURTON is enabled to sell at these very reduced charges from three simple causes, which he is most anxious the public should understand and appreciate:

First. From the frequency and extent of his purchases.

Second. From those purchases being made exclusively for cash.

And last, not least, from the non-allowance of the usual discount of 10 or 15 per cent. to architects, builders, &c., on the amount of goods sold through their recommendation, by which arrangement the price of such goods is of course enhanced to, at the very least, the extent of the discount.

WILLIAM S. BURTON has just completed some extensive alterations in his premises, by which he has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the Show of GENERAL FURNISHING IRONMONGERY, including cutlery, nickel silver, plated and japanned wares, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues with engravings sent (per post) free. The money returned for every article not approved of.

39, OXFORD-STREET (corner of Newman-street), Nos. 1 and 2, NEWMAN-STREET, and 4 and 5, PERRY'S-PLACE. Established A.D. 1820.

THE TEETH AND BREATH.—A good set of Teeth ever insures favourable impressions, while their preservation is of the utmost importance to every individual, both as regards the general health, by the proper mastication of food, and the consequent possession of pure and sweet breath. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the Teeth to the latest period of life. It will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the Teeth firmly in their sockets; and from its aromatic influence impart sweetness and purity to the breath. Price 2s. 9d per box Beware of spurious imitations. The genuine article has the words, "A. ROWLAND and SONS, 20, Hatton Garden," engraved on the Government stamps affixed on each.—Sold by them, and by Chemists and Perfumers.

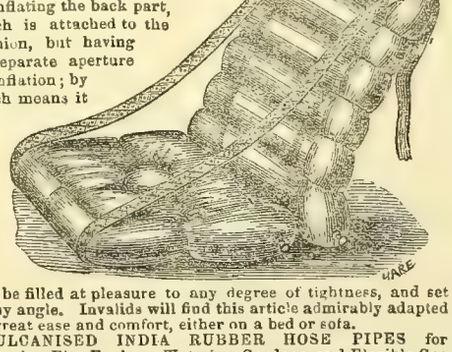
ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF and the HIPPOPOTAMUS, presented by H. H. the Viceroy of Egypt. Admission, 1s. On MONDAYS, 6d.

FORD'S EUREKA SHIRTS.—"The Great Exhibition has produced a multitude of novelties which have alternately delighted and astonished the world. How many of these will survive for any practical purpose is a question. It is another question if any one of them will bring half the practical comfort of a good shirt. MR. FORD, of the Strand, has an invention of this kind, which is a material improvement upon the old plans, and for positive enjoyment is worth nineteen-twentieths of the marvels of the huge building in Hyde-park."—*Atlas.*

FORD'S EUREKA SHIRTS are not sold by any Hosiers or Drapers, and can, therefore, be obtained only at 185, Strand. They are made in two qualities, the first of which is 40s. the half dozen, and the second quality 30s. the half dozen. List of Prices, containing an illustration, with directions for self-measurement, sent per post free.—RICHARD FORD, 185, Strand.

HOLLOWAY'S PILLS HAVE CURED A PALPITATION OF THE HEART AND SHORTNESS OF BREATH.—J. Wood, of the 1st European Bengal Fusileers, Lahore, had suffered for three years from a palpitation of the heart, difficulty of breathing, a diseased liver, and an overflow of blood to the chest to such a degree that he vomited considerable quantities. His case was considered hopeless, having baffled the skill of several eminent medical men, who gave him up as past all human aid. Whilst lingering in this condition he was advised to try HOLLOWAY'S Pills, and solely by their means he has been effectually cured and his health completely re-established. Sold by all Vendors of medicine, and at Prof. HOLLOWAY'S establishment, 244, Strand, London.

NEW SHOW ROOMS FOR BEDSTEADS.



HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy, and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, are of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part, which is attached to the Cushion, but having a separate aperture for inflation; by which means it

may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2½ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

"KNOW THYSELF."—THE SECRET ART of DISCOVERING CHARACTER from HANDWRITING is still practised by Mr. ELLISON with astonishing success. His startling revelations of the mental and moral qualities, talents, and defects of his applicants, fill the four pages of a sheet of paper, the style of description differing from anything yet attempted. Test this by sending any specimen of the writing of yourself, or of those in whom you are interested (inclosing 14 postage stamps, addressed to Mr. R. ELLISON, Professor of Graphiology, 151, Strand, London.

THE HAIR.—LOST AND RESTORED.—"Newport, Isle of Wight, Sept. 6, 1843.

"Gentlemen,—Some three months since, finding my hair falling off by nearly handsful, and my head approaching baldness; in fact, being quite bald at the crown and on the sides, I was induced, through my hairdresser, Mr. Beach, of this place, to try your BALM OF COLUMBIA, and after persevering with four bottles, according to your directions, I found a new crop produced, which has now restored my head to its former appearance. As I had apprehended a total loss of my hair, I feel it due to the virtues of your Balm of Columbia thus publicly to bear my testimony. Mr. Beach, who recommended me, is the same who used it successfully in Mr. Wilson's case, whose testimony you have lately published. Mr. B. is a Lymington man; I am also a native of that place, though for the last ten years in practice here as a solicitor.—Yours, &c. H. RICE.

"To Messrs. C. & A Oldridge."

For the strengthening of weak hair, its restoration when thinly scattered, or falling off and consequent general improvement and embellishment, the powers of OLDRIDGE'S BALM OF COLUMBIA are known by the continually increasing numbers who are testing its merits, as powerfully and unfailingly efficient.—Price 3s. 6d., 6s., and 11s. per bottle. No other prices are genuine. Ask for OLDRIDGE'S BALM, and never be persuaded to use any other article as a substitute.

13, Wellington-street North, seven doors north of the Strand.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dizziness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government Stamp, pasted round each box; also the fac simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes at 1s. 1d., 2s. 9d., and family packets at 11s. each.

"NORTON'S" CAMOMILE PILLS are confidently recommended as a simple but certain remedy to all who suffer from Indigestion, Sick Headache, Bilious and Liver Complaints, Heartburn, and Acidity of the Stomach; Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, Costiveness, &c. They act as a powerful tonic and gentle aperient; are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use. Sold in bottles at 1s. 1½d., 2s. 9d., and 11s. each, in every town in the kingdom.—CAUTION. Be sure to ask for "NORTON'S Pills," and do not be persuaded to purchase an imitation.

THE FOLLOWING WORKS

By JOSEPH PAXTON.

Published by J. MATTHEWS, 5, Upper Wellington-street, Covent-garden, London.

## SALES BY AUCTION.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed to sell by Auction, at the Mart, Bartholomew-lane, on FRIDAY, 7th November, at 12 o'clock, a First-class Collection of Carnations, Picotees, and Pinks; also a selected assortment of Tulips, the property of Mr. Wilmer, of Sunbury; together with 500 Standards and Dwarf Roses, consisting of Hybrid Perpetuals, Bourbons, Chinas, Noisettes, Dutch Bulbs, &c. On view the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, BUILDERS, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, on the premises, Medcalf's Nursery, near the Rosemary Branch Bridge, Islington, on MONDAY, Nov. 10, at 12 o'clock (by order of the proprietor, in consequence of the land being required for building purposes), the whole of the Nursery Stock and Greenhouse Plants, &c., together with four Greenhouses, six 3 and 5 light Boxes, a quantity of Bricks, Pantiles, York Paving, Wood, Garden Pots, Tools, Handbarrow, Step ladders, an Iron Pump, and other effects.—May be viewed prior to the sale, and Catalogues had (6*d.* each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, FLORISTS, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Garvie to sell by Auction, on the premises, Maryland Point, Stratford, on MONDAY, Nov. 17, at 11 o'clock precisely, in consequence of the number of lots, about 500 DOUBLE CAMELLIAS, from 1 to 7 feet, beautifully furnished with bloom-buds, comprising all the approved kinds; also 3000 Ericas, in the finest condition; 400 very fine Dwarf Trained Morello, May Duke, and other Cherries; together with a quantity of Green Hollies, Spruce Fir, Laurels, Limes, Rhododendrons, Azaleas, &c. A capital Nest of 170 Seed Drawers.—May be viewed a week prior to the sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. WATERER will sell by Auction, on the premises, Sunningdale American Nursery, near Sunninghill, Berks, two miles from Virginia Water, two miles from Sunninghill Wells, and half a mile from Shrubs Hill, on TUESDAY, November 4th, and following day, at 11 o'clock, by order of the proprietor, without reserve, the Lease of the Land having expired, the valuable NURSERY STOCK, comprising 12,000 Rhododendrons, Kalmias, and Azaleas, including many large Ornamental Plants, a large quantity of choice Evergreen and Flowering Shrubs, Dwarf Roses, and Honeysuckles, Standard and Dwarf Maiden and Trained Apples, Pears, Cherries, Plums, Peaches, Nectarines, and Apricots, Common and Portugal Laurels of all sizes, Birch, Ash and Oaks, Purple and Common Beech, Spruce Larch, Scotch Balm of Gilead, and Hemlock Spruce Firs of all sizes, a large quantity of Quick, from three to five years old, and a great variety of other valuable Nursery Stock, the whole of which is in a safe moving condition, and well worth the attention of persons about planting.—May be viewed one week previous to the sale, and Catalogues had upon the premises; of Mr. CHARLWOOD, Seedsman, Covent-garden; and of Mr. WATERER, Auctioneer, &c., Chertsey, Surrey, who will forward them on application by post inclosing four postage stamps.

VALUABLE NURSERY STOCK, HANWORTH-ROAD, HOUNSLOW, MIDDLESEX, NEAR THE RAILWAY STATION.

MR. WATERER will sell by Auction, on the premises, on MONDAY, November 10th, and following day, at 11 o'clock, the property of Mr. J. Riddy, giving up part of his land, comprising 2000 APPLE TREES of sorts, including Hawthornden, Wellington, Early Julien, Manx and Keswick Codlin, White Juneating, and others, true to name; Standard, Dwarf, and Maiden PEARS, CHERRIES, APRICOTS, PEACHES, and PLUMS, of the most approved sorts. Standard Roses, a large quantity of choice Evergreen & Flowering Shrubs, Portugal and Common Laurel, Laurestinus, Spruce, Scotch, and Larch Firs; Hornbeam, Limes, Poplars, Sycamores, Weeping Willows, Mountain Ash, Chestnut, and a great variety of other Forest Trees and Nursery Stock, the whole of which is in a safe moving condition.—May be viewed one week previous to the sale, and Catalogues had, upon the premises; of Mr. Charlwood, Seedsman, Covent-garden; and of Mr. WATERER, Auctioneer, &c., Chertsey, Surrey, who will forward them on application by post.

LINTON, CAMBRIDGESHIRE. — TO NURSERYMEN, FLORISTS, &c.—COPYHOLD NURSERY, DWELLING-HOUSE, AND FLOWER GARDEN.

MR. WHITTLE will sell by Auction, at the Swan Inn, Linton, on THURSDAY, November 13, at 4 for 5 o'clock precisely, by the direction of the executors, all that COPYHOLD ESTATE, favourably known for half a century past as Gimson's Nursery and Flower Garden, comprising about 1½ acre, with Seed-shop, roomy Dwelling-house, three Cottages, and Out-buildings, abutting on the High Road, Linton, subject to the customary fine on death or alienation. The Quit-rent is 8*d.* only, rendering it nearly equal to a Freehold Investment; whilst to a Nurseryman, Gardener, or Florist it offers peculiar inducements for occupation. The Estate has a beautiful Southern Aspect, with a gentle slope, and is naturally well drained. The Soil is of an extraordinary rich quality, and great ingenuity, combined with sound judgment and infinite taste, is exhibited in the disposition of the Grounds and Flower Garden. It is stocked with an abundance of Bearing Fruit Trees, a fine assortment of Greenhouse and Border Plants, Shrubs, Evergreens, Bulbs, Forest Trees, Ornamental Trees, Rock-work and Pond, remarkably fine cut Yew, and other Arbours and Hedges, Greenhouse, Forcing-pits, &c. It is also suggested, that if the present House and Cottages were removed, the site would be exceedingly appropriate for the erection of a respectable Family Residence, and in that case, with the Garden and Grounds already in a matured state, the property, considering its size, would unquestionably become at once one of the most unique Estates in the county. Linton is only 10 miles from Cambridge, 6 from Saffron Walden, 4 from the Chesterford Station, and 12 from Newmarket. The purchaser will have the option of taking to the whole or any part of the stock of Shrubs, Flowers, &c., at a valuation.—May be viewed at any time prior to the sale, and particulars had on the premises, at the Swan Inn, Linton; at the usual Inns in Cambridge, Saffron Walden, Chesterford, and Newmarket; of Mr. GIMSON, Builder, Royston, Herts; of Messrs. NASH and THORNALL, Solicitors, Royston; and at the Auctioneer's Offices, 45, Old-street, St. Luke's, London.

WANTED, A PARTNER, who can advance from 10,000*l.* to 12,000*l.*, to join one of the most extensive Collieries in Lancashire. The Mines are in full working operation, with Railways, Waggons, Boats, and everything complete. The coming-in Partner might either take an active part or not.—Apply to X. Y. Z., 7 and 8, Exchange Arcade, Manchester.

## CRABB'S TECHNICAL DICTIONARY.

# A TECHNICAL DICTIONARY;

OR,

A DICTIONARY EXPLAINING ALL TERMS OF ART AND SCIENCE.

BY GEORGE CRABB, ESQ., M.A.,

Author of the "Universal Technological Dictionary," the "Dictionary of Synonymes," &c., &c.

LONDON: WILLIAM MAXWELL, BELL YARD, LINCOLN'S-INN-FIELDS.

ORCHIDS.—A CONSIGNMENT MADE TO MR. LINDEN BY HIS COLLECTOR IN SOUTH AMERICA, AND RECEIVED BY THE LAST MAIL PACKET "THAMES."

MR. J. C. STEVENS begs to announce he will sell by Auction, at his Great Room, 38 King-street, Covent Garden, on FRIDAY, 7th November, AN IMPORTATION OF RARE ORCHIDS, in good condition, and consisting of the following fine varieties, viz., Uropedium Lindenii, Odontoglossum Hallii, hastilabium, Naevium, Pescatorei, &c., in fine masses; Oncidium candelabrum, and cucullatum, Brassia cinnabarina, Miltonia pulchella, Myanthus sanguinea, Anguloa Margarita, Huntleya fimbriata, Epidendrum spectrum, Paphinia tigrina, Houlletia picta, and several new and beautiful species of Odontoglossum, Brassia, Anguloa, Arpophyllum, Sobralia &c.—May be viewed on the morning of Sale, and Catalogues had.

NEW BROMPTON.—GROWING CROPS, AND STOCK OF A MARKET GARDENER, &c.

MR. D. A. RAMSAY will sell by Auction, on the premises, Park-walk, near the Goat in Boots, on Tuesday, Nov. 4th, 1851, at 12 o'clock, by order of Mr. Salmon, relinquishing the business, some substantial Garden Frames and Lights, Market Cart, Horse and Harness, Ladders, Manure, and a large quantity of Moss Roses, fine Evergreens, American Plants, Ornamental Trees, &c.; may viewed one day prior to Sale, and Catalogues had on the premises, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

COLCHESTER BOTANIC GARDEN.

MR. W. K. DAWSON begs to say that he is instructed by the Messrs. Burgess to sell by Auction, on WEDNESDAY, November 5, and following days (in consequence of the property being sold for building purposes), their entire stock of splendid FLOWERING SHRUBS AND PLANTS at that establishment, consisting of about 300 Standard and Dwarf ROSES, a large assortment of Pot ditto, consisting of Hybrid Perpetuals, Bourbons, Teas, Chinas, Noisettes, &c., all named on white labels; all the greenhouse plants, with 4 large American Aloes; Fuchsias, Geraniums, &c.; a large quantity of Yews (3 to 6 inches), a fine lot of Evergreen Oaks, Spanish Chestnut, Scarlet Horse ditto, with other ornamental trees and shrubs; 20 doz. Myatt's Victoria Rhubarb, and other good sorts; about 20 lots of prolific Kidney Potatoes, &c.—Catalogues will be in circulation, giving fully detailed particulars, a week previous to the sale, to be had of Messrs. BURGESS, at the Gardens; of the Auctioneer, St. Mary's Colchester; also at the *Essex Standard* office.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE DISPOSED OF, with immediate possession, an old-established NURSERY and FRUIT GROUND, the proprietor retiring from business. Its locality is in a flourishing neighbourhood, six miles from London; the ground most excellent for Shrubs and Trees, also for producing the finest Fruit.

For particulars, apply to J. C. HARDY, Esq., National Guardian Assurance Society, 19, Moorgate-street, London.

GLENNY'S GARDEN ALMANACK, for 1852, is an unerring Guide to the Amateur Gardener in his purchase of new Flowers, Fruits, Plants, and Vegetables. It will be richly illustrated with Horticultural Subjects in the Great Exhibition, and appear as usual on 1st November, price 1*s*; post free, 18 stamps.

C. Cox, 12, King William-street, Strand, London.

GARDENERS' MAGAZINE OF BOTANY.—The Publishers respectfully intimate that the publication of Part 22 is unavoidably postponed till November 30th.

2, Amen-corner, October 30th.

In Two Volumes, handsomely half-bound, price 3*l.*, a new edition of

THE BOOK of the FARM; detailing the Labours of the Farmer, Farm-steward, Ploughman, Shepherd, Hedger, Cattle-man Field-worker, and Dairy-maid; and forming a safe Monitor for Students in Practical Agriculture. By HENRY STEPHENS, F.R.S.E. A new edition, entirely re-written, and EMBRACING EVERY RECENT APPLICATION OF SCIENCE TO AGRICULTURE. Illustrated with PORTRAITS of ANIMALS painted from the Life, engraved on Steel by THOMAS LANDSEER and others; and with 600 ENGRAVINGS on WOOD by BRANSTON.

"The best practical book I have ever met with."—*Professor Johnston.*

"A work, the excellence of which is too well known to need any remarks of ours."—*Farmers' Magazine.*

"One of the completest Works on Agriculture of which our literature can boast."—*Agricultural Gazette.*

WILLIAM BLACKWOOD and SONS, Edinburgh and London.

TABLES ON DRAINING, CATTLE, AND HAY.

Recently published, price 2*s* 6*d*., cloth,

A SERIES OF TABLES ON DRAINING: showing the Number of Roods and of Rods of Drains in any Quantity of Land from 1 Pole to 100 Acres, and from 4 to 35 Yards Apart. Also, the Number of Tiles, 12, 14, 15, 16, and 18 Inches long, required for from ¼ Rood or Rod to 20,000 Roods or Rods. And Directions for constructing Tanks and measuring their Contents. By JAMES STRACHAN. Second Edition, carefully Revised, with Additions.

By the same Author,

Seventh Edition, price 2*s.* 6*d.* cloth, of

A NEW SET OF TABLES for computing the Weight of Cattle by Measurement, the Quantity of Hay in Ricks of different forms, the Value of Land, &c. To which is now added, a Concise System of FARM BOOK KEEPING.

The Book-keeping is also sold separately, price 6*d.*

Edinburgh: OLIVER and BOYD.

London: SIMPKIN, MARSHALL, and Co.

Just published, in a neat pocket form, with Illuminated Cover,

A TREATISE ON THE GROWTH OF HYACINTHS.

BY G. P. TYE.

London: GROOMBRIDGE and SONS, and all Booksellers.

Just published, in a neat stiff wrapper, price 5*s.*,

A PRACTICAL TREATISE ON THE CULTURE OF THE VINE, AS WELL UNDER GLASS AS IN THE OPEN AIR. By JOHN SANDERS, Gardener to T. Assheton Smith, Esq. Illustrated with Plates.

"Mr. Assheton Smith's place at Tedworth has long possessed a great English reputation for the excellence of its fruit and vegetables; one is continually hearing in society of the extraordinary abundance and perfection of its produce at seasons when common gardens are empty. We have therefore examined, with no common interest, the work before us, for it would be strange indeed if a man who can act so skilfully as Mr. Sanders should be unable to offer advice of corresponding value. We have not been disappointed. Mr. Sanders's directions are as plain as words can make them, and, we will add, as judicious as his long experience had led us to expect. After a careful perusal of his little treatise, we find nothing to object to, and much to praise."—*Gardeners' Chronicle.*

London: REEVE and BENHAM, 5, Henrietta-street, Covent Garden.

SEND YOUR ORDER FOR THE

ORNAMENTAL FLOWER GARDEN AND SHRUBBERY. No. V., price 1*s.* 6*d.*, now publishing. ENGINEERING SCHOOL CLASS-BOOKS.

In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.

By W. D. COOLEY, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.

"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*

"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*

"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*

"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions reduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

STOKE NEWINGTON CHRYSANTHEMUM SOCIETY.—The Fifth ANNUAL EXHIBITION of this Society will be held at the Manor-rooms, Church-street, Stoke Newington, on THURSDAY, the 20th of November.

Doors open at 1 o'clock. Admission from 1 to 4 o'clock, 1*s.*; from 4 to 8 o'clock, 6*d.* E. SANDERSON, Hon. Sec.

HUNTER'S PROLIFIC CUCUMBER. — This handsome and delicious variety obtained, in June last year, with fruit upwards of 30 inches in length, the Silver Medal at the Botanic Gardens, Regent's-park; and a Certificate of Merit at the Exhibition in July. It has also been awarded Four Prizes at the Highbury Exhibitions. It is white spined, and an extraordinary bearer. To be had in packets of seven seeds, at 5*s.*; or three seeds, at 2*s.* 6*d.*, of Mr. HUNTER, 5, King-street, Islington; and at J. G. RENWICK'S Seed Warehouse, 107, St. John-street, Smithfield, London.

SEEDLING CHRYSANTHEMUMS.

JOHN SALTER will send out, on the 15th instant, his beautiful Seedling PENTSTEMON VARIABILIS, at 7*s.* 6*d.*; it is very distinct from any other colour—cream tinted, rose and pencilled maroon; it will be exhibited at the next meeting of the National Floricultural Society, 21, Regent-street, on the 13th. He has some very fine Seedling Chrysanthemums now coming into bloom.

Versailles Nursery, Hammersmith Turnpike.

CHRYSANTHEMUMS.—A large collection of the above is now coming into flower. Fine Bushy Plants, of the best sorts, 9*s.* and 12*s.* per dozen, at CHANDLER and SON'S Nursery, Waudsworth Road, Surrey.

JOHN AND CHARLES LEE beg to announce that they are NOW SENDING OUT their new variegated SCARLET GERANIUM, the MOUNTAIN OF LIGHT. Those subscribers who have not yet signified the number they will require are requested to do so without delay. Price 10*s.* 6*d.* each.—Nursery, Hammersmith, London.

BRITISH QUEENS, IN POTS FOR FORCING.—Now ready for sending out, strong healthy double crowned Plants, in 48-size pots, at 2*l.* 10*s.*, packed in boxes, and delivered free at any of the railways; or 2*l.*, delivered unpacked to Mr. Solomons, sen., or Mr. Charlwoods, seedsman, Covent-garden, or within seven miles of Isleworth. My British Queens were the largest and finest, which every one can testify that saw them in the Great Exhibition. See *Morning Herald*, July 8th; also see Cuthill's extraordinary account in the *Gardeners' Chronicle*, Aug. 2d; also Mr. Mann, of Isleworth, gained the head Prize at Chiswick, with plants prepared by me and forced by him afterwards. Queen Runners at 5*s.* per 100. Post-office orders, payable at Hounslow, to THOMAS BEACH, Market-gardener, Worton, Isleworth, Middlesex.

TULIPS, HYACINTHS LILIUM LANCIFOLIUM, AND DUTCH BULBS GENERALLY.

This being the season for planting these Bulbs,

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to state that he supplies the above FLOWERS of the finest quality, at very moderate prices. His Catalogue may be had on application.

BASS AND BROWN beg to offer the following CHOICE FLOWER ROOTS, fine, and true to name:

| ALSTROMERIA AURANTIACA, 7*s.* 6*d.* per doz.; Chilian, 7*s.* 6*d.* per doz.; pelegrina, 1*s.* each; psittacinus, 9*d.* each; pulchella and tricolor, 1*s.* 6*d.* each. | | |
| CROWN IMPERIALS, red, 4*s.* per doz.; per 100 | 16 | 0 |
| FEATHERED HYACINTHS, 2*s.* 6*d.* per doz.; per 100 | 25 | 0 |
| IXIAS, 25 fine vars., 12*s.*; 12 ditto | 6 | 6 |
| ,, fine mixed, per doz. | 3 | 0 |
| SCILLA AMŒNA, 2*s.* 6*d.* per doz.; campanulata alba, per doz. | 1 | 6 |
| ,, other fine vars., 2*s.* 6*d.* per doz. to, each | 0 | 9 |
| TRITONIA AUREA, a splendid orange-coloured new Cape Bulb, each 2*s.* 6*d.* to | 5 | 0 |

Also a choice assortment of IMPORTED DUTCH HYACINTHS, NARCISSUS, JONQUILS, &c. See our autumn Catalogue.

Goods free to London, or any station on the Ipswich and Bury line to Norwich; and with all orders of 40*s.* and upwards, extra plants presented gratis.

Remittances required from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

OTHELLO—NEW CARNATION CLOVE—now ready for sending out, at 5*s.* per pair, or 3*s.* per plant.—This will prove to be one of the finest and choicest ever offered to the public. It is the largest and darkest of its kind yet seen, and is of most powerful fragrance; the flowers are of an immense size, with long pod and fine rose-leaf petals, perfectly hardy, and will thrive well in any situation; it was the admiration of numberless spectators while in bloom during the season, and numerous orders taken for it. On the 9th August it was sent to the Editor of the *Gardeners' Chronicle*, and his opinion was given as follows: "A desirable dark Clove, with a strong scent, well worth cultivation." It is warranted to give satisfaction to all purchasers. Also the following, new:

BLACK WALLFLOWER—NEGRESS.—This is a new superb variety, and is superior to all others of similar kinds, the colour of which may be compared to that of a Mulberry when perfectly ripe; it has a fine large spike, is very hardy, beautifully double, a most prolific bloomer, of very superior habit, and delightful fragrance; price 5*s.* per plant. Both of the above varieties only require to be seen to be grown by every one who has a garden of the smallest dimensions.

TILEY'S VIOLA ARBOREA, or Perpetual Tree Violet, true (see *Gardeners' Chronicle* of 1st November), large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen, or 1*l.* per hundred.

Double White Viola Arborea, do. do., 6*s.* per doz., fine plants.

Russian Superb (true), very fine, 3*s.* per dozen.

White Russian Superb (true), very fine, 3*s.* per dozen.

Each of the above varieties will be forwarded, postage and package free, to any part, on receipt of a Post-office order, or penny postage stamps to the amount.

The Strawberry Plants, as named and priced in the *Gardeners' Chronicle*, on the 1st November, can be supplied as before.

Fine Giant Scarlet Brompton Stocks, 2*s.* 6*d.* per hundred.

Also fine Antirrhinums, all saved from striped and spotted varieties, and will bloom next spring, 5*s.* per hundred.

Fine Sweet Williams, saved from 50 distinct varieties (strong plants), will bloom next season, 5*s.* per hundred, or 1*s.* per dozen.

Will be sent, hamper and package free, on receipt of the amount.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath.

STIPA PINNATA.

WANTED, any quantity, if of approved quality. Sample, and price per pound, addressed to R. Y., Office of this Paper.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, near London, informs his kind patrons that his new ROSE AND FRUIT CATALOGUE FOR 1851 AND 1852 is now ready for circulation, and will be sent on receipt of a twopenny stamp. His Stock of Roses, Fruit Trees, Evergreen Shrubs, and Ornamental Trees, are of the finest growth, of all sizes.—Gardens and Pleasure Grounds tastefully arranged and planted on the lowest terms.

E. D. informs his friends that he has no Seed Shop in London.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH.—ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., NURSERYMEN *and* FLORISTS *to her Most Gracious Majesty the Queen, have a* LARGE SURPLUS STOCK *of* TREES AND SHRUBS *more than they require for their usual sale, and will be sold at very low prices.*

*** For prices, see front page, Nov. 1, 1851, of this Paper.

*Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees is just published, and can be obtained for one penny stamp.*

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. American Native, 10*s.* 6*d.* do. Early Manley, 10*s.* 6*d.* do. Early Ash-leaf Kidney, 10*s.* 6*d.* do.

"Moor Green, Sept. 13, 1851.

"Sir,—I can with confidence recommend your early No. 1 Pea for being very early and a good cropper, and in height about 3 feet.—Your humble servant, WM. EDDEN, gardener to T. Taylor, Esq., Moseley Hall, near Birmingham."

"Aylesbury, Sept. 13, 1851.

"Dear Sir,—I have great pleasure in testifying to the superiority of your early Number 1 Pea over every other I grow. I did not sow them till the last week in February, and it was even then earlier than any other I grew. It is a beautiful boiler, and a very prolific bearer. No garden should be without it.—Yours truly, JOHN PETTY, Gardener and Seedsman, Aylesbury."

"Brompton Park Nursery, Kensington-road,

"Sept. 11, 1851.

"Dear Sir,—I have much pleasure in informing you that I grew a few of your early Number 1 Pea, which was much admired by several friends calling on me from the country, in the trade, and pronounced it a first-rate article; very early, fine pod, well filled, and a great bearer.

"I am, sir, yours truly, JOHN ADAMS.

"To JOHN SANGSTER, Esq., Cumberland-place,

"Newington Butts."

With many more, too numerous for insertion.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newingtcn Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

CHOICE HARDY CONIFERÆ, FINE PLANTS AT LOW PRICES.—CARRIAGE FREE (see below).

HARDY HEATHS—Mediterranea, stricta, and rubra, strong bushy plants, grown without peat.

W. F. has a good supply of strong Quick, Larch, and Forest Trees of all kinds, Evergreen and Flowering Shrubs; also a choice selection of Fruit Trees, both trained and Standards. Prices (according to the number taken) will be sent, on application, with samples, if required.

HYACINTHS AND OTHER DUTCH ROOTS *now on Sale at RENDLE'S Nursery and Seed Establishment, Plymouth, at Reduced Prices; a Descriptive Catalogue of which can be had in exchange for one penny stamp.*

All orders above 2*l.* pre-paid to any Station on the South Devon, Bristol and Exeter, or Great Western Railways.

William E. Rendle and Co., Florists to her Majesty, Plymouth.

*** Our Descriptive Catalogue will be found useful, as it contains some good cultural advice.

EDWARD GEORGE HENDERSON, Wellington Road Nursery, St. John's Wood, London, will be happy to forward his NEW AUTUMN CATALOGUE, post-free, on application, containing lists of Geraniums in nine Classes, Dianthus or Carnations in six Classes, Cinerarias, Gladiolus; Hollyhocks, Pansies, Pinks, Liliums, &c. &c., with other new Plants not before offered; all the above Plants are priced, and descriptions corrected up to the present time; Catalogues are also post-paid through France, Germany, Belgium, Holland, Prussia, Austria, and America.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON and Co., have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21*s.* each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orleans Plum; when fully ripe are of a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

WILLIAM HAMILTON, Seedsman, &c., 156, Cheapside, London, will forward his CATALOGUE of BULBOUS ROOTS (of which he has a large collection), on application.

H. LANE and SON, Great Berkhampstead, Herts, are now ready to forward to applicants their—

CATALOGUE OF ROSES,
,, OF TREES AND SHRUBS,
,, OF FRUIT TREES,
,, OF INDIAN AZALEAS AND CAMELLIAS.
,, ROSA MANETTI, for stocks, 12*s.* 6*d.* per 100.

# STANDISH AND NOBLE, NURSERYMEN, BAGSHOT, SURREY,

Solicit attention to the following List of ORNAMENTAL PLANTS, selected from their general Nursery Stock. The greater portion are growing in the open quarters; and, from being periodically transplanted, their safe removal may be relied on. Every Plant sent out will be a healthy, robust specimen; the heights given afford but a slight criterion of their general character. To those having a star prefixed they invite special attention, as being remarkably fine, and fit for producing immediate effect. Gentlemen about to plant extensively would be repaid by making a visit to the Nursery.

All kinds of Ornamental Trees and Shrubs supplied. A fine Collection of Roses selected with reference to late autumnal blooming. Also of the best kinds of late-flowering hardy hybrid Rhododendrons, to the cultivation of which especial attention is given.

*** *Gentlemen requiring assistance in laying out, or improving their grounds, may procure the services of a competent person by applying to the Advertisers.*

With the exception of such names as are printed in italics, the whole of the plants in this list are perfectly hardy.

The number of inches named refer to the heights, unless otherwise stated.

ABIES BRUNONIANA, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*, each.
,, JEZOENSIS, one year's seedlings, 21*s.* each.
This is one of the best novelties in Conifers. It forms a noble tree of 120 feet in height, and of very distinct character.
,, DOUGLASII, 20 to 36 ins., 5*s.* to 10*s.* 6*d.* each.
ARAUCARIA IMBRICATA, 6 to 9 ins., 1*s.*; 12 ins., 2*s.* 6*d.*; 18 ins., 3*s* 6*d.*; 24 ins., 5*s.*, each.
*AZALEA, "Glory of Sunning Hill,"* 2*s.* 6*d* to 5*s.* each.
The best double variety in cultivation.
,, OVATA, a hardy evergreen, 6 to 9 ins., 2*s.* 6*d.* each.
,, *VITTATA*, a specimen of this unique variety was awarded a Knightian medal, when exhibited last April at the rooms of the Horticultural Society. The ground colour of the flowers is white, which is beautifully striped with purple, after the manner of a Carnation. It is a very free bloomer. 9 ins., 21*s.* each.
ABELIA UNIFLORA, new and distinct. A very free bloomer, 10*s.* 6*d.* each.
BUXUS sp., from north of China, round leaved, 10*s.* 6*d.* each.
,, ,, ,, long leaved, 15*s.* each.
BERBERIS FORTUNII, 9 ins., 1*s.* 6*d.*; 12 ins., 2*s.*; 18 ins., 3*s.*; 24 ins., 5*s.* each.
,, DARWINII, 7*s.* 6*d.* to 21*s.* each.
* CEDRUS AFRICANA, 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 30 ins., 5*s.*; 36 ins., 7*s* 6*d.*; 48 ins., 10*s.* 6*d.* each.
* ,, DEODARA, 2 to 5 ft., 2*s.* 6*d.* to 10*s.* 6*d.* each.
* CRYPTOMERIA JAPONICA, seedlings, very robust plants, will require no support from stakes. Plants 4 to 5 ft. high have stems as many inches in circumference. 6 ins., 6*3s.* per 100. 24 ins., 2*s.* 6*d.*; 36 ins., 3*s.* 6*d.*; 48 ins., 5*s.*; 60 ins., 7*s.* 6*d.* each.
,, JAPONICA NANA, seedlings 9 to 12 inches through, 10*s.* 6*d.* to 21*s.* each.
*CUPRESSUS FUNEBRIS, seedlings, very robust plants, from the open border, nearly as wide as high, very handsome plants, 12 ins., 5*s*; 18 ins., 7*s.* 6*d.*; 24 ins., 15*s*; 30 ins., 21*s.*; 36 ins., 31*s.* 6*d.* each. Cuttings, 6 to 8 ins., 2*s.* 6*d.* each.
* ,, ELEGANS, a rapid grower, and a most graceful tree, 12 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 36 ins., 5*s.*; 48 ins., 7*s.* 6*d* each.
* ,, GOVENIANA.—This is one of the most beautiful plants of its class. It has the merit of preserving its beautiful green colour during the most severe weather, 9 ins., 2*s.* 6*d.*; 12 ins., 3*s.* 6*d.*; 18 ins., 5*s.*; 24 ins., 7*s.* 6*d.*; 30 ins., 10*s.* 6*d.*; 36 ins., 15*s.*; 48 ins., 21*s.* each.
* ,, LAMBERTIANA, forms a noble tree, rivalling even the Cedar of Lebanon, and succeeds well in very exposed situations. 9 to 12 ins., 1*s.* 6*d.*; 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.* each.
Grafted beneath the surface of the soil, 30 ins., 2*s.*; 36 ins., 2*s.* 6*d* ; 42 ins., 3*s.* 6*d.*; 48 ins., 5*s.* each.
CEPHALOTAXUS FORTUNII, male var., long leaves, seedlings, 21*s.* each.
,, ,, female var., short leaves, seedlings, 21*s.* each.
CHAMÆROPS, sp., a hardy Palm from the north of China, a decided acquisition to our hardy ornamental evergreens, 21*s.* to 31*s.* 6*d.* each.
*CLERODENDRON FŒTIDUM.*—The only species of this beautiful genus which can be successfully cultivated in a cool greenhouse, a situation in which this succeeds admirably. It forms its large heads of rosy lilac flowers in great profusion. Strong plants, 21*s.* each.
CERASUS ILLICIFOLIA, 7*s.* 6*d.* each.
DAPHNE JAPONICA, 12 ins., 2*s.* 6*d.* each.
,, HYBRIDUM, 12 ins., 1*s.* 6*d.* each.
FORSYTHIA VIRIDISSIMA.—This plant is not sufficiently known. It is an early spring-flowering plant, producing its yellow blossoms in great profusion. But it rarely flowers, or but scantily when young. The plants offered are well set with flower-buds. It forces well. Bushy plants, 24 ins., 1*s.* 6*d.*; 36 ins., 2*s.* 6*d.*; 48 ins., 3*s.* 6*d.*; Standards, 10*s.* 6*d.* each.
ILEX DIPYRENA, 9 to 12 inches, 3*s.* 6*d.* each.
,, MICROCARPA, 21*s.* each.
,, LATIFOLIA, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.*; 24 ins., 5*s.* each.
,, FURCATA, 21*s.* each.
JUNIPERUS ARGENTEA, new and very beautiful, 12 inches, 5*s.* each.
,, PHŒNICEA, 12 ins., 1*s.* 6*d.* each.
,, CHINENSIS, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d.*; 24 ins., 2*s.*; 30 ins., 2*s* 6*d.* each.
,, TAMARISCIFOLIA, 12 ins., 1*s.* each.
,, FLACCIDA, 12 ins., 1*s* 6*d.*; 24 ins., 3*s.* 6*d.* each.
,, EXCELSA, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.* each.
,, SQUAMATA, 12 ins., 1*s.*; 24 ins., 2*s.* 6*d.* each.
,, CRACOVIA, 12 ins., 1*s.* each.
,, MACROCARPA, 12 ins., 2*s.* 6*d.* each.
,, REPANDENS, 12 ins., 9*d.*; 24 ins., 1*s.* 6*d.* each.
,, OBLONGA PENDULA, 6 to 8 ins., 2*s.* 6*d.* each.
,, BEDFORDIANA, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d.*; 24 ins., 2*s.* each.
JASMINUM NUDIFLORUM, strong blooming plants, 2*s.* 6*d.* each.
LIGUSTRUM JAPONICUM, 9 ins., 1*s.*; 24 ins., 2*s.* each.
*LYCOPODIUM WILDENOVII*, 5*s.* each.
LIBOCEDRUS CHILIENSIS, 7*s.* 6*d.* each.
MITRARIA COCCINEA, 2*s.* 6*d.* each.
*PICEA PINSAPO, very handsome specimens, 30 ins., 21*s.* each.
,, NORDMANNIANA, 10*s.* to 15*s.* each.
,, OVATA, 10*s.* 6*d.* each.
*PINUS INSIGNIS, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 30 ins., 7*s.* 6*d.*; 36 to 42 ins., 10*s.* 6*d.* each.
,, MURICATA, 9 ins., 10*s.* 6*d.*; 18 ins., 21*s.*; 24 ins., 31*s.* 6*d.* each.
,, MONTEZUMÆ, 12 to 15 ins., 10*s.* 6*d.* each.
QUERCUS SCLEROPHYLLA, 21*s.* to 42*s.* each.
,, INVERSA, 21*s.* to 42*s.* each.
ROSE, "FORTUNE'S YELLOW," dwarfs, 2*s.* 6*d.* to 5*s.* each.
,, ,, ,, standards, 5*s.* to 7*s.* 6*d.* each.
RHODODENDRONS.—Hardy late flowering Hybrids, varying in colour from white to deep crimson. Dwarfs, 31*s.* 6*d.* to 6 guineas per dozen; standards, 21*s.* to 5 guineas each.
,, COMMON PONTICUM, for covers, thrice transplanted, 12 to 18 ins high, very bushy, 15*s.* to 21*s.* per 100.
SIKKIM RHODODENDRONS.—We believe we may state, without fear of contradiction, that we possess the largest plants of these beautiful Rhododendrons in the trade. The heights of those we are offering vary from 2 to 9 ins. From the altitude from whence many of them were obtained, there is great probability of their proving hardy in this country. Collections of 24 distinct kinds at 3, 5, or 9 guineas.
SPIRÆA CALLOSA.—An abundant and continued bloomer. It has large corymbs of rosy purple blossoms, and is a handsome addition to our shrubbery plants; 10*s.* 6*d.* each.
SALISBURIA ADIANTIFOLIA (seedlings), 12 ins., 2*s.* 6*d.* each.
*TAXODIUM SEMPERVIRENS. This and Cryptomeria japonica are amongst the most rapid-growing Conifers. In situations where such are required they cannot be surpassed. 18 ins. to 5 feet, 1*s.* 6*d.* to 10*s.* 6*d* each.
TAXUS DOVASTONII, standards, 3 to 4 ft., 7*s.* 6*d.* to 10*s.* 6*d.* each.
,, ADPRESSA, 12 ins., 2*s.*; 24 ins., 5*s.*; 36 ins., 10*s.* 6*d.* each.
,, BACCATA (yellow-berried var.), 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 36 ins., 7*s.* 6*d.* each.
,, ,, (golden-leaved var ) 12 ins., 1*s.* 6*d* ; 18 ins., 2*s.* 6*d.* each.
VIBURNUM PLICATUM, 10*s.* 6*d.* to 21*s.* each.
*WEIGELA ROSEA.—This beautiful flowering shrub should be grown by every one. It forms a handsome object in the open borders in May. It also forces well. The plants here offered are as wide as high, and will flower abundantly in the spring. 18 ins., 2*s.*; 24 ins., 2*s.* 6*d.*; 30 ins., 3*s.* 6*d.*; 36 ins., 5*s.* each.

A Descriptive Catalogue of Hardy Ornamental Trees and Shrubs; to which is prefixed a Treatise on the Cultivation of American Plants, may be had free, by enclosing six stamps for postage.

IMPORTANT DISCOVERY.

CLARKE and Co., Gardeners, Seedsmen, and Florists, Percy-cross Nursery, Walham-green, Fulham, are now sending out, in small sealed stone bottles, secured for travelling, on the receipt of 5*s.*, a Mixture (which is both a remedy and preventive) for destroying those grievous pests, the White Mealy Bug, Scale, Thrip, and all other insects, without injury to the plants. This being the season for the more effectual remedy of all insects, C. and Co. recommend that their preparation be applied forthwith. Printed directions sent with each bottle.—Post-office Orders payable at Brompton, to Charles Clarke.

IMPORTANT TO ALL WHO HAVE A GARDEN.

CHALLENGE COMPARISON AND COMPETITION. Carriage Paid.

All orders above 5*l.* carriage paid to London, Liverpool, Birmingham, and Edinburgh, and all the intermediate Stations within 150 miles of the Nurseries, upon any line of Railway whatsoever. To those ornamenting their Gardens or Grounds, this is an advantage seldom offered.

SELECT HARDY HERBACEOUS PLANTS AND ALPINES.
100, own selection, two of each kind, 30*s.*; or our selection, in 100 varieties, 42*s.*
100, purchaser's selection, one of each kind, 42*s.*
100 Alpine or Rock Plants, 42*s.*

The above extends over 1000 species and varieties, selected from the choicest collections in the country, warranted second to none for beauty and display. Having an immense stock, they can be furnished at these low prices.

AMERICAN PLANTS, FLOWERING SHRUBS, ORNAMENTAL TREES, AND EVERGREENS.
Purchaser's, or our selection, from list, per 100, 2*l.* 10*s.*, one of each.
Own do. do. per 100, 1*l.* 10*s.*, two of each.

This Nursery has long held high celebrity for possessing a splendid stock of Flowering Shrubs and Ornamental Trees, extending over 800 species and varieties of the finest selection; and for quality, correctness in naming, and health, not equalled by any. To Gentlemen forming Arboretums, or adding desiderata, this is an opportunity never before offered.

HOLLYHOCKS.—No. 1, fine double kinds, all shades of colour, for exhibition, 9*s.* per dozen; 50*s.* per 100. No. 2, for border display, 6*s.* per dozen; or 30*s.* per 100. These are selected from the finest collection in the country.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or 10*s.* per 100, fine. 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*; or 12*s.* 6*d.* per 100.

PORTUGAL LAURELS, 1½ to 2 feet, 20*s.* per 100; fine, 3*s.* per dozen. 2 to 3 feet, extra fine and bushy, 30*s.* per 100; 6*s.* per dozen.

EVERGREEN PRIVET, fine, 2 to 3 feet, per 1000, 40*s.*; per 100, 5*s.* 3 to 5 feet, strong, 45*s.* per 1000; or, per 100, 6*s.*, healthy and fine grown.

LIMES, per 100, 4 to 5 feet, 30*s.*; 5 to 6 feet, fine, 40*s.* per 100, fine avenue trees.

HORSE CHESTNUT, 5 to 6 feet, 30*s.* per 100; 10 to 12 feet, 50*s.* per 100, splendid.

ROSES, 50 splendid sorts, Standards, fine healthy stuff, per 100, 5*l.*; or 18*s.* per dozen, own selection. 100 superb sorts of Dwarf Roses, in 100 fine varieties, 50*s.*; or 9*s.* per dozen, own selection; mixed, 30*s.* per 100, or 6*s.* per dozen.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.
50 first-rate sorts, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
50 do. purchaser's selection, 3*l.*; or 18*s.* per dozen.
ERICAS, 50 of the finest sorts grown, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
,, ,, purchaser's choice from list, 3*l.*; or 18*s.* per dozen.
CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21*s.*; or 15*s.* per dozen.
,, ,, purchaser's choice, 1*l.* 5*s.*; or 18*s.* per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25*s.*; 50 fine for 15*s.*; 25 for 8*s.*, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.

CINERARIA, from the choicest sorts, per packet, 2*s.* 6*d.*
PANSY, do. do. 1*s.* 6*d.*
HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1*s.* 6*d.*

FRUIT TREES.

GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4*l.*, in 100 varieties; or 10*s.* per 100, in 50 varieties.

A selection of the choicest description for show, 4*s.* per doz.

The stock extends over 50,000, and is fine and free grown.

CURRANTS.—May's Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25*s.*; or per doz., 4*s.*

Black Naples, the finest black (no other sort grown), 12*s.* per 100, 2*s.* 6*d.* per doz.

Red Grape and Champagne, fine, 10*s.* per 100.

White Dutch, large and fine, 12*s.* per 100, 2*s.* per doz.

APPLES.—Fine clean Standards, 10*s.* per doz., 70*s.* per 100.
,, ,, Dwarfs, 8*s.* per doz., 50*s.* per 100.
,, Dwarf trained superior kinds, 2*s.* 6*d.* each, or 24*s.* p. doz.

The collection is very choice, from the Horticultural Society.

PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.

PLUMS and CHERRIES.—All the leading sorts, standards, 18*s.* per doz.
,, ,, Dwarfs, fine, 9*s.* per doz.
,, ,, Dwarf trained, 3*s.* 6*d.* each, or 36*s.* per doz.

APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5*s.* each, 50*s.* per doz.

RASPBERRIES.—Fastolff, 3*s.* per doz., 16*s.* per 100.
,, Antwerp Red, 2*s.* per doz., 12*s.* per 100.
,, Monthly, or Double-bearing, 12*s.* per 100, 2*s.* per doz.

STRAWBERRIES.—Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3*s.* 6*d.* per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to John May, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

MESSRS. J. MYATT AND SONS have a Stock of the VICTORIA or RABY CASTLE CURRANT, and can supply good strong Plants at 25*s.* per 100; extra strong, 2 years old, 5*s.* per dozen. Also, a good Stock of 2 year planted Rhubarb roots.

MYATT'S LINNÆUS ... ... 10*s.* per dozen.
MYATT'S VICTORIA ... ... 10*s.* „ „
MITCHELL'S ROYAL ALBERT
Smaller 1 year planted Roots, at 50*s.* per 100.
Manor Farm, Deptford, Nov. 8th.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1½ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Nov. 8.

DUTCH HYACINTHS for Forcing, 3*s.* 6*d.* per dozen; Best do., for Glasses, 6*d.* to 1*s.* each. Double Roman and Paper-white Narcissus, 4*s.* per dozen; Single and Double Duc Van Thol Tulips, 2*s.* per dozen. Also Crocus, Iris, Jonquils, Narcissus, Anemones, and Ranunculus, of which a priced List may be had free, per post, from A. COBBETT, Italian and Foreign Warehouse, 18, Pall Mall, London.

MESSRS. PLATZ AND SON, SEEDSMEN, ERFURT, Prussia, inform the Trade that their CATALOGUE for 1851 and 1852 is now ready, and to be had only of their Agent, ROBERT KENNEDY, Bedford Conservatory, Covent Garden, London.—Nov. 8.

SUPERB HOLLYHOCK SEED.—Well ripened Seed, warranted to be saved exclusively from Rosea grandiflora, Delicata, Comet, Model of Perfection, Elegans, Formosa, Gem, Belladonna, Bicolor, Queen, Fireball, Aurantia, Rosea alba, and Sulphurea perfecta. A good mixture of the above, in packets, containing 200 Seeds, will be forwarded, post free, upon the receipt of 2*s.* 6*d.* worth of postage stamps, by R. B. BIRCHAM, Hedenham Rosary, Bungay, Suffolk.

PLANTING SEASON.

W. H. ROGERS, NURSERYMAN and LANDSCAPE GARDENER, 130, High-street, Southampton, begs to offer any quantity and description of finely grown and well-rooted NURSERY STOCK, including Forest and Ornamental Trees, Evergreen and Flowering Shrubs, American Plants, Fruit Trees, Roses, Herbaceous Plants, &c., &c., at a very reduced price. Planting contracted for to any extent, engaging to replace failures. Gardens and Pleasure Grounds laid out and planted in the best taste.—All communications addressed to W. H. ROGERS, as above, will meet with immediate attention.

TO RAILROAD CONTRACTORS, NURSERYMEN, &c.

RICHARD HARTLAND AND SON, NURSERYMEN, Cork, will deliver, free in London, Bristol, Liverpool, or Dublin, any quantity (over a hundred thousand), of Thorn Quicks, at the following prices, for cash:—

3 year-old, in beds (stout plants), per 1000 ... 2*s.* 6*d.*
4 do. „ (transplanted), per 1000 ... 3*s.* 6*d.*
5 and 6 do. „ „ per 1000 ... 5*s.*
All orders addressed as above shall be promptly attended to.

ACER VILLOSUM.

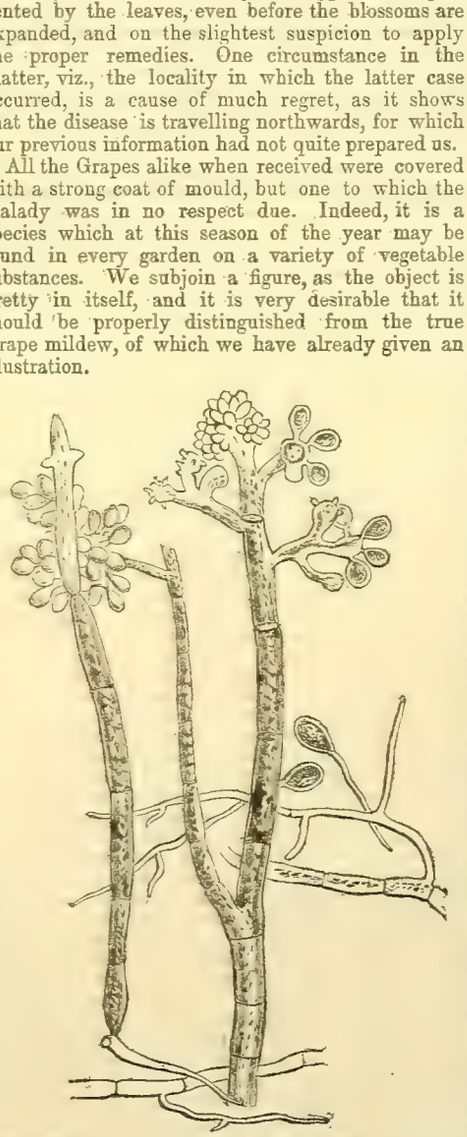
OSBORN AND SONS, NURSERYMEN and SEEDSMEN, Fulham, near London, respectfully inform the public that they have for sale the above fine and distinct species of Maple at 15*s.* each. (See a notice of it by the Editor of the *Gardeners' Chronicle*, of Saturday, the 25th October).

JOHN AND CHARLES LEE beg to offer fine plants, often transplanted, and warranted, of the following:

CEDAR OF LEBANON, 6 feet, clean and straight, 10*s.* 6*d.* each, or 35*l.* per 100.
COMMON HOLLIES, 5 to 6 feet, clean and straight, 5*s.* each, or 20*l.* per 100.
VARIEGATED HOLLIES, 8 feet, clean and straight, 25*s.* each.—Nursery, Hammersmith, London.

**The Gardeners' Chronicle.**

*SATURDAY, NOVEMBER* 8, 1851.



MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Nov. 11—London Floricultural .....6 P.M.
THURSDAY, — 13—National Floricultural .....2 P.M.

OUR late articles on GRAPE MILDEW, and the observations by LÉVEILLÉ, of which we have given a translation, accompanied by notes extracted from the last Number of the Journal of the Horticultural Society of London, afford almost all the information which exists upon this noisome but not unmanageable pest. In cases where a depravation of the system is produced by the presence of some internal irritant producing chemical changes in the constituent parts, though the vital energies may be able for a time to resist its agency when once the balance is turned, effects the most sudden and unexpected, and, apparently, out of all proportion to the exciting cause, will sometimes occur; a fact of which we have ample experience in the diseases to which the human frame is subject, and which is not without example in the vegetable world. Cultivators, therefore, who are cognisant of the history of the Grape mildew ought not to be surprised at the ravages which take place amongst their Vines, even in the course of a single night: effects strikingly similar to those which were produced, in 1845 especially, amongst diseased Potatoes, and of which there have been many examples in succeeding years.

Two most disastrous cases of sudden decay, in magnificent crops of Grapes, have just been submitted to us. In the one case, in which the Black Hamburgh was attacked there is no information as to the previous state of the Vines. It is a Grape extremely liable to decay, where the roots are not well drained; we have no reason, however, to suppose any fault of this kind, though the fact of plants being grown in the same house with the Vines is one not likely to lead to the best results; and the probability is, so far as we can judge from such imperfect data, that the cause was similar to that which was clearly at work in the second case in which the Black Hamburgh and Muscat were attacked, both evidently of first-rate quality, as appears from the specimens forwarded to us. In this case the houses, which during the summer had been greatly damaged by hail, though promptly repaired, were infested with mildew soon after the Hamburgh Grapes were ripe, and under the use of lime and sulphur the mould had, to a great extent, disappeared, but not entirely, as is manifest from the leaves which accompanied the specimens, on which there are still unquestionable traces of the parasite. It is most probable that the mildew had really existed at an early period of the year, at which time alone the remedies are certain in their operation, for it is well ascertained that at that period the delay even of a day or two may be fatal. It cannot, therefore, be too strongly impressed upon all Grape growers, to watch narrowly the appearances presented by the leaves, even before the blossoms are expanded, and on the slightest suspicion to apply the proper remedies. One circumstance in the matter, viz., the locality in which the latter case occurred, is a cause of much regret, as it shows that the disease is travelling northwards, for which our previous information had not quite prepared us.

All the Grapes alike when received were covered with a strong coat of mould, but one to which the malady was in no respect due. Indeed, it is a species which at this season of the year may be found in every garden on a variety of vegetable substances. We subjoin a figure, as the object is pretty in itself, and it is very desirable that it should be properly distinguished from the true Grape mildew, of which we have already given an illustration.

Our figure represents Polyactis fascicularis, CORDA, with its spores in various stages of progress, from their first appearance as minute subglobose granules to their perfect state; and the spores germinating and producing the fruit-bearing hyphasma. *M.J.B.*

ONE of the singular circumstances connected with the Crystal Palace is the well-known fact, that not even one of the anticipations of failure, in which its enemies were so ready to indulge, has been justified in the smallest degree by the result. It was to have been expected that, among so many prophecies of evil, mere accident would have brought about the confirmation of one—one little one. But no; the Fates were remorseless, and would not permit an accident—even to gratify the ASTRONOMER ROYAL.

On the other hand, every favourable view has become more and more brilliant as the great event progressed; as an illustration of which we may take the trees in the transept. These old Elms were pronounced by "practical" gentlemen to be irrecoverably doomed. It was impossible they could bear the dryness, and the heat, and the dust, and the confinement, and so on. We, on the contrary, mere theorists, as we are called, asserted that the trees would grow "with a vigour they had never known before." (*Gardeners' Chronicle*, 1851, p. 99.) And that some of them, at that time standing, and rotten, would become dangerous in consequence of the unusual weight which their brittle limbs would have to bear.

How far we were right may be learned from the following report accompanying some branches from Mr. TAYLOR, the intelligent gardener, to whose care the trees in the Crystal Palace have been entrusted during the season.

"These shoots exhibit the average seasonal growth made by the trees in question, as compared with the annual increase of a young and vigorous tree, standing betwixt the Crystal Palace and the Serpentine, in an open part of Hyde-park. Unfortunately, some shoots that would have more correctly indicated the *extreme* growth of these trees, especially of the one at the south end of the transept, could not, without much difficulty and danger, be got at, owing to their being at the top of the tree, and principally upon central branches.

"Among a quantity of shoots from these trees, which were recently left at Devonshire House for the examination of SIR JOSEPH PAXTON, were several that measured full 6 ft. in length. The latter were seen by many officers of the Executive Committee before they were taken from the building. Nor was the greatest amount of growth exhibited even in the instance just alluded to, the longest shoots being yet upon the tree in the south transept, and which the Sappers and Miners who assisted in obtaining those left at Devonshire House, although first-rate climbers, could not succeed in reaching without considerable risk. However, from an examination of the tree at the south end of the transept, from a position outside the roof-arch of the latter, we are quite sure that some of the longest shoots of this season at present upon this tree, cannot measure much less than 7 ft.; and this not arising, as might at first sight appear, from the unusual vigour generally induced by the breaking off of a branch or limb; for some of the longest shoots exist upon branches that have *not* been broken in the erection of the building.

"The extraordinary vigour of the annual growth—especially of one of the trees in the transept, may be attributed to an increased temperature (the transept not having been artificially shaded like other portions of the roof), and to copious root-waterings, to which may be added the syringing of leaves and branches likewise, for the foliage remained green, and it has continued so, longer than upon Elms in the open air. Sir JOSEPH PAXTON, with parental regard to the welfare of the trees, wisely insisted upon their receiving what has not been inaptly termed their 'weekly ablutions.'

"This watering 'overhead' of the old Elms in the transept and western carriage court, though not performed without difficulty, was happily accomplished without injury to the valuable property beneath and in their vicinity; and thus the freshness and vigour of the trees were preserved, to confer to the last the graceful charm of Nature's contrast with so much that pertained to art.

"In supplying these trees regularly with water, the services of the fire-brigade men, the Sappers and Miners, and of more than one fire engine stationed in the building, have been called into requisition.

"Generally the trees were watered at the root thrice a week, but this occurred oftener, when they first came into leaf, and the operation was always performed in the evening, after the departure of the public. The syringing overhead also performed in the evening, to refresh the trees and preserve the foliage green and fresh, was, as has been hinted, a weekly operation—in order to accomplish which, everything beneath, and in the immediate vicinity of the trees, within fire-engine range, had, for safety from wet and drip, to be securely encased with waterproof material, termed oiled calico. The alarm of some of the superintendents, as well as of the exhibitors and their assistants, respecting the safety of their goods, was great, but, notwithstanding this, Sir JOSEPH PAXTON insisted, for the welfare of the trees, upon having the 'ablution' performed at all risks, and although no serious injury to any one's goods was, to our knowledge, reported, never before, perhaps, were full-grown church organs, electric clocks, groups of marble sculpture, and plaster statuary, valuable cases of stuffed birds and other animals, highly-finished bronze gates, and other beautiful castings, hosiery, shawls, silk goods, and Highland plaids, tweeds, and tartans—*cum multis aliis*—exposed to so much apparent, yet happily so littl real danger!"

Hence it appears that while the dirty, half-starved Elms, growing as if wild in the open park, made shoots at the most a foot long on an average, the

well-fed, well-cleaned, well-lodged trees under the transept, made shoots from 6 to 7 feet long.

It is not unlikely, however, that some visitor to the place may remember how the ground in the north of the transept was prematurely strewed with leaves, and how one of the trees at an early period of the summer had all the appearance of dying. In order, therefore, to remove any misconception upon this point we may as well state that the tree in question was poisoned by the salt water thrown down continually by the confectioners in the place where they made their ices, which place happened to be in communication with the roots.

## BRITISH SONG BIRDS.

(Cage Birds, No. 37.)

No. LIII.—We find we are gaining ground with our subject, daily, and that we are fast making converts to our opinions,—or rather, converts to the truths of science. When a case is fairly argued, it becomes stripped of half its imagined difficulties; and the interest caused by the discussion cannot but be great.*

Paley, in his 'Natural Theology,' defines Instinct, with a nice discrimination, to be "a propensity prior to experience, and independent of instruction." This is strictly true. We, too, contend that it is by instinct that the sexes of animals seek one another; that animals cherish their offspring; that the young quadruped is directed to the breast of its dam for sustenance; that birds build their nests, and brood with such untiring patience upon their eggs; that insects, which do not sit upon their eggs, deposit them in those particular situations in which the young, when hatched, find their appropriate food. In short, that it is instinct which causes the salmon and some other particular fish to leave the sea, and enter rivers, for the purpose of safely depositing their spawn in fresh water.

What again can it be but instinct, that makes a bird prepare a nest for the reception of what she has never yet seen,—an egg? And what but instinct could teach her, that when laid the eggs require *warmth* to bring them to maturity? I can imagine, and admit, that when the embryon first receives the principle of "life"—about 10 days after the eggs have been under the 'parent in expectancy'—the case is altered. Here, natural affection is called into exercise, and every day brings with it pleasing evidence to the senses that pain is by-and-by to be rewarded with pleasure. The occupant of the egg is not only gifted with motion, but it utters a feeble cry long before it is born, and the quick ear of the mother knows, instinctively, at a very early period, all about what is to follow. Hence the difficulty of getting her to quit the nest for food, when the time for hatching is nearly arrived. Her self-importance at such a season is ludicrously comic.

The above observations concern all birds generally; excepting that in the case of birds of the air, the degree of instinct conferred by Nature is considerably greater than what is observable in the common hen for instance, geese, ducks, and other similar animals. Of all senseless, stupid, absurd, aggravating creatures, the domestic hen stands foremost. She will sit on a brick, a stone, a slate, or a block of wood,—and this for weeks at a time; indeed so long as the sensation of "heat" (peculiar at the breeding season) continues to rage. "A chemical operation," says Addison, "could not be followed with greater art or diligence, than is seen in hatching a chicken; yet is the process carried on *without the least glimmering of thought or common sense.* The hen will mistake a piece of chalk for an egg; is insensible of the increase or diminution of their number; does not distinguish between her own and those of another species; and is frightened when her supposititious breed of ducklings take the water!†"

In the case of domesticated fowls, and birds in a state of Nature, there is most assuredly "a distinction with a difference." This is a wise ordinance, worthy of a supreme intelligence. Yet has a fowl "brains." *Here*, surely, we have brains without "thought?"

I have before remarked, that instinct varies in degree with birds even in a wild state. For instance, the blackbird, the thrush, and many other larger birds, build in situations where their nests are readily observable and accessible; they consequently become an easy prey to the heartless robber. As these birds are very prolific, it may be that Nature designed this "limited gift" to be the means of checking their too great increase. This is a fair surmise, seeing that the lesser song birds are, for the most part, far more wary, far more cautious.

In no one thing is the instinct of animals more delightfully observable than in their affection to their young. Nature here addresses herself forcibly to us. Her voice is distinctly audible. "See," says Derham, "how tenderly do birds caress their offspring with their affectionate notes; lull and quiet them with their tender parental voice; put food into their mouths; cherish and keep them warm; teach them to pick, eat, and gather food for themselves; and, in a word, perform the part of so many nurses, deputed by the Sovereign Lord and Preserver of the world, to help such young and shiftless creatures!" Neither must we forget, whilst on this subject, how dear the "instinct" costs the animal which feeds it. Think how very much a bird gives up by sitting so long upon her nest! How repugnant it is to her organization, her habits, and her pleasures! Here we have an animal, light as air, and formed for liberty, submitting to confinement without a murmur; at a season too, when everything invites her to enjoy herself abroad. Made for motion, and to be constantly flying about, behold her for many consecutive hours, extending over many wearisome days and nights, *riveted* to her nest; her limbs cramped, her frame half wasted away, and the most arduous duties yet remaining to be performed!

These are some few of the interesting observations that await the diligent enquirer. We are treating now of birds *only*; but we hope that our readers will not rest here. The Book of Nature is a library of itself, and the student who enters it will find enough to occupy him for his life-time. To those weak-minded, short-sighted individuals, who ridicule our philosophy, we will not reply in our own words, but refer them to the remarks of the "Good Jones," as he is called, to distinguish him from the small fry of that extensive family tree—we mean "Jones, of Nayland." "He who cannot see the workings of a divine wisdom in the order of the heavens, the change of the seasons, the flowing of the tides, the operations of the wind and other elements, the structure of the human body, the circulation of the blood through a variety of vessels wonderfully arranged and conducted, the *instinct of birds, beasts, and other animals*, their tempers and dispositions, the growth of plants, and their many effects for meats and medicine,—he, I say, who cannot see all these and many other things, as *the evident contrivances* of a divine wisdom, is sottishly blind, and unworthy of the name of a man."

Being ourselves anything but vindictive, we will only add to the above that should any person despise these glorious pursuits,—'May he never grow fat!' We are in search of the noblest gifts of God to his creatures; and nothing short of the discovery will satisfy us:—

> So, turning round the lordly Oak,
> Secure th' ambitious Ivy grows;
> And, proof against the tempest's stroke,
> Laughs at the fiercest wind that blows!

We stand not alone, but have a goodly array of ardent followers. *William Kidd.*

## JOTTINGS ON FOREST PRUNING.

Excessive pruning often destroys life in a vigorously-growing tree; but more frequently, a prostration of the vital powers, and stagnation of growth, are the immediate consequences. The whole of a fine avenue of Horse Chestnuts (*Æsculus Hippocastanum*), was deprived of the lower branches, from a sordid motive, and many of them died in consequence. It must be recollected, that the despoiled branches were very large, and the trees very old. A similar result in the case of younger trees occurred two years ago, within a few miles of where I write. A plantation of Scotch Firs, from some cause, became so thinned in an early stage of their growth, that each tree had ample room to extend its lower branches. I saw them before the mutilation of which I am about to speak took place, and could not but admire their robust and healthy appearance, so opposite to what we usually witness in ordinary plantations of the same kind of tree. This robust character would appear, however, not to be exactly what their owner required, for passing through the plantation at a subsequent period, I was presented with a new kind of scenery. The trees, or rather portions of them, were there certainly, but how changed. A Hop-pole with a stable-broom on its top would afford an excellent representation of an individual tree, and the portrait of one would serve equally well for all. But the sequel is not told. This mutilation took place in winter, and when summer returned a botanical ramble led me to the locality, and I observed a quantity of my old friends dead and dying, to say nothing of various little collections of bare poles scattered about, composed of those which had been cut down previously to my visit. I passed through them again the other evening, and I observed how thin were their ranks, and viewing the heads of those still standing, against the clear background of an evening sky, for it was nearly dark, I could distinguish many more in a feeble condition of growth. Had the pruning or rather in this case "lopping" being performed gradually, I mean had a few branches been removed yearly, spreading the operation over several seasons, this destruction of trees would not have occurred. To deprive a tree of its branches at any time, is to disturb its whole circle of vital actions, which cannot but act detrimentally. To obviate its ill effects as much as possible, supposing the removal of such to be advisable, is to extend the operation over as great a space of time as possible, to allow the tree to recover from the effects of one attack before another is given. The philosophy of this we shall come to consider by-and-bye.

A great error in forest management may here be very appropriately alluded to. It is to be hoped that an opportunity for such does not often occur, but still it *does* occur, as those whose business or observation leads them to notice such matters need not be told. The plantations on an estate sometimes become neglected from various causes. The apathy of the proprietor, his fondness for game preserves, or sheer carelessness about the matter, allows his woods to become a tangled mass. Trees have struggled with each other for supremacy, the underwood has out-topped the legitimists of lordly growth, and the whole has become confusion, which a little timely attention would have obviated. From some of the many changes which are every day taking place in sublunary matters, the woodman gains access to the plantations; and, as if to compensate for past neglect, he is merciless in his operations. Nothing comes amiss, the wood is to be thinned, that's his orders, and it will be done. No judgment or forethought is allowed to influence his doings—thin, thin, thin, hack, hack, hack, is the only text he understands, or will understand. At last the wood is thinned, and the two great points of admiration are the clear naked stems of the trees, and the number of faggots for the market. The latter is a point worthy of consideration, certainly, but at what sacrifice is it gained? Stagnation of growth in many instances, death in others, and detriment to all. To effect so sudden a change in the condition of the trees is bad policy. The transition should be gradual; violent changes in the circumstances attending vegetable as well as animal growth, are often followed by disastrous circumstances.

In young plantations, under ordinary circumstances, trimming and cutting away branches too often takes the place of thinning. If sound timber is the object sought, the natural condition of growth cannot be too assiduously attended to. In forest pruning, as in all other operations of a like character, Nature should be assisted, not obstructed; her efforts should be directed, not perverted. *G. L.*

*(To be continued.)*

## ON THE FORMATION OF WOOD IN TREES.

(From the Proceedings of the Royal Irish Academy, June 23, 1851.)

Mr. David Moore, curator of the Royal Dublin Society's Botanic Garden, communicated the following details of the results of physiological experiments on the formation of wood in plants, made in the Royal Dublin Society's Botanic Gardens, Glasnevin, between the years 1839 and 1851:—

"It may appear remarkable in vegetable physiology that what has long been considered an axiom should now be gravely disputed by one of the best physiologists of the present time. Dr. Schleiden, of Jena, in his admirable work, 'Principles of Scientific Botany,' flatly denies that a downward current of elaborated bark-sap either does or can take place in plants, which opinion gives to the experiments I propose to describe much additional interest. At the time my experiments were commenced, and for several years afterwards, the descent of the sap in vegetables does not appear to have been doubted, the whole theory of wood-formation resting on the fact of such being the case. It was therefore more with a view of eliciting information on the latter subject, than to prove or disprove that sap circulates, as it has generally been considered to do, they were undertaken.

"Before entering into details I shall take the liberty of very briefly stating to the Academy the views held on this important subject by Drs. Lindley and Schleiden, which are entirely antagonistic. The former author, in his 'Theory of Horticulture,' at p. 28, makes the following statement:—'When sap leaves the earth and passes into the stem, it ascends by the woody matter of the finest fibres of the root; having left them, it flows into the new wood from which those fibres emanated, and passes along this until it reaches the leaves; on its return from them it descends through the liber, in part passing horizontally through the medullary rays. Wherever it passes, it deposits a portion of its solid parts,' &c. Dr. Schleiden, on the other hand, denies that wood is formed by a descending bark-sap. In his chapter on the 'Reproduction of Plants,' in 'Principles of Scientific Botany,' p. 535, when treating on grafting, we have the following statement:—'Yet the stock must always exert a greater or less influence on the eye or graft, as the sap brought to it must pass through the cells of the stock, and become changed there. In this case the relations are too complicated to enable us to offer an explanation. All that is known on the subject is detailed in manuals of horticulture. I will mention one case. If the branch of a quick-growing plant is grafted upon a very slow-growing one, as, for instance, the branch of a Plum upon a Sloe-stock, the graft will grow rapidly, but not so the stock, which retains its slow-growing character; a striking example of the permanency of the specific life of the stock, and, as it appears to me, affording a fatal argument against the pretended descent of the sap. If a descending bark-sap existed, the Sloe-stock would be naturally covered with annual rings of Plum wood from the graft, and it would grow in proportion to the growth of the graft; but this is by no means the case, for the new annual rings are formed, not out of a descending bark-sap, but out of a cell-development of the cambium already existing in the stock, and having essentially the same characters. The formation of new wood of the nature of the graft has always been taken for granted, in order to prove the descent of the bark-sap; but we find that this wood does not partake of the nature of the graft, and that it must, therefore, be formed independently of any descending juices.' These being the views held by the best authorities on the matter at present, I shall now detail my experiments, and show how far they bear on either,

* We hardly need remark, that we do *not* write for the "philosophers of the new school," who, deriding the doctrine of the immortality of the soul of man, and contending that we are no better than the brutes that perish (except in degree), are "wise far above what is written." We cannot travel, or keep pace, with the modern doctrines; so that we must amicably "agree to differ" from those who dissent from us. We advisedly state this *in limine*, to prevent any possible misconception.

† It is worthy of note, that Nature always appears to apportion her favours towards her children according to the circumstances in which they are to be placed. Thus fowls, and other domesticated animals, being under the immediate care of man, require *comparatively* little foresight, and this fully explains the "why and because" of their occasional stupidity.

"My predecessor, Mr. Niven, had been conducting some physiological experiments before he left the Botanic Gardens, the results of which are already before the public. I consider, however, it only just on my part towards him, that I shall here state my principal experiment to be founded on one he had commenced, though we do not appear to have been aiming to attain similar objects. He had cut several trees more or less through their boles in various ways, one of them, a large Horse-Chestnut tree, then 4 feet in circumference, and now 4 feet 9 inches. At three feet from the surface of the ground, two deep incisions had been made through the stem, crossing each other at right angles, and reaching the circumference on each side (Fig. 1). The tree was thus left growing on four separate pillars of wood, alburnum, and bark, but no results, that I am aware of, were deducible from this experiment, when I commenced the following. Seeing that it afforded an excellent example for observing the growth of woody matter, as it would form to fill up the perforations through the stem, I examined the portion of the tree where it was cut, and found that the heart wood was completely dead, and beginning to decay, at both the upper and lower lips of the cut. It, therefore, could render no assistance whatever for the phenomena of life being carried on through its medium. The ascent of the sap and formation of wood must then have depended altogether on the functions of the alburnum and cambium, which rested on the four pillars of dead wood, now simply acting as supports. During the spring of 1839, I had one of the pillars laid bare (Fig. 1, A), thus

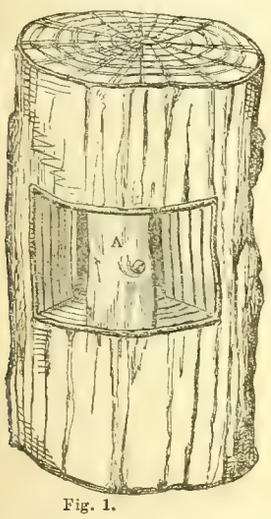


Fig. 1.

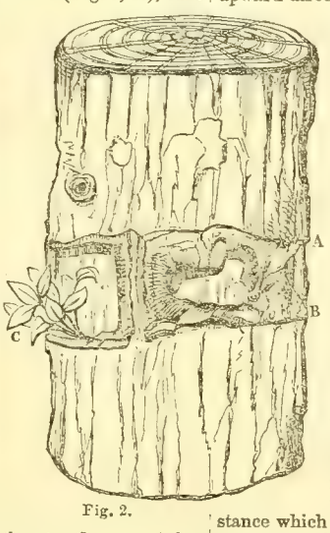

Fig. 2.

confining the life-supporting action to the remaining three. In a short time afterwards, granulated masses of cellular tissue began to form on the upper lip of the incision made, and continued to extend down the surface of the bare pillar throughout the summer, whilst the lower lip of the incision remained free from wood-formation. The woody matter continued to increase rapidly through the summer of 1840, extending itself both in perpendicular and lateral directions from the upper lip. On the lower lip two leaf-buds were formed (Fig. 2, C), which produced young shoots, when woody matter began to form at the bases of these shoots; but on their being removed, the farther increase of tissue at once stopped. In May, 1841, the masses of cellular tissue and wood had extended from the upper lip so as to touch the lower, and to spread along its surface.

"When the junction took place, a second of the pillars was laid bare, as the first had been, and the results were similar. The only difference observable was, that the woody matter did not form so rapidly as it did in the first instance. At the expiration of three more years, a second junction had taken place on the pillar last laid bare. A third was now subjected to the same experiment, the principal difference of results in this case being, that no leaf-bud was formed on the lower lip. As soon as the third junction occurred, the fourth pillar was treated as the others had been, the growths of young wood becoming gradually weaker on each succeeding one being the only difference.

"Having now detailed the way this experiment was conducted, the facts elicited enabled me to deduce:—

"1st. That every organ in an exogenous tree may be thoroughly destroyed, without causing the death of the plant, provided they are gradually destroyed. 2d. Exogenous plants, through their vital processes, have the power of again restoring the organs so destroyed. 3d. The formative energy takes place principally above the wounded portion of the stem, and the newly formed tissues increase, for the most part, in a downward direction.

"Though these results may, at first sight, appear to be little more than confirmations of the old theory of wood-formation, and even the experiment itself in some degree similar to others which have already been made, the latter differs materially from any I know of, in the following particulars. Here the main stem of the tree was operated on, and not the branches only. All the organs were destroyed, including pith, medullary rays, and wood. In the course of 12 years the stem of a large exogenous tree, measuring 4 feet 9 inches in circumference, has been completely killed in a circular ring 7 inches wide, and the organs of vitality again restored, without apparently affecting the health of the tree, which is now, while I write (June, 1851), in full bloom. The results, I conceive, rather than adding confirmation to the established theory, bear out Dr. Schleiden's views in a remarkable manner. It is true the newly-formed tissue extended from the upper lip of the cut chiefly in the downward direction, and that very little appeared on the lower lip. But the train of reasoning I adopt from these circumstances is that of Dr. Schleiden. The flow of sap by endosmotic process from cell to cell was interrupted by the alburnum and cambium being cut across on the pillar which was laid bare. It therefore diverged laterally, and followed its natural upward course, on the three pillars where no laceration had been made, which accounts for no growth taking place on the lower lip. On the portion of stem above the cut, a greater degree of formative energy accrued, in consequence of the interruption the endosmotic process met with below. The tissue thus formed would rather extend itself on the vacant space under, *i. e.*, the bare pillar, than upwards, where endosmosis was less vigorous in consequence of many of the cells being filled with sap of greater density. In this manner it continued to grow until it reached the lower lip of the cut, where its downward course was obstructed, when it spread in a lateral direction over the surface of the lip, as well as upwards, until the bare surface became covered over. During the whole process it did not occur to me, that the young wood was formed by a returning bark-sap. The growth seemed gradual and not periodical. The young tissue taking a lateral and upward direction when it met the lower lip, shows that, although the tendency be downwards, it will alter.

"A remarkable example of the permeability of the tissues of plants has farther been proved through this experiment. From knowing the heart-wood was dead at the part of the stem which was operated on, I was desirous to ascertain whether it continued so to the apex of the tree, which I had some reason to suppose it did, from having about four years ago observed a small portion of the top shoot dead. I, however, found the heart-wood full of sap, and apparently very healthy, in a piece of the top shoot which I had lately cut from below the dead part.

"With similar objects in view, a second series of experiments has been made, at various times within the last 12 years, by planting cuttings of free-growing plants with their tops downwards. Placed in this way, adventitious roots were protruded, and the plants grew. Cellular granulations at first appeared on the end which was now uppermost, and out of the ground, a circumstance which militates against the inference drawn by some, namely, that the physical law of gravitation operates in causing the sap to descend.

"In conducting this experiment, I have invariably found that no cellular callus formed at the lower extremity, as would have been the case had I planted the cutting in the regular way. The young roots were protruded laterally from the bases of leaf-buds under ground; when one or more of these elongated, the axis made a sharp curve upwards, until it regained its natural position. The growth and woody formation went on then in the usual way. In some cases the portion of the cutting above ground remained alive during a considerable period, though no leaf-buds grew on it. It, however, soon died after the ascending shoot gained strength.

"This experiment, in my opinion, also tends to prove that no regular return of assimilated bark-sap takes place in the formation of wood; because, if such were the fact, the portion of the cutting above ground would have lived, and continued to receive the annual deposits, which was not the case.

"The beautiful example I have laid before the Academy, of the junction of stock and graft, proves, beyond any manner of doubt, that the two increase by separate growths of their own wood, as thoroughly as if they still grew on separate roots. I cannot, therefore, see how this fact can be got over by those who hold that exogenous plants increase by annual deposits of bark-sap. It will not, however, do to draw final conclusions from isolated cases on a subject which, if Dr. Schleiden's reasoning be correct, so great a change must necessarily follow in our views of this part of the science of vegetable physiology."

## Home Correspondence.

*Yellow Bedding Calceolarias.*—Amongst the ornaments of a gay parterre, or mixed flower-border, few stand higher in public estimation than yellow Calceolarias; and we look in vain amongst other plants for the fine colour, continued flowering, and compact habit, which this useful tribe possesses. As every particular, therefore, relating to the merits or defects of the varieties now common cannot but be interesting, I send you a few remarks on those kinds which I have grown rather extensively this season; and in return I shall be glad to hear what additions others may have to make to the list. The well known C. angustifolia, and its twin brother rugosa, have proved almost hardy here; last year, every plant left out lived through the winter, and I think there were hundreds; but after a heavy crop of flowers very early in the season, they did not flower so freely as I could have wished; latterly, rugosa has, however, blossomed better, and what is of consequence to know, its flowers do not drop off so much with the rain as those of some others do; and for very late beds, I believe it is about the best variety we have. C. viscosissima floribunda has a better habit than either of the above, of a deeper or more orange colour, and individually the flowers are larger. It does not, however, stand rain so well as some others; but what is equally important, it endures the sun tolerably well—better than any other I have; and we all know what a dislike Calceolarias have to a long continuance of dry weather. Of a still deeper tinge, and quite as good in habit as the last, is a broad leaved variety, less glaucous than viscosissima, and more pointed in its leaves; but the name I have with it is only local, and therefore useless to the general reader. This one I like the best of any. The rain does not wash off its flowers so much as it does those of the kinds mentioned above, and it thrives pretty well. Another broad-leaved variety called (I think) Salvifolia, is much the same in character, except that its flower stems are too weak to resist severe weather, and that is a serious drawback. More gay than any of the above, but less hardy, is the brilliant C. Kayii; this, though lacking some of the good properties of a bedding Calceolaria, is, nevertheless, a great acquisition; its large truss and purity of colour rendering it a universal favourite. It stands the rain better than any sort with which I am acquainted, and for nosegays it is indispensable. A desirable point about it is that the back of the flower is nearly as bright as the front. Notwithstanding its size, however, clearness of colour, and other good qualities, it unfortunately has its faults. It is not so hardy as some others; it does not flower so early, and the plant wants that sturdiness of habit which is necessary to maintain its flowers erect against all kinds of weather; nevertheless, it is a great acquisition, and I have three beds of it now (Nov. 3), about the most showy of anything I have, Salvia fulgens perhaps excepted. In the early part of the season, it is more disposed to grow than flower; in which respect it is exactly the reverse of the variety called "Kentish Hero," which flowers itself almost to death at that time of the year. But I forget, "Kentish Hero" is not yellow; and I have promised to confine myself at present to that colour. Next to C. Kayii, is amplexicaulis, which differs but little from it, except in foliage; the size, shape, and colour of the flowers are the same, but the foliage presents a marked difference; of the two, I prefer Kayii. There is another bright yellow kind, called by some "Floribunda," a very improper name, for I could never get it into flower until late; and I have, therefore, thrown it away along with one or two others of less note. Were I to be asked which two sorts I would prefer, I would at once say "Kayii," and the one resembling viscosissima; if another, then Angustifolia. As I have formerly mentioned that the end of October and November are good times for propagating Calceolarias, I hope that amateurs have or will avail themselves of it. I have only lately put in my stock, which is little short of 2000 cuttings, and I have no fear that more than one or two per cent. will fail. With me the greatest drawback is the effect which dry weather has on them in summer; and in planting a given set of beds, the one that may be a little more shaded than the rest is not always the one that a due distribution of colour renders advisable to plant with yellow Calceolarias; this, together with my dry soil and absence of water, are evils difficult to overcome; nevertheless, I should consider a set of only four beds incomplete unless one of them was planted with this my favourite class of plants. *An Old Gardener.*

*Late Figs* (see p. 694).—Your correspondent "S. B." will not succeed in ripening Figs without fire heat at this season of the year, as they appear to require a greater stimulus than mere close confinement. I have seen it fail in our Fig-house every season. This year, however, I have managed to ripen late Figs, and I am now gathering from small plants in pots. The process is simple, and shows the Fig to be a more manageable plant than some people imagine. In the beginning of October the leaves of the Figs in our Vinery were turning yellow, and the half-formed fruit dropping off, when I had half-a-dozen plants removed to the stove, the surface of the soil well mulched with manure, and the leaves syringed frequently. The result of the experiment is that the leaves have regained their deep green colour, and in 10 days from the time they were first treated in this way the plants ripened fruit. I gather from them about once a week, and there is every prospect of a continued supply up to Christmas, as very few of the fruit has fallen off. *Charles Lee, Hammersmith.*

*Preservation of Fish.*—Since the preservation of fish has been noticed in the *Chronicle*, I am desirous of adding my testimony to the great injury done to many streams and rivers by the deleterious refuse drained into them from towns. I can bring evidence to prove that the waters of a small stream have been so much poisoned by gas and other refuse, which have been suffered to be emptied into it from a town on its banks, as to render it five miles below, at times, totally unfit for the cottagers living near it to make their tea from, which they are in the habit otherwise of doing. A thick, greasy scum, rising to the surface when boiled, discovers its impurity. I have also been credibly informed that many fish have been found dead near the town, evidently killed from this cause. I myself have observed that the fish, particularly dace, have become subject to a very destructive disease, to which, I believe, they were not formerly liable, and by which great numbers perish; this, too, I am inclined to attribute to the tainted water. The symptoms of disease are these:

the fish gradually become covered with a white leprous coating, and, if this is rubbed off, there appears underneath a bright red sore; in this weakened state they may be seen to rise to the surface, and, unable to resist the current, they float down the stream till they die. Another curious circumstance is, that there used to be innumerable quantities of minnows, now it is quite a difficulty to find any. There surely must be some secret, wide-spreading cause of their diminishment. The destructive effects of manufacturing dyes and things of that sort are immediately apparent, but these subtler poisons, which can thus be proved to be baneful in smaller streams, may be doing their work no less surely, though slowly and unseen in the larger salmon rivers of England. I think it is a point well deserving attention, and further investigation, and, if needful, the application of stronger remedies. *Moderator.*

*Samples of Seeds.*—As the originator of the discussion on this subject, you will pardon me for suggesting that the note appended to "An Old Gardener's," remarks, at p. 694, is calculated to stop the discussion altogether, as gardeners who are under the influence of those seedsmen and nurserymen who patronise the long list system, will be afraid to take part in it if their names are to be made public, and the "trade" who can give the most useful information of all, are not to speak at all. I was first induced to start the subject from a discussion which I had at one of the meetings of the National Floricultural Society with two of the leading wholesale seedsmen, when I suggested the propriety of their submitting their novelties to the same test as florists did their flowers, and they immediately said they should be glad to support a Society for the purpose. I have reason to know that several of the "trade" will join the discussion, and impart some very useful information. To the trade it is a matter of quite as much importance that the lists should be purged of all but really good articles, as it is to gardeners. We should then only have to keep half the number of kinds in stock, and should sell all we buy; whereas, at the present time, we buy annually many pounds' worth of seeds, three-fourths of which are thrown away. I was speaking with Mr. Barnes, Mr. Hanbury's late gardener, a day or two back, about Broccolies, and he says if a gardener can manage to get the Walcheren, and Snow's Winter White Broccolies true, "he is not worthy the name if he cannot send them to table every day in the year." He has done so for the last three years. Here, then, all the Broccolies are thrown to the winds. *W. P. Ayres, Brooklands, Blackheath.* [Our reason for objecting to "the trade" is merely this,—that interested parties are not fit judges in their own case; that is all.]

*Heracleum giganteum.*—I have a quantity of excellent seed of this, gathered from the crown umbels of fine plants, from 11½ to upwards of 12 feet high, and I would be happy to distribute it among such of your subscribers as may wish to grow this splendid biennial. You may, therefore, announce to your readers that any one applying to "W. C. G., Post-office, Sandbach, Cheshire," and enclosing a stamped envelope, with applicant's address, will receive seed in return. *M. D.*

*How to Crop a Small Kitchen-Garden* (see p. 693).—I have to thank your correspondent "Vectis," for giving his mode of cropping, as I consider it a step in the right direction. As he so strongly recommends his plan, I should feel obliged if he would answer the following questions, namely, where does he grow his Carrots, Onions, Beet, &c.? for as I read his account he appears to devote the whole of his garden to Cabbage, Potatoes, and Peas; also, what he does with the Cabbages when grown? as I have always found 100 of one planting sufficient for a family, provided they are well supplied with other vegetables. He states that having his ground ready he was enabled to get in his rotation crops without trouble; what crops does he mean? and what does he supply the table with from the time he has his garden cleared right through, till his Cabbages, Potatoes, and Peas are ready for use, say three months? *J. Steel, Clitheroe.*

*Cucumber Disease.*—I beg to thank your correspondents, Messrs. Graham and Webster, for their communications respecting this strange malady. Might I ask the latter if he cured it the same season he had it so bad, by the means he used; or, if he adopted them the following season, and had no disease. There is a wide difference in the merits of the cure in these two cases. In reply to Mr. Graham, who has pointed out to me certain works treating on the Potato disease, and mentioned the name of the fungus said to be the cause of it, I would say, that my proposition remains yet unanswered. As neither science nor experience has yet taught us how to treat that vegetable, so as to enable it to escape the blight, it is but poor consolation to be told that it is caused by a fungus, when that fungus is as obstinate to remove as the disease it engenders. However, I trust the Cucumber complaint will prove less tenacious; but, having baffled the means by which I and some others tried to remove it, I am the more inclined to believe its disappearance in other places may be due to other causes than the artificial remedies used to overcome it. *An Old Gardener.*

*Plumbago Larpentæ and Agapanthus umbellatus.*—These plants have stood with me here in the open air, during the last two winters, without the slightest protection. The Agapanthus has bloomed well; but although Plumbago Larpentæ forms a very pretty bush, it does not get into flower before the tops are cut down by early autumn frosts. *R. C. Haverthwaite, North Lancashire.*

*Saponaria calabrica, a good Bedding Plant.*—Did any of your readers attend to my advice last season to grow Saponaria calabrica (recommended originally I believe by Mr. Beaton), as a bedding out plant. In a well selected parterre garden in this late season, I find it the most beautiful plant now remaining. One long border is covered with it in full perfection, and it is like a carpet of the most delicate pink. Now is the time for those who care for a parterre garden to make up their minds what are the best kinds of plants to stand from June till the end of October, and longer. *Dodman.*

*Coe's Golden Drop Plum.*—Mr. Rivers states, in reference to some specimens of this Plum which he has sent you, that they were shrivelled through the dryness of the atmosphere in his orchard house. Now I beg to ask, is it not the nature of this Plum to shrivel just before getting ripe? I have invariably found it do so, and I have heard others complain of the same thing; in other respects the variety is in my opinion second to none. If it is its nature to shrivel, it ought to be made known, as many employers, unacquainted with the fact, might be induced to impute it to want of skill on the part of the gardener. *J. Steel, Clitheroe.*—Seeing that Mr. Rivers has succeeded in keeping Coe's Golden Drop Plum very late in the season in pots, I send for your inspection two fruit of that variety, which were grown against a south wall, and gathered this morning; my last dish for this season will be sent to table this evening (Nov. 4). I have been successful in keeping this Plum late for two seasons, in the following way. I take care to nail as many of the summer shoots to the wall as can well be got; the fruit is then nicely shaded from the burning sun, and as soon as it shows signs of ripeness I cover it with a close woollen net, in order to preserve it from wasps and beating rains. I believe that the crop this season would have hung till the end of this month. *William Culverwell, Thorp Perrow, Bedale.* [They were somewhat shrivelled; but very good.]

*Cryptomeria japonica.*—I entertain a very different opinion from your correspondent, at page 660, with regard to Cryptomeria japonica, not being likely to form an ornamental lawn-tree; for I am inclined to think that, where the soil is suitable, and the situation not too much exposed, it will in the course of a few years become a very graceful object, and have a striking effect, either as a single specimen or in a group. The cause of its sometimes having a sickly appearance is probably owing to the soil in which it is planted being of a stiff clayey nature, which it seems to dislike—as well as a dry poor soil—but in a moist rich loam it thrives amazingly; throwing up a leading shoot in the course of the season between 3 and 4 feet long, with branches in proportion. I had one plant that seemed very unhappy for two seasons after it was planted out, and made scarcely any progress, until treated with a little weak guano water, which had the desired effect of restoring it to a fine healthy green. I have since had ample proof of guano being acceptable to this plant, and I should recommend those who have any sickly-looking specimens to give them a little guano water occasionally. I feel confident of the result being satisfactory, provided care is taken not to make the dose too strong. *M. E. H.*

## Societies.

Horticultural, *Nov.* 4.—E. Brande, Esq., in the chair. W. Banting, Esq., H. Edwards, Esq., M.P., Rev. J. Thornycroft, and Mr. Keynes, of Salisbury, were elected Fellows.—Of subjects of exhibition, Mr. Franklin, gr. to Mrs. Lawrence, of Ealing-park, received a Large Silver Medal for a very fine collection of Orchids; among which were two plants of Vanda tricolor, two of V. suavis, two fine specimens of Cattleya labiata, a striking variety of Lycaste Skinneri, the useful Odontoglossum grande, Cymbidium giganteum (misnamed lancifolium), the beautiful Calanthe vestita, Miltonia candida and violacea, and some others, including a so-called new Oncidium and Odontoglossum.—Mr. O'Brien, gr. to G. Reed, Esq., Burnham, Somerset, sent a curious, rather than beautiful, new form of Myanthus, for which a Certificate of Merit was awarded.—From Mr. Woolley, gr. to H. B. Ker, Esq., came blooms of the charming terrestrial Orchids called Pleione (Cœlogyne) Wallichii, and maculata, which he stated were two most useful subjects for winter decoration. A plant of the former, which had been grown in a 6-inch pot, was reported to have had 15 flowers on it, all open at one time, and which lasted in perfection from three to four weeks.—Messrs. Veitch produced a slender growing white Dendrobe (D. album), and Pleione (Cœlogyne) lagenaria. The flowers of the latter resemble those of P. maculata, except that they are larger, and that the sepals, petals, and outside of the lip are pink instead of white.—Mr. May, gr. to Mrs. Lawrence, furnished a large and very fine Crowea saligna, together with the yellow Chorozema (C. flava).—Mr. Salter, of the Versailles Nursery, Hammersmith, contributed Pentstemon variabilis, a pale greenish white kind, tipped with pink.—Messrs. Weeks' again sent a bloom of the Royal Water Lily (Victoria Regia), one of Nymphæa cærulea, and a flower with a leaf of N. dentata, still from the open heated pond in their nursery in the King's-road.—Of Pine-apples, Mr. Price, gr. to W. Thompson, Esq., M.P., sent a well ripened Queen, weighing 4 lbs. 13 oz., for which a Certificate of Merit was awarded.—Among Grapes, which were produced in considerable quantity, Mr. Davis, of Oak-hill, had two baskets of Muscat of Alexandria, both of which contained fine bunches; but those in one of the baskets were ripe, while those in the other were not. A Certificate was awarded for the ripe fruit.—Mr. Martin, gr. to Sir H. Fleetwood, Bart., received a Banksian Medal for fine bunches of Oldaker's West's St. Peters, a valuable variety for hanging long after it is ripe without shrivelling. The same exhibitor also showed Muscats, the produce of a second crop from the same Vines this year, and a dish of excellent Hamburghs.—From Mr. Forbes, gr. to the Duke of Bedford, at Woburn Abbey, came a bunch of Mucat weighing 2½ lbs., three of Black Hamburgh, weighing respectively 2½ lbs., 2½ lbs., and 5¼ lbs. Concerning the latter it is to be remarked, however, that it was not one bunch, but a cluster of bunches all produced from a common point or bud. A Banksian Medal was awarded.—Mr. Woolley communicated Black Hamburgh Grapes, fair sized specimens, and perfectly ripe, from Vines that had been grown in what Mr. Rivers calls an "Orchard-house," *i.e.*, an unwarmed roughly constructed shed with a glazed roof. It was stated that there had been an abundant crop in this house, without any mildew, and that such places had been found very useful in winter for keeping Orange trees, Aloes, Fuchsias, or other half-hardy plants that require little water. A Certificate of Merit was awarded. Mr. Woolley also sent a punnet of the same kind of Cherry, of which Mr. Rivers furnished specimens on the branches the other week, and of which some account will be found at page 678. They were not large; but good fruit for this time of the year. They had been gathered from dwarf trees in the open ground, where they have received no protection. From the same gardener, also, came fruit in good condition of the "large monthly bearing Raspberry," which has yielded a succession of fruit ever since August up to the present time.—Mr. Martin sent specimens of a seedling Apple, and 28 varieties of the same kind of fruit also came from Mr. Salter, of Hammersmith.—The Garden of the Society contributed various Chrysanthemums, among which were some nice Daisy-flowered kinds, two Cape Heaths, Epacris miniata, Achimenes coccinea, Campanula garganica, and a large collection of Pears and Apples. Among the former was the beautiful Pear called Forelle, or Trout Pear, which proves to be a good bearer; and, although the tree blossoms earlier than almost any other, yet it has withstood the frosts which have destroyed the best blossoms of other kinds during the last two springs. Fruit was also furnished of Beurré de Capiaumont and Beurré Bosc, two fine Pears, more especially the latter, from standards, and also of Hacon's Incomparable. The latter has the character of being excellent when grown on standards; but from walls it is apt to be rotten at the core. A variety of curious evergreen shrubs and trees were contributed by the Hon. W. F. Strangways, from his garden at Abbotsbury, near Dorchester.

The following notice of an alteration in the bye-laws was read for the first time. "It is proposed to repeal the following bye-law of the Society, viz., Chapter 4, Art. viii., 'Every Fellow may at any time compound for all his future annual contributions, by paying ten times the amount of his annual subscription;' and to substitute the following words, 'Every Fellow may at any time compound for all his future annual contributions by paying, when first elected, 42*l.* 10*s.*; at the end of seven years, 31*l.* 10*s.*; at the end of 14 years, 26*l.* 5*s.*; and at the end of 20 years, 21*l.*'"

Microscopical, *Oct.* 22.—Dr. Arthur Farre in the chair. Mr. Shadbolt read a paper on the sporangia of certain fresh-water Confervæ. The author stated that in a previous paper he had described the conversion of the sporangium of Zygnema quadratum, and Z. varians, into a stellate body resembling the species of the genus Xanthidium. In the present paper he described more minutely the changes which the sporangia or spores of Zygnema quadratum and Z. varians undergo after conjugation. The stellate sporangium has a different appearance in the two species, and marked differences are observable in the form of the cells of the Algæ during their development. He had observed bodies of a similar character in the genera Lyngbya, Vesiculifera, and Tyndaridea. In the first, the spines forming the stellate body were small, and arranged in a spiral form. In the species of the second, the spines were very minute. The chairman exhibited leaves of the Maple, the under side of which were covered with the pupæ of Cassida viridis. A large drawing, representing this creature, was also exhibited. Mr. Busk drew attention to the development of the Diatomaceæ. He had observed, in a species of marine Bacillaria, that several individuals were contained in a membranous tube, from which they passed out, and occasionally retired within it again. After the papers were read, Mr. Shadbolt exhibited specimens of Zygnema, with the stellate bodies. The mounted specimens recently presented were on the table, and were examined by the members, with the aid of the four excellent microscopes in the possession of the Society. Mr. J. Howard, of Bolton, was elected a member.

## Reviews.

*Portrait of Prince Albert.*—Mr. Ransome's series of portraits, drawn by Maguire, has, on former occasions, been mentioned by us as remarkable for the excellence of the likenesses. We are happy to be able now to announce that the *chef d'œuvre* of the artist has just appeared in the form of an admirable portrait of Prince Albert, as patron of the Ipswich Museum. Mr. Maguire has seized with much skill the intelligent and benignant expression of H. R. Highness's countenance, and happily combined it with that dignified manner for which our

great and popular Prince is so remarkable. This likeness is not only the finest of its series, but, in our judgment, one of the best which has yet been published of Prince Albert.

*Sir Wm. Hooker's Species Filicum* (*Pamplin*) has now reached the 5th part, that is to say, the 2d part of the 2d volume, and we understand that the 6th part may be shortly expected. The present issue of this very important work contains the genera *Adiantum*, *Ochropteris*, *Lonchitis*, and *Hypolepis*, occupying 60 pages of letter-press. The plates, of which there are 20, are charming specimens of Mr. Fitch's graceful and accurate pencil.

*The Vade Mecum of Fly-fishing for Trout, being a complete Practical Treatise on that Branch of the Art of Angling, with plain and copious Instructions for the Manufacture of Artificial Flies.* Illustrated by numerous Engravings. By G. P. R. Pulman. Longman and Co.

To those who wish for information and instruction for making artificial flies, this book will be found useful; the directions are clear, and the plates are given in explanation of the proper way of managing and handling the materials throughout the whole process of fly making.

The author is evidently an enthusiastic fisherman, and no doubt understands his business sufficiently to fill his basket in the Devonshire rivers to which he has been accustomed, though he might find more difficulty in doing so, if he tried his hand in rivers where the trout are grown of a higher average weight than in the Axe.

Although there is but little original matter in the book for a practical fisherman, with the exception of the method of making flies above alluded to, the subjects are well arranged; but, in compiling from authors who have written on the natural history of those insects on which the trout feed, and more particularly in that part which treats of Ephemeræ and Phryganeæ, it might be better, before the author publishes another edition of his work, to avail himself of the more close observation of the natural history of those insects which his presence at the river side will enable him to take advantage of, than to trust to comparatively casual observers, who have arrived at hasty conclusions without a careful and minute investigation of the subject of which they have treated.

*Crabb's Technical Dictionary* (8vo, Maxwell), is a well printed volume of 658 pages, containing short definitions of as many terms in art and science as can be compressed into such a space. We would recommend the author, on a future occasion, to omit all generic names of plants except those which are in familiar use.

## FLORICULTURE.

Horticultural Society's Schedule of Prizes for 1852.—Upon reference to page 583, notice will be found of the London Horticultural Society's List of Prizes for 1852, as advertised a few weeks previously in these columns. Since that notice was penned, the schedule itself has been printed and published, and is now in course of distribution to Fellows, to those usually exhibiting at the Society's *fetes* at Chiswick, and to applicants generally. Although my present notice is that of the invitation given to exhibitors at large, so far as florists' subjects are concerned, I yet feel bound to award my meed of praise to the Council, for the improvement made in the form of the publication here referred to; for instead of the old-fashioned sheet, we have now a neat pamphlet of 16 pages, easy of reference, conveniently portable, and highly instructive. I cannot, however, but think, that the size of the said pamphlet should have been that of and uniform with the Society's quarterly journal, in order that the same might have been bound up with the annual volume which the four parts form. Is not the list of prizes offered quite as valuable as the report of those who win them? I would so argue, and further, as a reference in after years, would it not prove alike interesting as important? I feel sure that the Council will take these suggestions into consideration, and I would fain hope that even now a reprint may be made, to form a portion of the Society's next quarter's part, thereby rendering the schedule a permanent and welcome annual feature. I closed my former notice with the Scarlet Pelargonium classes; and now, passing Roses and Heaths, I would call attention to Nos. 9, 10, 11, 12, 13, 14, 15, 16, and 17, which more particularly invite those subjects with which it is my pleasure to be most associated; 12 Carnations are invited in distinct varieties growing in 11-inch pots, a size always used in the south; as also 24 varieties of cut blooms, to be exhibited in growers' boxes; now, although the Horticultural Society never specially meddled with florists' matters, it had foresight enough to set up a standard of what a 24 show box should be, nor is it too much to say that so successful was it in the example given, that the same form and dimensions are universally acknowledged, and as universally adopted. Picotees receive the same ample invitation, 12 plants and 24 blooms. I hail Nos. 13 and 14 as being strides in the right road—yellow ground Picotees in plants, and in cut blooms, six of the former, and 12 of the latter; the flower, even if it be not new, will thus be made to assume a position it so highly merits; I have long considered them as neglected gems; how they will repay with interest the liberal invitation, I am fully aware, knowing that several collections are being formed, and others much extended, to claim a forward place on "the boards of the day;" these, with the white ground varieties, and Carnations, will, there can be no doubt, make the July meeting of deep interest to the growers of such flowers, and one which must well repay for a journey from afar. No. 15 is for Pinks in 12 varieties, growing in 8-inch pots, and No. 16, for 24 varieties of cut blooms; these are, of course, for June. As I lately stated, there is much to be done with Pinks; let us hope that at least some improvement may be made during the season to come, especially as regards pot culture; Pinks are to be "done" in pots, and well, too, as I can testify from an experiment made last season by myself, when, from one pot, in which was grown three plants of Mrs. Herbert (Keynes), I had 16 well-laced and average-sized blooms, fully expanded, and all showable at the same time, standing without stick, tie, card, or split pod, and "the Grass" numbered over 100. No. 17 invites 6 distinct Calceolarias growing in 8-inch pots, both for May and June; dissimilar as are these flowers from blossoms in general, yet by the almost universal ground colour, yellow, much of the interest which they ought to possess is lost; I would remind growers and exhibitors that contrast is of as much importance as good cultivation, for however much a collection may aspire to quality, half its merits rests in a well arranged and well contrasted group. So far I have reviewed Division 1, in which be it remembered nurserymen and private growers exhibit independently of each other, to whom the medals offered are not only numerous, but I may add valuable; amounting as they do to 493*l*. The floral portions of the other divisions shall receive early attention; in the meanwhile I shall feel most happy to receive any suggestions our readers may submit, either for publication or private consideration, as they may direct. The days of exhibition are fixed for the second Saturdays in May, June, and July; which, for 1852, will fall on the 11th, 8th, and 13th, respectively, somewhat early for florists' flowers generally; but this offers little difficulty, fixed and made known so long before; let a florist know what is wanted, and when you want it, giving him reasonable notice beforehand, and I mistake if it be not forthcoming to the hour in all its glory; this touches a subject on which it is my intention to enlarge, viz., the proving the necessity of an early publication of Societies' schedules, in order that growers may know how to fashion their stock, and what to prepare; in this the Horticultural Society has long shown an excellent example, fully worthy of general adoption, and one which should be considered by all committees as imperative. *J. E.*

Cinerarias.—Plants received from the nursery, either last month or this, will be in good condition in 3 and 5-inch pots. They are wintered here in pits or frames well secured, so as to exclude frost. The glass is well covered with mats and straw, but no artificial heat is applied. Thus treated they are always strong and robust; but many grow them in houses, and I think that for a month or so, about January, it would be of service to them to be in a cold house, or a pit heated with pipes, so as to ward off damp, while a long continuance of frost prevails, otherwise a pit is the best place for them, and they can be brought into the house at various seasons, so as to prolong their period of flowering; indeed, by judicious management, they may be had in blossom from November till June. When wintered in pits they will require to be well watched, so as to give air every day to dry up damp. If this is not attended to the leaves will "fog off." At the present time, when they are growing rapidly, they should not have the lights taken off, except when the air is mild and not drying; but let them be tilted on the side contrary to the direction in which the wind is blowing. If the lights are altogether removed their growth is retarded, as they dislike dry easterly winds as much as we do; but a moist air will not harm them. A slight warm shower is always beneficial to them when the weather is such as to permit them to receive it. Never let them become pot-bound; directly this is the case, green fly attacks them, the leaves get pale, and the plant starts for bloom prematurely. If grown in a house, they should never be allowed to have a cold dry air playing amongst the leaves; they delight in moisture while they are in a growing state. When they have finished blooming, about an inch of the surface soil should be removed, and fresh material placed all round the plant, which should be kept in a shady part of the garden. Where a quantity is wanted, plant out in light soil, in some situation shaded from the mid-day sun; or, if you possess only one plant, perhaps a choice seedling, and you wish to be more particular over it than usual, keep it in a pot in a frame, so that you can protect it from wet, when required. Those in pots must not receive much water; indeed, directly the flower is going off, watering should be carefully performed, or the plants may die, or the roots, from which your young stock is to be produced, are injured. Permit the stem to gradually die away and remove the leaves as they wither off, cutting the flower away only. This applies more particularly to some varieties than to others, as many grow freely and produce plenty of stock without this extra care. Never keep old plants to bloom the following season, they seldom produce such fine flowers, and they are more subject to insects and diseases. Let your slips be quite small and young, cutting down into the earth where the stem is blanched; these will strike root quickly. Place them round a pot prepared in the usual way, *i.e.* half crocks; on these some siftings, to prevent the soil from running through the drainage, then the soil as used for the plants, except that it should be finer sifted and should have more sand mixed with it, and the surface should be white sand, in order to prevent the cutting from damping off; place the pots under a common handlight or in a close frame, airing a little now and then, to dry up over abundant moisture; after the first watering, when the cuttings are put in, leave them an hour or two to dry, and then little or no water is required till they are rooted (of course shading, &c., when requisite). Where a few plants only are required the old plant may be taken out of the pot, say in August, and the soil shaken away, dividing and keeping only the young fresh growths. There will be plenty of roots to many of them, and therefore all old roots may be cut away, and any that have not got roots can be put in as cuttings. With the treatment just mentioned you may cut off three or four crops of cuttings in the course of the autumn, and then have the bottoms for dividing. In potting off cuttings they should be kept close for a day or two; then air should be given gradually, and finally, the lights should be thrown off every night. At this stage they will require particular attention; mildew is likely to attack them, *i. e.* the early crops in August. As soon as you perceive it, sulphur freely the parts affected. The insects they are subject to are green-fly and thrips. The former may be destroyed by means of tobacco-smoke and tobacco-water, and the latter by tobacco-smoke; but it must be repeated for two or three consecutive days, as the insect will otherwise recover, and be as lively as ever. When the month of August has been got over there is little to fear, for they will grow away rapidly after that. The lights should then be taken off at night, to lower the temperature and allow the plants to receive the heavy dews. Shade a little, with side air, in August from sun-heat, and indeed keep them as cool as possible. In raising seedlings you must select three or four good shaped and dwarf habited varieties, from which you will have all colours. Some object to dwarf kinds; but, if a tall variety appears amongst my seedlings, I consider it a fault, as they are more apt to run back to the original varieties (shrubby), with long, straggling flower-stalks. Seed, sown in pots or pans, comes up very freely in a few days; let the surface soil be very sandy, and only cover the seed just sufficient to keep it from being washed off while watering; prick off from the seed-pans into store-pots. The soil I recommend is, four parts rotten dung (*i. e.*, decayed into mould) and five parts of loam; or, instead of five, say four maiden loam and one rich yellow loam. The following is a list of some of the most esteemed varieties:—

| | |
|---|---|
| Bessy, distinct. | Pauline, distinct. |
| Carlotta Grisi, good form. | Queen of England. |
| Cerito, ditto. | Wedding Ring, neat and bright in colour. |
| Coronet, very early. | |
| David Copperfield, distinct. | Amy Robsart, good shape. |
| Effie Deans. | Adela Villiers, nice colour. |
| Electra, early and pretty. | Amœna, white. |
| Flora M'Ivor, rich crimson. | Hammersmith Beauty, distinct. |
| King of Crimsons. | |
| Lady Gertrude, good blue. | Marianne, good form. |
| Lady Hume Campbell, finest, early and late, always blooming. | Prima Donna, fine blue. |
| | Nonsuch, distinct in colour. |
| | St. Clair of the Isles, good form. |
| Lettice Arnold, good form. | |
| Madame Sontag. | —*E. G. H.* |

Antirrhinums: *G J.* We believe that Primrose Perfection will be offered for sale in early spring. *J. E.*

Hollyhocks: *Scottish Amateur.* Many of the best varieties now being offered owe their origin to the perseverance of Mr. A. Parsons; his last and crowning efforts have been lately advertised in our columns, and are in the course of delivery. Messrs. Bircham, Baron, and Chater have also raised many splendid flowers. *J. E.*

Pansies: *E.* For the past four or six weeks these have been blooming freely at the nurseries, whither you should have paid a visit, and then have judged and chosen for yourself; we will, however, endeavour to help you in making a selection next week. *J. E.*

Tulips: *J L.* Ours were all planted by the 3d instant; we have long made it a rule not to let the first chance pass after the 25th of October, for at this uncertain season of the year the first favourable weather should always be embraced in open ground operations. Breeders do not excite so much interest here in the south as they have long done in the midland and northern counties; but few collections can be found round the metropolis, yet they are not altogether overlooked, and we should by all means recommend an early application for those you may desire to grow; the cost is somewhere about 2*s.* each for full blooming bulbs; if taken in numbers some reduction is allowed. Of course this applies to varieties in general cultivation; for Juliet (Willison), we have just paid 30*s.*; here you have a rose breeder "very promising, of good shape, and with very pure base;" moreover, it is "let out" this season for the first time, and received a label of commendation by the National Floricultural Society. We know of none by name around London; the midland florists can supply Pilot. We cannot say when Maid of Orleans, Princess Royal, Chellaston Beauty, Countess of Harrington, Van Amburgh, Purple Perfection, Sable Monarch, Alice Grey, &c., will break; that is not in our power even to speculate upon; for whether planted in rich soil, in poor soil, deeply, or near the surface, taken up annually or allowed to remain, the result is just the same—all uncertainty. With all our boasted philosophy, the breaking of Tulips remains a "splendid mystery." *J. E.*

## Miscellaneous.

*Road-side Trees.*—The *Staats Anzeiger* of Berlin contains a curious edict from the Department of Public Works, by virtue of which all the *allées* of Poplars along the public roads are gradually to be removed, and replaced by trees of another kind. The reason alleged is the damage the Poplars do to the neighbouring fields. The Lombardy Poplar is chiefly proscribed; but the Canadian Poplar is only to be replaced in case of the destruction of existing trees by storms of wind and other accidents. Where cultivation is high and the population numerous, fruit trees are to be planted along the roads; but in ordinary cases Oak is the wood selected; next, the Chestnut, the Plane, and the Linden. The selection is to be determined by soil and situation. In damp and moory places the Alder and the Ash are recommended.

The conversion is to be made in two periods, partly to avoid throwing on the market too great a quantity of Poplar wood at once, and depressing the price already very moderate, that species being in no great repute, and partly from an artistic regard to the appearance of the highways, or the *Aesthetische Gesichtspunkt* of the change. This part of the Prussian decree might be recommended to the special attention of the Commissioners of Woods and Forests. The first period may commence forthwith in the manner prescribed, but the second is not to begin till the trees first planted have attained a fair degree of growth, so that some years must elapse between them. If many complaints are made that the change will spoil the prospect (for even an alley of Poplars has its value on a level) the improvement is not to be pressed. And in the vicinity of Royal residences due notice must be given to the Crown, and special permission obtained ere the heads of the doomed Poplars can fall before this general sentence. The decree is accompanied by a diagram, representing the present condition of the avennes, the first period of the change, or *umwandlung*, when Oaks and Chestnuts will have been mingled with the present growth, and the second period when the substitution will be complete.

*Ivy on Exterior Walls.* — A correspondent of the "Paper-hangers and Upholsterers' Guide" says, "The last thing I have to mention on the subject of damp relates to Ivy on exterior walls of buildings. Its effect on walls is, that if it does not entirely eradicate damp, it may be admitted to be a repellent placed on the exterior. I had my attention drawn to a case of this description, where damp had prevailed for a length of time in the walls of an apartment, but Ivy having grown up to cover the opposite exterior side, the affected parts inside had become dry. The gentleman, in whose house I observed the improved change, accounted for it, I think, with much reason, namely, that the close overhanging pendant leaves prevented the rain or moisture from penetrating to the wall, contrary to all other trees which are trained for bearing fruit. *Builder.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

ORCHIDACEOUS PLANTS.—To assist such of these plants as have completed their growth, in going quietly to rest, the atmosphere of the house should be kept gradually cooler; or perhaps it will generally be more convenient to remove them to a cooler house. A situation something similar to that in which Cactuses are wintered will be very suitable, taking care, however, never to allow the temperature to fall below 45° for general species. Some few will endure a lower temperature uninjured, but these are exceptions. At the same time excess of damp must be studiously avoided by carefulness in watering, and by admitting sufficient air to dry up and expel the superabundant moisture. Let the roof sashes be made perfectly clean, that the rays of light may be as little impeded as possible; but while the house is under cool treatment in winter, it is not advisable to allow the tender species to hang too near the glass, as the temperature there is more liable to variation, and the foliage of the evergreen varieties is often injured thereby. Let drip be carefully guarded against, for if it fall upon the roots of the plants, it will injure if not destroy them; or it will excite them into growth, which is scarcely less objectionable. Dendrobiums, Renantheras, Cœlogynes, &c., should now be removed to a cool dry house, to prepare them for flowering. Any plants which are unfortunately producing young growths, out of their natural season, should be placed at the warmer end of the house; but the temperature even there must be very moderate, as the object is not to stimulate them, but merely to keep them in such a state of gradual progression as shall prevent their perishing.

FORCING DEPARTMENT.

PINERIES.—Furnishing bottom-heat by means of hot water has made the management of Pines during winter so simple a matter, that a very brief space will suffice to give all the necessary directions. The moderate bottom-heat required to keep them in a gentle growing state, and top-heat, laden with any required degree of moisture, and sufficient to allow of the free admission of air, are given with equal facility. The amount of moisture raised within the pit must never be very great at this season, and the slightest excess in this respect must be carefully guarded against during dull or foggy weather. Where dung, leaves, and tan are still the materials employed to furnish the necessary amount of top or bottom-heat, the impossibility of suddenly increasing or decreasing its power, according to the particular requirement of the weather, render it a necessary precaution to keep up a stronger heat than is generally wanted, and to moderate it in warm weather by a freer admission of air, that there may be less difficulty in keeping up the temperature when a sudden change takes place. In pits where such means are used, air, by back ventilation, must at all times be more liberally furnished, to allow the exhalations to escape. When there is evidence of a decline in the bottom temperature, let a little fresh tan be pushed in amongst the pots, and even over their rims. In such cases it is often necessary to remove a portion of the old surfacing material, before the new is put in. These matters must be done by very careful workmen, without going amongst the plants, that the leaves be not damaged; for nothing is more injurious to the health and appearance of the plants than mutilating their foliage.

FORCING PITS.—Insure a sufficient supply of Rhubarb, Seakale, and Asparagus, by introducing successions at regular intervals, according to the supply required, and the quantity of plants to meet it. In selecting Seakale plants, take those first which showed the earliest indication of ripeness by casting their foliage. If a frame or pit with glass lights can be spared for Asparagus, it is much more tender and delicate than when grown in a dark place; they should, therefore, when their shoots appear above ground, have all the light and air possible. We force this favourite vegetable in frames, which, during summer, are occupied by Melons. The bottom heat, produced by hot water pipes, is turned on very moderately at first, and afterwards gradually increased, when the roots are fairly in motion. A portion of the stock of the three last mentioned vegetables should be mulched over with some decayed litter as soon as possible, that the warmth of the earth may be retained.

FLOWER GARDEN AND SHRUBBERIES.

All possible advantage should be taken of the few shrubs which flower during winter, such as Laurustinus, Erica carnea, Polygala Chamæbuxus, Menziesia, and others. The display may be materially assisted by a judicious selection of variegated plants, the gold and silver tints of which contrast prettily with the general dark green, and at a short distance they may easily be mistaken for flowering plants. Early flowering herbaceous plants may be planted near the outsides, and still nearer to the edge; belts or patches of Hyacinths, Tulips, Crocuses, and other bulbs, may be planted. In addition to the above, we make use of a choice selection of hardy evergreen shrubs, such as Rhododendron ponticum, Pernettya mucronata, Gaultheria, Tree Box, &c. These are removed with good balls of earth, and in spring are returned to their places in the reserve garden. Take care also to have a constant succession coming on of various sizes, so that when any of them are grown too large for the purpose, they are finally planted out in appropriate clumps.

HARDY FRUIT GARDEN.

During this frosty weather, mulching may be wheeled on for newly planted fruit trees, or for such as are to be planted. Standard Currant trees may be staked and pruned. The operation of training wall trees is performed with greater ease and comfort, and consequently with much saving of time, if commenced early in the season, so that the best weather may be devoted to it. The first operation is to loosen the trees from the walls, and if it be admissible, the latter should have a coat of colour, that all insects and their embryo may be smothered; otherwise, they may at least be well washed with clean water from an engine. If nails and shreds are used, let the former be made hot, and dipped in linseed oil, for the double purpose of destroying insects, and preventing rust; and let the best of the old shreds be boiled, washed, and dried, previously to being re-used. Those who intend to apply the method of using fixed studs, and tying the trees to them with bass matting, will of course take this opportunity of doing so. Where the common nails or shreds have been long used, it will be necessary to rake out and re-point all the joints; the studs are then to be fixed in at suitable distances, and the wall is ready for retraining. At the same time, let diseased trees and inferior varieties be removed, and after carefully preparing their stations let better plants, from other parts of the garden, or young trees from the nursery, be planted in their stead. By carrying on these operations together, a larger number of labourers may be usefully employed, thus keeping the force together. The handier men will of course be selected for that part of the work which requires the greatest care and dexterity. Previous to the trees being retrained, they should be washed over with the following mixture, to destroy any insects with which they may be infested. To one gallon of water, add about a pint of tobacco water, a quarter of a pound of soft soap, and half a pound of sulphur, with sufficient lime and soot to give it the colour and consistence of lead-coloured paint.

KITCHEN GARDEN.

If Cardoons and Celery have made any growth since they were earthed up, they may be gone over again, and a little more soil drawn up around the collars of the plants, to assist in blanching them, and in preserving them more effectually from the frost. It is most fortunate for tender vegetables (though not for many other things) that we had so heavy a fall of snow on the night of the 3d inst., as they would otherwise have suffered severely from the 12° of frost on the following night. Such things as Beet, if not already housed, should be as soon as possible. We are to-day (Nov. 5) filling our ice-house.

State of the Weather near London, for the week ending Nov. 6, 1851, as observed at the Horticultural Garden, Chiswick.

| Oct. and Nov. | Day of Week | Barometer. Max. | Barometer. Min. | Temperature of the Air. Max. | Min. | Mean | Temperature of the Earth. 1 foot deep. | 2 feet deep. | Wind. | Rain |

| Satur. 15 | 49.0 | 35.4 | 42.7 | 12 | 0.32 | 2 | 4 | 3 | 2 | 4 | 7 | 2 | 1 |

The highest temperature during the above period occurred on the 12th, 1841—therm. 63 deg.; and the lowest on the 15th, 1848—therm. 18 deg.

## Notices to Correspondents.

*** The Editor's absence on the Continent compels us to leave a few questions till his return.

AMATEUR TULIP SOCIETY: *E T C.* We decline discussion. We repeat that we have examined all the correspondence, we have given our best attention to it, and we have made private enquiries, all which prevent our entertaining the smallest doubt that this Society has allowed itself to be most egregiously misled.

ASPARAGUS: *S Y.* It is a good time to transplant Asparagus as early in February as the weather will permit ‖

BACK NUMBERS.—Full price will be given for the following Numbers: 1844—36; 1846—25; 1850—41.

BIRDS: *J T.* By some mischance, your note, dated Oct. 28, did not reach us till Nov. 3, too late for us to reply before you left Wexford. If this comes under your notice whilst at Leeds, we beg to tell you that we know no dealer in birds residing there to whom we could recommend you for what you are in search of. London alone can supply it. Thanks for the kind hint about the hollow perches; the idea is excellent.—*T F.* Your bird is weak and husky. Give him some boiled milk for two days, instead of water; and in a fortnight a little scraped raw beef (lean), moistened with water. He will soon recover.—*Alexis.* The cost would be about 6*s.*—*Spes.* Try one or two Hemp-seeds among the general food. It will warm your bird's stomach. Discontinue all green meat.—*Ninetta.* Yes; you, too, are to be blamed; dirt alone has injured your bird's feet. Soak them carefully in warm water before attempting to remove the "pellets."—*S P.* Warmth is the only remedy now left you. These open cages are fatal to many thousands of birds at this season.—*Penelope.* The mealy-coloured birds are by far the stronger of the two, and generally sing best.—*J C.* Elder-berries and ants' eggs.—*B W.* Certainly not. If you do, cramp will be the inevitable consequence.—*Georgiana.* Let the front only be of open wire-work.—*John L.* Refer to the *Gardeners' Chronicle* of Feb. 1. *W. K.*

BOOKS: *R S.* Moore's "Handbook of Ferns."‡—*F.* Apply to Mr. Cuthill, Denmark-hill, Camberwell.—*G A P.* Price's "Modern Gardener."‡

CUCUMBERS: *Beginner.* Soil composed of three-fourths light rich mould from an old pasture, one-eighth vegetable mould, and one-eighth rotten dung, will produce Cucumbers in abundance. Keep the temperature of the beds about 65° at night, allowing about 10° of a rise in sunshine. Cover at night with mats, but they should always be removed by sunrise, in order to admit all the light possible to the plants. This is very essential to their welfare.‡—*J D.* Cuthill's Black Spine is a good sort for early forcing, as well as for a general crop.‡

HEATING: *W R F., Dublin.* We have no objection to the mode of heating about which you enquire. ‡

HYACINTHS: *L.* Hyacinths which have been grown in pots in the usual way may be removed into glasses when the flowers begin to show colour. The bulbs should then be gently shaken from the soil, the roots washed in lukewarm water, and placed in the glasses, which should be filled with water of the same temperature.‡

INSECTS: *A Constant Subscriber.* Your Vines and Orange trees are badly infested with the common thrips. Careful and repeated fumigations are the best remedy. *W.*

NAMES OF FRUITS: *C B.* 1, Beurré Diel; 2, Gansel's Bergamot; 4, Beurré Bosc; 5, Duchesse d'Angoulême; 6, Winter Nelis; 7, Marie Louise. 1, Hollandbury; 2, Golden Reinette; 4, Beauty of Kent; 6, Court of Wick; 8, Blenheim Pippin; 10, 11, King of the Pippins; 13, Lemon Pippin; 15, Royal Russet; 16, 17, 18, Early Nonpareil; 21, Minchall Crab; 22, Dumelow's Seedling; 23, Hawthornden.‖—*J C.* Your seedling Apple, large, round, brownish yellow, partially russetted, is worthy of cultivation. The flesh is tender and brisk flavoured, though scarcely so sugary, as that of the Blenheim Pippin.‖—*T G, Clitheroe.* The Apple you sent under the local name of "Honest John" is not known by any other. The seedling raised from a pip of the Scarlet Siberian Crab, supposed to have been fertilised with pollen of the "Greenup Pippin," has the bitter peculiar to some good cider Apples, and we can only presume accordingly, that it deserves trial by those who are in the habit of making cider. The other seedling is not worthy of cultivation.‖—*B F T.* 1, Ribston Pippin; 2, 5, Kerry Pippin; 10, 11, 14, 16, King of the Pippins; 13, Manks' Codlin; 18, Golden Reinette; 19, Norfolk Beaufin; 20, Scarlet Nonpareil; 21, Norfolk Beaufin; 24, Yorkshire Greening; 25, 26, Easter Pippin, or French Crab; 27, Berton Russet; 28, Reinette du Canada; 4, Chaumontel, 6, Bishop's Thumb.‖—*H A W.* 2, King of the Pippins; 3, Scarlet Nonpareil; 4, a Red Streak; 6, Hollandbury; 7, 9, Bedfordshire Foundling; 8, perhaps King of the Pippins; 10, Ross Nonpareil; 11, Alfriston; 12, Bringewood; 15, Martin Nonpareil; 16, Downton; 17, Margil, and along with it the London Pippin; 18, Beauty of Kent; 1*s.* 7*d.* was paid for carriage.‖—*Thos. N.* A, Early Nonpareil; C, King of the Pippins; D, Nonpareil; E, Mère de Ménage; G, Court pendu Plat; H, Yellow Ingestrie; N, Dumelow's Seedling; O, T, Golden Reinette; P, Norfolk Beaufin; Q, Hollandbury; R, Lamb Abbey Pearmain; S, Bedfordshire Foundling; A, Marie Louise; C, Beurré Rance. "Carriage-paid" was marked out, and 10*d.* was charged.‖

NAMES OF PLANTS: *Erzeroum.* Received letter, dated Oct. 3, 1851. Many thanks for what is coming; we wish our leisure would enable us to do more justice to your excellent communications.—*C M—l.* Oncidium cri-pum and Warrea Wailesiana, with O. Forbesii.—*T C.* The Acorn-cup belongs to the Valonia Oak (Quercus Ægilops); the other is a seed of the Ivory Nut.—*Shem.* 4, Asplenium Ruta-muraria; 5, A. Trichomanes; 6, Polystichum lobatum. *S.*—*J D.* 1, Escallonia montevidensis; 2, Helianthus altissimus.

PEACH TREES: *J Abell.* The Noblesse will suit your climate, to form a succession to the Royal George. ‖

POTATOES: *G W.* We do not in the least know what you mean, or to what you refer.

STOCKS: *Cymro.* The time chosen for sowing your Stocks was right, but they were kept in the frames three months too long. March would have been better. Your want of success in getting a good bloom, may no', however, have been owing to this; as we have seen Brompton Stocks (though perhaps of a spurious kind) stand two years before they flowered, and when they did flower they were not satisfactory, many being single; and those that were double, blooming very thinly.‡

WISTARIA: *Reader.* Prune this about the beginning of March; cut the leading shoots about half way back, and spur the others in rather short.‡

MISC.: *T S.* We shall be glad to receive the Numbers; they will come free by post.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SMITHFIELD CLUB, 1851.—CHRISTMAS FAT CATTLE SHOW.—Prize Sheets and Blank printed Forms of Certificates may now be obtained, on application to the Honorary Secretary.

The last day for receiving Entries is SATURDAY, THE 15TH NOVEMBER, 1851.

THE ANNIVERSARY DINNER of the CLUB will take place at the FREEMASONS' TAVERN on the WEDNESDAY of the Show Week, instead of the Friday, as heretofore.

B. T. BRANDRETH GIBBS, Hon. Sec.,
Corner of Half Moon-street, Piccadilly, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

CUNDY'S PATENT PRIZE STOVE.—W. HODGES, 123, Oxford-street (late J. E. Dowson), is the sole manufacturer of CUNDY'S patent open fire-place, pure warm air ventilating STOVE, which has been so long tested and approved by the public, and for which he received the large Silver Medal from the Society of Arts. It is admirably adapted for warming and ventilating churches, school rooms, and other public places, halls, dining-rooms, &c., &c. Also CUNDY'S Patent Dioko-Capnon or smoke-expelling register Grate, a perfect cure for smoky chimneys; together with a large assortment of Marble Chimney-Pieces, Drawing-room and other Grates, Fenders, Fire-irons, and Kitchen Ranges of the most improved principle, Wind-guards, &c.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

EXHIBITION PRIZE—HYBRID WHEAT.

MR. RAYNBIRD begs to offer to Agriculturists a new variety of WHEAT, a Hybrid between the Piper's Thickset and the Hopetoun, at 10s. per bushel, including delivery to the Bury St. Edmund's Station.—Address, Mr. R. RAYNBIRD, Hengrave, Bury St. Edmund's, Suffolk.

MILK, CHEESE, AND BUTTER.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, advises any one who keeps Cows to send two postage stamps, and obtain a description of his LACTOMETER, with its uses, and the results of experiments with it upon different Milks. Lactometers, complete, in a mahogany box, 10s. 6d.; Do., with cheaper fittings, 7s. 6d. and 5s.; Hydrometers for testing sulphuric acid, 5s., 7s., and 10s. No consumer of acid should be without one, as it is often sold highly diluted. Saccharometers for Brewing, with tables, 5s., 7s, and 10s. Pediment Barometers, from 1l. each. Wheel Barometers, from 1l. 1s. each. Packed carefully for the country, there being nothing to fear of them getting out of order, as they are warranted to be properly made and good instruments.

**The Agricultural Gazette.**

*SATURDAY, NOVEMBER* 8, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Nov. 13—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 20—Agricultural Imp. Soc. of Ireland.

THE conversion of our PEAT BOGS into a source of fertilising wealth is a subject of growing importance. Many practical men, who have hitherto been looking to legislative sources for relief, are now with greater earnestness turning their attention to an increased produce, as the only means of relief; and such an increase can only be obtained from an increase of manure, with better cultivation. Now, a large extent of the country is covered with peat, long the most useless and bleak portion of the kingdom, but now assuming a different aspect, because chemists and mechanics have turned their attention to it.

Machinery is now beginning to play upon a few of our bogs; but two great obstacles appear in the way,—1st, the extravagant notions entertained of the value of peat charcoal itself, and the extravagant price charged for it; 2d, the impression that we cannot be supplied with peat charcoal at a cheap rate for fertilising purposes without the infringement of certain patents. To each of those topics we shall, therefore, briefly advert, confining our observations to an agricultural view of the subject.

From time immemorial peat charcoal has been acknowledged to possess valuable fertilising qualities. "Nearly 20 years ago, in the Highlands of Scotland, our attention," says a correspondent, "was drawn to the fact,—a fact no less than an experiment of some centuries standing. It was a circular spot of Grass of the richest verdure, surrounded by stunted heath. 'Here,' my informant told me, 'my grandfather made peat coal for the forge.' He was a very old man, about 90, a blacksmith, unable to work, but was succeeded by his son, who was at the time getting in his coals, consequently the day was a high day with RORY, and accidentally putting the question to him to check his inquisitiveness rather than procure information—'What did your forefathers do before they got coal from the south?'—'Come and see,' said the old man. So we followed him to the green spot of Grass in question, when he explained to us very graphically the whole process of making peat charcoal during the patriarchal times of his forefathers. A pit was first dug, and the dried peat put into it. It was next covered with a tough sod of sward, then fired, and the process carried on, as in the manufacture of wood charcoal. We next discussed the verdure of the green spot of Grass, when we were likewise informed that the whole refuse of the charcoal heap was carefully husbanded and mixed in the dunghill. In short, over the whole north of Scotland, where peat fuel is largely used, the inhabitants, generally fishermen living among dirt, would be suffocated with the stench but for the deodorising qualities of peat-ashes always containing in them a large per centage of the charcoal. Strangers, who visit their miserable shielings, do not experience that degree of disagreeableness which circumstances would lead them to expect—a result which is easily accounted for." All, therefore, that we can boast of having discovered in these piping times, is "a lost sheep in the wilderness;" for between the Land's End and Ultima Thule, there are many green spots to prove the practices of our forefathers, and many a deodorised *midden*. And the fact that those practices have been nearly lost sight of by us ought to convince some, who are now spreading their wings over our peat bogs, in the hopes of making fortunes rather easily, that peat charcoal is not of such a newly-discovered value as many have supposed. As a material for entering into combination with, or retaining within itself other elements, it forms a powerful absorbent; but, even in this respect, it has to compete with a powerful host of cheap enemies; and hence can never possess more than a comparative value. That it forms, however, a valuable basis for a compound, when mixed with other elements of a volatile character, cannot be questioned. It may be profitably used in the farm-yard, as we formerly suggested, in the working up of the sewage matter of towns into a portable manure, but probably no where more advantageously than in our fishing villages along the coast, to absorb the abominable effluvium of fishy matter, converting it into a valuable manure. Mixed with this in the fishermen's midden, it would form a manure not inferior to guano. To such purposes it might be profitably applied, were it obtainable at a reasonable price, but the present price charged is a complete barrier to its general adoption.

The present prices of Irish peat charcoal in the metropolis are, "granulated" for agricultural purposes, 60*s.* per ton; "lumps," for fuel, 80*s.*; "dust," 100*s.* At Dublin it can be had at about 13*s.* per ton less money.

A correspondent, the other day, on being told these prices, answered that he himself could "make peat charcoal at half the money." "No doubt of it," was the reply, "for *we*," said the official, "can afford to sell it at 25*s.* per ton at the works, and have a good profit; but so long as we can get 45*s.* we are not disposed to do so." Such is the position of the peat charcoal trade at present. Either the demand exceeds the supply, or else there exists a monopoly. Our correspondent, a patentee for sewage manure apparatus, &c., is now endeavouring to form a manure company; but the price of peat charcoal, an article required along with other agents, is experienced as a strong barrier. First, it requires an extra capital to start with, and, second, it cannot be sold to farmers afterwards. He is an old practical farmer himself, of many years' standing; knows the value of manure, and thinks that a manure like the one in question might be worth about 40*s.* per ton on the field, according to the present prices of guano, &c.; but this figure no company can afford to sell at, so long as they are called upon to pay 60*s.* for one of the raw materials. "Not many years ago," say they, "your landlords would have given any money to get rid of their peat bogs, so as to be able to cultivate the subsoil; but now, when science has put a value upon them, they cannot bestir themselves to supply the demand of the market. Within themselves they have the means of relieving their depressed tenantry, but those very means they convey over to monopolists, to make fortunes of, while they themselves are complaining of poor-rates."

Were the money now paid in poor-rates invested in the manufacture of peat charcoal for fertilising purposes, there cannot be a doubt but that it would be had at something like half the present prices, labour and capital being at the same time amply remunerated. No doubt *two* patents exist for peculiar methods of making peat charcoal, but why not 150, since the field is open and inviting; for the patentee who will sell the farmer the cheapest and best charcoal will receive his orders. On the soundness of this conclusion inventors and the mechanical world may rest perfectly satisfied. The two patentees, to which we have referred, are sensible that their patents are liable to be superseded by others, and are prepared, we believe, to enter into competition the moment that others enter the field; but so long as they can get 45*s.*, they are not disposed to take 25*s.* We can hardly blame them, though we might, in a friendly manner, suggest that this game may be carried too far; for he who firsts lowers the price to its legitimate level may command the trade. Farmers are not always ungrateful, as sewage manure manufacturers may ascertain if they please.

---

IT was said long ago of one Irishman—

SWIFT for the ancients has argued so well,
He has made it quite clear that the moderns excel;

and the same compliment may now be paid, though in a somewhat different sense, to another. Mr. GOODIFF has written so well against our views respecting Irish emigration, that he has virtually written in favour of them. We have displeased him by expressing a belief that a society could scarcely be formed with a more patriotic object than to promote emigration. The remark had special reference to the present circumstances of Ireland, where the whole social system has become deranged, by the loss of the Potato on which it was based; but it is equally applicable to any other conntry, in which, from any cause, the population has become greater

than the means of subsistence, with the existing habits of the people, and the existing social system, which it requires at least the duration of a generation to alter. Emigration has been the resource of every people, so circumstanced, in all ages. In this they but follow the example of the bees, to whom Mr. Goodiff sends us, for a lesson on political economy. The greater the number of working bees, he says, the greater the produce of honey, and the greater the power of resisting aggression. Then why do they swarm? Simply because their hollow tree, when they live in a state of nature, is absolutely and permanently too small for their increasing numbers, and the necessary store of honey; and notwithstanding the many ingenious devices which have been invented to prevent their swarming, when living in an artificial state, it is found in practice to be most expedient to let nature take its course, and to allow emigrant bees to go forth with equal advantage to themselves and to those whom they leave behind them. The national prosperity of the hive is just the aggregate prosperity of individuals. Mr. Goodiff, therefore, should not cite the case of the bees as an argument against emigration. He says, however, that the hive is not full; but that wasps, a mouse, a death's-head moth—one or all of them—in the shape of bad government, have got into the hive, and are driving out the bees.

Irishmen are quitting Ireland, not because it cannot support them, but "because the ignorance, neglect, or supineness of those who govern has forced them to look to America, as the only refuge." We are not to suppose, however, that Mr. Goodiff is one of those querulous Irishmen—for such it seems there are, who carp at everything, and think a Government is fully equal to the task of warding off those ills which are the consequences of our own misdeeds, or negligence, or selfishness. He is more moderate in his views than to expect such impossibilities; and only "thinks a Government can do more than it generally does, and that it ought to do it."

The duty of a Government, under this extremely moderate view of its responsibilities, is defined to consist, in "devising some way of supplying the agriculturists with the means of working up their raw material—the land." In other words, if Irish farmers will persist, year after year, notwithstanding repeated warnings, in staking their all upon the Potato, and relying on it as "the only anchor that can bring up the labouring vessel," it becomes the duty of the Government, when that anchor parts, to provide them with the same amount of food, and the same means of cultivating their land, and paying their rent, as if it had not failed. Will Mr. Goodiff descend from generals to particulars, and say how this is to be done? Let us suppose that her Majesty has honoured him with her commands to form an administration, and that he is so fortunate as to find—no easy task—a sufficient number of Irishmen to constitute a Cabinet, agreed on a system of Irish policy? What will it be? On one point, and one point only, we can imagine them unanimous—a long pull, and a strong pull, and a pull altogether, at the Treasury, for funds to be advanced by way of loan, without interest and without a repayment of principal, to enable the landlords to support the poor in such reproductive works as cropping the land and paying rent. From this point they would diverge.

One would advocate a well digested system of colonisation, to rid the estates of a pauper tenantry; another would propose to bring in a bill to prohibit emigration. The former was demanded a year or two ago, before the Irish peasantry had solved the problem of self-supporting emigration; the latter appears to be the cry now, among the employers of labour, when wages have risen from 13*d.* a day to 20*d.* Will the new Administration repeal the Encumbered Estate Act, which starving Chancery lawyers and landowners whose encumbrances amount to 20 years' purchase of their rental, denounce as an act of spoliation? Are we to have fixity of tenure; and if so, how low in the scale is it to descend? Are tenants only to benefit by it, or is it to include those servants of servants, the subtenants of a sub-tenant? Are we to have a re-distribution of property, under the name of tenant right, or is it to be effected by more violent means? Or are landlords to be armed with more stringent powers for recovering rents, ejecting tenants, and doing what they will with their own? All these have lately been demanded by some section of the Irish, in the name of Ireland. Are mortgages to be cancelled, or will Ireland be satisfied with repudiating the loans made under the Temporary Relief Act? Is the Poor-law to be abolished, which enacted that Irish property should support Irish destitution? Are the poor to be left to starve; and if not, from what funds are they to be supported? Will the model Irish Government re-enact the Corn-laws, the repeal of which is denounced by some querulous Irishmen, as the source of Ireland's woes, and the cause of Irish emigration? This would be to crown the climax of absurdity. By the loss of her staple food, through the visitation of Heaven, Ireland is reduced from the condition of an exporter to that of an importer of food. Without foreign food her people must starve; and the remedy proposed is to render it less accessible; to protect the home produce which she has not, against the foreign produce which she wants. Behold a proof of Irish wit:

> "Here Irish sense is seen;
> With nothing left that's worth defence,
> We build a magazine."

We await, in breathless anxiety, the message which is to develop the policy of the Goodiff administration on these questions. For ourselves, we consider the great evil of Ireland to be, the difficulty of inducing her people to work up the raw material—their land, without the Potato, which Heaven appears to have decreed that they shall not have. We often hear from Ireland of the superiority of the Belgian to the British system of agriculture. Why, then, is it not followed in Ireland? They have the Belgian foundation of small farms; why not add to these the varied rotation of Belgium, its stall feeding, and its liberal manuring? A reformed agriculture can only originate with the people themselves, with the landowners and their tenants. It can no more be enforced by Act of Parliament, than the Potato blight can be prevented by the same means. If we would know the condition of the bulk of the population of Ireland in the palmy days of its agriculture, when the Potato wantoned as in its prime, Mr. Goodiff has sketched it for us, with the hand of a master. Every man was then a capitalist to the amount of a year's food; and yet the village farmers were destitute of capital—all the rich men were graziers; and Sir Robert Kane has told us why—because they were too proud to condescend to such ungentlemanly occupation as arable culture. The land was scarcely laboured or manured so as to give the return it was capable of, and while the produce of an acre in Great Britain averaged 4*l.* 7*s.* 7*d.*, that of the same quantity of land in Ireland averaged 2*l.* 9*s.* 3*d.* As a natural consequence, with a superior soil, lower rents, less taxes, and markets only a shade lower, the farmers rarely paid higher wages, in harvest time, than 13*d.* a day. The unemployed population amounted, on the average of the year, to one-fourth of the whole; and while food was exported to the value of 13,000,000*l.*, the people were *fed like—like Irishmen*, on the potato. Such is Mr. Goodiff's account of the state of Irish agriculture in its best days, given as nearly in his words as possible. Those in italics, in the last sentence, are his. The word in capitals is our comment on them, and on his advocacy of the Potato as the only anchor that can bring up the labouring vessel. Those were glorious days for Conacre and Castle Rackrent, agrarian outrage and wholesale assassination of landlords and land agents; but they are departed. The unemployed, Potato-fed population, seeing the blight of the lazy root perennial, are fleeing. With the diminished competition for land agrarian outrage is on the decline. Even in Tipperary assassinations are few and far between, though she still keeps her hand in. Those who emigrate improve their own condition, for, "the most good-for-nothing here is sure to do well there," says Mr. Goodiff. "It is not more than two years," he adds, "since the broken-down, indolent, lame, and weakly occupant of part of the land I hold, left his wife and nine little boys for this El Dorado of the west. He has twice in that time remitted small sums to his wife, and has now sent 11*l.* to defray the charge of sending out his two eldest sons. It is expected that by their joint labours they will be able to send for the mother and the other children, at an early period next summer." The condition of those who remain is also improved; for Mr. Goodiff has been obliged to pay 20*d.* a day for reaping his grain, against the 13*d.* which he paid with grain selling for half as much more than at present. National prosperity is just the aggregate of the prosperity of the greatest number of individuals. We do not believe that a society with a more patriotic object could be formed than to promote emigration from a country circumstanced like Ireland at the present time.

## ON HARVESTING ROOT CROPS.

Self-interest is the mainspring of all productive and economical labour, and it comes forth most prominently in piece-work. "In the estimation of every labourer, the wages are better than the work." The labourer on piece-work not only gets value for the additional work he performs, but he also reaps the advantage of his mechanical ingenuity and skill, as well as for the additional strength he puts forth to perform a much greater result, than he does when working by the day.

Hard work is easily performed with good will, when the men know the more work they perform the more will be their earning. Piece or task work is therefore greatly to their advantage; but it is also greatly to the advantage of the master, for he also partakes of the profits of piece-work, for the hands and horses which he must employ by the day, in connection with the taskers, must move on much more quickly, and, of course, more work is performed by them in the same time than would have been done if all were at work by the day, either with or without the master's eye on them. In illustration of this, I will endeavour to describe the work performed, and the expense of lifting, cleaning, carting, and storing 30 acres of Mangold Wurzel.

I estimated the crop of Mangold Wurzel at about 30 tons per acre, and to test the correctness of this estimate, I had several cart-loads weighed. The ground being very dry, the roots were capable of being lifted without much earth sticking to them. The empty cart weighs 7¾ cwt., and, without the wings, holds just one cubic yard, but, with the wings, which are 9 inches wide, and are placed so as to bend over the wheels, making the cart about 8 inches wider at the top, and 6 inches higher in the sides, enables it to hold a much greater quantity of roots. I found the weight of the cart-load of Mangold Wurzel to be 20, 22, and 23 cwt.; this, of course, includes the earth sticking to the roots.

The mode of harvesting our root crop, which we have adopted for several years, is this; we let the lifting—cutting off the leaves and the roots, and putting the roots into the cart—at so much per acre, according to the weight of the crop, to one man, who gets other men to join with him in the work and share in the profits; and the arrangement I require to be adopted is, that the one-horse carts which I employ to haul the roots shall be constantly employed, and I require from 16 to 20 loads or tons of roots to be filled hourly. The number of carts required is according to the distance of the field from the store; thus, the distance from the middle of the field to the store being 15 chains, four carts are required; 22 chains require five carts; and 30 chains require seven carts.

*The mode of lifting the roots.*—Five men are employed to pull up the roots; each man pulls up two rows; standing between the rows, he takes with his left hand a root from the row on his left side, and with his right hand a root from the row on his right side, and pulling both up at the same time, places them side by side, across the row where he pulled up the roots with his right hand, so as to have the tops lying in the space between the two rows he has pulled up; the next man takes the two rows at the right hand of the last two rows we have just described, and he, with each of his hands, pulls up a row, and places them on the line of the row which he has pulled up with his left hand, with the root end lying towards the root end of the first row, so that we have now four rows of roots lying close together in two rows, side by side, with their leaves on the outside of each of these rows, and the roots of each row nearly touching each other; and every four rows, when growing, are thus, when pulled, laid in two rows, root to root, occupying not more than 27 inches. Now, as the next four rows are lifted in the same way, and placed in like manner, we have a space unoccupied of three times 27 inches, or 6 feet 9 inches between each double row of roots, for the cart to go between them (viz., this double row of bulbs after they have had the leaves and roots cut off), to carry off the bulbs to the store. After the five men who are pulling the roots, there follow 10 women or boys with knives, made of pieces of old scythes, who, with repeated blows, cut off the leaves and roots, without ever moving one of them with their hands; this is constant, but not hard work, and it requires 10 active women or boys to keep up with the five men pulling.

Immediately on the heels of the cutters follow the carts between the two double rows of bulbs as they lie, having their leaves and roots cut off, and a man, one of the principals of the gang, and nine young active boys and girls throw up the bulbs as fast as they can into the cart, the man speaking to the horse to move forward, or stop, as they clear the ground; when one cart is full, an empty one has been brought by one of the boys who drive the carts, and placed immediately behind the full one; so that as he moves off with the full cart, the man calls the horse with the empty cart to move forwards, and they proceed to throw the roots into the cart as fast as they did into the one that has just gone off the field.

The pulling of the roots and the filling of the carts being the principal work, one of the leaders are in each of these departments of the work; so that, by his example, he shows those with him how he wishes them to work, and thus the work proceeds with the utmost regularity and dispatch; 20 cart-loads are hourly filled in the fields and delivered in the store; 180 to 182 loads of 22 cwt. and 23 cwt. each in a day of nine hours; thus a cart-load is filled every three minutes by 10 pair of hands, which are pulled by five pair of hands, and the leaves and roots cut off by 10 pair of hands—in all 25 pair of hands, men, women, and boys; this has been repeatedly done in a day.

The stores are made of posts and rails, enclosing a space 9 feet apart and 4½ feet high, and of any length, if the space will admit, and as near to where they are to be consumed as possible. The posts are 5 feet apart, let into the ground 18 inches, and 4½ feet above, with five rails above, 4 or 5 inches wide, nailed to the inside of the posts; and each of these stores are 3 feet apart. I have 14 of them about 70 feet long each, which is sufficient to store from 1000 to 1200 tons of bulbs.

In placing the roots in the store, we put straw inside

the rail, of some thickness, to keep out the frost and wet from the sides. As the store is being filled, the end of each store being railed off as the sides are, straw is placed against it and against the ends, for 8 or 10 feet from the end; the full carts are backed to the end, the tail-board of the cart being taken out, the load is tumbled out, and the horse walks out of the store, when a boy, who by this time has brought another loaded cart, walks off with the empty one to the field; two stores are always being filled at the same time, so that each store gets the alternate load; there are two men, one woman, and one boy, to each store; one of the men puts up the straw beside the rail, and thatches the stores as they are full; the man, woman, and boy throw up the roots, forcing them into a roof—the thatcher making them equal, by placing the roots close, so that that he can thatch the store as it is completed; these hands are fully employed in storing from 160 to 182 loads in nine hours. When the store is nearly filled, five rails are placed in the end of it, and the roots thrown up, and the roof formed to the end as it was formed at the beginning.

*The Expense of Harvesting the Mangold, Swedes, Carrots, and Potatoes.*—The price paid for pulling, cutting the leaves and roots off, and filling the roots and the leaves into the cart, per acre, for Mangold, is 6*s.* 6*d.*; for Swedes, 6*s.*; for Carrots, 16*s.*; for Potatoes, 25*s.*

If we look at the mode of proceeding, the pulling, cutting, and filling of the roots, we shall see the advantage of a system, not only in the rapid mode of clearing the ground, but also in the wages which the taskers earn at this period of the year, when the wages of farm labourers are generally at the lowest average.

*The Time and Hands employed in Harvesting 29 Acres of Mangold and 11 Acres of Swedes.*

| 1850 Oct. | | | Men Pulling | Women and Boys Cutting. | Filling Cart. Men. | Filling Cart. Women & Boys. | Quantity. Acres. |

| | 36 | 930 | 40 |

930 loads carted by 36 days of one horse, is 26 loads per day.

*The expense of carting 930 loads off 40 acres of Mangold Wurzel and Swedes.*

| | | | |
|---|---|---|---|
| 36 days of a horse, say at 3*s.* ... ... ... ... | £5 | 8 | 0 |
| 7 days of a man to back and tip the carts, 2*s.* ... ... | 0 | 14 | 0 |
| 7 days of 2½ boys = 17½, at 8*d.* ... ... ... ... | 0 | 11 | 8 |
| | £6 | 13 | 8 |
| Or per acre ... ... ... | 0 | 3 | 4 |

*Expense of storing 40 acres of roots, 930 loads.*

| | | | |
|---|---|---|---|
| 4 men, 7 days = 28 days, at 20*d.* per day £2 | 6 | 8 | |
| 2 boys, 7 days = 14 } 28 days, at 10*d.* ... | 1 | 3 | 4 |
| 2 women, 7 days = 14 } | | | |
| | £3 | 10 | 0 or 1*s.* 3*d.* p. ac. |

| | | | | |
|---|---|---|---|---|
| So that the total expense of pulling, carting, and storing 40 acres, 930 loads of roots is, for pulling, filling in the carts, cutting leaves, &c. ... ... ... ... | £12 | 9 | 0 or 6*s.* 3*d.* p. acre. | |
| Carting the whole ... ... ... | 6 | 13 | 8 ,, 3 | 4 ,, |
| Storing the whole ... ... ... | 3 | 10 | 0 ,, 1 | 9 ,, |
| The expense of harvesting 40 acres | £22 | 12 | 8 or 11 | 4 p. acre. |

The power which the five men brought to bear on this pulling 182 cart loads, of at least a ton each, equal to 182 tons of roots from six acres, besides the leaves and roots, which were equal to eight tons per acre, or to 48 tons on the six acres, this makes 190 tons; besides, to overcome the resistance of the hold which the roots have in the ground, which must be in every case equal to 190 tons; the weight of the roots and leaves, 380 tons. Thus the five men overcame a resistance of 380 tons in nine hours' constant labour, equal to 76 tons for one man, to pull up say only one foot high, and lay it down regularly on the ground; this is an amount of manual strength which we have never witnessed before. *John Morton.*

## MANURES.—No. V.

**Bones.**—The price of bones varies according to the labour bestowed in their preparation, no difference being made between boiled and unboiled bones. A bushel weighs from 42 lbs. to 45 lbs., and costs from 2*s.* 3*d.* to 2*s.* 6*d.* Bones are an invaluable source of phosphoric acid, an element of so much importance to plants; few plants but require phosphate of lime and magnesia in variable quantities, their nutritive value depending in a great measure upon the supply of these substances in the soil. By a wise provision of Nature, the phosphates abound to the greatest extent in such crops as are universally employed as food. A man eating 1 lb. of farina a day would consume 3½ lbs. of phosphate of lime in a year. Leguminous crops, from the small amount of phosphates they contain, are incapable of imparting that strength and solidity of bone to the animals fed on them as others containing less nitrogen. 100 lbs. of bones contain 50½ lbs. of phosphate of lime, which distinguishes them from all other animal substances; 33¼ lbs. of decomposible animal matter, with a little carbonate of lime (least in carnivorous animals); phosphate of magnesia; and a little soda, in the form of common salt. When bones are burned in a fire until everything organic is consumed, a white substance remains called earth of bones, consisting principally of phosphate of lime, a salt composed of 51½ per cent. of lime, and 48½ of phosphoric acid. I have stated that phosphate of lime imparts strength and solidity to bones, full grown animals contain most of this phosphate, hence the hardness of their bones. Young animals contain least, hence their softness of bone. Disease frequently softens the bones, by dissolving out more of this earthy matter than is supplied by the food. Phosphate of lime is white, tasteless, and insoluble, but dissolves readily in acids; hence it is suspended in milk by means of lactic acid, and, by the agency of the organic acids in the soil, is rendered capable of entering the roots of plants. It is largely found in Estremadura, in Spain, under the name of apatite, where it forms entire mountains. It is also found in the urine of adults, but not in that of young animals, for the rapid formation of the bones of the latter require none of the salt to be wasted. If the legs of hens be broken they will lay eggs without shells until the fracture is repaired, the circulation of the lime being required for the recovery of the bone! When bones are boiled they are deprived of gelatine, which dissolved in the water (the fat being previously skimmed off), forms size or glue used in Manchester for stiffening calicoes. Three or four lbs. of fat are extracted from one bushel of bones in process of boiling for 24 hours, which is employed for greasing coarse machinery. During the process of boiling, the bones absorb more water; thus the gelatine decomposes more rapidly when laid in the soil. If rain be excluded bones may be preserved for an indefinite period; but if finely divided and moistened, their temperature rises, and they putrify "on the same principle as, when carried to excess, shows itself in the formidable shape of spontaneous combustion by setting fire to our ricks and kindling the cargoes of ships." Soft bones generally contain much water and fat; the quantity of the latter depends upon the position of the bone in the body, and the condition of the animal—the amount of the former upon the solidity and age of the bone. By the employment of bone-dust, much waste land has and can be brought into cultivation, from its comparative lightness, ease in transport, and containing in a condensed form the elements of vegetable nutrition. There is a vast demand for bone-dust. In South America cattle are slaughtered to supply us with bones, and we cannot even predict how important a branch of commerce may yet arise in the importation of bones from Australia and our Asiatic territories, for the improvement of our fields. The manner in which bones act cannot accurately be explained, so many conflicting results being presented to our consideration. Some are of opinion that in the case of unboiled or unburned bones, the fertilizing action is to be attributed to the organic matter they contain. Others again state their action is to be traced to the inorganic matter. The composition of the soil, whether it be exhausted more of organic or inorganic matter, should be kept in view. Where the former may prove deficient, unboiled or unburned bones may be found more marked in their action; while in the latter the effects of the inorganic elements may be more perceptible. Since phosphate of lime and ammonia are among the chief substances required by plants, may we not without error attribute a double function to bone manure? It would be as equally unwise to burn bones for the sake of their phosphates as it would guano for a like result. Bones are principally applied to the Turnip crop, though their effects are equally good on other crops cultivated for their roots. They are applied to Grass in the form of bone dust, in this state being more easily converted into food for plants, and more evenly extending over a larger space of ground. In Cheshire, bones have been applied to pasture land with much success, an application of 33 cwt. of bones per acre increased the value of worn-out pasture land to double—quadruple its value, and their efficacy remained perceptible for 20 years. Thus pasture land becomes exhausted of phosphate of lime, by the cattle which feed on it—milk, butter, cheese, beef and veal, the indirect products which carry it away. There is 1 lb. of bone earth in every 30 gallons of milk, and in 1⅝ lbs. of bone the same quantity; and for every 2 lbs. of phosphate of lime abstracted from the soil, 3 lbs. of bone earth would be required to supply the deficiency, occasioned either by the selling of dairy products—young stock or cereals. By feeding full-grown pigs upon bran, we could restore the loss of some of the earth of bones; as it contains 50 per cent. of the phosphate. Bones are more permanent in their action than guano; the latter, from the minutely divided state of its constituents, and the readily formed ammonia, from the decay of its organic matter, produces a more immediate and consequently a more transient effect. Bones decay sooner when in the form of dust, because a larger surface is exposed for absorbing moisture from the air and soil. To dissolve bones, procure the latter broken as finely as possible, as a greater surface will be thus exposed to the action of the acid. Place the bones in a broad shallow trough, barrel, or on a flagged floor, raising a little wall of earth of peat to keep the mixture from flowing about; add to the bones half their weight of boiling water, to thoroughly moisten them; after the mixture remaining in this state for a few hours, add half the weight of the bones of sulphuric acid, constantly stirring the mixture, so that every portion of the bone may be acted upon by the acid. At the end of 24 hours, when the bones will be reduced to a mass of paste, the latter should be mixed with an equal bulk of ashes, sawdust, dried peat, or garden mould. Four pounds of common salt added to every bushel of bones facilitates their decomposition, in consequence of the muriatic acid contained in the salt. The sulphuric acid should have a specific gravity of 1.845; will cost from 1*d.* to 1¼*d.* per lb. Water is required to be added to the bones previous to adding the acid, as it will afford an easier passage for the acid through the bones, and prevent the loss of that great heat (266°) arising from the mixing of the acid and water, which otherwise might produce dangerous results to the operator. *Libra.* [In the last article, No. 4, on manures, it was said, "Gelatine united with *tartaric* acid forms leather;" it should be *tannic* acid.]

## Home Correspondence.

*Mangold Wurzel.*—We grow Mangold Wurzel every year on the same ground, manured with dung. The seed is sown in the beginning of April. We are sadly troubled by the plants running to seed. Can you tell me why this is, and whether the tops of the plants running to seed should be broken off? Flintshire is our county. *Overton.*—[You sow too early. Breaking the seed shoots is of no use.]

*Prices of Agricultural Produce.*—Below I copy from the official statements, to be found in the returns presented to Parliament, the average annual prices of Wheat during the preceding five years in Great Britain, France, and Belgium, reduced into English quarters and English currency.

| | Great Britain. s. | d. | France. s. | d. | Belgium. s. | d. |
|---|---|---|---|---|---|---|
| 1846 ..... | 54 | 8 | 55 | 9 | 56 | 3 |
| 1847 ..... | 69 | 9 | 67 | 4 | 72 | 2 |
| 1848 ..... | 50 | 6 | 38 | 7 | 41 | 7 |
| 1849 ..... | 44 | 3 | 35 | 7 | 40 | 5 |
| 1850 ..... | 40 | 3 | 33 | 2 | 37 | 5 |

It was in the first of these years that the Act reducing the duties on the importations of foreign corn into this country was passed, in the last year the duties were suspended, and so continued till sometime in the following year, and in 1849 all the restrictive duties were abolished. It is remarkable that in the year commencing this period the price of Wheat in this country, in its average, was below that which prevailed both in France and Belgium (evidencing the superior resources of this country under pressing circumstances), in the following year it rose to a medium between the averages of the other two, but during the last three years (almost a time of free importations) it has fluctuated at a price exceeding that of the other two countries, although there appears a gradually downward tendency to approximation, no doubt caused by the very large and increasing importations of Wheat and Wheat-flour from its neighbouring rival during such period. Farmers, however, I am inclined to think, may yet encourage a hope that the price of their produce will not permanently be deteriorated so low as it is at the present moment in this country. I so incline from considering what has been the average price of Wheat in France and Belgium during the last 22 years; in the former the average of this period was 45*s.* 9*d.*, and in the latter 46*s.* per English quarter. Compare these figures with those above, and it will be evident why the farmers in France are now suffering a distress equal to those in this country, and are equally earnest in their complaints. Doubtless there are political and social causes in that country, which, it must be admitted, have operated as well as productiveness from favourable seasons and improved agriculture, to produce a supply greater than the demand, and a consequent lowness in its money value. May we not then expect that when the unusual deteriorating circumstances shall subside (and these cannot long continue, for labour must be rewarded), that the price of corn in France will be re-established at something like its former and more normal value? and if so, we should have then nothing to fear in its effects on being introduced into our markets. France, last year, imported into this country just one-fourth of the whole Wheat produced received by us from our own colonies and all foreign countries together, Prussia, even with so low an average price as 31*s.* 6*d.* per quarter, not being able successfully to compete with France, in sending her produce to our markets. It is, then, the great and unusual depreciation of agricultural produce in France, which has caused the very low price which has prevailed here; and, notwithstanding her large exports, she herself is suffering. It is singular that France, not hitherto deemed a corn-growing country, should at once manifest its powers, not only to provide for the wants of her own population, but to be able to administer so largely to those of her neighbours. I do not know what is

and has been the state of the law in regard to the exportation and importation of corn in France and Belgium, having hitherto unsuccessfully endeavoured to get information on the subject. A principal object in addressing this letter to you, is to obtain attention from some of your intelligent correspondents to the subject of the foreign influences to be apprehended upon the future value of our own produce. I have no doubt that many of your readers would be glad of the information as well as myself. *Rusticus.*

*Pinguedo.*—The larger portion of every manure should consist of mineral substances, and not of organic matter; for, who supplied the Garden of Eden with manures, or with vegetable mould? I have adopted a plan of mixing these suitable ingredients so as to form a manure, which I can honestly say I never found to fail. The Pinguedo contains, without exception, every element necessary to vegetable growth, and its components are of great commercial value. I shall now give an elementary analysis of the Pinguedo, that you may see that all proper ingredients are present. It consists of fixed ammonia, carbonic acid, potash and soda, in three different states of combination, phosphates of soda, of lime, of potash, and magnesia, sulphates of lime, magnesia, &c., and carbon and hydrogen combined. It may not be amiss to give here a small list with the present prices of some of the principal and most valuable salts used for the manufacture of this manure, lest those who have not had an opportunity of seeing or trying it, should suppose that it is made up of dung, night-soil, urine, or other stuffs, which are really valuable in their proper places, but which must give way, as I have before said, to the superiority of a manure composed of salts purely chemical, and all of which are used, more or less, as medicines. Nitre, 28*s.* per cwt.; nitrate of soda, 14*s.* to 16*s.* per cwt.; phosphate of lime, 14*s.* per cwt. In addition to what I have just said, the Pinguedo presents the following advantages:—it occupies the least possible bulk,—say one barrel contains 3½ cwt. net, of concentrated Pinguedo, which is enough for a statute acre, possessing as much fertilising power as 20 tons of horse manure. It is exempt from fraud or deception, being purely chemical. It suffers no damage from exposure to the air, nor emits any smell. The economy in cartage and labour is immense, and the method of using it is most simple and convenient, adapted for all soils and situations, and all states of weather. It must be spread on the soil soon after the crops have been gathered, and in the spring. Its efficacy can be seen on Grass within eight days after it has been spread,—the Grass acquiring a dark-green colour, and the height an inch above the unmanured Grass. The Pinguedo answers also for flower shrubs, Gooseberries, Currants, Strawberries, &c. A quarter of a pound round the stem of each plant will afford sufficient nourishment, and the leaves become dark-green, the fruit more perfect, and all kinds of grubs and worms are destroyed. *Conclusion.*—During the spring of the year 1846, I had a favourable opportunity for trying a new experiment with the Pinguedo. Having planted a portion of land with the Potatoes affected with the "murrain" of the previous autumn, and manured them with my composition, I had the satisfaction of finding that the resulting crop was more healthy than other Potatoes of the present year. From this I feel assured that there is no necessity for renewing the Potatoes in this country by an importation of fresh seed. In conclusion, I beg to say that it would be presumptuous in me to offer the Pinguedo to the agricultural world as an infallible manure; for the best guano has failed in many instances, on account of the soils, &c. All that I can state is, that I have never found it to fail in Lancashire, on clayey soils, and this discovery being made only last year, a fair trial must be given (as was the case with the guano when it was first introduced in this country), before any judgment be formed. All parties who have tried it, are prepared to certify that it is superior to any other agent yet tried. I do consider that the Pinguedo is more calculated to supply the wants of a growing vegetation, than a manure like Liebig's, composed of nearly insoluble matter. And with due deference to that great philosopher, I must say that I differ from him in the view which he takes respecting the composition and capacity for solution of manuring matters.

Composition of the "Pinguedo."

| | lbs. | Remarks. |
|---|---|---|
| Sulphate of lime ... | ... 112 | Cheap. |
| Ground bones ... | ... 84 | Cheap. |
| Sulphate of ammonia | ... 56 | Cheap (at the gas works). |
| Peruvian guano ... | ... 28 | 10*s.* per cwt. |
| Nitrate of soda ... | ... 28 | Cheap. |
| Ground charcoal ... | ... 28 | Very cheap. |
| Nitrate of potash ... | ... 14 | About 28*s.* per cwt. |
| Sulphate of potash | ... 14 | Cheap. |
| Sulphate of magnesia | ... 14 | Cheap. |
| Sulphate of soda ... | ... 14 | Cheap. |
| | 392 lbs. or 3½ cwt. | |

To be well mixed and ground together, adding about 30 lbs. of soot, which, together with the sulphate of ammonia, will kill grubs, &c. To be kept in barrels in a dry place until wanted. N.B.—No lime, either in the caustic state, or carbonate, should come in contact with the Pinguedo, or double decomposition will take place in the above mixture. *J. W. Hopkins, Manchester.*

*Poultry Diseases.*—As I have received a number of letters with reference to the communication which appeared on the 18th, requesting further information, I am induced to think I was not sufficiently explicit in the directions for the use of the powder therein recommended. The sulphur and cayenne should be mixed in the proportion of 3 ozs. of the former to ½ oz. of the latter; this will be sufficient for a dozen adult fowls, and should be divided into two doses and given on two successive days; afterwards give the other powder every day "si opus sit." The medium in which it should be given is Barley meal, or any other food the chickens are fond of, and which can be mixed up with water or pot liquor, *i. e.* put enough meal to make a good feed; they may not like it at first, but if hungry by abstinence will soon take to it. Should the birds be very ill and not able to feed, I have found the following very useful—equal quantities of ginger, Epsom salts, gentian, fœnugric, and garlic mixed up with fresh butter to a paste, and pellets the size of a filbert, given night and morning. These doses are all for adult birds; for younger ones, the doses must of course be adapted by the discretion of the donor. P.S. I should have said that one great cause of want of success in the rearing of poultry is, that persons are not sufficiently careful in the relationship of the parents. The cock bird should have a perfectly distinct parentage from the hens; breeding in and in spoils health, beauty, and size. *Henry Copland, Chelmsford.*

*Burned Weeds and Earth, &c.*—I shall feel obliged, if you will state your notion of the effect on Beans, Peas, and Tares, of manure composed of burned weeds and earth, with the emptying of privies, and mixed with sulphuric acid. The mixture appears very powerful, and my men say it is better than any of the London manures I have had down; but as I once tried superphosphate after salting for Oats, and got seriously injured by it, I fear to try any more of my experiments without advice. *Colchester.* [Burned weeds afford fertilising salts essential to vegetation. Nothing can be better than the emptying of privies; and sulphuric acid fixes the ammonia that escapes from the decomposition of such matter. But it requires caution to avoid wasting the sulphuric acid; and, perhaps, gypsum or sulphate of iron are preferable as fixers, since the evolution of the ammonia is a slow process, and the sulphuric acid would, I presume, waste itself by immediately attacking other matter besides the ammonia. You must not add the ashes before you add the sulphuric acid, or it will act on them. I conceive the superphosphate of lime could not possibly be to blame for the injury to your Oats. The salt was probably the injury. Except in rare cases, I can hardly suppose that salt can ever be very serviceable to agriculture, and it must often be injurious. *J. S. H.*]

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's house, in Hanover-square, on Wednesday last, the 5th of November: present—The Earl of Ducie, President, in the chair; Lord Southampton, Sir Robert Price, Bart., M.P., Colonel Austen, Mr. Raymond Barker, Mr. S. Bennett, Mr. Bramston, M.P., Mr. Brandreth, Colonel Challoner, Mr. Walbanke Childers, M.P., Mr. Garrett, Mr. Grantham, Mr. Fisher Hobbs, Mr. Law Hodges, M.P., Mr. Jonas, Mr. Kinder, Mr. Milward, Mr. Pusey, M.P., Mr. Shaw (London), Mr. Villiers Shelley, Prof. Simonds, Mr. Simpson, Prof. Way, and Mr. Wingate.

The following new members were elected:—

Nesfield, R. N. M., Castle Hill, Bakewell, Derbyshire.
Demidoff, the Prince, Florence.
Field, William (Veterinary Surgeon), 224, Oxford-street, London.
Grissell, Thomas, Norbury Park, Mickleham, Surrey.
Wright, R. J., Thorpe, Norwich.

The names of 31 candidates for election at the next monthly meeting were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented to the Council the report on the accounts of the Society to the end of the previous month, and submitted to the inspection of the members the various quarterly balance-sheets connected with income, expenditure, funded capital, assets, and liabilities: the current cash balance in the hands of the bankers being 659*l.*—This report having been adopted, the Council, agreeably with the special recommendation it contained, unanimously agreed to a vote of their best thanks to Messrs. Navile Reid and Co., of Windsor, for the kind manner in which they had accepted the appointment of the local bankers of the Society, during the period of its Windsor Meeting, and for the courtesy and exactness with which they had discharged the duties of that appointment.

Prize Essays.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported the following awards made by judges in the class of Essays:

I. To Finlay Dun, jun., Veterinary Surgeon, Heriot-row, Edinburgh, the prize of Twenty Sovereigns, for the best Essay on the Diseases of Farm Horses arising from mismanagement.
II. To William Charles Sibbald, Veterinary Surgeon, Biggleswade, Bedfordshire, the prize of Twenty Sovereigns, for the best Essay on the Diseases after Parturition in Cows and Sheep, with the remedies.
III. To Edward J. Hemming, of Lismore, co. Waterford, Ireland, the prize of Twenty Sovereigns, for the best Essay on any subject in Agricultural Chemistry.
IV. To Joshua Trimmer, of Foden Bank, Macclesfield, the prize of fifty sovereigns, for the best Report on the Agricultural Geology of England and Wales.

Fines for Non-Exhibition.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Shelley, the report on the result of the application made to parties who had neglected to pay the fines, for the non-exhibition of animals entered by them for competition, at the Windsor meeting, or to assign in due time a just reason for their absence, was referred to a committee, consisting of the Earl of Ducie, Col. Challoner, Mr. Milward, Mr. Simpson, Mr. Shaw (London), Mr. Brandreth, Mr. Druce, Mr. Barnett, Mr. Jonas, Mr. Brandreth Gibbs, and Mr. Fisher Hobbs.

December Meeting.—The Council decided that the ensuing General Meeting should be held on Saturday, the 13th of December, at 11 o'clock in the forenoon.

Miscellaneous Communications.—Sir George Cayley, Bart., presented to the Society a model of his anti-friction plough; Mr. Lister Maw, an original painting by Davis, of the first-prize short-horn bull, bred by Mr. Maw, at Tetley by Crowle, near Bawtry; Sir W. C. Trevelyan, Bart., offered a collection of agricultural books from his private library; Mr. Kirtland, a case of Indian corn; Mr. J. C Halmers Morton transmitted a sample of Van Diemens Land guano; Mr. Reeve, fine specimens of Beet-roots, grown without manure; Mr. White suggested honorary awards to exhibitors; M. Andreolet offered his services to the Society as a foreign correspondent; the Board of Health addressed enquiries on "the use of precipitates of any kind from sewer-water, or of earths saturated with sewer-water being successfully applied as manure;" the Georgofili Association at Florence expressed their sense of the value of the Society's Journal; Lieut. Edgar Slade, R.N., transmitted for inspection the model of a digging machine, to be worked by steam-power (the construction and probable value of which was explained to the Council by Mr. Garrett); Mr. Matthews, Secretary of the Driffield Farmers' Club, transmitted a favourable report of the trial of M'Cormick's reaping-machine; Mr. Hill Dickson transmitted papers connected with Flax cultivation and management; Mr. Thomas Ellman, of Beddingham, addressed inquiries in reference to the veterinary inspection of cattle, and the conditions under which fat cattle would be disqualified at the Society's country meetings; Mr. Lee and Mr. Bate suggested the purchase of Lawson's collection of Grasses, &c.; Mr. Lister Maw favoured the Council with the results of his experience in Potato and Beet cultivation; Mr. Nathaniel Mathew, of Wern, Carnarvonshire, addressed a further communication, on the subject of the model of the moveable bridge for marsh-lands, presented by him to the Council at a former meeting.

The Council having ordered their usual acknowledgments for the favour of these communications, adjourned to their next monthly meeting on Wednesday, the 3d of December.

Trafalgar (Fifeshire), *Oct.* 19.—At the annual Show of this Society, Mr. Andrew Landale, Easthall, read an essay on "Farm Leases," which we have considerably abridged.

That leases give greater security to the tenant and encourage him to lay out his capital in improvements, and so promote a higher standard of cultivation, is what has been the generally adopted view of the subject in this country. That view of the matter is quite correct, provided these leases are granted in a liberal and fair manner; but if they are clogged with restrictive conditions, and set and fixed rules of cropping, it must be evident to all that the tenant may, with these conditions, be prevented taking advantage of such improvements as may tend to the greater productiveness of his farm. I am sorry to say that a very great number are of the latter description, and not only retard agricultural prosperity, but generally end in the ruin of the farmer and in a decrease of the fertility of the land. For example, should the cultivation of Flax turn out a profitable concern, what signifies it to a tenant with a fixed rotation from which it is excluded? In that case, he is a mere nonentity tied up and fettered; his whole ideas and aspirations are apt to descend and become on a level with the circumstances in which he is placed. Such is the generally defective system of leases that the tenant has usually followed the plan of improving his farm the first half of his lease, and then trying to take out of it in the last five or six years what he has put into it in the former part. And who can blame him? But that system surely bears on the face of it the stamp of something very far wrong. Take it in a national point of view, it is detrimental to the country in keeping down the produce of the soil; and it is injurious more immediately to the landlord as keeping down the condition of his land, and, consequently, the rent of that land. For those owners who insist upon stringent clauses in the leases are almost always disappointed; and it will generally be found that on estates where the terms of agreement are the most liberal, the tenants are the most forward in adopting improvements and cultivating the land upon the most improved systems, while on those estates where the tenants are hampered and dictated to, they are almost invariably behind their neighbours as farmers. For what is it that has raised the agriculturists of Scotland to their present proud and elevated position among the surrounding countries in the world, and enables them to wield such a mighty influence in their own? What is it that has converted heathery and barren moors, whin-clad hills, and stagnant, obnoxious marshes into fertile and fruitful fields? And what is it that has within little more than half a century in many instances more than tripled the value of land? Why, doubtless, their own persevering industry, coupled with their ready adoption and skilfully energetic application of the many and great improvements which have from time to time been introduced, and which is due only to those Scotch farmers that are free and unfettered. Seeing, then, that leases have so far a good effect in improving cultivation in the first part of their duration, it certainly is possible to devise some means whereby all these disadvantages I have mentioned may be obviated, whereby the landlord may have some benefit from the increased fertility of the soil, and the tenant reap the advantage of his improvements up to the last moment of his lease. The means are very simple and very obvious, namely, the adoption of tenant right. I need not describe what that is, as you all know it as well as I do, and I do not argue it for the sake of the tenant alone, as I consider it of as much advantage to the landlord as the tenant. Tenant right is nothing more than remuneration to the tenant for unexhausted improvements at the end of his lease. That it is for the benefit of the landlord as well as of the tenant to maintain the good condition of his land is a self-evident fact, and that result can surely be best accomplished by that law which induces the tenant not to reduce its fertility. I need scarcely enter into any system of cropping, as in leases properly constructed I consider that the tenant should be left entirely to his own will in that matter, and as every locality under different circumstances would require different management, I would frame leases in such a manner as would leave a tenant free and unfettered to farm his land to the best of his skill, and for his unexhausted manures and permanent improvements I would make an allowance at the end of the lease. While doing this it would be necessary to have some clause whereby the landlord would be prevented running the risk of having his land deteriorated by a tenant, and the simple clause generally adopted in some leases binding the tenant to farm according to the rules of good husbandry, would, in my opinion, fully protect the landlord. It must be evident to all, however, that it mainly rests

with the parties contracting to fix terms for themselves. One of the principal parts of any lease is the amount of rent, and that fixed, an important point for consideration is, the term at which that rent should be paid. The general system in this country is that the tenant is not called upon to pay any rent till he has reaped and threshed part of the crop; but in England it is different—the tenant, in most cases, paying rent the first year of his possession, and, consequently, before he has reaped any crop. The latter system, of course, requires more capital by the amount of rent on the part of the tenant, but I am rather inclined to think that if it were generally adopted it would be for his benefit, as the system pursued in Scotland by allowing tenants, with comparatively small capital, to come into the field of competition, keeps up a fictitious value of land. I do not think I am infringing upon the rules which are generally understood to prevail in all societies of this sort met to discuss agricultural subjects, to say, that the law of hypothec acts injuriously to agriculture. On that law I do not mean to enter farther than to say, that in a mercantile point of view, and when agriculture is becoming more a profession than it was when the law of hypothec was framed, it surely is an act of gross injustice to the public generally that a landlord should have a preferable claim to every other creditor. The matter will no doubt be ultimately looked upon as an agricultural grievance which, in these days of free trade and no protection to any one party, we may hope to see abrogated in a very few years. Another most important item in leases is in regard to steadings. The importance of a tenant having sufficient accommodation for the rearing and feeding of all kinds of stock cannot be overrated, and more especially when he is now laid open to competition from all quarters of the world. There is another point which I must not omit to notice, and that is as regards game, as, in most leases, the game is generally reserved by the proprietor. This subject, I believe, has been the cause of more heart-burnings and quarrels between landlord and tenant than almost any other; and, besides, these iniquitous and unjust laws have added more than any other to the amount of crime in the country. There is no point on which a tenant should be more guarded than in taking a farm in the neighbourhood of a game preserve, as although he may have provisions for damages, still he is sure to find to his loss that these damages always fall short of the injury done. Every tenant, in my opinion, should have the power to shoot over his own farm; and it has been found, in every instance where a tenant has been granted that right, that the landlord has always had as much game as offered sufficient sport, and such a quantity at the same time as would do no great injury to the crops. In England I am aware that the most scientific farmers do not care for leases at all, provided they have tenant right; and I am quite of that opinion myself; that I would rather farm a land with no lease and with tenant right, than with the generality of leases and no tenant right. If the two, however, can be judiciously combined in the manner I have stated, a system would be formed whereby the tenant would not only be encouraged to improve the condition of his land, but have a motive to maintain it in that condition, whereby the landlord would be secured of his land being permanently improved, and of its yielding him a greater return by another lease, whereby the country would be advantaged by a higher cultivation, and the public benefited by an increased productiveness of the soil. Before sitting down, I beg, in connection with the remarks I have made, to propose the following resolutions:—1st. It is of the utmost importance to the progress of agriculture, that an intelligent and friendly relation should subsist between landlord and tenant, whereby confidence should be secured between the parties, so that their interests should harmonise, and every means should be taken by the principal contracting party to establish and consolidate that system which is best suited to the respective districts. 2d. The first external symptoms of an advanced state of agriculture are apparent in a well-regulated system of rotation of cropping, but that the experience of one period is too often perpetuated in leases from one generation to another, and what was suited for one stage of agriculture becomes detrimental towards its progress in another. 3d. That remuneration to the tenant for unexhausted improvements at the end of his lease is quite indispensable to maintain the soil in a fertile condition at its termination.

Mr. HAXTON, Drumnod, in seconding the adoption of the first resolution, said there was one statement in the resolution which he thought very important, to the effect that "an intelligent and friendly relation should subsist between landlord and tenant, in order that their interests should harmonise." How was it possible to make them harmonise? In all ordinary bargain-making it was the generally-received maxim that the seller should sell as high as he could, and the buyer buy as cheaply as he could. Now, in individual cases, and applied within certain limits, this maxim was a correct one, but beyond these limits it came to be far from safe. It was perfectly evident that in commercial transactions, if any party should for a lengthened period sell their articles at a higher value than they were worth—and they knew of many instances where this was the case—sooner or later a reaction must take place, whereby they themselves in the long run were the sufferers. In fact, there could not exist a condition of matters where any kind of property sold above its value could continue long to retain its value, because those who are purchasing it must be losers, and those who are selling it must be losers by destroying their customers. How did this apply to agriculture? The landlord was probably not exactly in the position of a seller, but he was in the position of a lessor. He lets his land, and whenever they found a landlord acting on the principle of taking the highest rent for his land, there they would find a reaction must take place which would ultimately injure the landlord himself. It was a self-evident truth that moderately-rented land would in the long run better remunerate the landlord than high-rented land for a short time. When land was overset, the tenant was continually hampered. It was up-hill work with him. He was giving more than the natural value of the land. Rent was the excess of produce after paying for labour, manure, interest of capital, and tenant's profit; and wherever the rent was more than that excess, it must encroach upon one or other of these sources of produce. He believed it first encroached upon the tenant's profits, then his capital, and ultimately upon his expenditure. Whenever the tenant was obliged to draw in his expenditure on the land, then the produce of the land begins to fall below its normal quantity, and both parties will suffer in such circumstances. (Applause.) If he had defined rent properly, the thing became a matter of simple calculation for those who had land to take. If they offered more as rent than the excess of produce over manure, labour, interest of capital, and tenant's profit, they had themselves to blame. They could hardly blame the landlords of the country for taking more for their land than its real worth. How often did they see scores of farmers after one farm, and never so many offers for it, much above the value of the land? They had themselves to blame in such circumstances. (Hear, hear.) The value of agricultural produce had suddenly changed, and all their calculations had been frustrated, because they were not receiving from the produce of the soil what they originally bargained for. Where there were existing leases taken under higher prices, it was a matter of moral duty for the landlord to take into account the condition of his tenant who took the land under these high rates. There was a responsibility laid upon them; they had their own and the tenant's interest to look after. If their tenants were paying more than its natural value for the land, it was perfectly evident that they themselves must ultimately suffer; and they would suffer first by the tenant's taking as much out of the land as would enable him to meet the demands of the landlord. There were one or two other points which he would merely notice, as coming more particularly under the first resolution. Leases had been framed of late years all upon the same principle, as if farming was like making shoes, or any other article of manufacture—as if all land and all climates were alike. No principle could be more pernicious than this when applied to practical agriculture. He quite agreed with the latter part of the resolution, where it was said that "every means should be taken by the principal contracting party to establish and consolidate that system which is best suited to the respective districts." Their leases, taking them as they are written out, were decidedly far more cumbrous and verbose than there was any necessity for. They had page after page of bad language and worse grammar, endeavouring to explain to them certain conditions which any man could tell another in two or three sentences. These things should all be abolished, for they had to pay for them all. The lawyers should set their brains asteep—though he could hardly expect them to do what was against their own interest—in order to shorten and simplify these cumbrous leases. Mr. Haxton then referred to the two payments, "kane" and "carriages," often introduced into leases, characterising them as unpleasant and absurd arrangements, often put into leases without reference at all to their being part of the value of the farm. He hoped the landlords would see it their duty to do away with these old feudal usages, and place their business transactions on a business footing.—Mr. RUSSELL, Kilwhiss, next rose to support the second resolution; and after some prefatory observations as to the necessity of farmers being dealt liberally with in the matter of rotations, spoke as follows:—Leases are often framed very absurdly in the matter of rotation. In some leases which have respect to certain kinds of land, there is a great aversion shown towards Wheat being too often repeated in the rotation. Now, in my opinion, this entirely arises from a misconception that does not reflect much discrimination in those who do so. By them, Wheat is considered a most exhausting crop, which deteriorates the land more than any other. Now this, I may say, entirely arises from the confounding of principles which are entirely different. Land, no doubt, requires to be in a higher condition to raise Wheat than Oats or Barley; but, then, why not encourage this higher condition? You have not the slightest grounds for supposing that the land is more exhausted with Wheat than with other spring crops; but, on the contrary, in almost every lease, Barley is permitted to be sown after Wheat. Now, if the land had been so much exhausted after carrying Wheat, why is it able to grow a good crop of Barley? The one proposition is set in downright mockery to the other. But the real fact is, you cannot reduce the fertility of land by Wheat, because it will not pay any one to sow it where the land is out of condition. You must employ Oats or Barley, which are the real scourgers, simply because they can maintain a much more successful struggle in poor, worn-out, and foul land than Wheat can do. You cannot really reduce land by Wheat to the same wretched condition as you can do with Oats and Barley, and at the same time have any chance of doing it so profitably. Then, would it not show as much common sense in those who prescribe rotations to exclude the growth of Oats and Barley, as a means of maintaining fertility in land, than the suicidal one of being afraid that too great an extent of Wheat will be grown. Wheat will only be grown when the land is in a condition to do so. The cultivation of Wheat in the general farming of Scotland has steadily increased with the larger amount of stock and manure applied to the land. I do not mean to say whether it is more profitable to grow Wheat or the other spring crops at present prices; but this I will maintain that it shows great ignorance of practical agriculture to discourage the growth of Wheat on the supposition that it deteriorates and wastes the land, for it should rather be looked upon as a test of its condition and improvement that it is able to grow it. Let landlords and tenants, then, endeavour to follow such courses as will promote good farming. Our agricultural system is undergoing a severe trial; we have much need of encouragement; it has fallen upon us to feel and bear the change which has taken place; we are in the foreground, but those who are above us must look upon us as their representatives, who are endeavouring to the best of their ability to bear up under the pressure of the times. And no one can deny that the present condition of the tenantry has every claim to the sympathy and consideration of the proprietary, and with the actual results of changes before them, their claims will not be plied in vain.—Mr. HAXTON said he wished to say one word with regard to the important question of the rotation of crops. There were, no doubt, instances in which Barley could be successfully grown after Wheat, but he thought, as a general principle, it might be said that a grain crop extracted from the soil that which a green crop did not extract. If that were correct, all they had to do was to grow a white crop for sale and a green crop for consumption—a white crop to pay the rent, and a green crop to be consumed on the farm to supply manure and keep up the fertility of the land. In these circumstances, the thing was narrowed to a small point—a grain and a green crop alternately. It required no laboured paragraphs to say in a lease that no two white crops shall be grown in succession. This proposition would meet most cases, and would leave the tenant a wide margin upon which to work, as he might grow Wheat, Barley, or whatever he chose, provided he had a green crop intervening. The old-fashioned system of so much for fallow and so much for the different kinds of crops, tied a man down too much; but during the last years of a lease it would be necessary to specify that a certain quantity of Grass should be left upon the farm, and that being specified, he did not think it would be necessary to specify how many acres of white and green crops should be grown.—Mr. RUSSELL, Newmiln, had some difficulty in acquiescing in Mr. Haxton's principle. So far as his own experience went, it was not the principle upon which he would like to work his farm. One very important green crop with him he held to be Clover; and he knew well, from experiments he had made, that he never had Clover at all like a crop unless following Barley after Wheat—two successive white crops. It might be peculiarity of soil, but he would enter into no lease for his land unless he could grow two white crops in succession.—Mr. HAXTON said Mr. Russell had informed them he could not grow good crops of Clover unless with Barley after Wheat. He (Mr. H.) knew a farmer who grew white and green crops alternately, Clover coming in every eight years, and the Clover was always first-rate. He believed that in East Lothian—and the land there was as good as Mr. Russell's—they did not take Barley after Wheat. They always took Turnips after Wheat, and then Barley, and then Clover. If Mr. Russell would extend his rotation to seven or eight years he would grow as good Clover as after Barley. With regard to Mr. Russell's and Mr. Mitchell's remarks about the rules of good husbandry, he would say that a landlord was entitled to insist on a green crop alternately if their land was not sufficiently good to grow Barley after Wheat. In general cases it was not for the advantage of farmer or landlord that two white crops should follow each other. He would give the tenant every liberty at the beginning of his lease, but, in justice to the landlord, would say, at the end of the lease, that he should put the land in such a condition that it could be readily let.—Mr. SHAW said it could not be counted bad farming where a tenant succeeded in raising an excellent crop of Clover even by sowing Barley after Wheat.—Mr. LANDALE, Coalzie, said he thought the tenant ought to be left entirely to his freedom in the matter of cropping. Mr. Haxton had referred to farms in England where Clover came in once in eight years; but if on good land they could produce Clover once in five years by growing Barley after Wheat, surely that system must be considered immeasurably superior to the one which only produced it once in eight years. It was a most extraordinary fact that the premium for five acres of Wheat taken that day was for Wheat sown after Oats by Mr. Honeyman. If Mr. Haxton's system of alternate white and green crops had been carried out, they would not have had that Wheat on the ground at all. They were told, on the one hand, by Mr. Haxton to adopt every new improvement to enable them to meet the times, and, on the other hand, he would so restrict them as to make this impossible.—Mr. HAXTON complained that Mr. Landale had left altogether out of view what he started with, that there were exceptional cases in which Barley could be grown after Wheat. He was speaking of farms generally, and he was affirming what would be for the benefit of farms generally, namely, that farmers should not take two white crops in succession on average lands, at least during the last two years of the lease. No doubt, if they had a proper tenant-right, full compensation for unexhausted improvements, there would be no necessity for such restrictions. (Hear, hear). If, however, there was to be tenant-right there must also be landlord-right, and if a tenant deteriorated his land, he must also pay his landlord compensation for the amount of that deterioration.—After some further discussion, it was agreed, in order to bring the matter to a bearing, to take the opinion of the meeting on the following motion, by Mr. Landale: "That it is the opinion of this meeting that the practice of taking Barley after Wheat cannot be considered bad farming." The vote being taken, 12 voted for the motion, and as none voted against it, the Chairman declared it carried.—Mr. HAXTON then proposed a motion to the effect that the landlord was justified in insisting that alternate white and green crops should be grown during the last five years of the lease, which was put to the vote, and lost by 13 to 6.

## Miscellaneous.

*The American Reaping Machines.*—The following is an extract from a report of the jury appointed by the committee of the Cleveland Agricultural Society, on the comparative merits of the reaping machines of Mr. M'Cormick and Mr. O. Hussey, tried and tested before the jury, on Thursday and Saturday, Sept. 25 and 27, 1851:—"The jury regret exceedingly the most unfavourable state of the weather on the days of trial (a perfect hurricane blowing the whole of the first day), and their consequent inability to make so full and satisfactory a trial as they could have wished. The machines were tested on a Wheat crop, computed at 25 bushels per acre, very much laid; and on Barley at 25 bushels per acre, very short in the straw, and, if possible, more laid than the Wheat. The jury, taking the different points submitted to their consideration, express—1. Their unanimous opinion, that Mr. Hussey's machine, as exhibited by Messrs. William Dray and Co., cut the corn in the best manner, especially across ridge and furrow, and when the machine was working in the direction the corn laid. 2. By a majority of 11 to 1, that Mr. Hussey's machine caused the least waste. 3. Taking the breadth of the two machines into consideration, that Mr. Hussey's did most work. 4. That Mr. Hussey's machine leaves the cut corn in the best order for gathering and binding. This question was submitted to the labourers employed on the occasion, and decided by them, as above, by a majority of 6 to 4. 5. Their unanimous opinion that Mr. Hussey's machine is best adapted for ridge and furrow. 6. That Mr. Hussey's machine at first cost is less price. The trials took place on the farm of Robert Fawcitt, of Ormesby, near Middlesborough-on-Tees, who, in the most liberal and disinterested spirit, allowed his crops to be trodden down and damaged to a very great extent, especially on the 25th, when, in spite of the storm, an immense crowd assembled to witness the trials. The jury cannot conclude their report without expressing the great pleasure they have derived from seeing two machines brought into competition that were able to do such very good work; and also at witnessing the friendly, straightforward, and honourable way, in which the exhibitors of the machines met on this occasion." *Morning Chronicle.*

*Gorse.*—Thomas Matthews, Esq., of Park Hall, near Kidderminster, in a letter to Mr. Saunders, states that he took a field of 10 acres for cultivating Gorse, at a rent of 10*s.* per acre; the soil was of a thin, light character, intermixed with very coarse gravel, resting upon red sand. The seed was sown in 1842, in drills, 12 inches apart, and at the rate of 20 lbs. per acre; it was cut the second year after sowing, and in December, 1845, the crop was weighed and found to produce nine tons to the acre. Gorse arrives at maturity in four years, and should be cut every year; for this purpose a broad strong scythe is used; the cost per acre, with assistance in loading, being 16*s.* per acre. From January 1st to April 26th, 1846, Mr. Matthews had eight horses and 16 cows, consuming each two bushels per day, and 100 ewes, eating 12 bushels per day, making a daily consumption of 60 bushels—say 400 bushels weekly, 2½ tons, a heaped bushel weighing 14 lbs. The Gorse, after being cut, is passed through three rollers of different velocities, at one operation, and the weekly expense of providing for the above animals is stated as follows:—Rent and taxes, 6*s.*; cutting, 8*s.*; carting, 4*s.*; man and boy attending the machine, three half days, 4*s.* 6*d.*; power, coal, (one ton), 6*s.* 6*d.*; engine-man three half days, 6*s.*; making a total of 1*l.* 18*s.*, the cost per ton being 14*s.*; but as double the quantity may be done for the same cost, if carried on upon a larger scale, the cost per ton may be more accurately stated at 7*s.* per ton. The simple machinery required might easily be added to water corn mills, thus still further economising the cost of crushing. Mr. Matthews sometimes mixes equal parts of cut hay and straw, in the proportion of two-thirds Gorse to one-third cut hay and straw. The horses work upon it with less corn than with any other description of food. For barren cows it has constituted their entire food, and they thrive upon it as well as upon the best meadow hay. To milking cows he gives two pounds of oilcake daily, with the above mixture. The Gorse imparts to milk and butter a sweet and agreeable flavour. He give his ewes, 100 in number, 25 lbs. per day of oilcake, with their Gorse, and they have done well; their lambs are better than any in the neighbourhood, and he did not lose one, although great mortality prevailed around him. *Notes on Lancashire Agriculture.*

METEOROLOGICAL REPORT.—OCTOBER—NOVEMBER.
*(Continued from p. 702.)*

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| * Oct. 30 | 7.40 a.m. | ... | 29.35 | P.M. NNW. Brisk. Barometer rising steadily. |
| | 10.10 p.m. | 29.51 | ... | |
| 31 | 7.30 a.m. | ... | 29.53 | A.M. NNE. Stiff breeze; overcast. P.M. NW. to WNW. Moderate, fine, and sunny. Barometer steady. |
| | 10.15 p.m. | 29.54 | ... | |
| Nov. 1 | 7.25 a.m | ... | 29.49 | A.M. W. Barometer falling. |
| † | 11.30 a.m. | 29.50 | ... | Noon, WNW. Brisk, sunny; cold, passing showers. Barometer rising. Evening, NW. Moderate. |
| | 11 p.m. | 29.49 | ... | Night. Barometer falling. |
| ‡ Sun. 2 | 7.50 a.m. | ... | 29.29 | WNW. A.M. Noon, NW. Barometer rising all day. |
| | 10.30 p.m. | 29.56 | ... | Fine, with occasional showers. |
| 3 | 8 a.m. | ... | 29.68 | NNW. Stiff breeze. Fine. Barometer rising steadily. |
| | 10 10 p.m. | 29.85 | ... | |
| 4 | 7.35 a.m. | ... | 29.70 | N. Brisk. Bright and sunny. |
| § | 10.50 p.m. | 29.90 | ... | Barometer rising steadily. |

* Continuation of preceding storm, which lay to the northward, and was travelling eastward.

†‡§ These are all storms coming from the westward, and crossing England (or Scotland) to the eastward. It will be observed that whenever the wind veers from west towards the north, the barometer rises, and then falls as the wind goes back to the westward.

Dorchester Nov. 5. *F. P. B. M.*

*(To be continued.)*

## Notices to Correspondents.

ASPHALTE: *W M.* Will any of our correspondents give a recipe for the cheapest durable asphalte which will bear a cart, and do for barn floors.

CHICORY: *J M* It should be cut into pieces an inch or an inch and a half long. A common box chaff-cutter, worked by a dexterous hand, would do for them very well.

CHURN: *Constant Subscriber.* The American churn is made to churn 10 or 12 lbs.; and it does its work well and speedily.

COMPOUND FLOWERS: *K B.* What do you mean by "compound flowers?" Clovers do not belong to the natural order Compositæ.

DEALERS: *Dulce et Utile.* We must not advertise dealers. They advertise themselves in our columns.

MANGOLD WURZEL: *G S.* In the *Agricultural Gazette*, October 4, Calendar of Operations, Dorset Farm, gives an account of the store pigs being fed entirely from the last year's Mangolds, up to that time. Would he be so good as to say in what state the Mangolds are given, whether raw and whole, as they come from the heap, or are they cut or boiled, and would he also give the method of storing.

SOFT BUTTER: *Northwood.* Try Bean-meal in place of linseed.

PIGS: *M N.* "Ringing" is the only remedy we know of.

POULTRY: *Godstone.* Cochin China fowls, at four months old, will easily bear a long journey. They should start by an evening or night train. *J. Baily, 113, Mount-street.*

ERRATUM. In the article on "Granite Manure" in our No. for Oct. 18, for "*Silenic* acid," read "*Silicic* acid."

# Markets.

## COVENT GARDEN, Nov 8.

English Pine Apples continue plentiful, and Grapes, both foreign and English, are also abundant. Pears are still brought from the Continent. The best English kinds fetch 2s. to 4s. a doz., and 8s. to 12s. per half sieve. Oranges are coming in plentifully. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are still a little cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 2s to 5s | — sweet, per lb., 2s to 3s |
| — Lisbon, per lb., 9d to 1s | Oranges, per doz., 1s to 1s 6d |
| Melons, each, 1s to 2s | — per 100, 6s to 10s |
| Apples, kitchen, p. bsh., 1s to 2s 6d | Nuts, Barcelona, p. bsh, 20s to 22s |
| Pears, dessert, p. doz., 2s to 4s | — Brazil, p, bsh., 12s to 14s |
| Lemons, per doz., 1s to 2s | Filberts, per 100lbs., 70s to 90s |
| Walnuts, per bush., 12s to 24s | |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 8d to 1s | Shallots, per lb., 6d to 8d |
| Cauliflowers, p. doz., 6d to 3s | Garlic, per lb., 6d to 8d |
| French Beans, p. h. sieve, 2s to 4s | Artichokes, per doz., 4s to 6s |
| Broccoli, per bunch, 3d to 1s | Lettuce, Cab., p. score, 4d to 1s |
| Peas, per sieve, 6s to 8s | — Cos, per score, 3d to 1s |
| Potatoes, per ton, 45s to 80s | Small Salads, p. punn., 2d to 3d |
| — per cwt., 2s to 5s | Horse Radish, p. bundl., 1s 6d to 4s |
| — per bush., 1s 6d to 2s 6d | Red Beet, per doz., 1s to 2s |
| Turnips, p. bunch, 2d to 3d | Mushrooms, p. pot., 1s to 1s 6d |
| Cucumbers, each, 1d to 1s | — per bushel, 7s to 10s |
| Radishes, per doz., 9d to 1s 6d | Sorrel, per hf. sieve, 6d to 9d |
| — Turnip, p. doz., 1s to 1s 6d | Tomatoes, p. half sieve, 3s to 4s |
| Celery, p. bundle, 6d to 1s 6d | Fennel, per bunch, 2d to 3d |
| Carrots, per bunch, 4d to 6d | Savory, per bunch, 2d to 3d |
| Brussels Sprouts, per hf. sieve, 1s 6d to 1s 9d | Thyme, per bunch, 2d to 3d |
| | Parsley, per doz. bun., 2s to 3s |
| Spinach, per sieve, 1s 6d to 2s | — Roots, p. bundl. 9d to 1s |
| Veget. Marrows, p. dz., 1s to 1s 6d | Mint, per bunch, 1d to 2d |
| Onions, p. bunch, 1d to 5d | Basil, p. bunch, 3d to 4d |
| — Spanish, p. doz., 1s 6d to 3s | Marjoram, do., 3d to 4d |
| Leeks, per bunch, 1d to 2d | Watercress, p. 12 bunch., 4d to 6d |

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, Nov. 6.

| | | | | | |
|---|---|---|---|---|---|
| Prime Meadow Hay | 72s | to 78s | Clover ... ... ... | 70s | to 85s |
| Inferior ditto ... ... | 60 | 68 | 2d cut ... ... ... | 60 | 72 |
| Rowen ... ... ... | 60 | 65 | Straw ... ... ... | 23 | 27 |
| New Hay ... ... | — | — | | J. COOPER. | |

The supply large and trade heavy.

CUMBERLAND MARKET, Nov. 6.

| | | | | | |

### COAL MARKET.—FRIDAY, Nov. 7.

Hollywell, 17s.; Wallsend Gosforth, 19s.; Wallsend Hetton, 20s.; Wallsend Lambton, 20s.—Ships at market, 44.

### HOPS.—FRIDAY, Nov. 7.

Messrs. Pattenden and Smith report that since the declaration of the duty the trade has improved for middling and fine samples, which are now becoming scarce.

| | | | | | |
|---|---|---|---|---|---|
| Mid & East Kents | 160s | to 252s | Sussex ... | ... 100s | to 130s |
| Weald Kents ... | 126s | to 147s | Yearlings ... | ... 95 | —112 |

### POTATOES.—MONDAY, Nov. 3.

The committee report that the market is well supplied both coastwise and by rail. Trade is exceedingly heavy, and it is with difficulty the following quotations are realised:—York Regents, 60s. to 70s.; Scotch do., 40s. to 50s.; Kent and Essex do., 50s. to 60s.; ditto Shaws, 45s. to 50s.; Lincolnshire whites, 40s. to 50s.

### SMITHFIELD, MONDAY, Nov. 3.

Last Monday's improvement in trade has caused a considerably increased supply of Beasts to this day's market. There is consequently a slight reaction, but the choicest descriptions still make 3s. 8d., the reduction being chiefly discernable in inferior qualities. The number of Sheep is small—equal, however, to the demand, and we are not enabled to quote higher prices; a few of the choicest kinds may be stated the turn dearer. Good Calves are freely disposed of, at fully late rates. From Holland and Germany there are 1612 Beasts, 4680 Sheep, and 168 Calves; and 2050 Beasts from the northern and midland counties.

| Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 6 to 3 | 8 | |
| Best Short-horns | 3 | 4 — 3 | 6 | |
| 2d quality Beasts | 2 | 4 — 2 | 10 | |
| Best Downs and Half-breds ... | 4 | 0 — 4 | 2 | |
| Ditto Shorn ... ... | | | | |

| Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools . | 3 | 8 to 3 | 10 | |
| Ditto Shorn ... | | ... | | |
| Ewes & 2d quality | 3 | 2 — 3 | 6 | |
| Ditto Shorn ... | | ... | | |
| Lambs ... ... | 0 | 0 — 0 | 0 | |
| Calves ... ... | 3 | 0 — 4 | 0 | |
| Pigs ... ... | 3 | 4 — 4 | 8 | |

Beasts, 5451; Sheep and Lambs, 25,370; Calves, 218; Pigs, 510.

FRIDAY, Nov. 7.

It was expected there would have been several Beasts left over from Monday, but considerable business was done towards the close. This day's supply is short, and we are consequently enabled to retain Monday's quotations, although the demand is not extensive. The number of Sheep is small, but sufficient; prices remain unaltered. The non-arrival of some Dutch boats causes an unusually small supply of Calves, and a consequent increased activity in trade. From Germany and Holland we have 98 Beasts and 60 Calves; and 125 Milch Cows from the home counties.

| Best Scots, Herefords, &c. ... | 3 | 6 to 3 | 8 |
|---|---|---|---|
| Best Short-horns | 3 | 4 — 3 | 6 |
| 2d quality Beasts | 2 | 4 — 2 | 10 |
| Best Downs and Half-breds ... | 4 | 0 — 4 | 2 |
| Ditto Shorn ... ... | | | |

| Best Long-wools . | 3 | 8 — 3 | 10 |
|---|---|---|---|
| Ditto Shorn ... | | ... | |
| Ewes & 2d quality | 3 | 2 — 3 | 6 |
| Ditto Shorn ... | | ... | |
| Lambs ... ... | 0 | 0 — 0 | 0 |
| Calves ... ... | 3 | 4 — 4 | 0 |
| Pigs ... ... | 3 | 4 — 4 | 8 |

Beasts, 891; Sheep and Lambs, 3550; Calves, 179; Pigs, 560.

### MARK LANE.

MONDAY, Nov. 3.—There was a fair supply of Wheat by land carriage samples from Kent, but small from Essex; the whole was a slow sale on the terms of this day se'nnight. Foreign met s me inquiry, but the state of the English market induced buyers to hold off, and the sale was limited, last week's prices being with difficulty obtained.—There is a good demand for Barley, and foreign is 1s. per qr. dearer.—Peas are unaltered in value.—Beans sell readily at rather more money.—The Oat trade is very firm, and in some instances a slight advance is established on last week's prices. We observe no alteration in the sale or value of Flour.

FRIDAY, Nov. 7.—The arrivals of English grain since Monday have been moderate, but we have a good supply of Wheat from the Continent, and of Oats from Ireland. This morning's market was thinly attended, and great indifference to purchase Wheat was generally evinced, and prices of both English and foreign remain unaltered.—Barley is in good demand, at the extreme rates of Monday.—Beans and Peas are unaltered in value.—The trade for Irish Oats is dull; foreign remain as last quoted.—Good qualities of Flour are in request at the extreme prices of Monday.

ARRIVALS THIS WEEK.

LIVERPOOL, TUESDAY, Nov. 4.—Our market this morning was well attended by home and country millers, with several Irish buyers, directing their attention principally to foreign Wheats, in which a fair business was done at the currency of this day se'nnight, and in a few instances choice qualities were 1d. per 70 lbs. dearer. Farmers' new Wheat moved steadily on the terms last noted. Malting Barley was 1s. per qr. cheaper; grinding samples remaining unvaried. Malt, on the contrary, improved 1s. per qr. In Beans and Peas we have no change to note. Oats were in moderate demand, and steady in value; while Oatmeal receded 6d. per load from last Tuesday's prices. Floating and arrived cargoes of Indian Corn were rather easier to purchase to-day.—FRIDAY, OCT. 31.—Upon a slender attendance of home and country millers at our Corn Exchange to-day the transactions in either English or foreign Wheat were very moderate in amount, but without the sales being pressed, and holders refusing to lower their pretensions, the current rates of Tuesday remained unvaried. Barley, Malt, Beans, and Peas, upon a moderate demand, ruled steady in value. Oats, moving sparingly, were rather cheaper, and Oatmeal declined 3d. per load. Indian Corn dull on the spot, and floating not in active request.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

Milk Pans, 2s. to 6s. each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO. beg to hand in their prices of SHEET GLASS for cash:

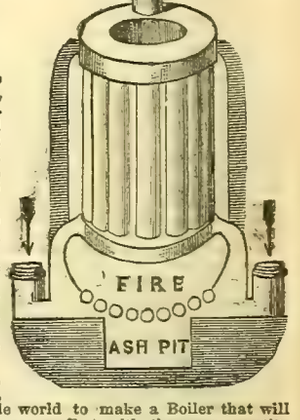
FOREIGN SHEET GLASS, of very superior quality, packed, in cases of 200 feet, and in sizes varying from 36 by 26 to 44 by 30 inches, at 38s., 40s., to 42s. per case.

HARTLEY'S PATENT QUARRY GLASS.



Milk Pans, from 2s. to 6s. each, Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoy's Milk Syphons, Tiles and Slates, Wasp Traps, Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the Trade.

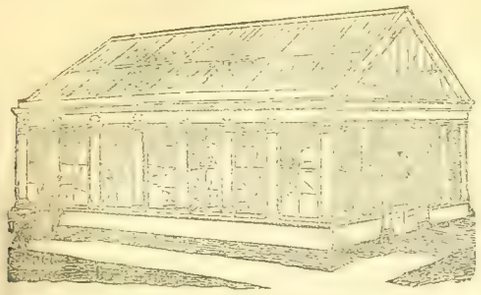
HORTICULTURAL GLASS WAREHOUSE, 116, Bishopsgate-street Without.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS AND Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.



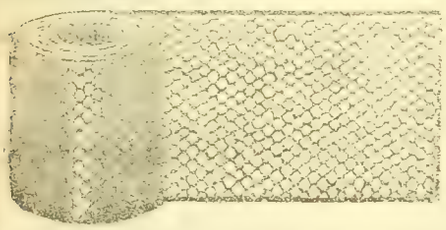
GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d. per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

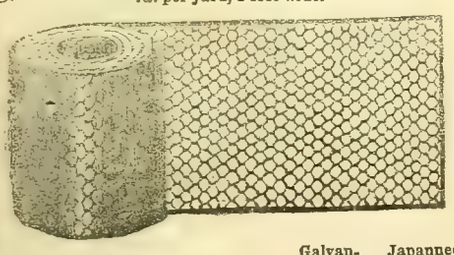


GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

WIRE NETTING ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3d. | per yard. | 30 inches wide | 7½d. | per yard. |
| 18 " | " | 4½d. " | 36 " | " | 9d. " |
| 24 " | " | 6d. " | 48 " | " | 1s. " |

Galvanised do., 1d. per foot extra.

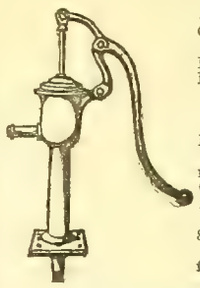
Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each. Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1⅝-inch " light " ... | 8 " | 6 " |
| 1⅝-inch " strong " ... | 10 " | 8 " |
| 1⅝-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.



COPPER BOILERS, of various Shapes, for Heating Baths and Conservatories.

Fig. 1. Fig. 2 Fig. 3. Fig. 4.

FIG. 1. TYLOR'S IMPROVED COPPER CIRCULATING BATH BOILER, on Iron Frame complete for fixing.—FIG. 2. COPPER-RIVETTED ARCH-TOP BOILER for large Greenhouses or Public Buildings, from 4 to 40 gallons.—FIG. 3. DOME-TOP COPPERS, with draw-off Cocks, for Public Baths, from 15 to 150 gallons.—FIG. 4. TINNED COPPER COIL PIPES for heating Baths, by passing water through the kitchen range boiler.—Apply to Ironmongers or Plumbers, or to the Manufacturers, J. TYLOR and SON, Warwick-lane, London.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

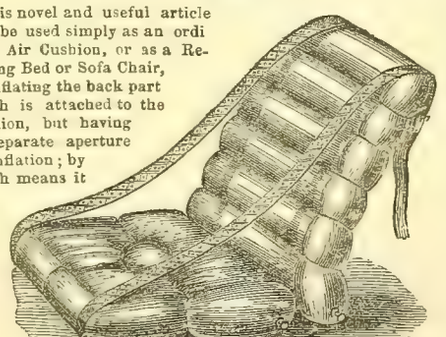
| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.



HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it

may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

BERDOE'S SUPERIOR OVER-COATS combine, with every other quality essential to a really respectable article, the established reputation of being thoroughly impervious to rain, and are supplied at charges the lowest possible for first-class garments. A very large stock for selection. Also of RIDING and DRIVING CAPES, SHOOTING JACKETS, and of the WATERPROOF PALLIUM, the well-known light Over-coat for all seasons, long regarded as one of the most gentlemanly, economical, and valuable garments ever invented. Price, 45s. and 50s. No slop or inferior goods kept.

96, NEW BOND-STREET, and 69, CORNHILL (only).

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars, London; and 36, Seel-street, Liverpool.

FORD'S EUREKA SHIRTS and FORD'S EUREKA SHIRT COLLARS are not sold by any hosiers or drapers. The Collars possess an improved method of fastening, which entirely dispenses with the use of strings, loops, or elastic contrivances. Adapted to any size, suitable for once or twice round cravats. They may be had in three different sizes, and either rounded or pointed. Price 11s. 6d. per dozen. Two, as samples, sent post free on receipt of twenty-eight postage stamps.—RICHARD FORD, 185, Strand, London.

THE BIRMINGHAM CATTLE SHOW.—CLOSING OF ENTRIES.—The Certificates of Entry for Cattle, Sheep, Pigs, and Poultry may be had on application to Mr. E. LATHBURY, 2, Insurance-buildings, Union-passage, Birmingham. The Entries close on Saturday the 15th of November.

RANDALL'S PROLIFIC RHUBARB.—In submitting the above to the public, E. R. begs to state, that while possessing all the qualities of Myatt's Linnæus, it is nine days earlier; of superior flavour; upright in growth, and producing large stems all of equal size. Roots 2s. 6d. each. To be obtained of the principal seed-houses in London, and at EDWARD RANDALL'S, Loughboro' Gardens, Brixton, Surrey. Orders accompanied with a remittance will be promptly attended to.—N.B. The usual discount to the trade.

BASS AND BROWN beg to refer to their Advertisement of CHOICE GERANIUMS, in the 2d page of each number of *Gardeners' Chronicle*, of Sept. 27th and Oct. 11th. The plants are exceedingly fine and vigorous. With immediate re-potting, they will make good specimen plants for exhibition next season, with abundant blooms, and will be found very cheap. They also, in the same Advertisements, beg to refer to their select list of NEW PLANTS. Also NEW CHRYSANTHEMUMS, AZALEA INDICA, &c., of which they have a choice assortment, strong and vigorous, and offered at low prices.

12 splendid Stove Plants, for winter and early spring flower, for 20s. 12 beautiful Greenhouse Plants, for do., 15s.

Catalogues on application. Goods free to London, or any part of the Ipswich line to Norwich, and extra plants, gratis, for orders of 40s. and upwards. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CEDRUS DEODARA,

For planting Avenues, single specimens for Lawns, or mixing with Fir and other plantations, grown from seed, either in or out of pots.

MAULE AND SONS respectfully inform Gentlemen about planting, that their immense stock of this most desirable Hardy Ornamental Tree consist of well-grown plants from seed, of all sizes, suited for the above purposes, which are offered by the dozen, hundred, and thousand, on moderate terms. ☞ Prices forwarded on application.

The curious in seminal productions will find by inspecting M. and SONS' Stock, many pleasing peculiarities of foliage in their present state of growth.

Stapleton-road Nurseries, Bristol.

TEN THOUSAND FRUIT TREES, all choice leading sorts, to be sold this autumn, at one-third the usual prices.—The public are respectfully informed that the remaining part of Mr. BELL'S STOCK OF CHOICE FRUIT TREES will be offered at the under-mentioned low prices, all warranted true to name, on his late Nursery Grounds, adjoining the New Church, Lakenham, Norfolk.

All communications to be addressed to JOHN BELL, at Mr. Claxton's, Davey-place, Norwich. A reference or Post-office order to accompany each order.

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

| | |
|---|---|
| Strong well-established plants ... ... | 7s. 6d. |

Usual discount to the Trade.

Clapton Nursery, London, Nov. 8.

EXOTIC NURSERY, CHELSEA.

KNIGHT AND PERRY beg respectfully to inform their Patrons, and particularly those who are interested in the introduction of NEW HARDY ORNAMENTAL TREES, that they have now a superb collection of those that are especially suited for the Park, Pleasure-ground, and even Hedge-rows, inasmuch as their judicious introduction there, instead of the too prevalent Elm and Ash, would speedily add much to the beauty of the British landscape. They are now preparing a list of them, and other hardy trees and shrubs, and will be happy to send it to those who apply for it.

Messrs. K. and P. avail themselves of this opportunity to observe that their WALL-TRAINED FRUIT TREES, for which their Establishment has been so long renowned, are now fit for removal. To insure such specimens as they should like to send out, they would respectfully solicit early commands.

KNIGHT and PERRY, Exotic Nursery, Chelsea, London.

TO THE TRADE.

PEAR STOCKS, 3 years transplanted, strong and fine, 30s. per 1000.

CHERRY STOCKS, 3 years transplanted, 3 to 5 feet, fine, 30s. per 1000.

PEARS (Standards), all the leading sorts, fine.

ARBOR-VITÆ (Chinese), 2 to 3 feet, ditto.

LAUREL (Common), 1 to 2 feet, ditto.

RHODODENDRON PONTICUM, 6 to 24 inches, ditto.

YEWS (Common), 2 and 3 feet, ditto.

We have a large stock of the above, and will sell them cheap. Prices on application. Water and rail conveyance to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead Nursery, Newcastle-upon-Tyne.

## *SALES BY AUCTION.*

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction at the Mart, Bartholomew-lane, on THURSDAY, Nov. 13th, 1851, a first-class Collection of DUTCH BULBS, comprising double and single Hyacinths, Narcissus, Crocus, Jonquils, Gladiolus, Snowdrops, Tulips, &c., also Standard and Dwarf Roses, consisting of Hybrid Perpetuals, Bourbons, Chinas, Noisettes, &c., together with a fine assortment of American Plants.—May be viewed the morning of Sale, and Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, NURSERYMEN, FLORISTS, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Garvie to sell by Auction, on the premises, Maryland Point, Stratford, on MONDAY, Nov. 17, at 11 o'clock precisely, in consequence of the number of lots, about 500 DOUBLE CAMELLIAS, from 1 to 7 feet, beautifully furnished with bloom-buds, comprising all the approved kinds; also 3000 Ericas, in the finest condition; 400 very fine Dwarf Trained Morello, May Duke, and other Cherries; together with a quantity of Green Hollies, Spruce Fir, Laurels, Limes, Rhododendrons, Azaleas, &c. A capital Nest of 170 Seed Drawers.—May be viewed a week prior to the sale. Catalogues had (6*d*. each, returnable to purchasers) on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

GREENHOUSE AND HOTHOUSE PLANTS.
VERY RARE AND CHOICE RHODODENDRONS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. T. Whalley to offer by Auction, at Fairfield Nursery, Liverpool, on TUESDAY, the 25th, and WEDNESDAY, the 26th, the whole of his valuable Collection of choice and rare RHODODENDRONS, including R. argenteum, barbatum, Falconerii, fulgens, Dalhousianum, Wallichii, and many other varieties figured by Dr. Hooker, and also from Major Madden's very valuable collection from Thibet, &c. Also a large quantity of fine and large Rhododendron hybridum, crossed with especial care from R. arboreum rubrum, arboreum album, campanulatum, cinnamomeum, zeylanicum, with R. alta-clerense, corriaceum, pictum, Victoria, &c.; also crossed with Azalea sinensis, Perryana, indica alba, &c., together with a fine stock of Azalea indica seedlings, Camellias, Pelargoniums, Calceolarias, Chrysanthemums, Lilium lancifolium, extra fine, and a large general stock of Greenhouse Plants. Above 200 Grape Vines in pots from eyes, Carnations, Pinks, Auriculas, fine Standard Dwarf and Moss Roses, Dahlias, and Herbaceous Plants. A large quantity of Standard and Dwarf Fruit Trees, together with Evergreens, and the whole of the Nursery Stock remaining unsold. Also a large Conservatory, four Hothouses, Frames, Handglasses, a large Iron Roller and Second-hand Mowing Machine, and sundry utensils in trade. Catalogues, with full particulars, may be had on the 17th, at the Nursery; the Seed Warehouse, 12, St. George's-crescent, Liverpool; from the Auctioneers; or free by post, on receipt of two postage stamps.

FINAL SALE.—ISLINGTON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Islington Nursery, about the middle of November (by order of Mr. G. Smith, in consequence of the Land being let for building), the remaining NURSERY STOCK, comprising Rhododendrons, Ghent and other Azaleas, Variegated and Green Hollies, several thousand Aucuba japonica, from 1 to 4 feet; fine Mulberries of different ages, many are fine bearing trees; also Arbor Vitæ, Mezereons, &c.—May be viewed prior to the sale. Catalogues had (6*d*. each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FULHAM ROAD.—IMPORTANT SALE OF NURSERY STOCK.

MR. D. A. RAMSAY will submit to public competition at the Brompton Auction Ground, Fulham-road (one mile from Hyde Park corner), on WEDNESDAY, Nov. 19, and following day, at 12 o'clock, a large assortment of Ornamental Trees, Deciduous and Flowering Shrubs, Evergreens, choice Fruit Trees, Bulbs, a Market Cart, and other miscellaneous Nursery Stock.—May be viewed prior to sale, and Catalogues had at the principal seed shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

KING'S-ROAD, CHELSEA.—SALE OF MULBERRY TREES, EVERGREENS, AND OTHER NURSERY STOCK, IN CONSEQUENCE OF THE EXPIRATION OF THE LEASE.

MR. D. A. RAMSAY has received instructions from Messrs. Dennis to submit to Sale by Auction, on the Premises as above, on TUESDAY, ——, and following days, the whole of the valuable Stock of Mulberry Trees (unrivalled in the country), Evergreens, Shrubs, Bulbs, &c., to which he begs to call the attention of the Trade and the Public.—Catalogues will be forwarded on application to the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

LINTON, CAMBRIDGESHIRE. — TO NURSERYMEN, FLORISTS, &c.—COPYHOLD NURSERY, DWELLING-HOUSE, AND FLOWER GARDEN.

MR. WHITTLE will sell by Auction, at the Swan Inn, Linton, on THURSDAY, November 13, at 4 for 5 o'clock precisely, by the direction of the executors, all that COPYHOLD ESTATE, favourably known for half a century past as Gimson's Nursery and Flower Garden, comprising about 1½ acre, with Seed-shop, roomy Dwelling-house, three Cottages, and Out-buildings, abutting on the High Road, Linton, subject to the customary fine on death or alienation. The Quit-rent is 8*d*. only, rendering it nearly equal to a Freehold Investment; whilst to a Nurseryman, Gardener, or Florist it offers peculiar inducements for occupation. The Estate has a beautiful Southern Aspect, with a gentle slope, and is naturally well drained. The Soil is of an extraordinary rich quality, and great ingenuity, combined with sound judgment and infinite taste, is exhibited in the disposition of the Grounds and Flower Garden. It is stocked with an abundance of Bearing Fruit Trees, a fine assortment of Greenhouse and Border Plants, Shrubs, Evergreens, Bulbs, Forest Trees, Ornamental Trees, Rock-work and Pond, remarkably fine cut Yew, and other Arbours and Hedges, Greenhouse, Forcing-pits, &c. It is also suggested, that if the present House and Cottages were removed, the site would be exceedingly appropriate for the erection of a respectable Family Residence, and in that case, with the Garden and Grounds already in a matured state, the property, considering its size, would unquestionably become at once one of the most unique Estates in the county. Linton is only 10 miles from Cambridge, 6 from Saffron Walden, 4 from the Chesterford Station, and 12 from Newmarket. The purchaser will have the option of taking to the whole or any part of the stock of Shrubs, Flowers, &c., at a valuation.—May be viewed at any time prior to the sale, and particulars had on the premises, at the Swan Inn, Linton: at the usual Inns in Cambridge, Saffron Walden, Chesterford, and Newmarket; of Mr. Gimson, Builder, Royston, Herts; of Messrs. Nash and Thurnall, Solicitors, Royston; and at the Auctioneer's Offices, 45, Old-street, St. Luke's, London.

OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE

OF THE

# GREAT EXHIBITION OF THE WORKS OF INDUSTRY OF ALL NATIONS, 1851.

"A complete literary type of the original to which it refers, opening up sources of amusement or instruction to every class of taste, and improving equally at home on the drawing-room table, handled by fashionable dilettanti in the study, pored over by the scholar or the man of science, at the merchant's desk as a book of constant reference—in the factory, the foundry, and the workshop, as a *repertoire* for designs, and as highly suggestive for future progress. A more pleasant work to dive into during an idle hour can hardly be imagined, for wherever it is taken up there is something new and striking, and worthy of attention."—*Times*.

"The work is without a precedent in the annals of literature; and when we regard the circumstances of difficulty that surrounded the task of its execution, the praise bestowed on those who undertook it can scarcely be too great. The Contractors, in that enlarged spirit which appears to have entered into all that belongs to the Exhibition, engaged men of reputation and authority in every department of science and manufacture to contribute such descriptive notes as should render the work eminently instructive. It thus contains a body of annotations which express the condition of human knowledge and the state of the world's industry in 1851: and is a document of the utmost importance, as a summary report of this vast international 'stock-taking,' which no great library—nor any gentleman's library, of those who aim at the collection of literary standards—can hereafter be without. It is not a work of a day, a month, or a year: it is for all time. Centuries hence it will be referred to as an authority on the condition to which man had arrived at the period of its publication. It is at once a great Trades Directory, informing us where we are to seek for any particular kind of manufacture—a Natural History, recording the localities of almost every variety of native production—and a Cyclopædia, describing how far science has ministered to the necessities of humanity, by what efforts the crude products of the earth have been converted into articles of utility or made the medium of that refined expression which belongs to the province of creative art. The Exhibition has lived its allotted time, and died; but this Catalogue is the sum of the thoughts and truths to which it has given birth,—and which form the intellectual ground whereon the generations that we are not to see must build. . . . It will be evident from what has been already stated that a more important contribution to a commercial country than the 'Official Descriptive and Illustrated Catalogue of the Great Exhibition' could scarcely have been offered. . . . All possible means have been taken to render it worthy of the wonderful gathering of which it is the permanent record."—*Athenæum*.

This Work is also published in Five Parts: Parts 1 and 2, price 10*s*. each; and Parts 3, 4, and 5, price 15*s*. each.

SPICER BROTHERS, Wholesale Stationers; WM. CLOWES AND SONS, Printers.

Official Catalogue Office, 29, New Bridge-street, Blackfriars, and of all Booksellers.

# POPULAR RECORD OF THE GREAT EXHIBITION.

## HUNT'S HANDBOOK,

Being an Explanatory Guide to the Natural Productions and Manufactures of the Great Exhibition of the Industry of all Nations, 1851. In Two Volumes, price 6*s*.

By ROBERT HUNT, Professor of Mechanical Science, Government School of Mines.

"It should be read and retained by all as a compact and portable record of what they have seen exhibited."—*Literary Gazette*.

"Every care has been taken to render this compilation a record worthy of preservation, as giving within a limited space a faithful description of certainly one of the most remarkable events which has ever taken place upon this island, or in the world—the gathering together from the ends of the earth, of the products of human industry, the efforts of human thought."—*Extract from Preface*.

"One of the most popular mementoes and histories of the actual gathering of the nations."—*Athenæum*.

SPICER BROTHERS, Wholesale Stationers; WM. CLOWES AND SONS, Printers.

Official Catalogue Office, 29, New Bridge-street, Blackfriars, and of all Booksellers.

Official Catalogue Office, 29, New Bridge-street, Blackfriars, and of all Booksellers.

VALUABLE NURSERY STOCK, HANWORTH-ROAD, HOUNSLOW, MIDDLESEX, NEAR THE RAILWAY STATION.

MR. WATERER will sell by Auction, on the premises, on MONDAY, November 10th, and following day, at 11 o'clock, the property of Mr. J. Riddy, giving up part of his land, comprising 2000 APPLE TREES of sorts, including Hawthornden, Wellington, Early Julien, Manx and Keswick Codlin, White Juneating, and others, true to name; Standard, Dwarf, and Maiden PEARS, CHERRIES, APRICOTS, PEACHES, and PLUMS, of the most approved sorts. Standard Roses, a large quantity of choice Evergreen & Flowering Shrubs, Portugal and Common Laurel, Laurestinus, Spruce, Scotch, and Larch Firs; Hornbeam, Limes, Poplars, Sycamores, Weeping Willows, Mountain Ash, Chestnut, and a great variety of other Forest Trees and Nursery Stock, the whole of which is in a safe moving condition.—May be viewed one week previous to the sale, and Catalogues had, upon the premises; of Mr. Charlwood, Seedsman, Covent-garden; and of Mr. Waterer, Auctioneer, &c., Chertsey, Surrey, who will forward them on application by post.

RE EDWARD EVANS, NURSERYMAN AND FLORIST, A BANKRUPT.

MESSRS. CAFE AND REID will sell by Auction, by order of the Assignee, on the Premises, the ARGYLL NURSERY, Paddington-green, on WEDNESDAY, Nov. 12, at 12 for 1 precisely, 8000 Greenhouse Plants, including many very fine Camellias, Gardenias, and Azaleas, and others of a rare description; seven Greenhouses, 12 5, 4, 3, and 2-Light Frames, Pine and Melon Pits, Summer-house, 30 casts of Garden-pots, Iron Roller, and Tools, a Horse, Cart, and Harness, several loads of Dung and Leaf-manure.—May be viewed on Tuesday next, and Catalogues had on the Premises; also of P. Johnson, Esq., Official Assignee, 20, Basinghall-street; of Messrs. Davies, Son, and Campbell, Solicitors, 17, Warwick-street, Regent's-street; and of Messrs. Cafe and Reid, Great Marlborough-street.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, at Newmarket, a good Walled-in GARDEN, containing about four acres, well stocked with bearing Fruit Trees and Shrubs. The Gardens contain three extensive Vineries, with the choicest collection of Vines; about half a mile of wall well covered with Fruit Trees, Macphail Pits, &c. There is a House and Shop in the town, and a Gardener's Cottage on the premises.—For terms, address Mr. Ridge, the Nurseries, Newmarket.

TO GENTLEMEN'S GARDENERS, NURSERYMEN, AND OTHERS.

TO BE DISPOSED OF, a recently built FORCING-HOUSE, with Stove and Apparatus complete.—Apply to Mr. Peirson, Builder, &c., Old Brompton, near London.

TO NURSERYMEN, HORTICULTURISTS, SEEDSMEN, AND OTHERS.

TO BE SOLD.—The LEASE of Premises, 40 years of which are unexpired, at a low rent, together with the Goodwill, Fixtures, and Effects of a NURSERYMAN, producing a net income of 200*l*. per annum. Also the LEASE of the Ground, about one acre, well stocked with choice Greenhouse Plants. Is situate about three miles north of town, and contiguous to the intended Finsbury Park; has large Greenhouse, Hot-water Pit, Stabling, Sheds, &c. The whole will be offered upon very easy terms, with early possession.—Apply to Mr. Morley, 1, Sidmouth-street, Gray's-inn-road, London.

The above may be had of WILLIAM DENYER, Seedsman, &c., 82, Gracechurch-street, London, near the Spread Eagle.

HUNTER'S PROLIFIC CUCUMBER.—This handsome and delicious variety obtained, in June last year, with fruit upwards of 30 inches in length, the Silver Medal at the Botanic Gardens, Regent's-park: and a Certificate of Merit at the Exhibition in July. It has also been awarded Four Prizes at the Highbury Exhibitions. It is white spined, and an extraordinary bearer. To be had in packets of seven seeds, at 5s.; or three seeds, at 2s. 6d., of Mr. HUNTER, 5, King-street, Islington; and at J. G. RENWICK'S Seed Warehouse, 107, St. John-street, Smithfield, London.

H. LANE AND SON, Great Berkhampstead, Herts, having a very large stock of EVERGREEN TREES and SHRUBS suitable for immediate effect in making New Plantations, Avenues, &c., every plant forming a specimen, have selected, as a more ready guide, the following; the different varieties of which will be found under their respective heads in Catalogue of Trees and Shrubs:—

Arbor-Vitæ, 2 to 8 feet.
Arbutus, 3 to 5 feet.
Araucaria imbricata, 2 to 3½ ft.
Cedrus Deodara, 2 to 6 feet.
,, Libani, 2 to 5 feet.
Cryptomeria japonica, 2 to 8 ft.
Cypress, 2 to 5 feet.
Holly, Green, 2 to 4 feet.
,, Variegated, 2 to 4 feet.
Juniper, 2 to 6 feet.
,, Virginiana, or Red Cedar (splendid plants), 3 to 5 feet.
Kalmia latifolia, 3 feet.
Laurel, Common, 3 to 5 feet.
,, Portugal (fine), 3 to 5 ft.
Phillyrea illicifolia, 3 to 5 feet.
Pinus Cembra, 2 to 3½ feet.
,, excelsa (fine), 3 to 4 ft.
,, insignis, 2 to 3½ feet.
,, Pinaster, 2 to 3 feet.
,, Weymouth, 3 to 6 feet.
Abies Douglasii, 3 to 7 feet.
,, Hemlock Spruce, 5 to 7 feet.
,, Khutrow, 2 to 3 feet.
,, Morinda, 3 to 4 feet.
,, Menziesii, 3 to 5 feet.
,, *Spruce, 3 to 5 feet.
Rhododendron, 2 to 8 feet.
Taxodium sempervirens, 2 to 5 feet.
Yew, Common, 4 to 6 feet.
,, Irish, 3 to 7 feet.

* These, the Common Spruce Fir, in two varieties, the White and Black, are splendid plants, bushy, according to their height.

"PINUS AUSTRIACA,"
THE BLACK AUSTRIAN PINE.

LUCOMBE, PINCE, AND Co., have now on sale a large stock of very fine, healthy, strong plants of this truly desirable Pine, from 9 inches to 2 feet high, which, having been frequently transplanted, are very well rooted, and consequently quite safe to remove to any distance, and are of a superior quality (great attention having been paid to their cultivation); price from 20s., 40s., to 50s. per 1000. They have also some of larger sizes, from 3 to 6 feet high, equally safe to move, owing to proper attention having been paid to their roots, at proportionately higher prices.

This noble and most serviceable Pine thrives in bleak and exposed situations even in poor soils), growing rapidly, and producing dense shelter, in places where other trees will not grow. It also succeeds admirably close to the sea, resisting there the spray and roughest winds.

Exeter Nursery, near Exeter, Nov. 15.

JAMES DICKSON, of Acre-lane, Brixton, begs to inform his Floral Friends that, after what has taken place, he will not act as Judge, nor serve on any Committee (after the next Election), with Mr. John Edwards, of Wace Cottage, Holloway.—Nov. 15.

MESSRS. J. AND H. BROWN offer the following desirable Plants, choice Fruit Trees, &c., which they will forward to any part of the kingdom.

| | s. | d. |

| Violets: Arborea, Russian, and Neapolitan, per dozen | 4 | 0 |
| 25 Choice Hardy Herbaceous Plants, named | 7 | 6 |

Rhubarb, Seakale, and new Giant Asparagus plants supplied.

Albion Nursery, Stoke Newington, London, Nov. 15.

TO GENTLEMEN ENGAGED IN PLANTING, &c.

J. J. FOSTER, of the Edgeware Nurseries, has a fine lot of five feet LARCH plants, which are scarce; also an abundance of splendid Evergreens, Fruit and Forest Trees, as well as Standard and Dwarf Roses of the best kinds, at low prices, delivered free in London, or within 12 miles of Edgeware.

A COMPLETE ARBORETUM.

C. LODDIGES AND SONS beg to state that they are now supplying the above, comprising upwards of 1200 species of TREES and SHRUBS, correctly named, for 50*l.*, cash on delivery; and as their collection of hardy plants will have to be dispersed this season, in consequence of the land being let for building, they most respectfully suggest that all persons contemplating the formation of a COMPLETE ARBORETUM should make early application, as the stock of some species is very limited.—Hackney, Nov. 15.

THOMAS HANDASYDE, Glen Nurseries, Musselburgh, by Edinburgh, begs to intimate that he has now fine plants of his new Seedling PANSY, "MAID OF ATHENS," ready for sending out, at 5*s.* each.

The Gardeners' Gazette, of 19th July last, gave the following character of the above:—"PANSIES: *T H, Musselburgh.* Your seedling came to hand in good condition. Upper petal, rich purple, of velvet-like consistency; lower petal broadly margined with the same; centre, pretty straw colour, shaded with ultramarine from the margin; blotch, the same tint, veined with black; eye bright gold; brow white, well raised, and finely arched; size desirable, and shape good."

Also HANDASYDE'S DUKE OF PESTH, and King's MERRY MONARCH, at 18*s.* per dozen, with all the leading show flowers of the season, of which Catalogues may be had.

Fruit, Forest, and Ornamental Trees, with many of the more rare Coniferæ, Evergreen and Deciduous Flowering Shrubs, Roses, Carnations, Pinks, Hollyhocks, Phloxes, &c., with Agricultural, Garden, and Flower Seeds, all from first-rate collections, at moderate prices.

## MAGNIFICENT SPECIMENS OF CONIFERÆ, HARDY ORNAMENTAL TREES, SHRUBS, &c.

LUCOMBE, PINCE, and CO., respectfully call attention to their fine, and perhaps unequalled Stock, of well-grown specimens, capable not only of producing great immediate effect, but also quite safe to remove to any distance, consisting of

Cedars of Lebanon, 6 to 8 feet.
Cedrus Deodara, 6 to 12 feet
Pinus insignis, 3 to 15 ft. *The most ornamental the most rapidly growing: indeed the finest Pine ever introduced.*
Austrian Pine, 2 to 8 feet.
Pinus Cembra, 3 feet.
Juniperus excelsa, 6 to 7 feet.
Biota glauca. *This is one of the handsomest of the Hardy Coniferæ*
Abies Douglasii, 3 to 12 feet.
Abies Menziesii, 3 to 6 feet.
Araucaria imbricata, 4 feet 6 in. high by 5 feet. *Grand specimens.*
Lucombe Oaks, 8 to 12 and 14 ft.
Ford's Oaks, 6 to 8 feet.
Ilex Oaks, 6 to 12 feet.
Scarlet Oaks, 8 to 10 feet.
Quercus ilex macrophylla, 2 to 3 feet. *Lucombe Pince, and Co.'s new Ilex, the finest of all the Hardy Evergreen Oaks.*
Standard Thorns, 9 feet. *Unusually fine, with large heads and straight stems.*
Purple Beech, 8 to 12 ft. *These are truly grand plants.*
Exmouth Magnolias, 3 to 8 ft.
Standard Rhododendrons, 5 to 6 feet.
Rhododendrons. *Fine bushy compact plants finely set with flower buds.*
Irish Yews, 8 to 10 feet. *These are extraordinary plants, unrivalled in size and form.*
Arbutus, scarlet flowered. *The finest variety.*
Arbutus Andrachne hybrida.
Standard Portugal Laurels, 6 feet. *With clean straight stems, and stately heads.*
Yuccas.
Hedera Fægneriana.

And many other things equally fine, but not within the limits of an advertisement; prices and further particulars of all of which may be had on application to them.

N.B.—Experienced Gardeners recommended.

Exeter Nursery, near Exeter, Nov. 15.

RARE OR CHOICE HARDY CONIFERS.

A. PAUL AND SON, Nurseries, Cheshunt, Herts, beg to offer the following, specimens of which were exhibited by them at the Crystal Palace:—

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.

50 first-rate sorts, own selection, 21. 10*s*; or 15*s.* per dozen.

50 do. purchaser's selection, 3*l.*; or 18*s.* per dozen.

ERICAS, 50 of the finest sorts grown, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.

„ „ purchaser's choice from list, 3*l.*; or 18*s.* per dozen.

CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21*s.*; or 15*s.* per dozen.

„ „ purchaser's choice, 1*l.* 5*s.*; or 18*s.* per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25*s.*; 50 fine for 15*s.*; 25 for 8*s.*, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.

CINERARIA, from the choicest sorts, per packet, 2*s.* 6*d.*

PANSY, do. do. do. 1*s.* 6*d.*

HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1*s.* 6*d.*

FRUIT TREES.

GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4*l.*, in 100 varieties; or 10*s.* per 100, in 50 varieties.

A selection of the choicest description for show, 4*s.* per doz.

The stock extends over 50,000, and is fine and free grown.

CURRANTS.—MAY'S Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25*s.*; or per doz., 4*s.*

Black Naples, the finest black (no other sort grown), 12*s.* per 100, 2*s.* 6*d.* per doz.

Red Grape and Champagne, fine, 10*s.* per 100.

White Dutch, large and fine, 12*s.* per 100, 2*s.* per doz.

APPLES.—Fine clean Standards, 10*s* per doz., 70*s.* per 100.

„ Dwarfs, 8*s.* per doz, 50*s.* per 100.

„ Dwarf trained superior kinds, 2*s* 6*d* each, or 24*s.* p doz.

The collection is very choice, from the Horticultural Society.

PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.

PLUMS and CHERRIES.—All the leading sorts, standards, 18*s.* per doz.

„ „ Dwarfs, fine, 9*s.* per doz.

„ „ Dwarf trained, 3*s.* 6*d.* each, or 36*s.* per doz

APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5*s.* each, 50*s.* per doz.

RASPBERRIES.—Fastolff 3*s.* per doz., 16*s.* per 100.

„ Antwerp Red, 2*s.* per doz., 12*s.* per 100.

„ Monthly, or Double-bearing, 12*s.* per 100, 2*s.* per doz.

STRAWBERRIES.—Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3*s.* 6*d.* per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to JOHN MAY, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shoveilers, gold-eyed and dun divers, Carolina ducks &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

FEATHER GRASS.

WANTED, any quantity, if of approved quality. Sample, and price per pound, addressed to R. Y., Office of this Paper.

ORNAMENTAL PLANTING.

C. LODDIGES AND SONS most respectfully call the attention of Noblemen, Gentlemen, and Public Companies, engaged in Ornamental Planting, to the undermentioned List of TREES and SHRUBS, which they are enabled to offer at an extraordinary reduction in price (for cash only), the land upon which their arboretum is planted being required for building.

Fine trees, from 4 to 10 feet high, of the following genera, comprising a great number of species: Acer, Æsculus, Alnus, Amygdalus, Betula, Cornus, Corylus, Cotoneaster, Crataegus, Cytisus, Fraxinus, Meopilus, Populus, Prunus, Pyrus, Ribes, Robinia, Salix, Sorbus, Spiræa, Tilia, Ulmus, 4*s.* per dozen named, or a selection from the above, 25*s.* per 100 unnamed, and highly recommended for rough planting.

American Oaks in great variety, 10*s* per dozen.

AMERICAN PLANTS.

Azalea pontica, fine bushy plants well set with bloom, 10*s.* p. doz.

„ Ghent and other varieties named, 18*s* per doz.

Rhododendron ponticum and varieties (very fine), 10*s* per doz.

„ campanulatum, 2 to 4 feet diameter, 10*s* 6*d.* to 42*s.* p. doz.

Andromedas in collections, 18*s.* per doz.; Vaccinium ditto, 12*s.* per doz.

N.B. Packing will be charged as low as possible. Post-office orders made payable at Hackney.—Hackney, Nov. 15.

OTHELLO—NEW CARNATION CLOVE—now ready for sending out, at 5*s.* per pair, or 3*s.* per plant.—This will prove to be one of the finest and choicest ever offered to the public. It is the largest and darkest of its kind yet seen, and is of most powerful fragrance; the flowers are of an immense size, with long pod and fine rose-leaf petals, perfectly hardy, and will thrive well in any situation; it was the admiration of numberless spectators while in bloom during the season, and numerous orders taken for it. On the 9th August it was sent to the Editor of the *Gardeners' Chronicle*, and his opinion was given as follows: "A desirable dark Clove, with a strong scent, well worth cultivation." It is warranted to give satisfaction to all purchasers. Also the following, new:

BLACK WALLFLOWER—NEGRESS.—This is a new superb variety, and is superior to all others of similar kinds, the colour of which may be compared to that of a Mulberry when perfectly ripe; it has a fine large spike, is very hardy, beautifully double, a most prolific bloomer, of very superior habit, and delightful fragrance; price 5*s.* per plant. Both of the above varieties only require to be seen to be grown by every one who has a garden of the smallest dimensions.

TILEY'S VIOLA ARBOREA, or Perpetual Tree Violet, true (see *Gardeners' Chronicle* of 1st November), large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen, or 1*l.* per hundred.

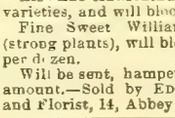
Double White Viola Arborea, do. do., 6*s.* per doz., fine plants.

Russian Superb (true), very fine, 3*s* per dozen.

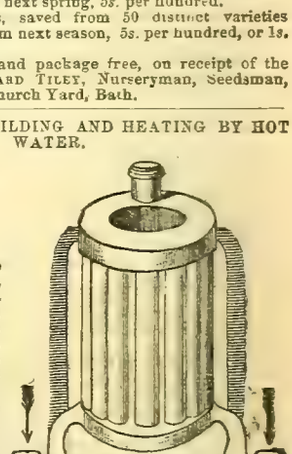
White Russian Superb (true), very fine, 3*s.* per dozen.

Each of the above varieties will be forwarded, postage and package free, to any part, on receipt of a Post-office order, or penny postage stamps to the amount.

The Strawberry Plants, as named and priced in the *Gardeners' Chronicle*, on the 1st November, can be supplied as before.



Fine Giant Scarlet Brompton Stocks, 2*s.* 6*d* per hundred.



Also fine Antirrhinums, all saved from striped and spotted varieties, and will bloom next spring, 5*s.* per hundred.

Fine Sweet Williams, saved from 50 distinct varieties (strong plants), will bloom next season, 5*s.* per hundred, or 1*s.* per dozen.

Will be sent, hamper and package free, on receipt of the amount.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

THERMOMETERS.

HENRY BAKER'S (90, Hatton Garden, London), List of Prices. Every instrument made by him warranted accurate.—Vertical self-registering THERMOMETER, for heat and cold, of the best construction, and not liable to get out of order, 14 inches high, in copper case, 1*l.* 5*s*; in japan case, 1*l.* 1*s.*, and 1*l*; 10 inches high, in copper case, 1*l.* 2*s.*; in japan case, 18*s.* Horizontal Thermometers for registering the extreme of cold only, 4*s.* 6*d*; Hot-bed Thermometers, in oak frames, 1*l.* 1*s*; copper frames, 1*l* 5*s.* Thermometers for Brewing, Baths, &c., in copper cases, 14 inches, 7*s.* 6*d.*; 10 inches, 5*s.* 6*d*; 8 inches, 4*s.* 6*d.*; in japan cases, 14 inches, 5*s.*; 10 inches, 3*s.* 6*d*; 8 inches, 2*s.* 6*d.* Dr. Mason's Hygrometer, or wet bulb Thermometer, for showing the humidity of the air, with tables, ivory scale, 1*l.*; wood, 15*s* An invaluable instrument in Hothouses, Sick Chambers, &c. Wheel Barometers from 1*l.* 1*s* each, sent, securely packed, without fear of getting out of order.

COCHIN CHINA POULTRY.—Three pairs of chickens, 15*s.* per pair; five young Cocks, 7*s.* each, or 30*s.* the lot; a Cochin Cock of 1850, 12*s.*; do. crossed with Dorking, 8 lbs. weight, price 6*s.*; do., with Spanish, same weight and price. They are to be parted with immediately, at the above low prices, on account of the bad health of the owner.—Address H. B., Esq., Post-office, Kingston, Surrey.

RANDALL'S PROLIFIC RHUBARB.—In submitting the above to the public, E. R. begs to state, that while possessing all the qualities of Myatt's Linnæus, it is nine days earlier; of superior flavour; upright in growth, and producing large stems all of equal size. Roots 2*s.* 6*d.* each. To be obtained of the principal seed-houses in London, and at EDWARD RANDALL'S, Loughboro' Gardens, Brixton, Surrey. Orders accompanied with a remittance will be promptly attended to.—N.B. The usual discount to the trade.

BASS AND BROWN beg to refer to their Advertisement of CHOICE GERANIUMS, in the 2d page of each number of *Gardeners' Chronicle*, of Sept. 27th and Oct. 11th. The plants are exceedingly fine and vigorous. With immediate re-potting, they will make good specimen plants for exhibition next season, with abundant blooms, and will be found very cheap. They also, in the same Advertisements, beg to refer to their select list of NEW PLANTS. Also NEW CHRYSANTHEMUMS, AZALEA INDICA, &c., of which they have a choice assortment, strong and vigorous, and offered at low prices.

12 splendid Stove Plants, for winter and early spring flower, for 20*s.* 12 beautiful Greenhouse Plants, for do., 15*s.*

Catalogues on application. Goods free to London, or any part of the Ipswich line to Norwich, and extra plants, gratis, for orders of 40*s.* and upwards. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SCARLET GERANIUM "THE AMAZON"

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7*s.* 6*d.*
Extra ditto, with flowering buds ... ... 10 6
Usual discount to the Trade.

Clapton Nursery, London, Nov 15

MESSRS. J. MYATT AND SONS have a Stock of the VICTORIA or RABY CASTLE CURRANT, and can supply good strong Plants at 25*s.* per 100; extra strong, 2 years old, 5*s.* per dozen. Also, a good Stock of 2 year planted Rhubarb roots.

MYATT'S LINNÆUS ... ... 10*s.* per dozen.
MYATT'S VICTORIA ... ... 10*s.* ,, ,,
MITCHELL'S ROYAL ALBERT

Smaller 1 year planted Roots, at 50*s.* per 100.

Manor Farm, Deptford, Nov. 15.

TULIPS, HYACINTHS, LILIUM LANCIFOLIUM, AND DUTCH BULBS GENERALLY.

This being the season for planting these Bulbs,

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to state that he supplies the above FLOWERS of the finest quality, at very moderate prices. His Catalogue may be had on application.

TO THE TRADE.

PEAR STOCKS, 3 years transplanted, strong and fine, 30*s.* per 1000.

CHERRY STOCKS, 3 years transplanted, 3 to 5 feet, fine, 30*s.* per 1000.

PEARS (Standards), all the leading sorts, fine.
ARBOR-VITÆ Chinese), 2 to 3 feet, ditto.
LAUREL (Common), 1 to 2 feet, ditto.
RHODODENDRON PONTICUM, 6 to 24 inches, ditto.
YEWS (Common), 2 and 3 feet, ditto.

We have a large stock of the above, and will sell them cheap. Prices on application. Water and rail conveyance to all parts of the kingdom.

SAMUEL FINNEY and Co., Gateshead Nursery, Newcastle-upon-Tyne.

EXOTIC NURSERY, CHELSEA.

KNIGHT AND PERRY beg respectfully to inform their Patrons, and particularly those who are interested in the introduction of NEW HARDY ORNAMENTAL TREES, that they have now a superb collection of those that are especially suited for the Park, Pleasure-ground, and even Hedge-rows, inasmuch as their judicious introduction there, instead of the too prevalent Elm and Ash, would speedily add much to the beauty of the British landscape. They are now preparing a list of them, and other hardy trees and shrubs, and will be happy to send it to those who apply for it.

Messrs. K. and P. avail themselves of this opportunity to observe that their WALL-TRAINED FRUIT TREES, for which their Establishment has been so long renowned, are now fit for removal. To insure such specimens as they should like to send out, they would respectfully solicit early commands.

KNIGHT and PERRY, Exotic Nursery, Chelsea, London.

HYACINTHS AND OTHER DUTCH ROOTS *now on Sale at RENDLE'S Nursery and Seed Establishment, Plymouth, at Reduced Prices; a Descriptive Catalogue of which can be had in exchange for one penny stamp.*

All orders above 2*l.* pre-paid to any Station on the South Devon, Bristol and Exeter, or Great Western Railways.

WILLIAM E. RENDLE and Co., Florists to her Majesty, Plymouth.

*** Our Descriptive Catalogue will be found useful, as it contains some good cultural advice.

W. FOSTER, NURSERYMAN, SEEDSMAN, and FLORIST, Stroud, Gloucestershire, solicits the attention of Planters to some very fine, well grown and well-rooted plants of the following, which will be sold low, as the ground must be cleared.

COMMON LAURELS ... ... ... ... ... 3 to 4 feet.
Do. do. ... ... ... ... ... 4½ to 6 ,,
PORTUGAL do. ... ... ... ... ... 3 to 4 ,,
CUPRESSUS SEMPERVIRENS ... ... ... 3 to 4 ,,
Do. do. ... ... ... ... ... 4½ to 5 ,,
BUXUS ARBORESCENS, the True TREE BOX 2 to 3 ,,
Do. do. ... ... ... ... 3 to 4 ,,
A few hundreds of strong Larch ... ... ... 4½ to 6 ,,

HARDY HEATHS—Mediterranea, stricta, and rubra, strong bushy plants, grown without peat.

W. F. has a good supply of strong Quick, Larch, and Forest Trees of all kinds, Evergreen and Flowering Shrubs; also a choice selection of Fruit Trees, both trained and Standards. Prices (according to the number taken) will be sent, on application, with samples, if required.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

# The Gardeners' Chronicle.

*SATURDAY, NOVEMBER* 15, 1851.

OUR readers have not forgotten the discussion in our columns a few years since, concerning what is by botanists called MORPHOLOGY; how some thought the doctrine that flowers and fruits are made of young leaves altered in their development absolutely impious, while others more charitably regarded it as simply absurd. It is needless to say that no enunciation of truth can be impious; or that a doctrine is not necessarily absurd, because it is beyond the comprehension of people unaccustomed to reason. It so happens that the present season has enabled some obliging correspondents to furnish us with evidence upon this subject of so conclusive a character that we think it desirable to produce it, for the sake of showing how completely monstrous productions are capable of being explained by morphological theory, while no other applies to them.

The following cuts represent three Pears, produced in different places, and in different conditions, by which it will be seen that the soundness of the theory in question may be proved, apart from all other proof. A Pear blossom consists of a calyx composed of five sepals; within these appear five petals; next to which stand about 20 stamens; and in the centre of all are five carpels or hollow cases arranged in a ring, and containing seeds. All these parts are regarded in theory as leaves in an altered state, and the whole flower as a very short branch, destitute of the usual power of lengthening, or, which is the same thing, as a leaf-bud, the centre of which will not extend. In the beginning the sepals, petals, stamens, and carpels of a Pear flower were scales, placed upon a fleshy centre; and not distinguishable from those scales, which in the leaf-bud become leaves. To use a gardener's language, there was at first no difference between the blossom-bud and the wood-bud. But, after a time, the parts which were identical begin to be organised differently; in the blossom-bud they gradually change into sepals, petals, stamens, and carpels; in the wood-bud they become young leaves. But if anything occurs to disturb the developement of the blossom-bud as a blossom, then it becomes a wood-bud, or approaches that state, more or less, according to the period at which the disturbing force began to act. It thus appears that whether a bud becomes a flower or a branch, depends entirely upon some unknown force, which acts at a particular moment upon parts originally of identical nature and quality, and capable of becoming leaves; if this action is complete, a flower is the result; if incomplete, a monster; if altogether withheld, then the rudimentary parts, not having their nature changed, proceed to acquire the condition of leaves. Hence it is that when from accidents, such as unusual heat and wet at a critical moment, exuberance caused by the excessive application of rank (azotised) manure, or any circumstances of a similar nature, the usual order of developement is disturbed, flowers are not formed—or we have them converted into tufts of leaves, or even branches, as was so strikingly the case with Roses last summer in some situations. The following three examples seem to offer conclusive evidence as to the truth of this theory:—

No. 1.

No. 1 represents a Pear, in which the calyx and its five sepals are not much disturbed, but in which the petals and part of the stamens, developed in the form of leafy scales, adhere round the centre of the flower, which has lengthened somewhat like a branch, while the remainder of the stamens and the carpels are concealed within the summit, in the form of withered rudiments. The constitutional tendency to fleshiness, which is the characteristic of the Pear, is not lost, in this or either of the two other cases, but is preserved throughout, only diminishing towards the eye.

In No. 2 the phenomena take a somewhat different direction, the leafy tendency being greater in some of the sepals, but the tendency to acquire succulence having been preserved in a far greater degree; as if the disturbing cause, whatever it may have been, which originally prevented the young parts from becoming petals, &c., and which forced the centre to lengthen like a branch, was eventually withdrawn

No. 2.

and overcome by the tendency to become succulent, which the parts had already acquired, when the disturbing cause began to act.

In No. 3, the change advances further, and in another direction. That dislocation of the rings of parts belonging to the flower, which was so visible in the two last cases is here carried still further;

No. 3.

and in addition, two of the young parts near the middle of the whole structure have each formed in their axil one bud, which has become a deformed flower, and produced a deformed Pear. No organ of the plant, except leaves and their modifications, has the power of producing a flower from its axil.

We have no doubt that plenty of similar cases may now be found; and we invite their possessors to consider—1, whether they may not be satisfactorily explained upon the foregoing principle; and 2, whether they can be explained upon any other intelligible principle.

---

WE believe that this Paper was among the earliest to draw attention to the machine for extinguishing flame, now called "PHILLIPS'S PATENT FIRE ANNIHILATOR," and to point out its great importance in rural districts. Without reverting to what was then said, we think it desirable once more to draw attention to this important invention, in con-

sequence of two striking experiments that have lately been made with it, and which leave no kind of doubt that it ought to find a place in every establishment, whether domestic or public. The first, tried at Stockport, and certified to by 35 master spinners, candlewick and wadding makers, is thus described by themselves :—

"At the Hopes Carr Mills, Hillgate, Stockport, belonging to Mr. Elkanah Cheetham, we placed in a room upon the ground floor 628 lbs. weight of cotton, known as 'oily waste,' and which burns much fiercer than any other kind of cotton. To make it still more inflammable, it was all passed through the 'picker machines;' into this body of cotton we put a quantity of wood, parts of old machines, which were all well soaked with oil, and then threw in the midst of it a large shovel full of red-hot coals from the engine fire. Having gone to all the expense entirely ourselves, we were determined to prove if we might for the future fully depend safely on your machines in cases of fire at our mills, which are very often happening; we therefore waited until this body of cotton, &c., was one mass of livid fire, and it was not until the beams and boards of the floor above had caught fire, that we gave the word to strike off two of the No. 5, Annihilator Hand Machines; the vapour instantly began to rush out, and in a few seconds the flames were entirely extinguished, and in three or four minutes the fire was entirely put out.

"As many of the persons present, amongst whom were the owners or representatives of the largest cotton mills in Stockport, could not approach the room where the fire was, owing to the great interest excited in the crowd of persons about, we decided to try the power of a hand machine, to see if it could extinguish burning cotton in the open air, and we had a fresh quantity of the same kind of cotton (oily waste) and some old machine boards taken on to the open ground behind the mills, and set on fire in the same way, by throwing into it red-hot coals; the flames were fed and increased by the wind, and after waiting until the whole was a mass of fierce fire, the word was given, and the only remaining No. 5 machine was struck off; notwithstanding the wind, the flames were instantly cut off, and in one minute the whole of the burning mass was dead out, to the great astonishment and complete satisfaction of every individual present.

"Why we have put your Fire Annihilator Hand Machines to such severe tests is for this reason: in our branches of the cotton business we are more liable to fire than in any other branch, and the fire offices will not insure us; it was to us, therefore, of the greatest importance to try and prove for ourselves if we could master this scourge of our trade. We have now fully satisfied ourselves we can do so, and that too without damaging our machinery or cotton."

The second trial, personally made by the Earl of Derby, we give in his lordship's own words, in a letter to one of the agents for the sale of the machine :—

"Knowsley, Oct. 18, 1851.

"I have much pleasure in bearing my testimony to the success of your Fire Annihilator in an experiment here on Wednesday last. The building in which it took place was one which I was about to pull down, and from which I had removed the woodwork, doors, windows, sashes, &c. The centre part, in which the experiment was tried, was a circular, two-storied building, 24 feet diameter in the interior, and having in the centre a circular staircase of 8 feet diameter. There were two windows to the back, and two and a door to the front, and the flooring being removed, and the upstairs window sashes, there was a very powerful draft of air through the building; the space between the outer and inner circle was about three parts filled with shavings, faggots, and a number of old tar barrels, and a considerable number of planks soaked with oil were set upright in a slanting direction against the inner and outer walls. This mass having been set fire to, I allowed it to become thoroughly ignited, and some of the tar barrels to be in a blaze, before I gave the signal for applying the machine. The flame at this time had attained a great height, and threw out a very fierce heat, notwithstanding which, the man who managed the machine was enabled to approach so near as apparently to touch it, standing in the doorway of the burning building. The first charge, though it checked, from whatever cause, did not extinguish the flame, and I confess I had some apprehensions that the experiment would prove a failure; but the effect of the application of a second charge was instantaneous, and almost magical. Every vestige of flame disappeared in the course of three or four seconds, and the fire was so completely subdued, that nothing remained except some smouldering embers. The planks, however, having been completely charred, and the tar barrels turned upside down, so that it was difficult to get at the burning materials inside, the flames broke out again in a few minutes, and were again completely and instantaneously subdued, and a few buckets of water removed all risk of their breaking out again. I am so entirely satisfied with the experiment, which I consider to have been a very high trial, and of the value of the invention, that I intend to keep some of your machines in different parts of this house and the buildings attached, and have to request that you will supply me with half-a-dozen of the size used the other day, which I believe were No. 5. I ought to add, that a very considerable number of persons who were present at the experiment appeared entirely to concur in the view which I took of its complete success."

No comment upon these conclusive experiments can be necessary.

## PREPARING GROUND FOR PLANTING FOREST TREES.

About 1815, Mr. Kirkman Finlay, the then M.P. for Glasgow, an extensive cotton spinner, employing altogether some 6000 people, being persecuted by the Radicals for his Conservative principles, left Glasgow and took shelter in Argyleshire, where he bought a large estate called Castle Toward. He no sooner got possession of it than he set about improving it, by employing 400 labourers, as well as building a new castle. So great an outlay of money in a comparatively poor neighbourhood soon regained for him his former popularity. In five years he planted an enormous amount of trees, nearly emptying the nurseries of Edinburgh, Glasgow, Kilmarnock, &c., of forest stock; a number of acres was trenched by the spade, the surface was deeply pared and put into the bottom of the trench, then a spit deep, and the crumbs were shovelled out and laid on the top. Where the land was shallow, it was only just dug as deeply as the gravel would permit. Large breadths were ploughed, and many acres were planted in the turf upon the slit or T system; but hundreds of the plants so treated died every summer, being choked by the rough herbage, as well as injured by the hooks and scythes used in destroying it. I am told, however, that after they outgrew the Grass they made good plantations; but taking the labour of mowing and clearing away the Grass into account, Mr. Finlay found that trenching or digging was by far the cheapest plan, and the best for the trees. Large "squads" of men were therefore employed all the summer in preparing the ground for the next winter's planting, as well as hoeing round the stems, and keeping down the weeds on the ground that had been planted in former years. Trees are just like other plants, the cleaner they are kept, and the more the earth is stirred about them, the faster they grow, and the sooner they are out of harm's way. Even in "Quick" (Thorn) planting, Mr. Finlay had trenches dug out, and rotten dung put in, and then the "Quick" planted in the trenches made capital fences in a very short time. Of course a "Quick" planter would not cut off the heads at the time of planting. The cutting down ought never to take place till the second year; the same holds good with fruit trees. A large market-gardener once informed me that he never cut down any tree till the second year, on account of the entire head exercising so much more power in drawing up sap, and consequently making good roots; therefore, when beheaded the next year, the roots being strong and numerous, plenty of sap is sent up, and a vigorous and well-formed head is the result. How often do we find Rose trees and many other plants die, on account of cutting their tops off?

How gentlemen can permit acres of forest trees to be planted upon the T or slit system, as is sometimes still done, on a hard grassy bottom, which in the memory of man has never been disturbed, one is at a loss to know, considering that so much good information has been published on forest management. Should the soil be a retentive clay, the slit into which the unfortunate roots are so unmercifully thrust must form a miniature well of water all the winter, rotting the roots, which can have no vigour when spring arrives. I had the superintendence of planting a few belts of plantations on the South Downs, belonging to the Earl of Chichester, where the land on the chalk was in many places only about 2 or 3 inches deep. In this case we had to collect the turf into hillocks, and plant the tree in the centre; and, I am told, they have thriven tolerably well. Had the trifling expense of collecting mould, and carting it near where the trees were to be planted, been incurred, however, they, no doubt, would have thriven as well again. Plantations are like other crops — if well attended to they pay; but if badly managed, just the contrary.

We have the best land in this country for all sorts of trees, but it wants labour before planting; and as it will not be disturbed during the next 50 years, it will get hard enough for even the roots of an Oak to permeate it in search of food. The landed proprietor is often told that he has no occasion to go to any more expense than that of buying the trees and then planting them three times as thick as they ought to be. He should not, however, be satisfied with this; he should do as Mr. Finlay did, insist upon having the ground either trenched, dug, or ploughed, according to its nature, and drained where required. Mr. Finlay, although rich, was a man of business, and had his operations done as they ought to be; and presently I shall be able to show that the produce paid accordingly.

Summer pruning ought to be looked after, until the plantation is from 15 to 20 years old; and it should be performed when the trees are in full leaf. Judicious pruning not only makes valuable timber in a much shorter time, but it renders the trees more handsome in form than when left to Nature, or branches allowed to grow till they are 5 or 6 inches in girth, and then haggled off by persons who know nothing about the physiological construction of a tree.

The highest ground at Castle Toward that was planted was about 800 feet above the level of the sea. In steep parts, where the spade could not be used with advantage, on account of the rains washing the earth down the hill, the trees were planted on the slit on turf system; and where the soil was sandy, I am told that the trees put in in this way have thriven pretty well. Where the land was not very good, green crops were grown upon it, merely to ameliorate it before tree planting was commenced. Upon very stiff and stubborn soils, the top could be burned. This would benefit the land.

Along the sea coast, the outer lines were Sea Buckthorn and that beautiful bush the Tamarisk, next to these nothing thrived better than Scotch Fir. Some Stone Pines were also planted, but I am told by Mr. Gillies, now gardener at Deanston, who lived there many years, that they became top heavy, and were blown down by the heavy gales, which are tremendous there; so much so, that during the building of the castle, a long wooden shed, holding about 50 masons, was carried away on one night several hundred yards. The thinning the wood commenced at the end of the first seven years or so. Mr. Finlay felled all his Larches when his trees were about from 12 to 15 years old; and having a saw-mill on the estate, they were prepared and sent to the Glasgow markets. The last time that I saw him, Mr. F. stated that all his thinnings would not pay for the whole of the outlay, such as fencing, draining, buying trees, planting, rent, &c.; but then the main crop was to come, not to say anything of the beauty, shelter, &c., which the trees afforded, compared with the Heath clad mountains and barren ground which previously existed where they grow; at the present time Castle Toward is one of the finest estates on the Clyde, and being exactly opposite the Bay of Rothsay, occupying about three miles of the rugged shore, its wooded appearance produces a striking effect; the beautiful turreted castle peeping through the dark Scottish Firs and the pretty cottages lining the shore; do much credit to the late Mr. Kirkman Finlay. *James Cuthill, Camberwell.*

## BRITISH SONG BIRDS.

Cage Birds, No. 38.

No. LIV.—Having drawn particular attention to this fact,—that birds which are under the immediate care of man (such as fowls, geese, ducks, &c.) are gifted with little foresight,—inasmuch perhaps as they have no immediate need to call it into exercise; we will now consider the instinct of those birds of the air, who have to provide for their own and their families' safety whilst surrounded by enemies of every kind.

I have not failed to vindicate the ways of Nature on every occasion where her aid is required; and it is pleasing to know, that I have been the means, indirectly, of most satisfactorily establishing the fact of the Cuckoo on certain occasions feeding her own young. This was, until lately, with some few persons a vexed question. I have elicited, also, most abundant and satisfactory proofs, from men of reputation, observation, and undoubted veracity, that the female *does* utter the well-known cry,—'Cuckoo! Cuckoo!!' and that the parent birds *do* linger with us *until after July*, to give safe conduct to such of their offspring as may have been hatched so late in the season.

We must not wonder, but rejoice, that dame Nature takes such singular care of her children, and protects them from their earliest infancy in all times of peril and danger. If they offend against her admonitions, as we "reasonable" folks do, too often, against our better knowledge,—then they, like ourselves, must take the consequences. There is but one law in these matters, and woe be to him who transgresses it!

The Creator of the universe having "limited" his "gifts" to the lower order of animals, and given them a talent of just sufficient value to secure their well-being and happiness,—has, by way of "compensation," endowed them with extraordinary powers, to which we "reasonable beings" are strangers. Among the most remarkable instances of natural instinct, I would direct attention to the especial provision made by the supreme intelligence to supply the necessities of helpless animals, who, if they were, like ourselves, left to grow wise, and take care of themselves, after whole years of nursing, and continual anxiety on the part of their parents,—would inevitably perish during the very first week of winter. To obviate this, there is implanted in every bird's breast, during the breeding season, an excess, if I may so speak, of natural affection,—that Στοργὴ which

"Knows no bounds,—save only to increase;"

and which comes into the world with every bird, some few alone excepted.

We cannot imagine that a mother, brooding over her callow family, can "reason" as to the time when they will be able to fly. This would be an absurd supposition. What then is it that *impels* her to make use of every moment, exert all her energy, and wear herself nearly out in the service she performs, to bring about so desir-

able a matter? It is that Στοργὴ of which we have spoken,—an instinct of so overpowering, so engrossing a nature, that every creature possessed of it *must* act under its influence. To make use of a homely but forcible expression, used on all occasions by a friend of mine who is an unflinching advocate for the doctrine of "philosophical necessity,"—"*they cannot help what they do.*"* Farewell, then, under such circumstances, to the exercise of "reason."

Previous to going more fully into the marrow of our subject, I am anxious to reply to some few cavilling but well-meaning individuals, who imagine that they have set us a task which we shall fail in accomplishing,—raised up arguments that we cannot overthrow. We are glad of the opportunity to prove how easily truth can triumph over error. All we want is, patience and good temper. Happily for ourselves, we possess a little of each.

We are asked, how we dare attempt to prove that "reason does not reign supreme in the magpie, the starling, the parrot, and the mocking bird, who give such ample evidence that they understand all that is said to them, and reply to certain questions?" As we wish to be generous, let us voluntarily include in our list the "talking canary," exhibited some years since at the Cosmorama Rooms, Regent-street. We *might* "throw in" the '*singing* mouse' (!) exhibited at the same place; but as *he* sang "*very* small," we will pass him by.

Let us class the magpie and starling together. What are their powers? They are imitative birds, truly; but neither the one nor the other of them can be taught to utter more than *one*, *two*, or *three* words. These form their "stock in trade." Vain is it to try and teach them something new,—you get the same chattering answer to every question. Then, as for their "intelligence," it just extends to this. They observe that whenever they utter their monotonous ditty,—it is nothing better,—*you* are pleased, and reward them with some favourite *morceau*. Hence, the old story over again. Surely we demolish the supposed fact of any intelligence reigning *here*. Their brain is so constructed, its organisation so imperfect, that it *cannot* possibly be otherwise than it is. At best, their intelligence is but "cunning." One moment's reflection will bear us out in this.

Now for the parrot and the mocking bird. I *ought* to be able to talk oracularly about the former; inasmuch as a neighbour of mine, only three doors removed, has one of the tribe that ranks among the *very first of his* "*order.*" To prove the "reasoning" powers of this bird, I need only remark that he is recognised as a public nuisance. His time is fairly divided between shrieking, screaming, imitating cats and dogs, and dolorously ejaculating throughout the livelong day,—"P-o-o-r Polly!" He utters, it is true, occasionally, a few unconnected words; but no person accustomed as I am, or rather "doomed" as I am, to listen to him whenever I am in my garden, could, even from the excess of an affection for him (if such be possible), dare assert that he knows what he says. His brain is *somewhat* more fully developed than that of the magpie, and just in that ratio are his powers of mimicry increased. In the agony of my sufferings, I have occasionally taken up his *refrain* (with emphatic "variations"). Alas! it was only to be punished on the morrow, and thenceforward, with an *Italicised* addition to my sufferings. My tortured feelings had expressed themselves in song (*de profundis*); and now I am a martyr to my own folly! So much for your "reasoning" parrots. *Requiescant in pace!*

It has become evident, that we cannot, this week, do adequate justice to the mocking bird; and as *his* pretensions to notice far exceed those of the silly parrot-tribe, we purpose speaking of him, at some length, in our next. "*Suum cuique!*" is our favourite motto.

Should we find no more difficulties in our way than have beset us in this our present investigation, with the "reasoning" parrot, &c., it needs not the gift of divination to foretell *who* will have the best of the argument hereafter. The organisation of an animal's brain is necessarily so contracted (for special purposes), that it has no more power to "reason," properly so called, than we have to "fly." The supreme intelligence, too wise to err, has decided that 'Equality' *cannot* exist in this our lower world. Happy is it for us that it *is* so ordained. *William Kidd.*

* It is a most curious fact, that some few hours after penning this sentence, I found recorded in the daily papers a case of attempted suicide. The poor would-be-suicide told the magistrate,—"It was no use to attempt to prevent him from 'doing' it. He *would* 'do' it—he COULD'NT HELP IT!" *Facilis descensus Averni.* Let all advocates for the doctrine of "philosophical necessity" read the remark of this fatalist, and pause 'ere their waning principles become "fixed." *Nulla vestigia retrorsum!*

## FOREIGN GARDEN GLEANINGS.

STETTIN, POMERANIA.—This important town, unlike most others in the north of Europe, has no botanic garden. The royal residence has not one, but there are instead magnificent pleasure gardens, such as are occasionally met with in the towns of Prussia and Germany. These gardens are used for promenading, and contain fine trees and beautiful flowers tastefully grouped, and create a feeling of surprise and admiration in the mind of every stranger. There are other gardens, those attached to the cafés and eating-houses, which contain some fine and rare plants; those a little out of the town are much frequented on Sundays.

Most of the horticultural establishments of Stettin are at some distance from the town. We were most struck with that at Grabow, belonging to MM. Gross and Bayer. The grounds, though small, furnish a large supply of Camellias, Ericas, Dahlias, and Calceolarias, of which we saw more than 30 varieties in flower in the open ground. In addition to these, we were shown Chrysanthemums, Fuchsias, Roses, Verbenas, and 180 varieties of Pelargonium. We ought not to omit to mention 35 or 40 varieties of species of Canna. Although hothouse plants are not abundant in this establishment, it contains a rich collection of perennials; amongst others, 100 varieties or Phlox, 40 of Bellis, &c. The above gentlemen carry on a large trade in flower and vegetable seeds.

ROYAL GARDENS AT POTSDAM.—These gardens, four in number, are about 12 miles from Berlin. The most remarkable is Sans-Souci, so intimately associated with the name of Frederick the Great. It is difficult to describe the magnificent effect of the hill side on which the palace is built. Eight rows of fine houses upon a single slope, nearly 1200 yards in length, form a sort of amphitheatre; in them are fruit trees—Vines, Peaches, Apricots, and Figs; these crystal galleries are divided into two sets by a flight of steps leading to the different levels upon which they are placed. The Orangery contains 500 fine Orange trees, many of which are 45 feet in height, and 1 foot in diameter. Other houses equal to the first in size, and turned towards the palace, enclose trees inferior to those last mentioned.

A large garden, completely surrounded by walls, is also set apart for forcing the same plants; they are placed in the open ground, or in pots, or under houses, extending altogether for a distance of a mile and a quarter at least. When we were there, about the 20th of May, the Cherry-trees had already furnished a supply of fruit; and the Plums were ripe. In this garden early Melons, Cucumbers, and Potatoes, are also forced. The head-gardener drew our especial attention to eight varieties of early, yellow, oblong Potatoes, and the Roman Emperor Cucumber, some seeds of which we brought away; this variety appeared to him to be better than any other, inasmuch as it can be easily kept for six or seven weeks under glass without change of air; nearly an acre of frames is filled with these early plants.

Pine-apples and Strawberries are attended to by M. Seilo exclusively, and he produces some wonderful specimens from his hothouses. The flower department, under the care of a young man, is worthy of the highest praise.

Although the residence at Potsdam is really composed of four palaces and four gardens, yet the latter are so near the one to the other, that they may easily be taken to be but one large garden. Potsdam we need not describe at any length; it is Versailles, on a smaller scale.

The two rows of old white Mulberry trees planted by Frederick, cannot, however, be passed over in silence. Some have been killed by cold, but those which remain are remarkably strong and vigorous.

At the gate of Potsdam we saw the Prussian colony which has been established there for many years, and was, with its rustic houses and national costume, given to the King of Prussia, by the Emperor himself; we paid a visit, too, to Pfau Island, where there is a collection of Roses, which is as celebrated in Prussia as that at the Luxembourg is in France. *Masson's Report.*

## Home Correspondence.

*Samples of Seeds* (*Onions*).—It is somewhat remarkable that the anxiety for multiplying names of "Peas, Lettuce, Cabbage," &c., should have extended itself so little to Onions; perhaps the paucity of names in this case may be owing to so many of the large growers raising their own seed, and the apathy of ordinary buyers to new names for this important vegetable; for if we except the "White Spanish" appearing under the names of "Reading and Portugal," and the Strasburg and Deptford being sold as different, I believe that little has really been done as respects Onions that can be complained of. The Brown and White Globe are evidently different from the above, but the James's Keeping very much resembles the Strasburg; while the Silver-skinned and Tripoli differ too much from any other to be ranked in the same family. But I suppose some will be asking which is the best of the kinds mentioned. I unhesitatingly assert that they are all good, when true; and if I had to buy the seed from an unknown party I would have a little of each, and mix all together before sowing. I have so often seen a blank in a plot of Onions, from one or more kinds not coming up rightly, that I invariably mix all uncertain seed, the Silver-skinned and Tripoli excepted. The latter I have ceased to grow for some years, and I only grow the former for pickling, and occasionally to stand the winter. Onion seed does not keep well longer than one season, and old seed ought to be rejected if possible. The best crops of Onions I have ever had were from home grown seed. But I was once deceived in some I had from a neighbour, which had been ripened on an elevated situation and on very dry ground. This when sown on rich garden soil, on a lower level, produced such an abundance of "thick necks" that I could not have believed the seed to have been genuine, had I not been an eye-witness to its being gathered and sown. I mention this as an instance in which an article, not bearing out all that may be said about it, may be excusable under certain circumstances; the variation, in this case, being evidently caused by the opposite kinds of soil on which the seed was sown to that on which it was raised, and to show that home-grown seed is not always the most successful, although it is usually regarded as being so. One thing most people agree in, viz. that Onions from home saved seed keep better than those from bought seed. This opinion I can neither confirm nor contradict, as it so often happens that long before they can be fairly tested the kinds get mixed. The Globes are said to keep worst, though they possess some good points, and generally yield well; the Blood-red is remarkable for its colour, but it is seldom productive. Useful Onions might be classed into "large kinds," "late keepers" and "mild flavoured," the first of these includes the White and Brown Portugal, Spanish and Reading; the second, the Strasburg, James's Keeping, and Old Deptford; and the Globes are said to be mild and pleasant, and for all culinary purposes they furnish less waste than any other kind. The very small space to which the rootlets are attached is so much the less to cut away; and that hard useless substance, which in some Onions extends to near the centre, is much smaller in a "Globe" than in any other variety; some of the flat shaped sorts are notorious for the latter evil, and in cutting it away a considerable part of what is useful is of necessity removed with it. Now this is an important matter, and one which gives a globular or deep formed Onion a decided advantage over a flat or compressed one; if the admirers of the large Tripoli would only consider the waste that attends cutting it up, they would find it much less productive than they are aware of. The Silver-skinned is rarely grown for any purpose except for pickling, so that if seedsmen would reduce the kinds of Onions to the three families as above, they would save us the trouble of mixing them afterwards. Onion seed, on the whole, is however tolerably true to name; but I cannot praise much its freshness and vitality, yet in that respect it is not worse than some other things. *An Old Gardener.*

*Plane Tree Timber.*—Have any of your readers had experience in the use of Plane tree timber? I am now cutting some large trees of that kind, some of which measure 14 feet in circumference. The wood appears as hard as that of Oak. I am anxious to know what it is most fit for; wheather durable in wet or dry places; whether, if used for flooring, insects are likely to prey upon it; and whether it is a timber likely to cast or warp. *H. B., Llandilo.*

*Vines in Pots.*—I am surprised that Grape vines are not more extensively grown in pots than they are, for they are easily managed, and bear abundantly; they can be trained round sticks or hoops, so as to occupy a very small space; and they could be grown by the cottager as well as by the gentleman's gardener. They would present a very ornamental appearance set about a garden or lawn. Some might be removed early into the house, to accelerate their ripening, and others left out till the last moment; in this way successional crops of this very beautiful and useful fruit might be obtained during a great part of the year. *J. R.*

*Ivy on Exterior Walls.*—The "Paper-hangers' and Upholsterers' Guide," may be right in considering Ivy to be a protector from damp; but a circumstance which I shall mention, leads me to think otherwise, and rather than select it "as, contrary to all trained fruit-bearing trees for eradicating damp," it is the last thing that I would employ for that purpose. There can be no doubt that the close, overhanging, pendant leaves may carry off rain, and while the plants are young no danger need be apprehended; but as they get old the roots penetrate the walls, the lime becomes an entire mass of them, and loses its action. The roots then become conductors of damp into the masonry, and the thick exterior covering of leaves keeping the sun from the walls prevents the latter from ever becoming thoroughly dry. Being employed some three years ago in making extensive alterations in the ground-work here, more particularly in levelling the kitchen garden, it became necessary to remove an old tool-house, the whole of which was covered with Ivy; it stood on gravel in the highest part of the grounds, the walls were built of stones, and about two feet thick, the whole of the roof was in good condition and perfectly dry, fires were lighted in rainy weather, or when doing inside jobs in winter; but, for sometime previous to its removal, the walls were constantly damp—so much so, that during frosty weather the ice was of such thickness inside, that it could be removed in pieces, and the only reason I could assign for this was—that in demolishing it, I found the roots of the Ivy reaching nearly through the wall in many places, and ramifying in all directions. *R. F., Fyvie, Aberdeen.*

*Peas.*—My favourites are Prince Albert, Glendinning's Hero, Champion of England, and British Queen. Scimetars are sown for house and common purposes. In sowing Peas I first sow Prince Albert; 2d, Prince Albert and Glendinning's Hero; 3d, Glendinning's Hero and Champion of England; 4th, Champion of England and British Queen; 5th, British Queen, a dish of which I gathered on Sunday last. *George Fry, Manor House Gardens, Lee, Kent, Nov.* 3.——The following are the kinds I like best; Prince Albert, Warwick, Woodford's Marrow (very fine), Knight's Tall and Dwarf Marrows, and Glory of England. *Alexander Matthew, Moore Abbey, Monasterevan, Nov. 5th.*

*The Weather.*—On the night of Tuesday, the 4th inst., this part of the country (Warrington), was visited by a fall of snow, a fact in itself remarkable, as being an unusually early sign of the approach of winter; but its effects are the most extraordinary part of the matter. When morning came it was found that that fall of snow, though in some places barely sufficient to cover the ground, had done more damage than will easily be conceived. Many a "brave old Oak," that had withstood all the storms and raging elements of the last century, has at length been shattered by the simplest of means.

Many trees have been stripped to the bole, and not a few deprived of their leading branches. Several woods and hedge-rows that I saw the other day presented a most pitiable appearance. The Oaks, especially the later kinds, are the principal sufferers; but other trees, such as the Chestnut &c., which were caught with their summer garments—their leaves—on, have also shared the same fate. The havoc has occurred thus, I imagine:—The snow was accompanied by a little rain and a slight frost, which was sufficient to fasten it upon the leaves, as it fell, until at last the accumulated weight tore down the branches with almost inconceivable force. This may perhaps be accounted for in some measure by the peculiar state of the sap at the present season. I am not aware that there was much wind at the time. What I have stated relates to North Cheshire: how much further it has extended I cannot say, but of one thing I am certain, that wherever the occurrence has taken place, the loss to some landowners will prove to be very considerable. *T. B. Ryder, Warrington, Nov.* 11.

*Late Figs* (see p. 709).—As "S. B." is desirous of obtaining late Figs, and is limited as to convenience for growing them, I would recommend him to try what in Jersey is called "the Double-bearing Black Fig." This plant will continue to produce an incessant crop from July to November, if planted in a pot of sufficient size, and placed in an ordinary greenhouse. *Charles B. Saunders, Jersey.*

*Double digging ground intended for Fruit trees.*—I observe that the utility of this practice is called in question in your Paper, at p. 693; both sides of the subject have been so well stated, that it is difficult to find arguments for either view, of greater force than those advanced. I have always been puzzled to account for the different practice pursued by the same persons in preparing ground for fruit trees. I have seen gardeners make rich borders for Vines, from 18 inches to 2 feet deep, upon which they would not allow a spade to be used; their reason when demanded is, that they wish to have all the roots sufficiently near the surface to be within the influence of sun and air; they tell you that when the roots are encouraged to a great depth the fruit is deficient in quantity and quality. Mr. M'Nab, of Edinburgh, plants his wall trees on the surface, and places good soil over the roots, so that the trees appear to be placed on a mound—the reason he gives for such practice is, that just stated; then why does not the same argument hold good in regard to dwarf fruit trees? Having 114 acres of orchards, some of which have been planted on both systems, I have no hesitation in saying, that the time expended in double digging has been worse than thrown away in our case. A few years since, we broke up a field of Grass land for the purpose of forming a new fruit tree nursery; about half was double dug, the turf turned towards the bottom, in the other half the turf was kept to the surface, both were planted with stocks of different kinds; the first season those planted in turf grew much the best, those planted in the first part being stunted, and the Plum stocks in particular being infested with smother-fly. In the following season they overtook the others, but were never so well rooted, being more difficult to get up, and their roots being long, instead of fibrous. Many of the dwarf Peaches were quite spoilt; for when they were once in the turf they quite overgrew themselves, and became unsaleable. It is possible that the experience of other persons may be quite the reverse of mine, and that in planting trees, like farming, it may be impossible to lay down particular rules; at the same time whatever may be said in favour of double digging, I think it would be difficult to justify the turning the good soil to the bottom, and the subsoil to the top; nor is this necessary in the operation, as both may be left in the same relative positions. *J. R. Pearson, Nottingham.*

*How to Crop a Small Kitchen Garden* (see p. 710).—In answer to Mr. Steel, I beg to state that I omitted to mention that I had retained one-fourth part of my garden for beds of Carrots, Onions, Beet, &c. (the Asparagus bed, of course, is stationary), and I propose the following year to retain again one-fourth for the same purpose in another part of the garden. I do not find that I have too many Cabbages for my household, as, being planted without dung, they are sweet and agreeable. It must be clear that in digging the garden through, if ranks are marked out and left unset, that these ranks are ready at any time to plant the different crops in at a moment's notice—Peas especially; and as I preferred superintending the putting in of the crops myself, I found this one of the advantages alluded to. For the "three months" Mr. Steel inquires about: I certainly only at present have the sprouts from the said Cabbages, but I imagine that crops could have been grown where the early Peas were. I thank Mr. S. for asking these questions, as I perceive that the article alluded to is copied in our local Paper, and these hints as to the mode of cropping may, I trust, partly prove, as he writes, "a step in the right direction." *Vectis.*

*Coe's Golden Drop Plum.*—It is asked, at page 710, whether it is not the nature of this Plum to shrivel just before getting ripe? I say decidedly not. The shrivelling commences after the fruit has attained maturity. I have trees of large size, trained both against south and west walls, and also as standards, the fruit of which this season has been unusually fine and abundant. All the first gatherings were sent to table perfectly ripe, and as smooth and even as possible; but as the season advanced the fruit became shrivelled, but retained an exquisite flavour. I gathered my last dish yesterday, Nov. 10, which affords another proof as to the length of time they will hang on the tree, after they have reached maturity. This variety of Plum is esteemed (and justly so) one of our finest autumnal fruits, and I deem it worthy as much care and attention as the best Peach or Nectarine in cultivation. *G. Fry.*

*Broccoli.*—It is an established fact, that whenever a reformation of any kind is attempted, whether of a political or social nature, some are always found anxious to carry it to excess; and that Mr. Ayres, or rather Mr. Barnes, should be desirous of going the "whole hog," is another proof of what unstable beings we are. At page 710, we have a list of names for Broccoli, sufficient to fill a page in a boy's spelling-book, all cut down to two; or as Mr. Ayres says, "cast to the winds." Now, though I have been a reformer all my life, I cannot coincide with extreme notions, and I am old enough to remember how often similar ones have been wrong; but, no offence to Mr. Ayres, whose proposition does him great credit, and if one kind of Broccoli can be adapted to so varied a supply, the "Walcheren" is that kind; but I beg to ask him, if he thinks it can be depended on to stand a severe winter. I very well remember that all mine perished before February, in the winter of 1846 and 1847, and if I had not had some hardier kinds, I should have been in a poor plight that spring; as it was there was very little, yet there were a few. Now, though I consider the Walcheren to be the most useful kind we have, I do not think that it is much hardier than the Cape; but it comes in at more regular periods. Nevertheless, I question whether it can be depended on to come in at the same time as the Southampton and other large sorts, which are so serviceable in spring. But Mr. Ayres mentions another, which is a spring sort, and I do not question his having had the one or the other in use the whole of a mild season; but the same may be effected with more certainty by one or two more kinds, and in a severe winter their utility will be more apparent. *An Old Gardener.*——The following is a list of those sorts which I deem the most valuable. They succeed each other in the way in which their names stand. Autumn and early winter: Walcheren, Hammond's Cape, and Snow's Superb White. This last, if obtained true, is indeed a superb sort. It served me last season until the middle of February. Late winter and early spring: Winter Imperial, and Knight's Protecting. This last is also a first-rate variety. Late spring: Wilcove, Elsden's Late, and Miller's Dwarf, planted in a late situation. *G. Fry.*——I find the following to be first-rate; Snow's Early White, Grange's Early White, Knight's Protecting, Chappell's Cream, Mammoth, Late White, and Miller's Late Dwarf; the last sort is decidedly the best late sort out, and it is very hardy; it requires to be planted early, and richly manured. *Alexander Matthew, Moore Abbey, Monasterevan, Nov. 5th.*

## Societies.

Entomological, *Nov.* 3.—J. O. Westwood, Esq., President, in the chair. Amongst the donations were the beautiful case of Van Diemen's Land insects, exhibited by Mr. F. Cox, in the Australian department in the Crystal Palace; also Mr. Golding's interesting specimen of honey-comb, in which an artificial queen had been reared from a worker-larva in one of his bar-hives. The President exhibited a living larva of the fine Hamaticherus heros, sent by Sir Thomas Pasley from Pembroke-dock, where it is found occasionally in the heart of Italian Oak timber, and pointed out the peculiar construction of the anterior part of the body of this and other Longicorn larvæ, which had led to the first segment after the head being regarded by some writers as part of the latter, in consequence of the position of the first spiracle in the second segment of the thorax, contrary to the ordinary structure of larvæ. He also exhibited a drawing of the structural details of Leptinus testaceus, a small blind beetle, found in ants' nests, of which very few specimens have occurred in this country. Mr. W. W. Saunders exhibited some small beetles (Anobium paniceum), which had destroyed a quantity of small maccaroni ornaments, likewise some Kidney Beans which had been destroyed by a small species of acarus, the plants, after having laid on the manure heap for two or three days having been further found to be covered with a fine web, evidently the produce of the mites in question. Mr. S. Stevens exhibited a specimen of Dircæa discolor, a genus of Coleoptera, and a species of Gracillaria, both new to the British fauna, taken by Mr. Weaver, in the Black Forest, Perthshire; also specimens of Helops pallida from Tenby. Mr. F. Smith exhibited a drawing of the larva of Cynips longipennis, found within the galls on Oak leaves, commonly called "Oak spangles," and Mr. Douglas specimens of a new species of Tineidæ, the larvæ of which infest dried Figs, likewise various other micro-lepidoptera, reared from Solanum dulcamara and other plants. Mr. Edwin Shepherd exhibited a fine series of Noctua (Aporophila) australis, and a pale variety of Colias edusa, from the neighbourhod of Deal; and Mr. Wilkinson specimens of Talæporia lichenella, the females of which had produced fertile eggs without intercourse with the male; the young larvæ hatched from these eggs were also exhibited. A note was read from Mr. Weaver, on a supposed new species of Psychidæ, allied to Sterrhopteryx opacella. Mr. White exhibited specimens of various Crustacea, and insects brought from the Arctic regions by Mr. Ede, also drawings of some beautiful insects brought home from the South Seas by Mr. M'Gillivray: also a portrait of the late M. Savigny, of whose scientific labours he gave an account. Mr. Spence presented, on the part of Mr. Thompson, of Hull, specimens of corks from wine bottles, which had been destroyed by the larvæ of a small moth, Gracillaria V-flava.

## Notices of Books.

*The Book of the Salmon.* In Two Parts. Part I.—The Theory, Principles, and Practice of Fly-fishing for Salmon, with Lists of good Salmon Flies for every good river in the empire. Part II.—The Natural History of the Salmon, all its known habits described, and the best way of artificially breeding it explained. With numerous coloured engravings. By Ephemera, author of the "Handbook of Angling." Longman and Co.

Every man fond of fishing should read this book, and it will well repay him. Many that are not fond of fishing, after they have read it, are likely to become so. No salmon fisher should be without it, as the first part of it gives information of all the best salmon rivers in the United Kingdom, with plates and instructions for dressing the most killing flies for each river. Also full instructions for the tackle necessary for capturing this king of fish.

In the second part, the natural history and habits of the salmon are minutely described, from the time of spawning through the successive stages of its growth. These interesting details contain the results of the unwearied attention for many years of Mr. Andrew Young, of Inversbin, with instructions for making ponds for the artificial breeding and rearing of salmon, until they are large enough to turn into the river. By the means here pointed out, the proprietors of salmon rivers might increase the stock of fish, a point hitherto too much neglected in most of the salmon rivers in the United Kingdom.

The natural and familiar style of writing carries the reader with the author through all the details of both subjects, and it is at once perceptible that you accompany a master of the art.

The value of this book to the salmon fisher is already noticed; to the naturalist it will be equally essential. But one word of advice to those who are neither one nor the other will not be wasted upon such as will read "The History of the Salmon," for they will be made familiar with a subject not only interesting in itself for the moment, but calculated to enlarge the sphere of every intelligent and reflecting mind.

## Garden Memoranda.

Woodlands Nursery, Isleworth.—It is now pretty well known, by means of advertisement, and otherwise, that Mr. Dobson, formerly gardener to Mr. Beck, has commenced nurseryman and florist on his own account. He has bought a piece of ground, close to the Isleworth railway station, on which he has put up some of the glass-houses from Worton Cottage; and as Mr. Beck at one time amused himself in making experiments in heating, a short history of the means by which one or two of these houses were warmed, may not be uninstructive. The Orchid house at Worton Cottage was furnished with two wooden tanks, with a path between them. They were originally contrived as beds in which Roses in pots were plunged, and brought forward in gentle bottom-heat. Upon some 3 by 2½ inch Oak posts, 21 in. above the ground line, with bearers framed into the same, 3 by 2½ inches, placed edgewise, was fixed a tank formed of 1½ inch best yellow deal, entirely free from sap, dead knots, and shakes. For the bottom the boards were placed lengthwise, ploughed and feather-tongued, and bolted together with ⅝ inch bolts and nuts; sides and ends the same, 9 inches deep, put together with back nails, and white-lead in all joints. Down the inside and centre of the tank, to within 6 inches of the end farthest from the boiler, ran a 1½ inch board on edge, 6 inches deep, with fillet round the sides of the tank, to the same height. On these rested half-inch slates, laid crossways, and beneath them circulated 5 inches deep of hot water through a boiler, the flow pipe from which was introduced at one side of the division, at the end of the tank, about 2 inches from the bottom; whilst the return pipe was fixed in the bottom itself, and on the other side of the division. This formed the heating apparatus; but to make a plunging bed, when wanted for the purposes of propagation, the tank was deepened 7 inches, by removable sides, stayed by light iron bolts. From the edge of the tank sprang a series of removable shelves, rising with the pitch of the roof to the wall. These tanks were put up on the 13th of October, 1846, and now that they have been moved and replaced by Mr. Dobson, at Woodlands, they are found, after six years' tear and wear, to be nearly as sound as ever they were. Considering the facilities with which wooden tanks may be obtained, it is therefore something to know that they are not only durable, but that they have been found to be perfectly sufficient for the general purposes of amateur gardeners. One of Stephenson's copper boilers has been employed for heating this tank for these three years past, and it looks now as if it would last as long again; so much for heating.

In regard to plants, having been supplied with Mr. Beck's excellent collection of Pelargoniums, we need hardly say that Mr. Dobson's houses are well stocked with all that is good in that way. One half-span roofed house, 41 feet long, is quite full of nice small plants in 3 and 4 inch pots in the best possible condition. The next house, 24 feet by 12, contained specimen plants which are intended to be shown next season at the great metropolitan exhibitions; and a third house, 44 feet long and 9 feet wide, has been fitted up—one-half

as a stove and propagating house, and the remaining half as a receptacle for miscellaneous plants. Both divisions of this house can be heated at once, or only the one next the boiler, as may be convenient, the tank being furnished in the middle with sluices for turning off or on the water, as required. In addition to the houses just mentioned, Mr. Dobson has a large and commodious packing shed, a number of pits for half-hardy plants, and a neat little seed shop, facing the entrance to the nursery. Until lately, the ground between the shop and the gate has been exceedingly gay with Verbenas, Calceolarias, scarlet Geraniums, Cupheas, Dahlias, and Hollyhocks. The latter, more especially, have been very fine; they consisted of some of the best varieties, such as Sulphurea splendens, Mulberry superb, Model, Atrosanguinea, Rosea grandiflora, and others. In the seed shop, which was well stored with both seeds and bulbs, were some charming tree or Perpetual Carnations, which were just coming into bloom; and along with them one or two of Mr. Story's best Fuchsias, as well as some of the finer varieties of other raisers. Among Pelargoniums, a dozen of the best and most distinct raised by Mr. Beck, and supplied by Mr. Dobson, are perhaps Silk Mercer, Prince Arthur, Rosa, Diana, Emily, Loveliness, Cuyp, Governor, Delicatissimum, Star, Rosamond, and Gulielma. From among last year's seedlings we would select Ambassador, a large good-shaped flower; lower petals lilac, with a dark blotch on the upper ones, leaving a narrow margin—free bloomer and good habit; Arethusa, lower petals delicate salmon, with a crimson blotch on the upper petals shading off with deep rose—good habit, and very free flowerer, will prove a first-rate variety for all purposes; Commissioner, upper petals dark chocolate, leaving a narrow margin of rose, lower ones light purple, with dark veins, leaving a white eye—good in habit; Exhibitor, a large flat-sitting flower, with deep crimson maroon blotch, leaving a narrow margin of deep rose, lower petals the same colour, with a white eye — stout habit and free bloomer; Incomparable, rightly named from its colour, for in this respect it has no equal; a good-sized tolerably well-formed flower of the deepest orange scarlet; the upper petals have a dark blotch veining off towards the edge—good in habit, but not a free bloomer; Painter improved, a great improvement on the original variety; a striking flower—free bloomer, and excellent in habit. These are a few of the gems of the collection. We may just add, in conclusion, that the plants in the specimen-house looked very promising. By allowing them to receive plenty of light, and keeping them cool over winter, etiolation is prevented; they get well established in their pots, and by the time the growing season has arrived, they are enabled to progress satisfactorily. This is the way in which Mr. Dobson has always managed his plants, and with the best results, as the numerous prizes he has won at the Chiswick and other exhibitions amply testify.

## FLORICULTURE.

The Coming Chrysanthemum Exhibitions.—The Stoke Newington meeting takes place on Thursday, the 20th inst., the North London (Highgate) on Wednesday, the 26th and Newcastle-on-Tyne and Ipswich are fixed for the latter day. In regard to the metropolitan societies, the most lively interest prevails, and it cannot be too much to assume that, ere long, similar demonstrations will be current among our northern and eastern florists. The parent society, Stoke Newington, boasts of some experience, and announces in our advertising columns its fifth annual exhibition. We find by the schedule that several classes have been formed to suit the many capabilities and diversities of the subject. Single specimens: 6 pots; 24 cut blooms; 12 ditto; 6 ditto; and 6 ditto, for members who have never taken a prize for the same, are all invited. These, with some special prizes offered by Mr. Bird, Mr. James, the Treasurer, and Mr. Sanderson, the Secretary, complete he "inducement." At Highgate, invitations are even more diversified and numerous than those just noticed; for we observe that private growers exhibit independently of nurserymen with plants in 11-inch and in 8-inch pots, and with 12 cut blooms, Anemone-flowered varieties being also provided for. The extra prizes offered by Mr. G. Smith, Mr. Stein, Mr. King, Mr. Atkins, Mr. Bevan, Mr. Lochner, Mr. James, and Mr. Edwards, are numerous and valuable. It will be our own duty to furnish reports of the London meetings; and from distant friends we invite accounts of their exhibitions, in order that our readers may learn what is doing in different parts of the country with this our favourite autumn flower. We had almost forgotten to state that at Highgate and Stoke Newington the committees are pledged to empower the censors to award prizes to at least two-thirds the number of exhibitors in each class. The soundness of this policy no one can doubt. Such is the friendly feeling and harmony existing between the two societies in question, that a full gathering of the combined members, with their respective productions, is determined upon at both exhibitions. *J. E.*

National Floricultural Society.—The first Part of this Society's Proceedings has just made its appearance, and if others view it in the same light as we do, it cannot fail to give satisfaction. The arrangement and accuracy of its contents show that it has been got up with much care and judgment. The degree of award, quality of subject, and censors' names are all set forth in full, affording just the kind of information that has been so long wanted both by buyer and seller; and establishing the value of such tribunals as those furnished by the institution of well-managed societies of this kind. In publishing its opening report, the committee say that, "they have no other object in view than to record, for the information and reference of its members, the flowers brought before their notice, and the highly important and well-weighed decisions of the censors upon their respective merits. They simply record conclusions drawn by able and intelligent judges, which it will be evident will carry with them much more weight than if they were the unsupported opinions of an individual." We think so too; and if the society acts with the same caution and discrimination it has hitherto done, it cannot fail to be successful. The following is a digest of the certificates and commendations awarded from its commencement up to the meeting of September 4: Antirrhinum, Primrose Perfection, First Class Certificate. Auricula, Beauty of Bath, ditto. Azalea Indica, Pictura, label of commendation; ditto Vittata, ditto. Calceolaria (shrubby), Wellington Hero, ditto. Carnation, General Monk, ditto. Cineraria: Marguerite d'Anjou, First Class Certificate; Alba Magna, Certificate of Merit; Marianne, ditto; Orpheus, ditto; Queen of Beauties, ditto; Rosalind, ditto; Beauty, Label of Commendation; Christabel, ditto; Field Marshal, ditto; Formosa, ditto; Lady of the Lake, ditto; Loveliness, ditto; Model of Perfection, ditto; Nonsuch, ditto; Prince Arthur, ditto. Dahlias: Dr. Frampton, First Class Certificate; Laura Lavington, ditto; Triumphant, ditto; Douglas Jerrold, Certificate of Merit; Nancy, ditto; Phantom, ditto; Globe, Label of Commendation; Morning Star, ditto; Delphinium: Hendersonii, Certificate of Merit; Erica: Marnockiana, ditto; Fuchsias: Diamond, ditto; Nil Desperandum, ditto; Nonsuch, ditto; Gladiolus: Mrs. Willmore, First Class Certificate; Josephine, Certificate of Merit; Wellington, ditto; Atro-roseus, Label of Commendation; National, ditto; Psittacinus superbus, ditto; Hollyhocks: Swansdown, First Class Certificate; King of Roses, Certificate of Merit; Rosamund, ditto; King of Yellows, Label of Commendation; Joan of Arc, ditto; Magnet, ditto; Meteor, ditto; Safranot, ditto; Mule Pink (without name), Label of Commendation; Pansy, Kossuth, Certificate of Merit; Pandora, ditto; Swansdown, ditto; No 2, Label of Commendation; Pelargonium, Advancer (fancy), First Class Certificate; Elise, ditto; Formosissimum (fancy), ditto; Ganymede, ditto; Optimum, ditto; Magnet, ditto; Mountain of Light (variegated), ditto; Arethusa, Certificate of Merit; Ariadne, ditto; Caliban (fancy), ditto; Chieftain, ditto; Enchantress, ditto; Gipsy Queen (fancy), ditto; Miranda (fancy), ditto; Purple Standard, ditto; Richard Cobden (fancy), ditto; Rubens, ditto; Attraction, Label of Commendation; Beauty of St. John's Wood (fancy), ditto; Fireball (fancy), ditto; First of May, ditto; Herald, ditto; Incomparable, ditto; Lady Emma (fancy) ditto; Queen of the Fancies (fancy), ditto. Phlox Drummondii: Mayii Variegata, Label of Commendation. Picotees: Christabel, Certificate of Merit; Duke of Rutland, ditto; Mary, ditto; Victoria Regina, ditto. Ophelia, Label of Commendation; Prince Arthur, ditto. Pink: Optima, First Class Certificate. Potentilla: Alpha, Label of Commendation. Rhododendron: Superbissimum, Certificate of Merit. Rose: Queen Victoria, First Class Certificate; Robert Burns, ditto. Tulip: Juliet, Label of Commendation. Verbenas: National, Certificate of Merit; Orlando, ditto; Purple rival, ditto. Eliza Cook, Label of Commendation; Koh-i-noor, ditto. The characteristics of the flowers have, for the most part, been given in our reports of the meetings at the time. From the above enumeration, it will be observed that the Society has been pre-eminently supported by seedling raisers, the subjects submitted during the six months numbering many hundreds. *J. E.*

*The Midland Florist*, for October, contains a gossip about Carnations and Picotees, which is in truth the observations of a practised eye during a late sojourn in the south; the flowers noticed are truthfully described In Scarlet Bizarres, the writer has selected Admiral Curzon, Splendid, Lamartine, Emperor, Howard, Bolingbroke, Bardolph; Crimson Bizarres: Duncan, Owen Glendower, Queen Victoria, Lord Milton, Prince Albert; Pink Bizarres: Falconbridge, South London, Princess, Kirke White, Sarah Payne.; Purple Flakes: Premier, Beauty of Woodhouse, Squire Trow, Poins, Perfection, Mayor of Oldham; Scarlet Flakes: Cradley Pet, Splendour, Justice Shallow, Queen Victoria, Firebrand; Rose Flakes: Ariel, Lorenzo, Flora's Garland, Princess Royal, Antonio, Romeo, Madame Sontag. Picotees, Heavy Red: Mrs. Norman, Prince of Wales, Hogarth, Julia Romano Elizabeth; Light Red: Mary, Gem, Miss Holbeck; Heavy Purple: Alfred, Duke of Rutland, Prince Arthur, Lord Nelson, King of Purples; Light Purples: Ophelia; Heavy Rose: Victoria Regina, Grace Darling, Unexpected, Venus, Queen Victoria, Princess Royal; Light Rose: Mrs. Barnard, Countess Howe, and Nina. Such an enumeration shows that "tastes differ" but little in regard to Carnations and Picotees. Under the Editor's record, with the standing motto, "these things we would buy ourselves, and therefore recommend them," is described a Carnation, Slater's Warrior, C.B., a flower not seen in the south. It is reported to be "a large flower, and apparently constant. We received four or five blooms, and they each exhibited the bold well-defined ribbons, without scratch or spot, which a first-rate flower ought to have. The white was particularly good, and the rich markings very beautiful. We should imagine this to be the best crimson bizarr ever raised in Lancashire." Upon such a recommendation, who dare withstand the temptation. We shall look with interest for its "coming out." The Number for November comprises some running comments by the editor, on the Tulips which he saw in 1851, at and around Derby, Nottingham, &c.: Maid of Orleans, Lady Jane Grey, Royal George, Lord Denman, Shakspeare, Deutonian, Anastasia, Vicar of Radford, Queen Catherine, Cerise belle forme, Camuse de Craix, Camillus, Lysander Noir, Prince of Wales, Superb en Noir, Priam, Tariff, Thomas Brown, Charbonnier Noir, General Bournavelde, Midland Beauty, Prince Albert, Pyramid of Egypt, Van Amburgh, Catafalque, Vivid, Earl Douglas, Pilot, Albion (our own strain), Queen Charlotte, Chellaston Beauty, Rufus, Grace Darling, Earl of Radnor, Earl of Pembroke, God et parfait, Salvator Rosa, Heroine, King, Donzelli, Abercrombie, Captain White, Rose Blanc, Lady Clifton, Bion, Carthusian, Telemachus, Queen Eleanor, Virginia, Horatio, Violet Brun, &c., are all spoken of with praise. We deem the article "On Judging the Tulip," by Mr. Caparn, which this Number contains, of so much importance, that we make no apology for giving it entire. Mr. C. says—

"I have carefully noticed the communications which have periodically appeared in various numbers of the *Midland Florist*, and have remarked the difference between the southern and midland opinions on the requisite properties of a flamed Tulip. Although a midlander myself, I must confess I think my local brethren wrong in their judgment. Form and purity are, it is admitted by all, of course, indispensable; it is in the marking, therefore, on which the judges differ. A pure unbroken feather, without any flame, is, I believe, esteemed by both southern and midland the correct marking of a feathered flower. If so, reasoning from analogy, why should not a flamed flower be correct, indeed only correct, without any feather? To require feather without flame in a feathered Tulip, but the flame accompanied with feather in a flamed one, appears to me an irreconcileable anomaly, a perversion of terms. To obviate any difficulty which may arise on the subject hereafter, as the question appears yet unsettled, I would suggest, that in future each class of Tulips be separated into three distinct kinds of marking—feather, flame, and flame and feather; and each pan shall in future, of course, consist of nine flowers, instead of six, being three in each class.

"This communication may, it is probable, meet the eyes of the committee of the Tulip show to be held at Birmingham, in 1852; and I submit it to them whether it be not worthy of consideration, to put an end to existing differences on this point, to adopt at that show the suggestion I have made.

"In other florists' flowers, censors are generally agreed as to the properties, proportions, and marking of the specimens submitted to their judgment. It is desirable that they should be equally so in their censorship on Tulips; for it would be a saving of trouble to them, and an avoidance of perplexity to exhibitors, to have a standard fixed for their guidance." *J. E.*

*Beck's Florist, Fruitist, and Garden Miscellany*, for October, has a truthful portrait of Paul's New Perpetual Rose, Queen Victoria. Having ourselves seen the flower, we can testify to the accuracy of the representation. A neat article on bedding Roses deserves notice, which, together with reports of the late metropolitan exhibitions, make up a number more floral than we have had for some time. The number for November has chosen a happy subject for its illustration; viz., a Sweet William, owing its parentage to Mr. Hunt; this variety (Queen Victoria), forms one of a batch to which we directed particular attention in our report of the Wycombe Floral Meeting. The subject is well handled, and very pretty. The number generally maintains its well-earned and high reputation. *J. E.*

*The Floricultural Cabinet for October.*—The articles on the progress of the Pelargonium proceed and increase in interest. The number for November is embellished with coloured drawings of two Fuchsias. "Orion" brings his "Progress of the Pelargonium" up to the close of 1847, in a way which shows that he must have watched the flower very attentively during a series of years. These, with an enumeration of Carnations and Picotees, complete the number. The number also contains several other good articles on florist flowers, which may be consulted with advantage. *J. E.*

*The Gardeners' Magazine of Botany*, for October (the last we believe that will ever appear of this work), contains a valuable account of insects injurious to Roses, by Mr. Westwood; a good dissertation on the growth of Chrysanthemums for exhibition; a woodcut representation, and a description of Rhododendron glaucum, one of the Sikkim Himalaya kinds; hints on Camellia growing, by Mr. Errington; and excellent practical directions for training the Pelargonium, by Mr. W. P. Ayres. The last-mentioned article is amply illustrated by woodcuts. *J. E.*

National Floricultural, *Nov.* 13.—Mr. Hoyle in the chair. A Certificate of Merit was awarded to a Chrysanthemum named "Versailles Defiance," a rosy lilac coloured variety, of good form, and broad in the petal; Pentstemon Variabilis received a Label of Commendation. It is a promising greenish-white flowered kind, tipped and marked with cherry; both these subjects were contributed by Mr. Salter, of Hammersmith. Mr. Wilkinson, of Ealing, and Mr. Clark, of Playford, were elected members. *J. E.*

Catalogues received from C. G. Wilkinson, Western Rose

Nursery, Ealing Common. The MS. referred to has not been received. *J. E.*

CHRYSANTHEMUMS: *C.* Feed constantly at this season; if the pots are well drained, you can hardly supply too much liquid manure, provided it be not too strong. *J. E.*

CINERARIA: (—). Too late for this week. *J. E.*

DOUBLE DAISIES: *T.* Some very pretty ones were shown at Chiswick last season, by Mr. Salter, and others. *J. E.*

GARDEN-POTS: *C P L.* There can be no doubt that the makers' measurements are "growing small by degrees." Some alteration is imperative, if 32's are 6 ins. wide and 6 ins. deep, 24's 8½ ins. wide and 8 ins. deep, that standard should be adopted by those who make them; failing that, the remedy is with the purchasers. From what we know, there is scarcely a pot sent out of the required size. A reformation is as much needed in this particular as in any connected with floriculture. The "Lancet" is effecting much good by its exposure of frauds in common articles of consumption; we do not promise to follow the same course, but a few casts purchased from the different metropolitan kilns might serve to show who are dealing fairly and who are not. *J. E.*

POLYANTHUSES: *L.* They are favourites, and will well repay your attention; few subjects are more gay in early spring. They are seldom received in too large a state; therefore do not divide too severely. *J. E.*

SCHEDULES: *R S.* Some copies have been forwarded. *J. E.*

TULIPS: *J L.* We are delighted to hear of your success. You may plant any time this month with safety. Let care be exercised in the transit of the bulbs; 4 inches at most—if of moderate size, less. *J. E.—W W. Whitby.* Next week. *J. E.*

PRIMULA: *F R H.* Worth preserving. The other flower has nothing to do with C. puniceus.*

ERRATUM.—The dates of the second Saturdays in May, June, and July, of 1852 (the Chiswick fete days) were inadvertently given wrong last week; they should have been—May 8, June 12, and July 10. *J. E.*

## Miscellaneous.

*Victoria regia.*—On the 28th of August the Victoria regia blossomed for the first time at Hamburgh, in the aquarium of the Botanical Garden. This is the third plant of this species which has flowered on the continent, and the second in Germany. Immense interest was excited in Hamburgh by this occurrence. To prevent too great a crowd, tickets of admission were issued at four schillings each (about two shillings of our money); and as a limited number only could be admitted at once, hundreds were disappointed. On the two days during which the first blossom was expanded, especially on the second morning and evening, more than 2800 tickets were disposed of. *Botanische Zeitung, Sept.* 12, 1851.

*Candle Tree of Panama.*—A production, less beautiful but equally singular, is the Palo de velas, or Candle tree (Parmentiera cereifera, Seem.) This tree is confined to the valley of the Chagres, where it forms entire forests. In entering them, a person might almost fancy himself transported into a chandler's shop. From all the stems and lower branches hang long cylindrical fruits, of a yellow wax-colour, so much resembling a candle as to have given rise to the popular appellation. The fruit is generally from two to three, but not unfrequently four, feet long, and an inch in diameter. The tree itself is about 24 feet high, with opposite, trifoliolated leaves, and large white bossoms, which appear throughout the year, but are in greatest abundance during the rainy season. The Palo de velas belongs to the Natural Order Crescentiaceæ, and is a Parmentiera, of which genus, hitherto, only one species, the P. edulis, De Cand., was known to exist. The fruit of the latter, called Quauhxilote, is eaten by the Mexicans; while that of the former serves for food to numerous herds of cattle. Bullocks, especially, if fed with the fruit of this tree, Guinea Grass, and Batatilla (Ipomœa brachypoda, Benth.) soon get fat. It is generally admitted, however, that the meat partakes in some degree of the peculiar Apple-like smell of the fruit; but this is by no means disagreeable, and easily prevented, if, for a few days previous to the killing of the animal, the food is changed. The tree produces its principal harvest during the dry season, when all the herbaceous vegetation is burned up; and on that account its cultivation in tropical countries is especially to be recommended: a few acres of it would effectually prevent that want of fodder which is always most severely felt after the periodical rains have ceased. *Hooker's Journal of Botany.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

PAY particular attention to securing as much light as possible in all structures containing plants; and where the rafters or roofs are used as trellises for climbers, these should be reduced within convenient bounds, as the growth of nearly all is, or ought to be, completed. The late autumn flowering creepers, which have been left unpruned in the conservatory, such as Mandevillas and Ipomœas, are now sufficiently ripened for the purpose; but little more should be done after removing the changed leaves than to prune the weakest shoots, deferring the final pruning till March or April. If larger and stronger shoots are cut now, they are apt to commence growing, in spite of the moderate temperature, and thus expend the strength which ought to be reserved till spring. The shoots of Maurandyas should be considerably reduced in bulk, as they are affected by the slightest damp during winter. If any of the late growing Passion-flowers or other creepers impede the ingress of light, they should on this account be reduced; deferring, however, their final pruning until they are about to commence their new growth in spring. FORCING PLANTS.—The free admission of light and air is indispensable to these, and the latter especially, in order that the plants may be kept moderately hardy, and be thereby better enabled to bear moving about during cold weather.

### FORCING DEPARTMENT.

SEAKALE.—Where any regard is paid to neatness, convenience, and economy of labour, let the old fashioned way of forcing Seakale by means of pots and fermented stable litter be abandoned. The pots are expensive, and very liable to get broken; and the litter, if not required for the linings of dung-frames, will make a much better manure by being rotted without fermentation. Where there is not a spare pit, with the bottom heat supplied by hot water, the most economical method is to make up a small bed of Oak leaves, sufficiently strong to ensure a bottom heat of 50°, but not exceeding 55°; and to place upon this a small frame about 30 inches high, and filled to about 18 inches with soil such as is procurable from an old Melon bed. The plants should be taken up with great care, preserving as much as possible of the thick fleshy root, upon which the success of the artificial crop very materially depends; and after watering them sufficiently to settle the soil about them, the frame should be covered with shutters and mats, to exclude the light. The Seakale, forced in this manner, is decidedly superior to that produced by the ordinary method, being firmer in texture and shorter in its growth; it is also a much easier matter either to examine its progress or to gather it for use. By planting the roots 4 inches apart, a superficial yard will produce six or eight dishes; and if the roots are preserved after removal, and laid in till spring, by picking off all the buds but one, they will make good sets for another season. But one of the best places for forcing this vegetable is in the Mushroom house, as the temperature of that is just sufficient, and the very important consideration, absence of light, is secured without additional trouble.

### FLOWER GARDEN AND SHRUBBERIES.

Amongst the numerous exotic plants used for summer and autumn decoration, there are many which will survive the winter, with but a slight protection. All such should now be carefully guarded, as they will materially diminish the quantity of plants to be provided for planting out next spring; and for this excellent reason, preference should be given to the kinds above referred to, in making a selection of plants for flower garden purposes. Under this head will fall Gladiolus, Sparaxis, and many other Cape of Good Hope bulbs; with a great variety of deciduous and half deciduous herbaceous plants, such as Antirrhinums, Pentstemons, Salvia patens, Stachys, Lobelia propinqua, and others; and also some shrubby and sub-shrubby plants, as Fuchsias, Hydrangeas, and the more tender varieties of tea-scented and other Roses. The material we usually employ for this purpose is decayed tan, or half-decomposed leaves, laid over the surface of the soil as a mulching, 2 or 3 inches thick. Whatever be used for this purpose, it should be such as is least liable to absorb and retain moisture. Many use sawdust or dry leaves for this purpose, and conceal their unsightly appearance, by covering with a little soil; but old tan is more convenient, and forms a very congenial top dressing in spring. Some other plants, such as Roses, and the more tender varieties of Antirrhinums and Pentstemons, in addition to a slight mulching, for the preservation of their roots, require some kind of shelter to preserve their branches. The neatest material for this purpose is the prunings of evergreens, stuck into the ground round about them; as, at a short distance, they are not distinguishable from the plants themselves.

### FLORISTS' FLOWERS.

Now we have a lull in floricultural matters. DAHLIAS as a matter of course are all out of the ground and stored away. TULIPS should be planted; if any bulbs are out now, they will, as a matter of course, suffer severely. Many florists hoop over their beds, in order to keep them dry, and prevent the effects of heavy autumnal rains; this we consider a good plan. CARNATIONS and PICOTEES—The beds appropriated to seedlings should be gone carefully over, and the surface soil stirred. Those plants which look the weakest ought to have the greatest attention paid to them, as it is those generally which produce the best flowers. The strongest are generally "selfs," or single flowers. As for AURICULAS we may consider them safe; the demand on the florist's time will be very small indeed; as far as they are concerned, occasional watering, keeping free from weeds and insects, and sheltering from heavy rains, are all that will be required for the next four months. The RANUNCULUS bed may now be turned over, and thrown up into shallow ridges; let these lie exposed to the winter frost, turning over when thoroughly frozen through.

### KITCHEN GARDEN.

PEAS AND BEANS.—Those who reside in favourable localities should now make a sowing of these vegetables, with the hopes of obtaining a very early crop. The seeds should be sown on the leeward side of low ridges, the crowns of which will protect the young plants from cold winds, and the hollows between will aid in keeping the soil dry. Some chopped Furze, or other similar material, should be sown along with the seed, to prevent the depredations of mice. A dwarf variety of Pea, such as Bishop's Longpod, will be found very suitable for the purpose; and of Beans, the Dwarf Fan will be found both hardy and prolific. There is a chance, in warm dry localities, that these sowings will produce good crops, a prospect which is a sufficient warrant for the expenditure in seed and labour; but in medium or late situations, the chance of success is very small. In the latter case, there is less trouble and more certainty by sowing in boxes or turves early in spring and planting them out with a slight shelter towards the end of March. Cauliflowers should be examined every three or four days, and those which have arrived at maturity, if not required for immediate use, should be lifted when dry; after tying their leaves together, they should be laid in by the heels, in a sheltered situation, or hung up in an airy shed, where they will be protected from wet and frost.

State of the Weather near London, for the week ending Nov. 13, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BIRDS: *Clarinda.* From your statement of grievances, we much suspect that your bird-seed is *old*, and consequently *unwholesome*. Procure some of the newest and largest Canary, Rape, and Flax seeds; discard those which you now have, and see if there be any improvement in the health of your birds. The *best* seeds are 'plump,' have a glossy appearance with them, and may be readily known. Write again soon.—*John W.* From 4s. to 12s., according to their excellence.—*Jane D.* Not until Christmas.—*Clarence.* Try a little Maw-seed, and one or two Hemp-seeds now and then.—*Wilhelmina.* At this season, birds *will* go off song occasionally. Keep them warm, and you will soon be recompensed to your heart's delight.—*Anna P.* If you wish them to sing by candle-light, keep them all in close cages, open only at the front. When they see the fire, and hear the delightful preparations for that most 'amiable,' social meal—"tea," there will soon be a "sweet union of happy voices."—*Louisa C.* From our very heart we pity you. Four of your pets 'lying dead!' However, as you know the worst, let experience make you wise for the future. If you *love* your birds—which we perceive you do—study them as you would do children. *Keep them warm, and out of the reach of all draughts.* Very many thousands die annually, from neglect in these matters. We have described a "model cage" long since. — Why not adopt it? — *Thomas Finch.* Early in the ensuing year. — *Felicia.* No; these side glasses are very objectionable. Have your cage made with a long trough, or drawer for the seed; let a circular glass be introduced in one corner for the water. —*Emma.* We *cannot* refuse your request, urged as it is with so much persuasive eloquence. We will undertake the commission gladly, and have no doubt that you will be well satisfied with our choice. — *William A.* You have been deceived. The bull-finch is a *hen* bird, and not worth one penny.—*E. Smith.* As a rule, if you are in search of a *hen* bird of any description, inquire of dealers in the street for "a male bird that *sings*." What is handed to you, will be just what you want,—a *hen* bird that does *not* 'sing.' Only be careful not to pay too dear for your 'whistle.' *W. K.*

CHARCOAL OVEN: *T C.* We do not know that any one has begun to manufacture portable iron ovens for charring vegetable matter, like that of Popelin Ducarre. Probably a drawing of his oven will be given in the report of the jury. *E.*

GRAVELLING WALKS: *B A.* Shell gravel never binds well if laid on thickly. It should be spread thioly, and evenly raked and well rolled. It is better to give two thin dressings in the year than one thick one.‡

MARKET GARDENING: *Mathetes.* If you have not our back Numbers to refer to, you cannot do better than provide yourself with Mr. Cuthill's pamphlet on this subject, which will furnish you with the kind of information you require.‡

NAMES OF FRUITS: *L S.* 1, Crimson Queening; 3, Pearson's Plate; 4, like Dutch Mignonne; 5, Ten Shillings' Apple; 6, Hollow-crowned Pippin; 7, Gravenstein; 8, Northern Greening; 9, Nelson.‖—*Novice.* 1, Easter Beurré; 2, Crassane; 3, Colmar.‖—*P A D.* 3, 4, Rymer; 5, Franklin's Golden Pippin; 6, Downton.‖—*E R C.* 1, Winter Nelis; 2, Brown Beurré; 4, 6, Easter Beurré; 5, 7, Napoléon; 8, Autumn Bergamot; 11, Gansel's Bergamot. 1, Alexander; 2, Yorkshire Greening; 3, Bedfordshire Foundling; 4, 5, Court of Wick; 8, Norfolk Beaufin; 11, Sweeney Nonpareil; 13, Ribston Pippin; 15, Old Nonpareil; 16, French Crab; 17, Lemon Pippin; 21, Downton.‖—*Dr. Miller.* 1, London Pippin; 2, Hollandbury; 3, Minchall Crab; 4, Ord Apple. Pears: 1, Figue de Naples; 2, decayed; 3, Autumn Bergamot.‖—*J M M.* 1, Doyenné Gris; 2, Winter Nelis; 3, Passe Colmar; 4, Winter Crassane; 6, Doyenné Blanc; 7, Easter Bergamot; 8, Beurré Bronzé; 9, Ne Plus Meuris; 10, Grande Bretagne Doré; 12, Poire Neill; 13, Beurré de Capiaumont; 15, Duchesse d'Angoulême. Apples: 1, Trumpington; 2, White Russet; 3, Royal Russet; 4, Golden Reinette; 5, King of the Pippins.‖

NAMES OF PLANTS: *Georgie.* None of your specimens are in fructification; no native country is given; the species of the groups to which they belong are numerous, and very much alike; therefore, without more information, it is impossible to say with certainty what they are. 1 is some Cystopteris; 2, like Lastrea Filix-mas; 3, a Hymenophyllum, or Trichomanes; 4, Polyatichum, perhaps P. proliferum. *S.*

OAK LEAVES: *H B.* They are covered with Oak spangles, which are figured and described in our volume for 1843, p. 52.‡

PEAR TREES: *M. H.* See Mr. Errington's remarks on the subject at p. 260 of last year's volume.‡

ROSES: *Walley Abby.* The best free-flowering climbing yellow Roses are:—Jaune Desprez, Lamarque, and Solfaterre. Night-soil, in a liquid state, is a capital manure for Roses; it will induce a vigorous growth and fine blooms, but it must be administered with care, as it is very powerful.‡

WATER PLANTS: *Sub.* The following are suitable for a pond:—Nymphæa alba, Nuphar lutea and advena; Butomus umbellatus, Menyanthes trifoliata and nymphoides, the double variety of Sagittaria latifolia, Aponogeton distachyon, and Alisma plantago.‡

MISC.: *St. Beda.* Thanks; but your suggestion is impracticable—at least for the present.‡—*B L.* Interesting; but of little value.‡

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE PEAT CHARCOAL, impregnated by pressure with the fertilising matter of the London Sewage, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

ROYAL SOCIETY for the PROMOTION and IMPROVEMENT of the GROWTH of FLAX in IRELAND.—The ANNUAL MEETING of the Society will take place on Friday, the 28th inst., at 12 o'clock, in the Society's Rooms, Commercial Buildings, Belfast, to receive the Annual Report of the Committee, to elect Office-bearers for the ensuing year, and to transact such other business as may be brought forward. By order, JAMES MACADAM, Secretary.

Belfast, Nov. 1, 1851.

THE BIRMINGHAM CATTLE and POULTRY SHOW.—The THIRD GREAT ANNUAL EXHIBITION of FAT CATTLE and the various kinds of DOMESTIC POULTRY will be held in the BINGLEY EXHIBITION HALL, BIRMINGHAM, on the 9th, 10th, 11th, and 12th of December next. The PRIVATE VIEW on TUESDAY, December 9.

**The Agricultural Gazette.**

*SATURDAY, NOVEMBER* 15, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Nov. 20—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 27—Agricultural Imp. Soc. of Ireland.

AT this crisis of Ireland's social condition, and in the prospect of her agricultural improvement, it is of great importance that every legal impediment to the satisfactory arrangement of the relations between landlord and tenant should be removed, so that both these parties which have so deep an interest in the adjustment of their differences—present or prospective—shall clearly understand their mutual rights and privileges, and feel secure in their dealings with each other. Until what is called the land question be put to rest, the letting of lands will be more or less delayed, the outlay of capital on permanent improvements withheld, and the emigration of the labourers of the country continued till there may not be hands sufficient to cultivate the soil.

Will it be credited that there are more than a hundred statutes respecting land tenure in Ireland? Yet, such is the fact; and the stringency of the greater part of them is in favour of the landlord. No wonder that there should be complexities, inconsistencies, and abuses, in the transactions between landlord and tenant. The glorious uncertainty of the law is proverbial even in simpler matters; but, with such a multiplicity of Acts of Parliament affecting what ought to be clear and definite to every one concerned in it, and plain dealing, as between man and man in general, there can be no systematic order established in the rural economy of Ireland.

Without discussing the political and social causes which have rendered the land-tenure question so unsatisfactory to tenants seeking what they consider equitable rights, and displeasing to landlords possessing but illusive privileges in many instances, we shall briefly advert to some of the principal remedial measures proposed for the quietude of Ireland in this respect, by two members of the Irish bar.*

We owe, perhaps, an apology to these gentlemen for noticing thus publicly a work professedly intended for private circulation only; but considering that 450 pages of a goodly octavo, when sent into the world, cannot really remain a confidential communication to friends; and approving cordially, as we do, of the style, matter, and spirit of the book (which was written at the suggestion of Mr. NAPIER, M.P., and is dedicated to Lord MONTEAGLE), we are disposed to think we are not taking an unwarrantable liberty in calling attention to it.

The work is divided into two principal parts, and subdivided into chapters and sections, with the subject of each distinguished, so that any specific information (whether relating to the technicalities of Acts of Parliament or to the author's remarks on any of the numerous topics discussed) may be found without loss of time or confusion of ideas.

The first part, of which the range is very copious and diversified, embraces everything that concerns leases and tenure of land generally in Ireland, under these heads: leasing power—length of term—valuation of the rent in an improvement lease—abatement of rent, and corn rent—taxes—reservations—fences—repairs—fixtures—cultivation—subletting—conacre and cottage allotments—covenants—remedies for rent—ejectments. As may be supposed from this enumeration, there is much reference to law forms and technicalities; but it is without the pedantry or the mystification of law, and there is throughout a great deal of acute observation offered in a common-sense way and in a popular style, which, when the occasion admits of it, rises into writing of a superior order.

Under the head of cultivation we find, after some preliminary allusions to the established customs regarding the course of husbandry in England and Scotland, the usage in Ireland thus distinguished from that in Great Britain:—"In very many parts of Ireland, but more especially in the south and west, the only course of husbandry practised has been frequent corn crops, with an occasional Potato crop between them. In other cases, it was Potatoes succeeded by Wheat, the stubble of which being dug in, they sowed Potatoes again without manure, and afterwards Wheat and Oats; and then they ploughed or manured, or let it remain fallow one year, and so on again. But in the northern and eastern counties the value of a rotation of crops has been more justly appreciated and followed, and Flax has become, perhaps, the most important member of the series; and it has been generally found, that less than a four years' course is too short to be of much practical utility. The mischief of the repetition of white crops, and the immense value, both directly and indirectly, of green crops is, no doubt, beginning to be sensibly felt; and we are led to hope, that in the course of a few years, this practice shall have received such an universal recognition as to amount to a legal usage binding on tenants who are less sensible of its importance; while landlords are beginning more generally, by covenants in their leases, and in their parol lettings, by their influence and control, to insist upon an observance of a system which has become essential to the well-being of the country."

One of the peculiarities of Irish agriculture has been (may we safely use the past tense?) the system of land-letting, known by the term conacre. What the derivation of this expression may be we have never heard, even as conjecture. Be its origin what it may, the inconstancy of employment, and the excessively low rates of wages to the cottier, obliged him to seek for a rood or more of land from a farmer or proprietor, to whom he was bound to pay from 4l. to 12l. per (Irish) acre, according to the quality and condition of the land, and its being manured or otherwise for him. This was analogous to the English allotment system, but differing from the latter in two essential particulars; 1st, the greater extent of land rented by the cultivator; and, secondly, the almost exclusive culture of a late sort of Potato, without any attempt at intercalary or successive crops, during nine months' occupation of the allotment. The conflicting decisions of law courts, respecting the cases of litigated claims for the rent of conacre land, especially when the crop failed and the farmer was left to his remedy on the contract, was among the evils of the system, and these are dwelt upon in the legal points of view, by the learned authors of the book before us. The altered circumstances of Ireland, arising from the combined results of the repeated failures of the Potato crop, the emigration of the peasantry, the increase of steady employment at remunerating wages to those who remain in the country, and the energies of new proprietors and farmers, will, we hope, occasion the total extinction of a system which is only tolerable under a very defective state of the labour market, and of money wages. But we desire to see the *English* allotment system, or some approved modification of it, established in Ireland. We were not, indeed, prepared for the announcement contained in the beginning of the paragraph we here quote:—"The great body of the proprietors in Ireland have lately turned their attention to the English allotment system, as a preferable mode of accommodating the agricultural labourers to the Irish conacre system. Wherever the allotment system is practicable and safe, it appears certainly to be preferable to the conacre, because the tenant gets a more permanent interest in the land than the conacre tenant, who has no interest beyond taking as much out of the crop as he can, and, accordingly, cannot be expected to cultivate it so well as the farmer himself would; and the allotment system would have another important advantage, namely, in emancipating the cottier tenants from the tyranny and extortion of the small farmers, who used to exact the most extravagant rents for the wretched hovels in which the peasant was doomed to drag out his dreary existence. The conacre system, with the poor cottier tenant, not only extorted every farthing of money that he had, but generally managed to keep him in debt, and in absolute dependence upon the farmer. He received no money for his labour, but gave so many days' work for the rent of his cabin and plot of ground. The labour was taken from him at the time of year when it was most valuable, and during the rest of the year he was provided with none, and having no money, was advanced meal or Potatoes by the farmer, at exorbitant prices, to be worked off in labour with the rent; and so long as the small middlemen farmers could exact these large rents from the unfortunate labouring cottiers, they suffered the annoyance of having them in the midst of their farms; but the moment they ceased to be profitable they were turned off the land, and became the first inmates of the poor-house and victims of the hospital."

We should observe that much of the information contained in the book is condensed from the testimony of intelligent and well-informed witnesses who were examined by the DEVON commissioners.

The second part, which extends to 150 pages, is devoted to the *questio vexata* of tenant right, under the heads of tenant right of Ulster—tenant right of occupancy—tenant right of compensation for improvements, involving the principle of compensation—ascertainment of claims, and payment of compensation—are embraced all points in natural connection with the subject.

Lord MONTEAGLE, who, in August last, moved in the House of Lords for a commission to inquire and report on the subject of land tenure in Ireland, failed in obtaining it, but this matter cannot remain in its present unsettled state. "The difficulty of legislating upon tenant right is sufficiently evidenced by the number and variety of enactments that have been from time to time proposed on the subject, and the abandonment of them all successively." "Those who have attempted, as we have done, to deduce from the body of evidence some definite conception of the true nature of the custom of tenant right, can well understand the difficulty of legislating upon a phantom that melts away under every attempt to define it, and that, chameleon-like, appears to assume a different aspect every time it presents itself, so that even the same individual person seldom can be found to speak upon it twice in consistent terms. It is at one time described as a right of the tenant to dispose of his holding for a valuable consideration, although he himself be tenant at will, and have expended nothing on valuable improvements; at another time as a right of continued occupation by the tenant, subject to the payment of the rent to which the premises are liable, or such change of rent as may afterwards be settled from time to time by fair valuation, with a right to sell the occupation to any solvent tenant to whom the landlord shall not make reasonable objection; or less reservedly, as a system of absolute perpetuity at a valuation rent, or as an absolute perpetuity in a farm, subject to a fair rent, to have and to hold to the tenant, his heirs, &c., for ever; or, as claimed in Tipperary, the natural vested right of the people of Ireland, by the grant of God, to the soil of Ireland, to the extent of full, comfortable, secure, and independent existence; or when presented to the British public, in the more specious and winning form of compensation for improvements, a right of occupancy depends on an expenditure of capital and labour; or a right which the tenant has, if he has laid out anything in improvements, and subsequently happens to become unfortunate, to sell his interest, and get compensation for his improvements; or as an equitable claim, whereby the tenant, having expended capital in valuable improvements, or having purchased or inherited the occupation of them, has enjoyed the privilege of selling his interest, subject to the approbation of the landlord; or as the *full* value of all unexhausted improvements in the soil, whether inherited, purchased, or created by the labour or capital of the tenant farmer." All these definitions of claims are marked by the authors as accurate quotations from the various authorities, whether conservative or violently democratical, from which they are taken. The British landlord and the British tenant may well

* "The Tenure and Improvement of Land in Ireland considered with reference to the Relation of Landlord and Tenant, and Tenant Right." By WILLIAM DWYER FERGUSON and ANDREW VANCE, Barristers-at-Law (for private circulation). Dublin: G. J. MILLIKEN, College Green, 1851.

express surprise at some of the notions so gravely entertained. Though the established usage of tenant right is considered as especially confined to Ulster, it is to be found in Tipperary, Sligo, Clare, and Cavan, and principally on the estates of absentees. Mr. KINCAID, one of the most extensive land agents in Ireland, accounts for the usage in Ulster, from the comparative lowness of the rents charged there by the London companies and the great resident proprietors, and the habitual respect paid to the claims of old and industrious tenants.

The authors very forcibly expose the extravagance of the claims put forward in many instances, and their total want of an equitable basis. When a miserable pauper tenantry, incapable of cultivating their lands, are told that they have prescriptive right to the soil, for which they perhaps pay no rent —and that they are entitled to compensation for improvements which exist but in imagination, and which there is not even the intention of effecting, it is certainly time to put a stop to such unreasonable chimeras by legislative authority, and yet to secure concession by the landed proprietary of tenants' claims of recompense for real outlay on permanent improvements.

The authors are of opinion that the tenant-right of Ulster is the effect and not the cause of the tranquillity of that province; that it has arisen from the mutual confidence which has subsisted between landlord and tenant in that province—where there is generally such moral and social superiority—that it is unsuitable for other parts of Ireland differently circumstanced; and in fact "incapable of existing elsewhere," because in Ulster alone there is a great number of small manufacturing capitalists, who are ready to invest their savings in the purchase of "tenants' good will," in little farms suited to their means.

But some of the people of Ulster are not now satisfied with the liberal treatment they have so long received from their landlords, who—we have Lord LONDONDERRY's authority for this—if the tenants desired to quit a farm, received full compensation at a valuation, open to public opinion, for any outlay, and liberty to substitute another tenant. They are agitating for fixity of tenure, and a *right* (instead of permission to do so), of disposing of their holdings to the highest bidder—with other extravagant demands, which are utterly incompatible with the inherent rights of property, and would, if conceded, transfer the real interest in the soil from the landlords to the tenants.

If inconveniences of tenant right are experienced by the best landlords in Ulster, *à fortiori*, they would press much more heavily upon the owners of the soil in those parts of the kingdom where a less educated, orderly, and thrifty class of tenants are in occupation. We think it is satisfactorily shown in the work to which we have so cursorily invited attention, that the tenant right of Ulster ought not to be extended to new districts, and that "to legalise it on the terms which its advocates propose is a pure impossibility, until it shall have acquired some substantial embodiment and uniformity;" nor do we see any reason to dissent from the opinion expressed by Sir GEORGE GREY in the House of Commons, that "it is undesirable to interfere with any custom that has been in existence in any part of the country, and that is not positively mischievous; and where landlord and tenant agree to be bound by such a custom the law should not interfere."

On a review of all the bearings of the case, the learned authors of the work before us, in adverting to the legal part of it, suggest a consolidation of all the statutes affecting the relations of landlord and tenant, and desire only to introduce such changes as have stood the test of experience in this country; they believe that one act might embrace "all statutable powers with respect to leasing and making improvement contracts, and that the remedies of both landlord and tenant might be contained in another." They give very pertinent legal reasons for this opinion, which we need not add: but this sentiment is too important to be omitted—"To the uncertain condition of the law may be traced most of the unsettled notions of the Irish peasantry as to property, and its rights and duties, and the agrarian outrages that have disgraced the country, and no substantial improvement can be effected for the people until the principle is recognised in its fullest integrity, that the vindication of rights should be speedy, cheap, and certain."

## WHAT HAS CHEMISTRY DONE FOR AGRICULTURE?

A LECTURE

DELIVERED AT THE BOTANIC GARDENS, OXFORD, OCT. 30, 1851.

By CHARLES DAUBENY, M.D., F.R.S., Professor of Rural Economy, &c.

IN the lectures delivered in this place on the subject of Rural Economy, it has been my endeavour to explain the rationale of practices ordinarily employed in husbandry, by reference to the principles of modern science, at the same time inviting attention to any new discovery which appeared to have a bearing upon the practical operations of the farm.

But, although, supposing no important omissions to have occurred in the filling out of the outline I had originally sketched, the pupil will thus have had an opportunity of obtaining some acquaintance with such departments, at least of agriculture, as bear any connection with, or admit of any elucidation from, science; yet it may not be amiss occasionally to take up the subject in a different point of view, by bringing together within the scope of a single lecture some of the more important inventions and discoveries, by means of which chemistry has benefited the art of culture; thus holding out encouragement to the further prosecution of science, by an estimate of what has been already accomplished through its instrumentality.

This, indeed, is the professed aim of those able reviews detailing the progress of agricultural knowledge, which have from time to time emanated from the pen of Mr. Pusey, the latest of which appeared in the "Journal of the Royal Agricultural Society," about the close of the preceding year. But on rising from the perusal of that part of the Report, which relates to the scientific part of farming, I can understand, that many have gathered, as I am told has been the case, from the general tenor and spirit of his remarks, an impression, that chemistry has in fact done but little for the improvement of agriculture; and I therefore am not surprised, that a foreigner, who stands confessedly foremost amongst the cultivators of that science, and especially of that branch of it which has the nearest relation to agriculture, should have at first taken umbrage at certain passages, which, viewed by themselves, seem to convey a meaning which I feel convinced would be repudiated by scientific farmers in general, and by none more than by the distinguished editor of a journal, whose motto is "Practice with Science."

For my own part, I see no great reason to object to any statements in this report, when rightly understood, and regarded with reference to the purely practical object which its framer professes to have in view, except only that I should be unwilling to admit that the mineral theory of manures has "broken down," because the particular mineral specific founded upon that theory may have proved a failure.

Whilst, however, I do not come forward to controvert the opinion of so high an authority as Mr. Pusey, when he asserts that Liebig's suggestion for dissolving bones with acid and Sir Robert Kane's for using Flax-water as a manure, are the only new processes in agriculture arising out of chemical discovery, I may at least remind you, that agricultural chemistry embraces a much wider field of utility than is comprised under the category of the invention of new processes, in the limited sense in which the term is employed in the passage before us.

One of the most beneficial aims, indeed, of that science, is to impart greater precision to known and familiar methods of culture, by pointing out the causes upon which their efficacy depends, and thus to enable the agriculturist to employ greater discrimination in their use; whilst another not less important practical end is that of furnishing a clue to the discovery of new and more economical sources for materials of acknowledged utility in husbandry, and of instructing us how to preserve, in all their integrity, the constituents on which their virtue depends.

I believe, indeed, that by taking a somewhat larger view of the subject, it would not be difficult to show, that there have been few improvements in practical agriculture, in the first suggestion, the final development, or the judicious limitation of which to their appropriate objects, chemistry has not been more or less instrumental.

Nor would it be fair to confine ourselves in this enumeration to points upon which the minds of men of science are already made up, leaving out of the account those which are still under debate, but which do not seem susceptible of a perfect solution without the aid of chemistry.

The controversy, for instance, with respect to the importance of mineral manures, is one which can only be settled by the joint efforts of practical and scientific agriculturists; and therefore, may fairly be included amongst those questions of importance on which the services of chemists are demanded.

Nor is it material, with reference to the present argument, whether the scientific principles which serve to regulate the present practice of agriculture have been long established, or are of recent discovery; whether they were pointed out by Sir H. Davy in the last age, or by Baron Liebig in the present; or whether, as often happens, they have resulted from a number of independent investigations, of many of which it is difficult to determine the exact parentage.

In order to estimate the services rendered by science to agriculture, the fairest plan perhaps would be to contrast its present condition, in which scientific principles are often unconsciously adopted even by those who repudiate science altogether, with that in which it existed, after centuries of civilisation, amongst nations like the Romans, where the light of physical science had never penetrated.

Compare the modern systems of husbandry, as adopted in the more enlightened countries of Europe, with that laid down by Columella during the most flourishing period of the Roman empire; and the superiority fairly ascribable to the former may furnish something like a measure of the value of those scientific aids in which the latter were deficient.

It must moreover be recollected, that the value of diffusing sound scientific information amongst the agricultural public is felt, not merely in the attainment of truth, but likewise in the exclusion of error; aiding, as it does, our progress in the right direction, and at the same time guarding us against being led away by the *ignis fatuus* of quackery and fanciful hypothesis. Just as in medicine, a contempt for scientific principles is apt to engender a belief in homœopathy, mesmerism, and other mystical departments of the craft; so an ignorance of the true principles of scientific husbandry leaves the mind open for the reception of any crude hypothesis in vogue at the time, which may chance to take hold of the imagination.

I have myself seen the very farmers, who would turn aside, with incredulity or with indifference, from any sober exposition of the chemical considerations which were to guide them in the selection and management of their manures, in the rotation of their crops, and in other every day operations of husbandry, eager to try the effect of encircling their fields with a *cordon* of wires, intended either to draw down, or to draw off electricity from the ground, they knew not exactly which; but, at any rate, to benefit them in some unaccountable manner, by a new distribution of this mysterious agent over their crops.

I conceive, therefore, that even those who disbelieve in science, might find reasons for promoting its cultivation, if only to prevent the greater evil of an indulgence in crude and absurd hypotheses; just as those who have no faith in medicine, may nevertheless recommend their invalid friends to resort to a physician, in order to prevent them from falling into the hands of a quack.

That many benefits, however, have resulted from the application of science to agriculture, beyond those negative ones which alone, perhaps, would sufficiently vindicate its study, will appear, I think, from a few examples, taken, as I feel myself quite justified in doing, from cases, where something, indeed, had been contributed by unenlightened experience, but where science afterwards stepped in to take advantage of the lucky accident which communicated the first impulse.

It had been known for a long period of time, that certain parts of England were peculiarly well adapted for dairy husbandry; and in consequence, they have been set apart as permanent pastures, devoted especially to the maintenance of cows, whose milk was principally converted into cheese, and sent off to a distance, as fast it was produced, to supply the large cities of the empire.

After a lapse of years it was observed that the produce fell off, and that the ground became exhausted—a natural consequence, as modern science has shown, of the fact, that the soil, from the surface down to the point to which the roots of the Grasses penetrate, contains only a limited quantity of phosphates, without which the plants could not grow; or if they did, would be incapable of supplying to the animals fed upon them the materials for their milk.

The exhaustion, therefore, of this mineral ingredient is seen at present to be a natural consequence of the constant drain made upon it by the system of husbandry pursued, and to entail of necessity the failure of the crop.

There can be little doubt, therefore, but that the chemistry of the present day would have suggested the remedy, had the evil remained until now unredressed; but it must be in candour admitted, that the application of bones to the exhausted dairy lands of Cheshire was, in the first instance, the result of pure accident, or of observation unassisted by science.

Yet, although chemistry did not suggest the remedy, it accounted for its operation, and by these means furnished a clue by which other substitutes might be discovered, and improved means of applying it invented.

That the extraordinary efficacy which the application of bones has been shown in some cases to possess in restoring fertility to exhausted pasture land, is owing to their containing the very material which had been removed by a number of successive Grass crops, is now regarded as so self-evident, that the farmer hardly feels his obligation to chemistry for pointing it out; and, yet, within ten years a standard writer on agricultural chemistry * expressed his disbelief as to the principal efficacy of bones being ascribable to their earthy ingredients, and considered that in Turnip husbandry the organic part constituted the most permanent and most immediately useful part of their composition.

Now it is evident, that the determination of such a question as this is not a matter of mere speculative curiosity. If the animal matter of the bone were really the most useful portion of the manure, it would answer best to spread over our land unburnt bones, irrespective of their price, rejecting altogether such expedients as the one which Mr. Pusey singles out as a specific instance of the benefits rendered to agriculture by science, where an acid is added to the bones; owing to which the earthy portion, indeed, is rendered more soluble, but the animal must be carbonised and destroyed.

Under such circumstances we might cease to smile at the method of manuring, which I have heard was adopted by some farmer, deeply impressed with the notion of the superior value to crops of the organic matter of his bones, and who consequently had it

* See Professor Johnston's work, 1st Edition

extracted by boiling, pouring the broth, or the watery solution, upon his land.

But the advantage of thus ascertaining the cause of the usefulness of bones did not end here, for it immediately suggested itself to the mind, that if the earthy phosphates contained in them constituted their principal value, advantage might be taken of those deposits of the same material which are occasionally met with in the earth itself.

Hence a desire arose amongst the agriculturists of this country to ascertain the extent and nature of a formation reported to exist in Spanish Estremadura, consisting, according to the vague accounts given of it, of this same mineral matter.

I was in consequence induced myself to visit Spain in the year 1843, in company with Captain Widdrington, for the purpose of exploring this locality; and we were thus enabled, not only to report upon all the circumstances relating to this interesting deposit, but also to bring away with us a sufficient quantity of the material itself, to test its efficacy as a manure in comparison with that of bones.*

At the time, indeed, at which we made our Report, the practical utility of this investigation might have appeared problematical, because the Spanish Phosphorite was found to lie at such a distance from roads and navigable rivers, that the expense of conveying it into England placed it beyond the reach of the farmer. Nevertheless, the efficacy found to belong to this description of mineral phosphate when applied as a manure, not only confirmed us in our belief, that bones owe their chief efficacy to their earthy constituents—but also established this important principle, namely, that the mechanical condition in which the material exists, does not exercise any important influence upon its action upon the land, and hence held out encouragement for further search for it being made in localities more accessible, or nearer home. Nor were these efforts unrewarded; although the success was attributable to scientific investigations, not originally undertaken with any practical object, but purely in that uncalculating spirit of inquiry after truth which animates the genuine Naturalist.

Baron Liebig, indeed, in the year 1843, was ridiculed by many for proposing, in a letter which he wrote to the late Sir Robert Peel, the coprolitic and bone beds, which had been pointed out to him by Dr. Buckland in the course of the tour he made through England, as substitutes for bones in agriculture; although even at that time the experiments by which I had convinced myself of the presence of minute proportions of phosphates in many secondary limestones † might have prepared us to expect, that extinct animals would have left in the strata the earthy materials contained in the soft, as well as in the osseous parts of their structure, and would thus, by their decomposition, have been the means of accumulating a mass of phosphatic matter sufficient to meet all the exigencies of husbandry.

This, however, would remain a matter of probable conjecture only, until the discovery above alluded to, as being the result of a purely scientific inquiry, had been made—I mean until the detection of the real nature of the so-called pseudo-coprolites of Suffolk had been brought about in the manner which I am now about to recount.

It so happened, that the farmers in the neighbourhood of Felixstow, in the county of Suffolk, frequently came across a multitude of oval or rounded pebbles, having a waterworn appearance, which lie disseminated through the loose sandy material of which the soil and subsoil of their land is composed.

Finding these bodies so hard and tough as not to be easily reduced to powder, they were in the habit of throwing them aside in heaps, as an hindrance to their farming operations, until at length the attention of certain geologists who visited the neighbourhood was attracted to them, and amongst the rest that of Professor Henslow of Cambridge.

The latter, on his first inspection of them in 1843, imagined, from the peculiar shape and twisted appearance which they often presented, that they might be coprolites, or the indurated fæces of some extinct animal; but a more careful examination convinced him, that the form they possessed was attributable to the circumstance, that the material of which they were composed had collected round any nucleus that might have presented itself, that nucleus consisting, in some cases of the teeth or vertebræ of fishes, at others of fragments of some mineral matter.

The next step in the investigation was to ascertain the chemical constitution of the nodules themselves, and this was effected through the exertions of Mr. Brown, of Stanway, who had them submitted to chemical analysis, which proved that they contained from 50 to 60 per cent. of phosphate of lime.

The discovery in the same locality of numerous sharks' teeth, and of bones of the tympanum of the ear of the whale, referred by Professor Owen to several distinct species of Cetacea, completed the solution of the problem relating to the real origin of this deposit.

There can now be but little doubt, that the phosphate of lime was derived from the decomposition of the marine animals, which had peopled the seas in that immediate neighbourhood during the tertiary period.

The phosphate, at first dissolved in the sea water through the agency of carbonic acid, was afterwards precipitated, as that solvent escaped; and at the moment of its deposition would be attracted to any hard body, whether of an animal or a mineral nature, that chanced to offer. Hence, the origin of those *pseudo coprolites*, as they are termed, which occur in the crag of Suffolk; hence that of the phosphatic matter, incrusting in so many instances the bones and teeth of marine animals found in the same locality.

The scientific exploration of this district quickly showed the great abundance of these phosphatic nodules over a wide district from the River Orwell northwards along the coast of Suffolk, and hence immediately suggested their importance for agricultural purposes. Accordingly, a demand was soon created for this new mineral fertiliser, and this demand has gone on steadily increasing up to the present year, when, as I was lately informed by a gentleman, who is the proprietor of some mills at Harwich, at which the nodules are reduced to powder, and thus rendered fit for conversion, through the agency of sulphuric acid, into superphosphate, nearly 10,000 tons of it are annually dug up, reduced to powder, and consumed as manure.

I have been assured that the landed proprietors of the district in which the coprolites prevail have benefited to the extent of from 300*l.* to 1500*l.* through this discovery; that the value of land throughout the coprolitic district has risen in consequence; and that 500 labouring men, boys, and women are employed the greater part of the year in digging up this material from the subsoil, or in preparing it for market. It is probable that the landowners, who are reaping such advantages from the discovery, are not generally aware of the steps by which it was arrived at, or we should surely have heard of some expression of gratitude at least, if not some more substantial token of the obligation felt by them to the naturalist, who first pointed out to the world the real nature of this hitherto neglected and despised material.

Nor is this the only discovery of the kind which has been lately achieved in Great Britain.

In the year 1843, Mr. Payne, of Farnham, having remarked the extraordinary fertility, especially for Wheat and Hop crops, belonging to the soil on a particular part of his farm, where a green band of marl, more or less silicious, and abounding in fossils, made its appearance; and having moreover noticed, that this same marl, when spread over other land, imparted to it its own fertilising qualities, was induced to submit it to analysis, and learnt from Professor Way, Consulting Chemist to the Agricultural Society, that no less than from 52 to 57 per cent. of bone earth phosphate was, on the average, present in it.

This discovery encouraged him and others, to undertake a kind of geological survey of the district in which this marl occurs, and to enquire into its relation to the contiguous rocks. From this examination it resulted, that the phosphatic marl forms a seam along the line of junction between the upper green sand and the chalk; the phosphoric acid spreading upwards also in smaller quantities, to a certain extent, through the chalk marl.

The gault also, which divides the upper from the lower green sand, occasionally contains fossils which are rich in phosphates; but below the gault, the lower green sand at and near its junction with it, is pervaded by phosphatic nodules, almost as abundantly as the upper green sand has been stated to be.

Now as the beds in which these phosphates occur extend from one side of England to the other in a direction from N.E. to S.W., namely, from Flamborough Head, in Yorkshire, to the southern coast, this material may be looked for everywhere throughout this range; and, in fact, by following such a clue, it has been detected already about Petersfield, Guildford, Folkstone, in the Isle of Wight, near Black Gang Chine, and between Culver Cliff and Atherfield Point, and in sundry other localities.

The presence of phosphate of lime has probably arisen from some process of nature by which this mineral came to replace the carbonate of which shells are commonly made up; and a striking proof that it was introduced from without, after the organic matter had become fossilised, is afforded by the fact, that the external portions of the Hampshire nodules are often richer in phosphates than the internal ones.

Professor Way informs us, that whilst the exterior portions of a fossil sponge, analysed by him, contained 32·17 per cent. of phosphate of lime, and only 61·71 of carbonate, the intermediate contained only 13·87 of phosphate to 67·14 of carbonate, and the interior 10·26 of phosphate to 69.17 of carbonate. Since, therefore, this phosphatic ingredient appears to have been of subsequent introduction, we cannot feel confident that it will be found uniformly present in the bed; still there can be little doubt, from what has been already ascertained, that the aggregate amount stored up in the interior of the earth would be sufficient to manure our lands with phosphate of lime for centuries to come, were all other sources of it exhausted.

Now in the instance before us we cannot, it is true, ascribe the whole merit of the discovery to scientific investigations, for the efficacy of the marl in question was observed before its real nature had been discovered; and it is therefore conceivable, that even in the absence of all chemical knowledge, it might have been employed as a manure, even although its true constitution had remained a secret.

Yet it is most probable, that had not the existence of phosphatic nodules in the chalk of France been announced in the first instance by Berthier; had not their occurrence also in England been subsequently made known to us by Dr. Fitton's investigations in the Isle of Wight, and by Professor Henslow's in Cambridgeshire; and had not the probability of bone earth being commonly found in a fossil state in the earth been so strikingly put before us by Dr. Buckland, in consequence of his researches on coprolites, the peculiar efficacy of this species of fertiliser would have been long overlooked, and its virtues, even if known in the immediate neighbourhood, would have been far from being so generally appreciated.

The same remark applies to another kind of manure lately introduced into English agriculture, the operation of which is in some respects similar to that of the phosphates. I allude to guano, of which within a few years so large an amount has been imported from the islands of the Pacific and elsewhere, that the annual consumption is stated not to fall short of 80,000 or 100,000 tons in Great Britain alone.

In this indeed, as in the preceding instance, it may be said that accident had the start of theory, for the Peruvians, unenlightened by science, have employed this material to renovate their lands for many centuries back. It must, however, be recollected, that although a circumstantial report of this fact was made to us by the most celebrated of modern travellers, in his well known Personal Narrative, nearly half a century ago, no attempts were made to introduce the substance into Europe, until the time when an increased interest in agricultural chemistry had been awakened amongst us, owing in great measure to the wide circulation of Baron Liebig's masterly treatise.

At any rate, even if guano had been introduced into husbandry independently of the suggestions of the chemist, it could not have been brought into general use with any degree of success without his assistance.

Two chances of disappointment await the farmer in the purchase of this commodity—the first, the liability to adulteration to which it is subject after its importation into the country; the second, the extreme difference in its value in the different localities from which it is obtained.

From neither of these hazards has the purchaser any adequate security, except from chemistry.

Without its aid, he possesses no means of judging whether he is applying to his land a material containing 55 per cent. of phosphate of lime or 24; 17 per cent. of ammonia or 1½ per cent.; or whether, indeed, there may not be as much as 50 or 60 per cent. of foreign matter intermixed with the really useful constituents of the sample submitted to him, even without any intentional fraud on the part of the vendor.

If, therefore, a farmer would feel mortified at being so destitute of all practical knowledge, as to depend wholly upon his farrier, whenever he attempted the purchase of a horse; ought he not to feel an inclination to acquire so much knowledge at least of chemistry, as would enable him to lay in his stock of guano without appealing on every occasion to the chemist for advice?

Now in the case both of the phosphates and of guano, the reason of the value of either commodity as a manure, would have remained to this day a mystery, had it not been for scientific research.

Without the light thus afforded, the farmer, safe only so long as he persevered in the beaten track of his predecessors, would in this instance, as well as in so many others, have found no guide to direct his footsteps, no principles upon which to modify his practice, with reference to any new circumstances that might arise; or if he ventured to appeal to principles at all, might have been led still farther astray by false hypotheses, such as those respecting the stimulating action of manures upon the ground or upon the crop, from which so many absurd inferences have been deduced.

The principles upon which modern agriculturists proceed in applying phosphates or guano to their land are now so generally understood, that men are apt to regard them as self-evident, and to forget that within a few years every one of them was either unknown, or was disputed.

Simple as it may appear to us in the present day, it is by no means a self-evident proposition, that the grain which nourishes us contains essentially certain earthy ingredients of a particular chemical constitution—that these ingredients can neither be dispensed with, nor yet be provided by the growing plant itself—that soils are charged with them in variable proportions, but always in limited quantity; and that consequently they often require to be supplied from artificial sources, in order that the crop may be enabled to grow luxuriantly.

Although these facts may now be regarded as truisms, and little gratitude felt towards chemistry for its share in establishing them, yet it must be recollected, that within 20 years, the contrary opinion was commonly enough entertained, to induce me to undertake a set of experiments partly for the purpose of disproving it;* that at the commencement of the present century, Schröder obtained a prize from the Academy of Berlin, for having, as was conceived, proved that a portion at least of the earthy ingredients found in plants was formed in the act of vegetation; and that even at a later period the same notion was indulged in, as at least not impossible, in the case of the earthy matter of the eggs of birds, by so eminent a philosopher as Dr. Prout.†

Indeed the possibility of transmuting one simple substance into another, can be by no means regarded as a self-evident absurdity, and hence it is not so

† Phil. Trans. for 1822.

surprising that such a power should be attributed to the mysterious operations of vegetable life, until its existence had been either disproved by facts, or at least shown to be utterly at variance with the whole tenor of experimental research.

The same remark applies to the now generally established belief in the presence of nitrogen in all species of grain, and the consequent necessity for a supply of ammonia from one quarter or another to the growing plant.

The first of these facts was ascertained by Gay Lussac only within a few years; the latter would even recently be disputed by those who, like Mulder, and Professor Johnston, of Durham, contend for the possibility of nitrogen being absorbed under certain circumstances from the air, and being thus directly assimilated by plants; an opinion discountenanced, as I conceive, by a reference to the general economy of nature, which appears to show, that the constituents of the atmosphere ever maintain their relative proportions unaltered, and suggests to us, that nitrogen must be conveyed to the plant through the medium of ammonia only, inasmuch as there is every reason for supposing, that this element cannot be made to abandon its elastic form through the influence of vegetative forces.

Nothing indeed short of the powerful action of electricity will cause it to unite with oxygen, although the strength of its affinity for this body is shown by the stability of some of the compounds it forms with it; nor do we know of any other element capable of uniting with it directly, except it be carbon, in an experiment not yet fully cleared up.*

It seems, therefore, *à priori*, improbable that the nitrogen of the atmosphere can have any share in the nutrition of plants; and so far as experiments have yet gone, the evidence is on the same side.

I have recently grown Beans in an artificial soil, composed of pounded brick, and enclosed a plant obtained from them in an atmosphere, sufficiently supplied with moisture, and renewed at regular intervals by the introduction of fresh air taken from the outside of the building in which the experiment went on, but from which all the ammonia present had been carefully removed, by passing it first through weak sulphuric or muriatic acid. After a certain time the plant confined in this atmosphere became feeble, mildewed, and flabby; whilst another placed under precisely the same circumstances, except that the air retained its ammonia, continued till the end of the experiment healthy, and comparatively vigorous. (The two plants were shown to correspond with the description above given, and the apparatus in which the experiments had been carried on was also exhibited.)

The many bearings on practical husbandry which these theoretical principles involve will not at the present day be disputed—they lie indeed at the root of those questions which have of late been so much agitated between Baron Liebig on the one hand, and Mr. Lawes on the other, as to the necessity of phosphates and of ammonia for the success of certain crops, and are taken for granted by both parties, notwithstanding the differences of opinion which exist between them with regard to the utility of ammoniacal and mineral manures under particular circumstances.

It must be confessed, that this discrepancy of opinion between the highest living authority on organic chemistry, and an experimentalist who has undertaken so elaborate and extended a series of researches with the view of elucidating the theory of husbandry as Mr. Lawes, is calculated to shake the confidence of practical men in the *dicta* of science. It may therefore be not amiss to show, that this discrepancy is after all confined within narrow limits, and by no means pervades the whole of their theoretical conclusions.

Baron Liebig for instance, maintains, that provided a plant be furnished with a sufficient quantity of those mineral ingredients which are essential to its constitution, in a form in which they can be readily taken up and assimilated, it can dispense with any artificial supply of ammonia; this being obtainable either from the atmosphere, or from the rain-water with which its roots are moistened.

He accordingly suggested to his friend, Mr. Muspratt, of Liverpool, a set of manures compounded upon the above principle, and calculated to meet the requirements of the several descriptions of crops in use in husbandry. These, although in fact patented by the above named gentleman, became commonly known by the name of the great chemist who devised them, a circumstance which has given occasion to an anonymous writer in the recent number of a periodical* to indulge in some rather ungenerous and misplaced sneers against the Giessen Professor; as if it had been beneath his dignity, as a man of science, to seek pecuniary profit from his own discoveries.

I have already stated, that the patent was not taken out by Liebig himself; but had the fact been otherwise, it would have been strange to bring such a charge against a Foreigner, in the country of the Arkwrights, the Watts, and the Wedgwoods; a country where a Wollaston increased his wealth, without damaging his reputation, by keeping to himself to the last hour of his life a chemical secret; and where at the present moment the same Gentleman is engaged, without the slightest impeachment on his respectability, partly in experiments on agricultural chemistry, and partly in more lucrative undertakings, as a vendor of manures.

Whilst, then, Baron Liebig lays the greatest stress upon mineral fertilisers; Mr. Lawes, on the other hand, infers from his experiments at Rothamstead, that cereal crops are improved more by ammoniacal salts than by phosphates, and that the latter are chiefly beneficial to Turnips and other plants of a similar organisation. Experiments of this description are doubtless valuable as a guide to direct our practice, where the circumstances are similar to those under which they were undertaken, and as an indication, that in the climates and on the soils with which we have to deal, cereal crops are unable to abstract from the atmosphere, or from the soil, sufficient ammonia for an abundant crop, and, therefore, require the adventitious aid of nitrogenised materials.

Before, however, we can admit their validity, as establishing a general law applicable to all places and climates, it will be necessary, at least, to reconcile them with facts well known to all the world, which point to an entirely opposite conclusion. Thus, for instance, as Baron Liebig observes, the fields in the Delta of the Nile are supplied with no other animal manure than the ashes of the burnt excrements of animals, which form their principal fuel in a country so denuded of wood; yet they have been proverbially fertile from a period earlier than the first dawn of history, and that fertility continues to the present day as conspicuous as it was in the earliest times. These fields receive every year, from the inundation of the Nile, a new soil, rich in those mineral elements, which have been withdrawn by the crops of the previous harvest. The mud of the Nile contains as little nitrogen, as the mud derived from the Alps of Switzerland, which fertilises the fields after the inundation of the Rhine. If this fertilising mud owed this property to nitrogenised matters, what enormous beds of animal and vegetable exuviæ and remains ought to exist in the mountains of Africa, on heights extending beyond the limits of perpetual snow, where no bird, no animal finds food, from the absence of all vegetation!

Why, indeed, should we be surprised, that under the vivifying influence of the exuberant heat and moisture of the valley of the Nile, cereal crops should be able to effect that, which, according to Mr. Lawes' own experiments, it would appear that, even in our own less genial climate, plants, with a larger development of leaves, are capable of doing; for how else are weto a ccount for the fact, that Turnips, which contain more nitrogen in proportion than the Grasses, can dispense with ammoniacal manures, provided only sufficient superphosphate be administered to them in an early stage of their growth?

On the other hand, the inutility of mineral manures can only be predicated with respect to land already charged sufficiently with all the fixed ingredients which the plants grown upon it contain, and that this is not the case in all parts, even of our own country, will appear from the case already cited, in which the pastures of Cheshire were so strikingly improved by a simple dressing of bones.

It cannot be contended, that what is true of some species of Grasses does not hold good with respect to the rest, and that it may not be possible by injudicious cropping to reduce other land, through the exhaustion of its phosphates, to the same state of sterility as the fields of Cheshire.

The experiments which I have myself performed on a small scale, and of which an account is given in the "Philosophical Transactions," for 1845,* tend to show that the phosphates, as well as the alkaline salts present in the soil, exist there in two different conditions, a part being readily taken up by water containing carbonic acid, the remainder capable of being extracted at the time only through the more energetic action of mineral acids. It is reasonable to suppose, that the portion which the former menstruum fails at once to dissolve, will not be immediately available for the purposes of the growing plant, but that it may nevertheless become so with greater or lesser rapidity, in proportion to the degree of energy with which the vegetable processes are going on in the soil which contains it.

In the case of Mr. Lawes's land, which, at the very time when it was considered by him as agriculturally exhausted, produced 16½ bushels of Wheat to the acre, it cannot be supposed that the mineral phosphates were actually deficient; but it is very possible, that the floating capital, as it may be termed, had been reduced by previous cropping, so that it might require a certain vigour in the plant to extract the requisite amount of phosphate and alkali from the soil. By the application of ammoniacal manures, this increased vigour may, as it would appear, be imparted to the cereal crops, but not to the Turnips, which latter would consequently be checked in their development, unless phosphate of lime were added, in a more soluble, and more readily available form, than that in which it existed in the soil.

We should, however, have had more solid grounds to proceed upon in this matter, had Mr. Lawes undertaken an analysis of his soil, at the time when he considered it to be in an exhausted condition, as was done by Mr. Way, in the researches in which I engaged his able assistance; we might then have had data for determining, how far the circumstances of his farm corresponded with the average ones in other parts of England, and what amount of phosphate of lime remaining in the land suffices for an abundant crop of cereals, when other plants grown in it are benefited by a more liberal supply of that mineral.

Whilst, however, Mr. Lawes' experiments appear to me insufficient to overturn Baron Liebig's position as to the utility of mineral manures to cereal crops in general, I am by no means prepared to advocate the opinion which that great chemist in some parts of his works appears to countenance, namely, that the artificial application of ammoniacal salts is of no practical utility. I should rather avail myself of the admission made by himself in other passages which might be quoted—that this abnormal supply of ammonia, although not essential to the growth of plants, tends to accelerate it; for if their development within a given time be in proportion, *cæteris paribus*, to the freedom with which they are furnished with manures of this descriptlon, it may be inferred, that in the absence of other counteracting influences, the subsequent luxuriance of the crop will bear some relation, at least, to the rapidity of its previous growth.

In common, then, with the larger proportion of men of science, as well as of practical agriculturists, I will take it for granted that ammoniacal salts, in due subordination to the earthy phosphates, are serviceable in vegetation; and proceeding upon these premises, shall point out, as a real boon to mankind, a recent discovery, of which Mr. Thomson, of Coot Hall, in Yorkshire, and the Rev. Mr. Huxtable, of Sutton Waldron, in Dorsetshire, seem to have had a glimpse about the same time, but which has been since more fully worked out by Professor Way, the consulting chemist to the Royal Agricultural Society, whose name has been already more than once referred to.

I allude to the fact, that argillaceous soils possess the property, not merely of detaining, by a sort of adhesive affinity, saline matters when made to percolate through them in solution in water, but also in some cases of effecting decompositions in those presented to them, of a kind which would not take place without its assistance

---

* In a popular lecture it did not seem desirable to dwell upon the proofs of this assertion, but as it is opposed to the opinion of certain able chemists, I subjoin the grounds upon which I object to the arguments by which they maintain the contrary.

*Arguments for and against the Theory of the Absorption of Gaseous Nitrogen by other Elements.*

1. When organic substances which contain no nitrogen are oxidised in the air, ammonia not unfrequently is produced. *Answer.*—This fact may be readily referred to the absorption of ammonia by all spongy bodies, as has been shown by Faraday, the ammonia being, of course, derived from the atmosphere.

2. When moist iron-filings are exposed to the air, and undergo oxidation, ammonia is disengaged. *Answer.*—Berzelius, Rapport, for 1844, admits that this experiment is fallacious. Will has also refuted it.

3. When tin-filings are rapidly oxidised by means of nitric acid, ammonia is produced. *Answer.*—This experiment proves nothing, as the nitrogen and hydrogen, when they combine, are both in a nascent state.

4. If a current of moist air be made to pass over red-hot charcoal, carbonic acid and ammonia are simultaneously formed. *Answer.*—This experiment I have myself repeated, but found that the ammonia did not continue to be evolved after the experiment had been for some time prolonged. Hence I conclude that it was derived from the charcoal, which had absorbed it previously.

5. If 40 parts of iron-filings be mixed with 1 part of hydrate and 1 of nitrate of potass, and then heated, ammonia becomes perceptible. *Answer.*—This experiment comes under the same category as experiment No. 3.

6. Nitrate of potass is generated in hot climates where no organic matters are present. Hence we infer, that nitrogen and oxygen are made to combine directly through the agency of porous bodies, lime being present to unite with the nitric acid formed, and the compound being afterwards decomposed by potass. *Answer.*—It cannot be denied, that in most cases, and in all those which have been fully examined, organic matters were present where nitre was produced. If in any instance, as in that of the caves of Ceylon, their presence cannot be substantiated, may it not be, that the lime and potass attracted ammonia from the air, and that the nitric acid proceeded from the oxidation of ammonia?

7. When a succession of electric sparks is passed through common air, nitric acid is slowly but sensibly generated. *Answer.*—I have repeated this experiment under circumstances which exclude the objections which might be raised against Cavendish's experiment, as originally performed, in which, as potass was used, ammonia might probably have been present in it. I am bound, however, to state, that even when no potase was employed, and the air had been passed through sulphuric acid, to deprive it of ammonia, nitric acid was produced by the electric spark, and therefore to admit that the direct union of nitrogen and oxygen may be accomplished in this way. No ammonia could be generated, when hydrogen and nitrogen were electrified together, by means of the same powerful machine as that I had used successfully for producing nitric acid. Yet the power of electricity to cause the union of nitrogen and oxygen must be confined to very narrow limits, or the quantity of nitric acid generated on the whole body of the atmosphere would have been so much greater than it is found to be, as to entail the destruction of animal and vegetable life.

8. Desfosses showed, that when nitrogen was brought into contact with carbon at a high temperature, an alkali being present, a cyanide was produced, and Mr. Lewis Thomson is said to manufacture Prussian blue on a large scale on this principle. Dr. Fownes (Brit. Assoc. Rep. vol. 10), appears to have shown that no ammonia could in these cases be present. *Answer.*—This experiment seems to establish the possibility of gaseous nitrogen uniting with carbon, as the preceding one does of its combining with oxygen But the porous nature of charcoal, and its power of absorbing gases, must be taken into the account; and it may, therefore, still appear doubtful, whether there is any decided evidence, that nitrogen can be made to abandon its elastic form on the earth's surface, except through the combined agency of electricity and of the attraction of oxygen. How then, it may be asked, can ammonia be produced at all? Doubtless great pressure would effect the union of its component parts, as we know that their mutual affinity is powerful enough to keep them united when once brought together. How this pressure is brought about is of course a matter of conjecture, but the theory which supposes the union to take place in the interior of the earth may serve to account for this, as well as for the evolution of ammonia through chasms in many places, more especially in those connected with volcanoes. This, however, is not the place to dwell upon such speculations, which are only alluded to in order to show, that it is not necessary to suppose the ammonia which plants and animals require to have been "pent up in deep caverns," since it might be generated gradually by volcanic processes, which caused nascent hydrogen, under great pressure, to be brought into contact with nitrogen. At any rate, I cannot admit my friend Professor Johnston's explanation, which, if I understand it rightly, assumes that carbonaceous matter has had a share in volcanic processes—an idea, I believe, abandoned as untenable, ever since the time of Werner.

* "Edinburgh Review" for July, article "Chemistry."

* Bakerian Lecture, "On the Rotation of Crops."

through the operation of the ordinary laws of chemical affinity.

The adhesive attraction which produces the former of these remarkable effects, although exerted in different degrees for different salts, seems to be exhibited more or less for all. Thus, water containing common salt, if made to filter through clay, loses a portion of its saline impregnation. But the decomposing agency of the soil is evinced principally with reference to salts of ammonia, which are often made to exchange their acids with those combined with other bases brought into contact with them, such as lime and magnesia.

Accordingly, sulphate and muriate of ammonia will be converted into the carbonate in their passage through clay, and the latter, through the adhesive affinity exerted for it by the earth, will be detained within its substance. Hence, water holding sulphate or muriate of ammonia in solution, if made to percolate a certain thickness of vegetable mould, containing some proportion of argillaceous earth, will come out entirely free from all ammoniacal salts, but containing, in the place of it, either sulphate of lime, or sulphate of magnesia, according to the nature of the earth present in the soil.

For the same reason it is that sewage-water may be freed from all its impurities, by being made to filter through a certain thickness of clay.

It is needless for me to remark upon the important aid this discovery affords us towards preserving and concentrating the valuable contents of our manure-heaps. We see, that an admixture of clay or marl in sufficient quantity with decomposing animal and vegetable exuviæ, will prevent the escape of ammonia, and even of alkaline and phosphatic salts, although the water which contained them be allowed to drain off, after passing through this material.

We perceive, also, under what circumstances it may be admissible to employ as manures such salts of ammonia as, when alone, would be useless in vegetation, because the plant being unable to separate from them their alkaline ingredient, could not obtain from them any nitrogen; and we also see opening upon us a promising train of research, which may not improbably suggest to us hereafter the means of availing ourselves, for the purposes of husbandry, through the instrumentality of certain mineral substances, of the whole of that immense accumulation of fæcal matters which is now emptied into the Thames, and at the same time of disarming it of its noxious influences upon mankind.

But I must hasten on to a few other examples of the service rendered by chemistry to husbandry, and I know of scarcely any to which I can appeal with greater confidence than to Professor Liebig's refutation of the *humus theory* of vegetation, and of his exposition of the true manner in which plants obtain their nourishment from the soil.

I am aware that Mulder * and a few others still profess to adhere to the old opinion, that *humus* does actually supply nourishment to plants, by being rendered soluble in the sap, and taken up along with it into their tissues; although the Dutch chemist himself seems to leave the question in doubt in another place, where he states, that it is still open to investigation, when humus, as such, appears to have nourished a plant, whether it had not been previously decomposed into carbonic acid, and in this state had supplied nourishment to the roots.

On the other hand, on reviewing the arguments which incline him to the belief that humic acid is actually taken up into the vessels of the plant; whilst on the one hand I see no reason to deny the possibility that its soluble salts may occasionally be contained in the sap, as is the case with other saline solutions brought into contact with the roots, I can, on the other, discover no proof that such is by any means an ordinary occurrence, or one having any reference to the nutrition of the vegetable. On the contrary, the sap of plants, whenever it has been examined, is found to consist of the same ingredients, namely of water, carbonic acid, carbonate of ammonia, and saccharine matter; but never to contain humus under any of its modifications.

Now the *onus probandi* surely rests with those who maintain a theory so opposed to all analogy, as that of supposing the vegetable to be nourished, in any degree, by means of a material, which is, at any rate, wholly inadequate to supply any considerable portion of what is necessary for its growth; as has been demonstrated both by Liebig and by Schleiden, authorities who, differing as they do on many other points, agree at least in this one.

Nature, however prodigal she may be in results, is chary as to the means she employs to obtain them; she has no occasion to resort to expedients to which man is often driven, who, having begun his work with one set of instruments, is induced to perfect it by the aid of another; and in this case physiologists have shown, that she has provided an entirely distinct machinery for the purpose of accomplishing the assimilation of the four organic elements, namely the specific influence of the luminous rays upon the green parts of the vegetable tissue, by which carbonic acid, water, and probably ammonia, are decomposed; and carbon, hydrogen, oxygen, and nitrogen, assimilated.†

The absorption of sap by parasites from the parent tree, which Mulder appeals to in support of his theory, is by no means a parallel case to the absorption of humus by the roots. The former can only be regarded in the light of a prolongation of the plant which supports it, in the same sense, at least, as a new shoot is of the original trunk, or a scion of its stock. When supplied with leaves, the parasite elaborates its own sap receiving the crude material from the new wood; when destitute of them, it implants its roots into the bark, in order to obtain the sap already elaborated; but in either case the mode of nutrition is entirely in harmony with that of plants in general, and can in no degree be appealed to, as countenancing the anomalous theory which supposes humus itself to be taken up and assimilated.

Although, therefore, much that relates to the nutrition of plants may be still obscure, I cannot admit that this is the case with respect to the manner in which the materials present in the soil are rendered available; conceiving, as I do, that the doctrine maintained by Liebig, even though it may still be doubted by a few, commands the assent of the scientific world generally enough, to be considered a safe foundation for practice.

Assuming, then, that the humus theory, which supposes vegetable mould to constitute in itself the food of plants, has given place to the doctrine which represents it as serviceable only, in proportion as it supplies, through its decomposition, or its absorbent properties, carbonic acid and ammonia; I will beg you to consider how much light has been thrown upon the hidden operations of agriculture by the establishment of such a truth—how greatly, on the one hand, our practice may be modified, and our methods of culture improved, by having the principle impressed upon our minds, that humus must undergo a kind of decomposition, before its constituents can become assimilated—and, on the other hand, how many faulty proceedings may be discontinued, through the rejection of the crude notion formerly in vogue, that plants are nourished in the soil on which they grow, in the same sense, and by the same process of assimilation, as animals are by the plants on which they feed.

The above examples may suffice to show the benefits which science has conferred upon agriculture, properly so called.

There is, however, another branch of rural economy, namely, the art of feeding and fattening domestic animals, in which the services rendered by it are even more palpable, and less open to dispute. To know that warmth is to a certain extent a substitute for food; that every expenditure of muscular force, and even every exertion of mental or bodily power, involves the consumption of an equivalent amount of animal tissue—that sugar, gum, and starch, no less than oil, are convertible by the processes of the animal economy into fat—a principle which even Dumas is at length compelled to concede; that the temperature of the body may be maintained by means of a cheaper kind of nourishment than is needed for supplying the waste of the system; are facts which cannot but prove of the highest practical utility to all those whose business it is to provide animal food for the wants of our population.

On these topics, however, less need be said, because ample justice has been done by Mr. Pusey, in his valuable report, to the services rendered by Baron Liebig to this branch of our subject.

In conclusion, then, let me request you to consider, whether the facts that have been brought forward in the course of this Lecture do not hold out inducements to all those engaged in agriculture, whose time and education permit, for making themselves familiar with the first great truths of chemistry, and for keeping its principles steadily in view in all the operations of farming, and especially whenever they aspire to innovate and improve upon existing methods. It may be true, that some of the principles alluded to were suggested at a period antecedent to that included within Mr. Pusey's Report. It may also be true, that the germ of some of the most important facts or generalisations announced to us by Baron Liebig, is traceable to Saussure and other of the earlier experimentalists. These, however, are points which, however much they may concern the reputation of the individuals, cannot affect our judgment as to the utility of science itself, or as to the probability of further assistance being derivable from its prosecution. Nor will I dispute the position, that, with the exception of the addition of sulphuric acid to bones, and the employment of flax-water as a manure, no successful process of recent introduction can be appealed to, solely and distinctly referable to the suggestions of the chemist;* and still less would I seek to encourage amongst my hearers the notion, that for every agricultural difficulty a chemical *nostrum* can be devised. It would be as absurd for a mere chemist to conduct a farm, as for a mere mathematician to command an army; although the best arrangement of troops in a battle may be a mechanical problem, and an Archimedes may have done good service to his countrymen, by firing the enemy's fleet, through the resources of science.

If, indeed, success in agriculture were so dependant upon the manipulations of science, as some sanguine persons, to whom Mr. Pusey's remarks are addressed, appear to have imagined, the consequences would be much to be deplored; as it would transfer the cultivation of our fields to the charge of a comparatively small number of men of subtle and refined intellects—closet philosophers, who had made physics the principal business of their lives—instead of continuing, as it has hitherto done, to supply an healthful and improving occupation to that larger body of practical and intelligent persons, whose plainer and less cultivated understandings, although unfitted for the abstractions of science, are perfectly competent to grapple with the difficulties of an art, in which it seems intended, that tact, and sagacity, and experience should, after all, always hold the highest place amongst the qualifications needed for success.

But with all these deductions, it may be safely asserted, that there is scarcely any process in the art of culture, however entirely it may have originated with unscientific men, which would not be benefited, by being brought so far under the domain of chemistry as to be carried on with a constant reference to its principles.

You must have seen, in the course of my previous lectures, abundant proof of this, in the remarks that have from time to time been made, on the management of farm-yard manure, on the selection of artificial substitutes for it, on the uses of tillage, and on the methods of rendering the soil available for the nourishment of plants. Nor can there be any doubt, that in proportion as our scientific knowledge advances, in proportion as agricultural chemistry is cleared from those doubts which hang over some of its principles, and also in proportion as the generalisations deduced from its facts by the first authorities become rooted in the minds of practical cultivators, it will, as Mr. Pusey anticipates, bring forth more fruit, and vindicate more completely than at present its claim to an important, although always, no doubt, a subordinate place, amongst the acquirements of the practical agriculturist.

* "Chemistry of Vegetable Physiology," chaps. v. and viii.

† See Liebig's "Chemistry in its application to Agriculture," chap. iii.; and Schleiden's "Botany, Engl. Trans." p. 473, *et seq.*

* May not, however, the use of charcoal in horticulture suggested by its absorbent powers with reference to gases, be held as another boon conferred by chemistry; and the power of gypsum in fixing ammonia—the failure in the use of which is, I believe, mainly attributable to the mineral not having been exposed to heat before it was pulverised, and being applied in a dry state, instead of being mixed up with water to the consistence of cream—be cited as another?

## Home Correspondence.

*Peat Charcoal.*—I shall be obliged by any of your correspondents informing me of their experience with peat charcoal, in growing Potatoes or Turnips. A friend of mine, who was at considerable pains and expense in preparing some, tried it this season upon both; but without the slightest apparent benefit. The Potatoes, upon which a good allowance of charcoal was put, over the sets and dung, at planting-time, were neither a better crop, nor freer of disease, than the rest of the field. Upon Turnips, three drills were manured only with charcoal, saturated with urine, from a feeding shed—the rest of the field has a good crop, but upon these three drills the Turnips are few in number, and are not larger than Radishes. Tried upon Grass, on a lawn, it has not been more successful. If this much-bepraised deodoriser (fertiliser we cannot call it) is not found to answer better elsewhere, the bogs of Ireland are not likely to turn out quite the California some patriots (speculators?) would have us believe. I have a fair crop of Turnips, upon a thin gravelly soil, which would be much improved were the crop eaten off by sheep, folded upon the field; but this is not convenient. I am told that the soil will be equally benefited by leaving the tops of the entire crop to rot on the surface; or rather ought I to plough them in whilst green? [Plough them in green.] The Potato crop in this county (Dumfries) is generally light; the disease varying according to quality of soil, whilst light, dry, gravelly, or pure mossy soils have not more than one-sixth or one-eighth; heavy loams and damp clays have as much as one-half and two-thirds diseased tubers. Upon some high lying farms the stems were blackened by frost in the beginning of July; here the tubers are few and small—not half a crop. Oats will be a fair average. In high, damp localities much of the crop, though cut three weeks since, is still in the fields; and, from the late wet and warm weather, must now be injured by sprouting: a great deal, too, destroyed by rooks, wild pigeons, black cocks, and grouse—the last as destructive as any; and then they come in such numbers you can hardly drive them away—to use a gun would be high treason; a human you may shoot, when carrying off your property, but with a black cock or grouse, it is quite "*un autre chose.*" They manage these matters better in France now, at any rate. A word upon these cunning rogues, the rooks; all summer I have had a boy to keep them from a 5-acre field of Potatoes. On Sunday week the callant went home to his mother's for a clean shirt. The crows soon observed, and took advantage of his absence; for some three hours they had it all their own way, and so good a use did they make of their time, that next morning 11 half-bushel basketsful of half-eaten Potatoes were gathered off the drills; how many were wholly eaten, and how many were carried away, could of course only be guessed at. As there is no unmixed good in this world, so neither is there any unmixed evil—the crows, though they occasionally help themselves rather more liberally than we like, to the corn and Potatoes in autumn, do good service at other seasons of the year by destroying myriads of slugs, grubs, and other "small deer," which, though unseen, are not the less active in blighting the hopes of the *Tenant Farmer.*

*Beer.*—In reply to "Senex," in your Number of the 25th, I beg to inform him that an ale far superior to Bass's (I speak medically and gastronomically) can be easily brewed from sugar and hops; and as the quality of sugar is less variable than that of malt, with more certainty of success, according to the recipe given by Michael Donovan in his "Domestic Economy," published in Lardner's "Cyclopædia." This work is valuable in many respects; but especially in its exposure of impositions practised to profit "the few" at the expense

"of the many." It is in "Domestic Economy" what Davis's Pharmacopœia is in medicine, the antagonist of quackery. Having often tried the process, and with success, the only modification I would suggest, is that the Hops, to prevent trouble, should be inclosed in a muslin bag, and that it should be fined, to hasten its clarification, with isinglass,—not dissolved in vinegar, as recommended in Black's Treatise, edition 3d, 1844; but in a small portion of the beer itself; a process also useful in the manufacture of cider—to get rid of the "yeast," which determines the vinous, then the acetous, and often the putrid, fermentation. "Senex" may be assured that beer thus manufactured, if bottled, soon becomes "champagne," from its lightness on the stomach, with the "bitter" tonic of the "Hops." *Agricola Cæsariensis.*

*Thin Seeding.*—I am always glad to please my neighbours, but I am not pleased with the cause (viz., bad crop of Wheat, only 7 sacks to the acre) of their pleasure. They rejoice to see my system (viz., thin sowing, no ploughing, clean hoeing) come to the ground; and tell me if I do not publish it to the world they will. I think they are rather premature in their rejoicing. I do not consider it an absolute failure. The very best farmers cannot every season invariably insure success. This 7 sacks, or 28 bushels per acre, that is so much talked about, is, after all, as much, I should think, as the average of England. A neighbour of mine, a four-course man, grew one year 12 sacks per acre; the next time it came for Wheat, farmed in the same way, he grew only 3 sacks per acre. I own I cannot control the elements, or I could grow more. After I put on the top-dressing (soot) there came a hasty shower and washed great part of it away, or there might have been 2 or 3 sacks per acre more. The wind also blew from all quarters, in currents between the trees (50 to the acre), and beat it about so that before harvest it pointed in all directions except the perpendicular, or there might have been 2 or 3 sacks more. Then again it was not the right sort of Wheat (of course not Piper's Thickset), or there might have been 2 or 3 sacks more. Taking these drawbacks into the account, I guess the public will think I am on the "laughing side." I think there are not many farmers can say what I can, viz., that they have grown on one acre in 7 years from about 2 pecks per acre seed, 70 sacks of Wheat, without the land being moved in any way, except the surface about an inch or so by hoeing. Perhaps the cream of the matter respecting this "jail" crop is, after all, that I get more than 3*l.* per acre profit. A neighbour said, last year, "Now after all you prove nothing. Perhaps if you had ploughed deep, subsoiled, dug, scarified, hoed, &c., you would have grown more still." I therefore dug a piece across the middle of the field, farmed it in the same way (except digging). It planted best, and looked best, all the season; but when we came to test it by the bushel, there were 5 pecks per acre less! *J. D. Piper, Colne Engaine, Essex, Nov.* 4.

### METEOROLOGICAL REPORT.—November.

(*Continued from p.* 718.)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| Nov. 5 | 8 a.m. | ... | 29.94 | Fine frosty morning. Light |
| | 11.30 a.m. | 29.95 | ... | at S. and N. occasionally. |
| | 6 30 p.m. | 29.93 | ... | P.M. Gentle northerly breeze. |
| | 10.30 p.m. | ... | 29.86 | Barometer falling steadily. Fine evening. |
| 6 | 7.40 a.m. | 29.79 | ... | A.M. Barometer rising during night, though lower than last observation. Northerly. Moderate. |

| | 7.5 p.m. | ... | 30.29 | Evening. Dense, overcast. |

* † ‡ ¶ All these fluctuations arise from currents of air passing over England from west to east, and lying to the northward.

Dorchester Nov. 13. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

### NOVEMBER.

Dorset Farm, *Nov.* 3.—We are now engaged in storing the Mangold Wurzel, which, although they were very backward during the early part of the season, have, after all, turned out a very good crop; and the Turnips have made up wonderfully; the consequence is, that the price of stock has risen very much lately—ewes, of average quality, are now worth 4*s.* to 5*s* a head more than they were a month ago; but they are not likely to rise much higher, as the weather is now setting in cold, which will put a stop to vegetation. Wheat sowing is progressing well, and may be stated as about half done. Although ploughing was delayed for some time by drought yet the very favourable weather that succeeded has tended very much to make amends for that, and I believe that Wheat has never been put in better, on ordinary land, than it has this season. We have got ours in, with the exception of some that comes after Mangold Wurzel. On this land we fold the sheep upon the Mangold Wurzel tops, which are left on the ground after the roots are carted off. The sheep do very well upon them, if care is taken not to let them have too many at one time, especially if the leaves are dried up a little before they have them; and as this root has generally a good allowance of dung applied to it, a very light dressing, with the sheep, is sufficient to insure a corn crop after; and the treading of the sheep tends to give that consistency to the land so necessary for Wheat. In the case of Turnips, if the land has had a dressing of dung, we carry off one-half or two thirds of them, and eat the rest on the land, which leaves it fit for the Barley. Grass is still abundant; but as the nights are getting long, and occasionally frosty, the more valuable cattle will have a little hay by night, instead of lying out. We shall now be employed ploughing the Wheat stubbles, to let them have the benefit of the frost during winter, and in doing so we endeavour to get a little beyond our usual depth with the plough, because the winter frost will help to naturalise the fresh soil, and also roots are fond of something new. *G. S.*

## Notices to Correspondents.

Books: *H Copland.* We cannot find the title. It is a pamphlet descriptive of a two-acre farm, cultivated most profitably by a tradesman of either Essex or Suffolk. Perhaps some one will furnish the name.

Food for Cows: *H T.* Cabbages and hay. And for sheep, 2 lbs. of chopped hay, ½ lb. of Bean-meal, ½ lb. of Linseed, and 20 lbs. of cut Swedes a day apiece. Give it in three lots.

Italian Rye-grass: *M.* The extracts from Mr. Dickinson were made in a past volume. See pp. 125, 534 (1845); and pp. 93, 459 (1847).

Kohl Rabi: *H S M.* It may be secured now. There is a good and cheap lantern for the stable made of wire gauze.

Mangold Wurzel: *Constant Reader.* The leaves may be given to cows without risk of injury, provided dry food (some hay or straw) be given with them. We are storing roots; and all the tops are gathered and thrown into yards, where the pigs work among them; but most of them rot.

Pond Mud: *Eboracensis.* A very short distance of carriage would justify a farmer in declining the gift, unless it be peculiarly rich in vegetable matter. It should be taken out, and suffered to drain and dry; then be broken up, mixed with salt and gypsum, and applied to Grass-land.

Poultry: *J C M.* The fowl has either had an injury in the back, or is cramped from a chill. If the bird is kept in a paved yard, or if used to a poultry house with bricks or stone floor, it is probably the latter. The treatment for it will be bread soaked in ale, and pounded peppercorns mixed up with meal. Examine his feet, to see whether it arises from ulcers caused sometimes by small gravel stones having entered through the skin, and remaining in the feet.—*W W H.* If the cramp complained of is in adult birds, adopt the treatment mentioned above; if in chickens, it is very often only the result of weakness, caused by fast growth, and merely requires age and generous food to cause it to disappear. *J. Baily*, 113, *Mount-street, London.*

Salt: *H B.* Salt has been tried broadcast, 2 cwt. or 3 cwt. per acre, in wet weather in June, as manure for Turnips. It has succeeded better with Mangold Wurzel. The best way to apply it to land is to add it to the farm-yard manure, about a stone to a ton.

Weed: *Anti weed.* The only tract on this subject that we are acquainted with is one published long ago by B. Holditch (Ridgway, Piccadilly), which is trustworthy and instructive.

## Markets.

### COVENT GARDEN, Nov 15.

English Pine Apples continue plentiful, and Grapes, both foreign and English, are abundant. Small quantities of Pears are still brought from the Continent. The best English kinds fetch 2*s.* to 4*s.* a doz., and 8*s.* to 12*s.* per half sieve. Oranges are plentiful. Nuts remain nearly the same as quoted last week. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are a little cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

FRUIT.

| | |

Hops.—Friday, Nov. 14.

Messrs. Pattenden and Smith report that the demand for all fine Hops continues unabated, at full prices.

Potatoes.—Southwark, Monday, Nov. 10.

The committee report that the market continues to be supplied quite equal to the demand, which is anything but brisk. In some few instances a little better prices have been obtained than in our last report. The following are this day's quotations:—York Regents, 60*s.* to 70*s.*; Scotch do., 40*s.* to 50*s.*; Kent and Essex do., 55*s.* to 65*s.*; ditto Shaws, 40*s.* to 55*s.*; Lincolnshire whites, 40*s.* to 50*s.*

Coal Market.—Friday, Nov. 14.

Eden Main, 16*s.* 9*d.*; Wallsend Braddyll's, 18*s.* 3*d.*; Wallsend Hetton, 18*s.* 6*d.*; Wallsend Lambton, 18*s.* 3*d.*; Wallsend Stewart's, 18*s.* 3*d.*; Wallsend Adelaide Tees, 16*s.* 9*d.*—Ships at market, 120.

Smithfield, Monday, Nov. 10.

There was a large supply of Beasts; the weather being milder the demand was smaller; the trade generally was worse; we are, however, still enabled to quote 3*s.* 8*d.* for choice Scots. There were a few more Sheep on offer; choice Downs maintained late quotations—indeed, 4*s.* 4*d.* was realised; in a few instances, big Sheep, owing to the weather, were lower, and, in consequence of a large supply from Holland, inferior qualities unsaleable. Trade on the average was worse for Calves, still a good one made 4*s.* From Holland and Germany there are 1784 Beasts, 5460 Sheep, 297 Calves, and 60 Pigs; from France, 100 Sheep and 12 Calves; from Scotland, 120 Beasts; and 2950 from the northern and midland counties.

Beasts, 5282; Sheep and Lambs, 26,780; Calves, 364; Pigs, 510.

Friday, Nov 14.

The number of Beasts is large and trade very dull; however, the favourable change in the weather enables us to retain Monday's quotations. Although the supply of Sheep is small it exceeds the demand. Monday's prices are fully realised for choice kinds, but they are scarcely reached for inferior qualities. Good Calves are scarce, and fully as dear. From Germany and Holland we have 500 Beasts, 1150 Sheep, and 153 Calves; and 115 Milch Cows from the home counties.

Beasts, 1207; Sheep and Lambs, 3810; Calves, 262; Pigs, 525.

Mark Lane.

Monday, Nov. 10.—The supply of English Wheat to this morning's market was moderate, and disposed of on the terms of this day se'nnight. The attendance of buyers being small, the sale of foreign was limited, but it realised our extreme quotations.—There is more demand for the low descriptions of foreign Flour, and prices for all sorts are fully supported.—Malting Barley sells at last week's prices; grinding is 1*s* per qr. dearer.—Beans and Peas are very firm, and in some instances 1*s.* per qr. more money is obtained.—The Oat trade is slow, and new Irish are 6*d.* per qr. cheaper.

Friday, Nov. 14.—The arrivals of grain of all kinds this week have been moderate. This morning's market was badly attended, and a mere nominal business in Wheat transacted; prices of both English and foreign may be considered the same as on Monday last.—Barley is firm, and grinding qualities being scarce are rather dearer.—In the value of Beans, Peas, and Oats there is no alteration. A cargo of Egyptian Beans afloat fetched 20*s.* per qr., cost, freight, and insurance. Flour meets a good inquiry at late rates.—A few sales of floating cargoes of P. O. Wheat have been effected during the week, at 28*s.* to 31*s.* per qr.; a cargo of Beheira realised 23*s.* per qr., both cost, freight, and insurance. In Maize there was nothing doing.

Arrivals this Week.

Liverpool, Tuesday, Nov. 11.—Our market this morning was well attended by country buyers. Wheat was in moderate request, at fully last Tuesday's price for useful samples of red, and at an improvement of 1*d* per bushel on white. There was a much better demand upon American Flour, choice qualities of sweet commanding an advance of 6*d.* per barrel on the quotations of this day se'nnight; sour barrel Flour sold more freely than of late, and to go into widely-apart districts. Indian Corn was not much dealt with to-day, but the value was considered to be supported. Good meaning Irish Oats were scarce, and improved 3*d.* to 1*d.* per bushel, and Oatmeal also 3*d.* per load. Grinding Barley improved 2*d.* per bushel, and Egyptian Beans 3*d.* to 6*d.* per qr. In Peas no bange occurred.

——Friday, Nov 7.—There was a good attendance of country millers and dealers at our Corn Exchange to-day. We experienced a heavy demand for Wheat, and full prices were paid; indeed, for superior samples of white a small advance was obtained. The better qualities of American Flour likewise commanded 3*d.* to 6*d.* per barrel more than on Tuesday, and a fair quantity taken for shipment, and into the interior. There was no change of price in Indian Corn. Oats were slightly better. No alteration as regards Oatmeal, Beans, or Peas.

## HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

| 8 by 6 „ 8¼ by 6½ | ... ... ... ... | 13 0 |
| 9 by 7 „ 9½ by 7½ | and 10 by 8 ... ... | 15 0 |

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.—1-8th, 6d.; 3-16ths, 9d.; ¼ inch, 1s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116 BISHOPSGATE-STREET WITHOUT, LONDON.

### GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | |
|---|---|---|---|---|
| 6 inches by 4 | and 6½ | by 4½ | ... ... ... | 13s. 0d. |

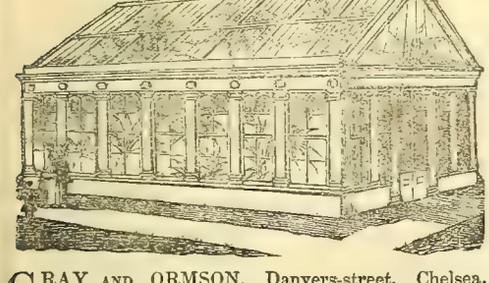
| 9 „ | 7 and 10 | by 8 | ... ... ... | 20 0 |
| 12 „ | 10 and 13 | by 9 | ... ... ... | 20 0 |

And many other sizes, or cut to order in various thicknesses. Cases containing large Sheets, in 100, 200, and 300 feet, at 21s. per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

| | | | |
|---|---|---|---|
| In sizes under 15 inches | ..... | 6d. | per foot. |
| „ „ 35 „ | ..... | 8d. | „ |
| „ „ 50 „ | ..... | 9½d. | „ |
| „ „ 75 „ | ..... | 12d. | „ |



Milk Pans, 2s to 6s. each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

### GLASS FOR CONSERVATORIES, &c.

HETLEY AND CO. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See *Gardeners' Chronicle* first Saturday in each month.

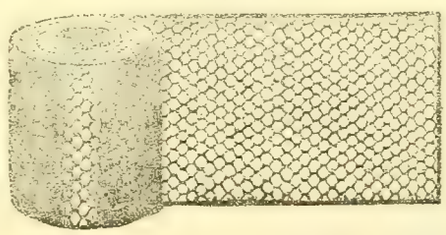
### HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

STEPHENSON AND Co., 61, Gracechurch-street London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.



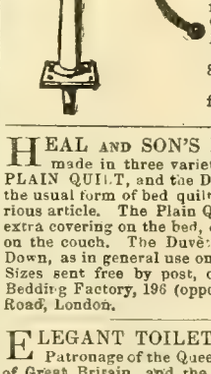
S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GREEN AND HOTHOUSE BUILDER.—Greenhouses and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet glass of a large size, 1d per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch „ strong „ ... | 9 „ | 6½ „ |
| 2-inch „ extra strong „ ... | 12 „ | 9 „ |
| 1⅝-inch „ light „ ... | 8 „ | 6 „ |
| 1⅝-inch „ strong „ ... | 10 „ | 8 „ |
| 1⅝-inch „ extra strong „ ... | 14 „ | 11 „ |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

### FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0

Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

The usual allowance to the Trade.

HEAL AND SON'S EIDER DOWN QUILTS are made in three varieties—the BORDERED QUILT, the PLAIN QUILT, and the DUVET. The Bordered Quilt is in the usual form of bed quilts, and is a most elegant and luxurious article. The Plain Quilt is smaller, and is useful as an extra covering on the bed, or as a wrapper in the carriage, or on the couch. The Duvet is a loose case filled with Eider Down, as in general use on the Continent.—List of Prices and Sizes sent free by post, on application to HEAL and SON'S Bedding Factory, 196 (opposite the Chapel), Tottenham Court Road, London.

ELEGANT TOILET REQUISITES.—Under the Patronage of the Queen, the Court, and the Royal Family of Great Britain, and the several Sovereigns and Courts of Europe. ROWLAND'S MACASSOR OIL. The unprecedented success of this discovery in restoring, improving, and beautifying the Human Hair, is too well known and appreciated to need comment. Price 3s. 6d., 7s., family bottles (equal to four small) 10s. 6d., and double that size, 21s.—ROWLAND'S KALYDOR. An eastern botanical discovery of unfailing efficacy in eradicating all Cutaneous Eruptions, rendering the skin soft, clear, and fair, and bestowing a healthy roseate hue on the complexion.—Price 4s. 6d., and 8s. 6d. per bottle.—ROWLAND'S ODONTO, or PEARL DENTIFRICE. A fragrant White Powder, prepared from oriental herbs, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Beware of spurious imitations. The only genuine of each bears the name of "ROWLANDS'" preceding that of the article on the wrapper or label.—Sold by A. ROWLAND and SONS, 20, HATTON-GARDEN, London, and by respectable chemists and perfumers.

### EXHIBITION PRIZE—HYBRID WHEAT.

MR. RAYNBIRD begs to offer to Agriculturists a new variety of WHEAT, a Hybrid between the Piper's Thickset and the Hopetoun, at 10s. per bushel, including delivery to the Bury St. Edmund's Station.—Address, Mr. R. RAYNBIRD, Hengrave, Bury St. Edmund's, Suffolk.

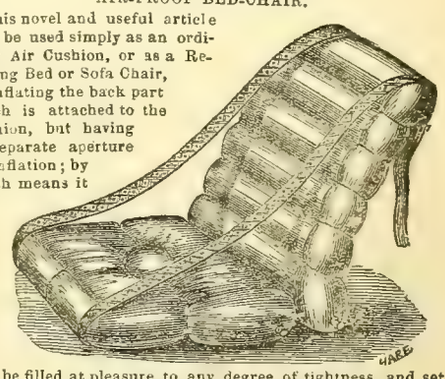
WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

### WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

### SACKS.

FOUR-BUSHEL ..... 1s. ½d.
FIVE Do. ..... 1s. 5½d.
NET CASH.
B. S. PLUMMER, 18, Bread-street, London.



### FOSSIL BONES AND PSEUDO-COPROLITES (FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD and Co., Artificial Manure Manufacturers, Ipswich, Suffolk.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it

may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

4, LEADENHALL-STREET.—Mr. MECHI begs respectfully to acquaint such of his patrons as honoured him with their orders at the Great Exhibition, that the ARTICLES are now READY for DELIVERY. Those who were restrained from giving their commands by the regulations of the Royal Commissioners, which prohibited the withdrawal of goods from the building, are informed that the unsold portion of the splendid stock exhibited is now removed to 4, Leadenhall-street, where it may be inspected in the same unique glass cases which excited so much admiration. The well-known elegant show rooms of Mechi have thus acquired another attractive feature, and he solicits an early visit from intending purchasers, as well as from persons of taste who are fond of seeing the most superb manufactures advantageously displayed. N.B.—The usual extensive stock of dressing cases, desks, work boxes, tea trays, and papier maché articles; razors, strops, table and other cutlery, needles, &c.; bagatelle tables, affording an unfailing amusement on a wet day.

"PITTAR'S PATENT POCKET UMBRELLA," Manufactured only by WADDINGTON and SONS, 1, Coleman-street, London.—This most useful, perfect, and portable Umbrella, made under her Majesty's Royal Letters Patent, is of such a superior mechanical construction, that it is made to open and shut with ease and expedition; its length, when folded, is 13 inches, its diameter 1½ inches, and weighs only 14 ounces, and is rendered a perfect covering for the shoulders, without interfering with the hat. It can also, when extended, be used as a common walking Umbrella.

THE ROYAL EXHIBITION.—A valuable, newly invented, very small, powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from four to five miles, which is found to be invaluable for YACHTING, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses, with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly-invented preserving Spectacles invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

## SALES BY AUCTION.

FINAL SALE.—ISLINGTON.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Islington Nursery, about the middle of November (by order of Mr. G. Smith, in consequence of the Land being let for building), the remaining NURSERY STOCK, comprising Rhododendrons, Ghent and other Azaleas, Variegated and Green Hollies, several thousand Aucuba japonica, from 1 to 4 feet; fine Mulberries of different ages, many are fine bearing trees; also Arbor Vitæ, Mezereons, &c.—May be viewed prior to the sale. Catalogues had (6*d.* each, returnable to purchasers), on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, NURSERYMEN, FLORISTS, and Others.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Garvie to sell by Auction, on the premises, Maryland Point, Stratford, on MONDAY, Nov. 17, at 11 o'clock precisely, in consequence of the number of lots, about 500 DOUBLE CAMELLIAS, from 1 to 7 feet, beautifully furnished with bloom-buds, comprising all the approved kinds; also 3000 Ericas, in the finest condition; 400 very fine Dwarf Trained Morello, May Duke, and other Cherries; together with a quantity of Green Hollies, Spruce Fir, Laurels, Limes, Rhododendrons, Azaleas, &c. A capital Nest of 170 Seed Drawers.—May be viewed a week prior to the sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone, Essex.

GREENHOUSE AND HOTHOUSE PLANTS.
VERY RARE AND CHOICE RHODODENDRONS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. T. Whalley to offer by Auction, at Fairfield Nursery, Liverpool, on the following days, viz.:—TUESDAY, the 25th, WEDNESDAY, the 26th, and THURSDAY, 27th Nov., the whole of his valuable Collection of choice and rare RHODODENDRONS, including R. argenteum, barbatum, Falconerii, fulgens, Dalhousianum, Wallichii, and many other varieties figured by Dr. Hooker, and also from Major Madden's very valuable collection from Thibet, &c. Also a large quantity of fine and large Rhododendron hybridum, crossed with especial care from R. arboreum rubrum, arboreum album, campanulatum, cinnamomeum, zeylanicum, with R. alta-clerense, corriaceum, pictum, Victoria, &c.; also crossed with Azalea sinensis, Perryana, indica alba, &c., together with a fine stock of Azalea indica seedlings, Camellias, Pelargoniums, Calceolarias, Chrysanthemums, Lilium lancifolium, extra fine, and a large general stock of Greenhouse Plants. Above 200 Grape Vines in pots from eyes, Carnations, Pinks, Auriculas, fine Standard Dwarf and Moss Roses, Dahlias, and Herbaceous Plants. A large quantity of Standard and Dwarf Fruit Trees, together with Evergreens, and the whole of the Nursery Stock remaining unsold. Also a large Conservatory, four Hothouses, Frames, Handglasses, a large Iron Roller and Second-hand Mowing Machine, and sundry utensils in trade. Catalogues, with full particulars, may be had on the 17th, at the Nursery; the Seed Warehouse, 12, St. George's-crescent, Liverpool; from the Auctioneers; or free by post, on receipt of two postage stamps.

BRITISH AND FOREIGN STUFFED BIRDS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, Nov. 25, at 12 o'clock, an extensive and valuable collection of BRITISH BIRDS, stuffed and set up by an eminent naturalist, and comprising many of rare occurrence; also a few Foreign specimens, spiritedly grouped, in glazed cases, and under glass shades. A copy of Meyer's "Illustrations of British Birds and their Eggs" (coloured plates), and Albin's "History of Birds and Insects."—May be viewed the day prior, and morning of sale, and Catalogues had.

Important Sale of Large Timber, comprising 4423 Sticks of superior Oak, Elm, Ash, Beech, and Fir on the Thellusson Trust Estates, in the county of Herts.

MR. GEORGE FULLER is instructed to sell by Auction, at the Essex Arms Inn, Watford, on WEDNESDAY, the 10th of December, at 12 for 1 o'clock, under the direction of N. W. Senior, Esq., one of the Masters of the High Court of Chancery, a large fall of very superior Timber, of immense length and girth, comprising 900 OAK, 797 ELM, 695 ASH, 1362 BEECH, 300 FIR, 154 CHERRY, and 215 others, with their lot, top, and bark, now growing on the Thellusson Trust Estates in the parishes of Aldenham, St. Stephens, King's Langley, Bushey, Ellstree, and Rickmansworth, being within 14 miles of London, close to water carriage, and accessible by capital roads. The Timber may be viewed 14 days prior to sale, on application to the tenants, and catalogues had gratis at the Chambers of the Master Senior, Southampton Buildings, Chancery-lane; of Mr. George Fuller, Land and Timber Valuer, 4, Raymond Buildings, Gray's Inn; T. W. Budd, Esq., 33, Bedford-row; John H. Benbow, Esq., Stone Buildings, Lincoln's Inn; at the Auction Mart, London; of Mr. Whitley, the Bailiff, at Aldenham; the Red Lion Inn, Aldenham; Essex Arms, Watford; Swan, Rickmansworth; Great Red Lion, St. Alban's; Bell, Hemel Hempstead; Salisbury Arms, Hertford; the Western Hotel, Bristol; and George Hotel, Portsmouth.

GREAT SALE OF VALUABLE NURSERY STOCK, IN CONSEQUENCE OF A PORTION OF THE LAND BEING REQUIRED FOR BUILDING.

MR. J. RAWLINGS has received instructions from Mr. Adams, to sell by Auction, on the Premises, Kensington-road (opposite the west end of the Great Exhibition), on MONDAY, Dec. 1, and following days, at 11 o'clock each day, the whole of that extensive and unequalled Stock of large Evergreens, Ornamental Trees and Shrubs, comprising Green and Striped Hollies, Common and Irish Yews, Phillyrea, Alaternus, American and Chinese Arbor-vitæ, Aucuba, Common and Portugal Laurel, Cedrus Deodara, Cedar of Lebanon, &c., all of which are from 3 to 10 feet high. Handsome specimens of Coniferous Plants, including Abies, Pinus, Picea, &c., with large Thuja filiformis, Taxodium pendulum and nuciferum, 6 feet high. A splendid collection of specimens of about 60 species and varieties of Oak, such as is not to be met with in any other establishment. As also a magnificent tree of Salisburia adiantifolia, 20 feet high, and many other objects of interest and value, which cannot be enumerated in an advertisement.—May be viewed prior to the sale. Catalogues (1*s.* each, returnable to purchasers) may be had on the Premises; of the principal Seedsmen; and of the Auctioneer, 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MR. J. RAWLINGS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, Nov. 19, and following day, at 12 o'clock, about 1000 Pot-roots of Dahlias, comprising all the new and leading varieties (the property of a Country Nurseryman, declining their further cultivation), 1000 Waterloo, Grootvoorst, Anna Maria, Lord Wellington, L'Ami du Cœur, Grand Monarque, and other Hyacinths, Double and Single Tulips, Narcissus, Crocus, Jonquil, Gladiolus, &c., with a selected assortment of Standard and Dwarf Roses.—May be viewed the morning of sale, and Catalogues had at the Mart, and of the Auctioneer, 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.

FULHAM ROAD.—IMPORTANT SALE OF NURSERY STOCK.

MR. D. A. RAMSAY will submit to public competition at the Brompton Auction Ground, Fulham-road (one mile from Hyde Park corner), on WEDNESDAY, Nov. 19, and following day, at 12 o'clock, a large assortment of Ornamental Trees, Deciduous and Flowering Shrubs, Evergreens, choice Fruit Trees, Bulbs, a Market Cart, and other miscellaneous Nursery Stock.—May be viewed prior to sale, and Catalogues had at the principal seed shops, and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton, London.

Ten magnificent Orange Trees, abundantly set with bloom and fruit, 8 feet high; Double Camellias, Azalea indica, 600 Standard Roses (including 100 Geant des Battailles), Lilium rubrum, Dutch Bulbs, Fruit Trees, Shrubs, &c.

MR. HASLAM will sell, as above, at the Auction Mart, on WEDNESDAY and THURSDAY, Nov. 19th and 20th.—N.B. The Orange Trees will be sold on Thursday. The whole may be viewed on Tuesday next.

TO NURSERYMEN, HORTICULTURISTS, SEEDSMEN, AND OTHERS.

MR. MORLEY has to dispose of the LEASE of premises, 40 years of which are unexpired, at a low rent, together with the Goodwill, Fixtures, and Effects of a Nurseryman, producing a net income of 200*l.* per annum; also the Lease of the Ground, about one acre, well stocked with choice Greenhouse Plants. Is situate about three miles north of London, and contiguous to the intended Finsbury Park; has large Greenhouse, Hot-water Pit, Stabling, Sheds, &c. The whole will be offered upon very equitable terms, with immediate possession.—Apply to Mr. MORLEY, 1, Sidmouth-street, Gray's-inn-road, London.

RE EDWARD EVANS, NURSERYMAN AND FLORIST, A BANKRUPT.

MESSRS. CAFE AND REID will sell by Auction, by order of the Assignees, on the premises, the ARGYLL NURSERY, Paddington-green, on THURSDAY, Nov. 20th, and following days, at 10 for 11 o'clock precisely each day, on account of the number of lots, 10,000 Greenhouse Plants, including many very fine Camellias, Gardenias, Azaleas, and others of a rare description; 7 Greenhouses, 12 five, four, three, and two-light Frames, Pine and Melon Pits, Summer-house, 30 Casts of Garden-pots, Iron Roller, and Tools; a Horse, Cart, and Harness; several loads of Dung and Leaf Manure; also a few lots of Household Furniture.—May be viewed on Wednesday, and mornings of Sale. Catalogues had on the premises; also of P. JOHNSON, Esq., Official Assignee, 20, Basinghall-street; also of Messrs. DAVIES, SON, CAMPBELL, and HARD, Solicitors, 17, Warwick-street, Regent-street; and of Messrs. CAFE and REID, Great Marlborough-street.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

PARADISE NURSERY, HORNSEY-ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises, opposite the new intended Finsbury-park, or to Messrs. PROTHEROE and MORRIS, American Nursery, Leytonstone.

COMPACT FARM TO BE LET, NEAR ELY.

TO BE LET, by Private Contract, a Compact FARM, consisting of 150 acres of first-rate Land, with substantial Farm House and Farm Buildings standing thereon. The Farm is in first-rate cultivation, and consists of about 110 acres of Highland Pasture, Arable, and Fen Land, lying within a ring fence, and about 40 acres of Fen Land, detached. The Farm House and Homestead joins a good Turnpike-road, and the Ely Station of the Eastern Counties Railway, and the navigable river Ouse, are within a distance of two miles.

N.B. The Landlord will pay the Tithes and Drainage taxes.—For further particulars, inquire of Mr. MARSHALL, Solicitor, Ely.—Nov. 15.

TO BE LET, at Offenham, in the Vale of Evesham, close to a Station on the Oxford, Worcester, and Wolverhampton Railway, about 70 acres of the best LAND in the Vale. This will be Let for Market Gardening, either together or in Lots of not less than 5 acres.—For particulars, apply to Mr. GEO. AGG, Surveyor, Evesham; or Mr. W. WRIGHT, 27, King-street, Cheapside, London.

TO BE LET, at Christmas, a GARDEN, RESIDENCE, HOTHOUSES, &c., near Battersea-bridge and Steam-boat Pier, adjoining the residence of a gentleman, attention to whose Garden pays the rent. A Yard, with Counting-house and Stabling for six Horses, may also be had.—Apply, on the spot, Beaufort-lodge, Beaufort-street, King's-road, Chelsea, near London.

WANTED, in the West of England, a PARTNER, who has a thorough practical knowledge of the Nursery and Seed business, and who can advance about 1000*l.* A suitable man will be liberally dealt with.—Direct to P. C. A., Post-office, Bristol.

WANTED, A PARTNER, who can advance from 10,000*l.* to 12,000*l.*, to join one of the most extensive Collieries in Lancashire. The Mines are in full working operation, with Railway, Waggons, Boats, and everything complete. The coming-in Partner might either take an active part or not.—Apply to X. Y. Z., 7 and 8, Exchange, Arcade, Manchester.

Just published, price 10*s.* 8vo, cloth,

THE THEORISTS CONFUTED; or Practical Farmers Vindicated. With a Reply to Mr. Mechi—"Tiptree Hall Farm is a Settled Question."

By W. W. GOOD, Practical (Suffolk) Farmer.

"Much as our friend Mr. Mechi has been criticised and commented upon in various journals, and in the speeches of individuals at public meetings, we have never met with any remarks containing a tenth part of the searching criticism and merciless exposure of the fallacies put forward by him, as will be found in this volume."—*Mark Lane Express.*

"Mr. Good has studied the system of which Liebig is the representative, not only in books and laboratories, but in the midst of nature, under the exigencies of actual business."—*Athenæum.*

London: HOPE and Co., Publishers, 16, Great Marlborough-street; by whom Books, Pamphlets, Sermons, &c., are printed and published greatly under the usual charges. Authors will save considerably by employing HOPE and Co.

ORNAMENTAL PLANTING.

C. LODDIGES AND SONS most respectfully call the attention of Noblemen, Gentlemen, and Public Companies, engaged in Ornamental Planting, to the undermentioned List of TREES and SHRUBS, which they are enabled to offer at an extraordinary reduction in price (for cash only), the land upon which their arboretum is planted being required for building.

Fine trees, from 4 to 10 feet high, of the following genera, comprising a great number of species: Acer, Æsculus, Alnus, Amygdalus, Betula, Cornus, Corylus, Cotoneaster, Cratægus, Cytisus, Fraxinus, Meopilus, Populus, Prunus, Pyrus, Ribes, Robinia, Salix, Sorbus, Spiræa, Tilia, Ulmus, 4s. per dozen named, or a selection from the above, 25s. per 100 unnamed, and highly recommended for rough planting.

American Oaks in great variety, 10s. per dozen.

AMERICAN PLANTS.

Azalea pontica, fine bushy plants well set with bloom, 10s. p. doz.
,, Ghent and other varieties named, 18s. per doz.
Rhododendron ponticum and varieties (very fine), 10s. per doz.
,, campanulatum, 2 to 4 feet diameter, 10s 6d. to 42s. each.
Andromedas in collections, 18s. per doz.; Vacciniums ditto, 12s. per doz.

N.B. Packing will be charged as low as possible. Post-office orders made payable at Hackney.—Hackney, Nov. 23.

MAGNIFICENT SPECIMENS
OF
CONIFERÆ,
HARDY ORNAMENTAL TREES, SHRUBS, &c.

LUCOMBE, PINCE, AND CO., respectfully call attention to their fine, and perhaps unequalled Stock of well grown specimens, capable not only of producing great immediate effects, but also quite safe to remove to any distance, consisting of—

Arbutus Andrachne hybrida.
Arbutus magnifica.
Arbutus, scarlet flowered, *the finest variety.*
Abies Douglasii, 3 to 12 feet high.
Abies Menziesii, 3 to 6 feet.
Araucaria imbricata, 4 feet 6 ins. high by 5 feet through; *grand specimens.*
Æsculus smalus ferrugineus.
Biota glauca. *This is one of the handsomest of the hardy Coniferæ*
Purple Beech, 8 to 12 feet. *These are truly grand plants.*
Cedars of Lebanon, 6 to 8 feet.
Cedrus Deodara, 6 to 12 feet.
Cupressus macrocarpa, 5 to 7 feet.
Cupressus Uhdeana, 5 feet.
Cupressus Goveniana, 3 to 4 feet.
Fagus Cunninghamii.
Fagus betuloides, 3 to 4 feet; *the Evergreen Antarctic Beech.*
Garrya elliptica.
Hedera Rægneriana, *the new Giant Ivy.*
Holly, Black Irish.
Irish Yew, 8 to 10 feet. *These are extraordinary plants, unrivalled in size and form.*
Juniperus excelsa, 6 to 7 feet. *Truly magnificent specimens.*
Lindleya mespeloides.
Magnolia grandiflora, Exmouth var.
Myrica californica.
Oaks, Lucombe, 8 to 12 and 14 feet.
Oaks, Ford's, 6 to 8 feet.
Oaks, Ilex, 6 to 12 feet.
Oaks, Ilex macrophylla, 2 to 3 feet. LUCOMBE, PINCE, and Co's *new Ilex, the finest of all the Hardy Evergreen Oaks.*
Oaks, scarlet, 8 to 10 feet.
Pavia californica.
Pinus insignis, 3 to 15 feet. *The most ornamental, the most rapidly growing, indeed the finest Pine ever introduced.*
Pinus austriaca, the Austrian Pine, 2 to 8 feet.
Pinus Cembra, 3 feet.
Pinus tuberculata, 1 to 1½ feet.
Pinus muricata, 1 to 1½ feet.
Pinus Sinclairii, 4 to 5 feet.

"THE RANUNCULUS, How to Grow it," price 6d.; "HINTS ON THE CULTURE OF THE ANEMONE, SINGLE AND DOUBLE," price 3d., may be had of any Bookseller.—London Publishers: JACKSON and WALFORD.—Wallingford, Nov. 22.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.—JOHN ANDREW HENDERSON AND Co. have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21s. each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orleans Plum; when fully ripe are of a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

BEST LANCASHIRE GOOSEBERRIES, named, at 15s. per 100.

Also, APPLES, PEARS, CURRANTS, RHUBARB, &c., in all the best varieties, and at equally moderate prices.

Carefully packed, to carry any distance, or for exportation.

H. BIGLAND and Co., Manchester.

FEATHER GRASS.

WANTED, any quantity, if of approved quality. Sample, and price per pound, addressed to R. Y., Office of this Paper.

50 first-rate sorts, own selection, 2l. 10s.; or 15s. per dozen.

50 do. purchaser's selection, 3l.; or 18s. per dozen.

ERICAS, 50 of the finest sorts grown, own selection, 2l. 10s.; or 15s. per dozen.

,, ,, purchaser's choice from list, 3l.; or 18s. per dozen.

CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21s.; or 15s. per dozen.

,, ,, purchaser's choice, 1l. 5s.; or 18s. per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25s.; 50 fine for 15s.; 25 for 8s., post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.

CINERARIA, from the choicest sorts, per packet, 2s. 6d.

PANSY, do. do. do. 1s. 6d.

HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1s. 6d. FRUIT TREES.

GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4l., in 100 varieties; or 10s. per 100, in 50 varieties.

A selection of the choicest description for show, 4s. per doz.

The stock extends over 50,000, and is fine and free grown.

CURRANTS.—May's Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25s.; or per doz., 3s.

Black Naples, the finest black (no other sort grown), 12s. per 100, 2s. 6d. per doz.

Red Grape and Champagne, fine, 10s. per 100.

White Dutch, large and fine, 12s. per 100, 2s. per doz.

APPLES.—Fine clean Standards, 10s per doz., 70s. per 100.

,, ,, Dwarfs, 8s. per doz., 50s. per 100.

,, Dwarf trained superior kinds, 2s. 6d. each, or 24s. p. doz. The collection is very choice, from the Horticultural Society.

PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.

PLUMS and CHERRIES.—All the leading sorts, standards, 18s. per doz.

,, ,, Dwarfs, fine, 9s. per doz.

,, ,, Dwarf trained, 3s. 6d. each, or 36s. per doz.

APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5s. each, 50s. per doz.

RASPBERRIES.—Fastolff, 3s. per doz., 16s. per 100.

,, Antwerp Red, 2s. per doz., 12s. per 100.

,, Monthly, or Double-bearing, 12s. per 100, 2s. per doz.

STRAWBERRIES.—Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3s. 6d. per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to JOHN MAY, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

CEDRUS DEODARA,

For planting Avenues, single specimens for Lawns, or mixing with Fir and other plantations, grown from seed, either in or out of pots.

MAULE AND SONS respectfully inform Gentlemen about planting, that their immense stock of this most desirable Hardy Ornamental Tree consists of well-grown plants from seed, of all sizes, suited for the above purposes, which are offered by the dozen, hundred, and thousand, on moderate terms. ☞ Prices forwarded on application.

The curious in seminal productions will find by inspecting M. and SONS' Stock, many pleasing peculiarities of foliage in their present state of growth.—Stapleton-road Nurseries, Bristol.

TO RAILROAD CONTRACTORS, NURSERYMEN, &c.

RICHARD HARTLAND AND SON, NURSERYMEN, Cork, will deliver, free in London, Bristol, Liverpool, or Dublin, any quantity (over a hundred thousand), of Thorn Quicks, at the following prices, for cash:—

3 year-old, in beds (stout plants), per 1000 ... 2s. 6d.
4 do. ,, (transplanted), per 1000 ... 3s. 6d.
5 and 6 do. ,, ,, per 1000 ... 5s.

All orders addressed as above shall be promptly attended to.

RANDALL'S PROLIFIC RHUBARB.—In submitting the above to the public, E. R. begs to state, that while possessing all the qualities of Myatt's Linnæus, it is nine days earlier; of superior flavour; upright in growth, and producing large stems, all of equal size. Roots 2s. 6d. each. To be obtained of the principal seed-houses in London, and at EDWARD RANDALL'S, Loughboro' Gardens, Brixton, Surrey. Orders accompanied with a remittance will be promptly attended to.—N.B. The usual discount to the trade.

Also a choice assortment of IMPORTED DUTCH HYACINTHS, NARCISSUS, JONQUILS, &c. See our autumn Catalogue.

Goods free to London, or any station on the Ipswich and Bury line to Norwich; and with all orders of 40s. and upwards, extra plants presented gratis.

Remittances required from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or to STEPHEN BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

OTHELLO—NEW CARNATION CLOVE—now ready for sending out, at 5s. per pair, or 3s. per plant.—This will prove to be one of the finest and choicest ever offered to the public. It is the largest and darkest of its kind yet seen, and is of most powerful fragrance; the flowers are of an immense size, with long pod and fine rose-leaf petals, perfectly hardy, and will thrive well in any situation; it was the admiration of numberless spectators while in bloom during the season, and numerous orders taken for it. On the 9th August it was sent to the Editor of the *Gardeners' Chronicle*, and his opinion was given as follows: "A desirable dark Clove, with a strong scent, well worth cultivation." It is warranted to give satisfaction to all purchasers. Also a pure white Clove Carnation, 1s. 6d. per pair. Also the following, new:

BLACK WALLFLOWER—NEGRESS.—This is a new superb variety, and is superior to all others of similar kinds, the colour of which may be compared to that of a Mulberry when perfectly ripe; it has a fine large spike, is very handy, beautifully double, a most prolific bloomer, of very superior habit, and delightful fragrance; price 5s. per plant. Both of the above varieties only require to be seen to be grown by every one who has a garden of the smallest dimensions.

TILEY'S VIOLA ARBOREA, or Perpetual Tree Violet, true (see *Gardeners' Chronicle* of 1st November), large bushy plants, 6s. per dozen; smaller ditto, 3s. per dozen, or 1l. per hundred.

Double White Viola Arborea, do. do., 6s. per doz., fine plants.

Russian Superb (true), very fine, 3s. per dozen.

White Russian Superb (true), very fine, 3s. per dozen.

Each of the above varieties will be forwarded, postage and package free, to any part, on receipt of a Post-office order, or penny postage stamps to the amount.

Fine Giant Scarlet Brompton Stocks, 2s 6d. per hundred.

Also fine Antirrhinums, all saved from striped and spotted varieties, and will bloom next spring, 5s. per hundred.

Fine Sweet Williams, saved from 50 distinct varieties (strong plants), will bloom next season, 5s. per hundred, or 1s. per dozen.

Will be sent, hamper and package free, on receipt of the amount.—Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath.

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7s. 6d.
Extra ditto, with flowering buds ... ... 10 6

Usual discount to the Trade.

Clapton Nursery, London, Nov. 22.

H. LANE AND SON, Great Berkhampstead, Herts, having a very large stock of EVERGREEN TREES and SHRUBS suitable for immediate effect in making New Plantations, Avenues, &c., every plant forming a specimen, have selected, as a more ready guide, the following; the different varieties of which will be found under their respective heads in Catalogue of Trees and Shrubs:—

Arbor-Vitæ, 2 to 8 feet.
Arbutus, 3 to 5 feet.
Araucaria imbricata, 2 to 3½ ft.
Cedrus Deodara, 2 to 6 feet.
,, Libani, 2 to 5 feet.
Cryptomeria japonica, 2 to 8 ft.
Cypress, 2 to 5 feet.
Holly, Green, 2 to 4 feet.
,, Variegated, 2 to 4 feet.
Juniper, 2 to 6 feet.
,, Virginiana, or Red Cedar (splendid plants), 3 to 5 feet.
Kalmia latifolia, 3 feet.
Laurel, Common, 3 to 5 feet.
,, Portugal (fine), 3 to 5 ft.
Phillyrea illicifolia, 3 to 5 feet.
Pinus Cembra, 2 to 3½ feet.
,, excelsa (fine), 3 to 4 ft.
,, insignis, 2 to 3½ feet.
,, Pinaster, 2 to 3 feet.
,, Weymouth, 3 to 6 feet.
Abies Douglasii, 3 to 7 feet.
,, Hemlock Spruce, 5 to 7 feet.
,, Khutrow, 2 to 3 feet.
,, Morinda, 3 to 4 feet.
,, Menziesii, 3 to 5 feet.
,, *Spruce, 3 to 5 feet.
Rhododendron, 2 to 8 feet.
Taxodium sempervirens, 2 to 5 feet.
Yew, Common, 4 to 6 feet.
,, Irish, 3 to 7 feet.

* These, the Common Spruce Fir, in two varieties, the White and Black, are splendid plants, bushy, according to their height.

ROBERT M. STARK, Edgehill Nursery, Dean, Edinburgh, respectfully invites the attention of his friends and the public to his STOCK OF TREES, SHRUBS, &c., which comprises every article generally in demand, and is unusually healthy this season. Priced Catalogues of the following may be had on application:

Forest Trees, Shrubs, Hedging, and Underwood, new and showy Shrubs, Trees, and Roses, new or rare Plants, containing many interesting novelties; select Herbaceous Plants, with height and colour indicated; Alpine Plants, hardy Ferns and Aquatics.—Nov. 22.

"ESSEX HERO" CUCUMBER.

JOHN CHAMBERLAIN, after growing this splendid CUCUMBER three years, feels pleasure in introducing it to the public, feeling sure that it will give general satisfaction, especially those intending to exhibit. It is an abundant bearer (one of his plants last June had as many as 16 on it at one time, all handsome fruit); it grows from 20 to 27 inches long, very slender, short neck, dark green, black spine, holds its blossom well, and in every respect coming to the standard of perfection in a Cucumber. It has been exhibited by J. C. at eight horticultural shows, where it was awarded seven first prizes—five at Colchester; at Ipswich, July 3, 1851; and at Chelmsford, July 15, 1851; at which places he received orders for it from nearly every grower, especially at Ipswich. It is now ready for sale, in packets of four seeds, at 3s. 6d.; eight seeds, 5s.; or good strong plants, 3s. each pot, or 5s. the pair.

J. C. has an excellent Ridge Cucumber, a hybrid between the common Long Prickly and the Great Britain; as hardy and prolific as the common Prickly; for example, J. C. sowed two rows in the middle of May, 1851, on well dunged heavy land, 18 yards long and two yards apart, from which he gathered 206 seed fruit, from 12 to 18 inches long, besides a great number very handsome, fit for table, during harvest. Sold in packets of 12 seeds, 1s.; or large ditto of 48 seeds, 2s. 6d.

The following good old sorts may be had of him, seeds at 1s. per packet, or good strong plants from the beginning of November till the end of April, at 1s. 6d. each pot, or 12s. the dozen:—Sion House, Great Britain, Walker's Rambler, Roman Emperor, Phenomena, Kelway's Victory, and his own White Spine.

MELONS.—BROMHAM HALL (Green-flesh), and LORD GLENCOE at 1s. each packet.

The above Cucumbers and Melons were all seeded by J. C., and the greatest care taken to keep them true. If plants are sent by carriers or rail, 1s. extra is required for box and secure packing. A remittance must accompany orders from unknown correspondents.

JOHN CHAMBERLAIN, Great Horkesley, Colchester, Essex.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, will be happy to forward his new Autumn Catalogue (post paid), on application. It is also post paid throughout America, Austria, Belgium, France, Germany, Holland, and Prussia.

E. G. H. can supply plants of the following (for description see page 27 in the above Catalogue).

The New Raspberry Belle de Fontenay, 7s 6d. each; Weigela lutea, or Middendorffiana, 10s. 6d. each; Hesperis Matronalis Flora Plena (Double Crimson Rocket), 2s. each.

Tropæolum azureum, 2s. 6d. each; T. tricolor, 2s. 6d. and 3s. 6d. each; T. Hockerianum (true), for winter flowering, fine, 3s. 6d. each.

Cremont's Perpetual Strawberry, 1s. each, or 9s. per dozen.

EARLY FLOWERS, adapted for Blooming In-doors, and in the Borders in the Winter and early Spring.—The undersigned beg respectfully to intimate to the nobility, clergy, gentry, and the public that they have imported a choice STOCK of DUTCH and other FLOWER BULBS, of the finest possible quality, and take the liberty of offering the following assortment for 10s., viz.—Half a dozen best Hyacinths for glasses, half a dozen good Hyacinths for pots, 50 Crocuses (four separate colours), 50 large double Snowdrops, half a dozen double Van Thol Tulips, half a dozen early Van Thol Tulips, one dozen double white sweet-scented Narcissus, half a dozen double Jonquils, one dozen winter Aconites, 25 splendid mixed Tulips, one dozen beautiful mixed double Anemones.—CLARKE and Co., Seedsmen and Florists, 86, High-street, Borough, about 30 doors from the London-bridge Railway Terminus.

WANTED, to Rent, either in the vicinity of London or in any part of the country, a GARDEN, with a good range of Glass, adapted for Forcing, &c. The most satisfactory reference can be given.—Apply, pre-paid, to A. M., Post-office, Exeter.—This Advertisement will not be repeated.—Nov. 22.

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their Descriptive Catalogue, with the treatise on the "Cultivation of American Plants," can still be had by enclosing six stamps for postage.

Gentlemen requiring the services of a Landscape Gardener can procure such by applying to the Advertisers.

Bagshot, Surrey, Nov 22

MESSRS. J. MYATT AND SONS have a Stock of the VICTORIA or RABY CASTLE CURRANT, and can supply good strong Plants at 25s. per 100; extra strong, 2 years old, 5s. per dozen. Also, a good Stock of 2 years planted Rhubarb roots.

MYATT'S LINNÆUS ... ... 10s. per dozen.
MYATT'S VICTORIA ... ... 10s. „ „
MITCHELL'S ROYAL ALBERT

Smaller 1 year planted Roots, at 50s. per 100.

Manor Farm, Deptford, Nov. 22.

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH.—ESTABLISHED 1786.

WILLIAM E. RENDLE AND CO., NURSERYMEN *and* FLORISTS *to her Most Gracious Majesty the Queen, have a* LARGE SURPLUS STOCK *of* TREES AND SHRUBS *more than they require for their usual sale, and will be sold at very low prices.*

*** For prices, see front page, Nov. 1, 1851, of this Paper.

*Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees is just published, and can be obtained for one penny stamp.*

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.

BASS AND BROWN beg to refer to their Advertisement of CHOICE GERANIUMS, in the 2d page of each number of *Gardeners' Chronicle*, of Sept. 27th and Oct. 11th. The plants are exceedingly fine and vigorous. With immediate re-potting, they will make good specimen plants for exhibition next season, with abundant blooms, and will be found very cheap. They also, in the same Advertisements, beg to refer to their select list of NEW PLANTS. Also NEW CHRYSANTHEMUMS, AZALEA INDICA, &c., of which they have a choice assortment, strong and vigorous, and offered at low prices.

12 splendid Stove Plants, for winter and early spring flower, for 20s. 12 beautiful Greenhouse Plants, for do., 15s.

Catalogues on application. Goods free to London, or any part of the Ipswich line to Norwich, and extra plants, gratis, for orders of 40s. and upwards. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

A COMPLETE ARBORETUM.

C. LODDIGES AND SONS beg to state that they are now supplying the above, comprising upwards of 1200 species of TREES and SHRUBS, correctly named, for 50*l*., cash on delivery; and as their collection of hardy plants will have to be dispersed this season, in consequence of the land being let for building, they most respectfully suggest that all persons contemplating the formation of a COMPLETE ARBORETUM should make early application, as the stock of some species is very limited.—Hackney, Nov. 22.

"PINUS AUSTRIACA,"
THE BLACK AUSTRIAN PINE.

LUCOMBE, PINCE, AND Co., have now on sale a large stock of very fine, healthy, strong plants of this truly desirable Pine, from 9 inches to 2 feet high, which, having been frequently transplanted, are very well rooted, and consequently quite safe to remove to any distance, and are of a superior quality (great attention having been paid to their cultivation); price from 20s, 40s., to 50s. per 1000. They have also some of larger sizes, from 3 to 6 feet high, equally safe to move, owing to proper attention having been paid to their roots, at proportionately higher prices.

This noble and most serviceable Pine thrives in bleak and exposed situations (even in poor soils), growing rapidly, and producing dense shelter, in places where other trees will not grow. It also succeeds admirably close to the sea, resisting there the spray and rough-st winds.

Exeter Nursery, near Exeter, Nov. 22.

**The Gardeners' Chronicle.**

COUNTRY SHOW.—Wednesday, November 26: Newcastle-on-Tyne Chrysanthemum.

THE appearance of BOYD'S Self Adjusting Scythe, as represented in our advertising columns, must have attracted the attention of our readers. We have received from Mr. BOYD a specimen of one of his contrivances, whose novelty consists in its being capable of being set, without the assistance of a blacksmith, to any angle that may suit the requirements of the workman who is to use it. The blade and handle are those of the common scythe, and it is therefore to the means of fixing the two together, that we have to direct attention. This consists of an iron band, attached lengthwise for 4 or 5 inches to the under side of the handle, immediately at the end of which is a joint, kept together by a screw and nuts, that moves horizontally inwards or outwards, and from this joint a square iron arm, about 3 inches long, reaches the heel of the scythe, which is furnished with an eye through which a flanged screw is passed into the circular flattened end of the small arm just alluded to. By these means the blade is attached firmly to the handle, and the cutting edge can either be set high or low, as may be required, while the upper joint permits the blade to be fixed in or out of the square, as suits the kind of work to which it is applied; all the implements required for these operations being a small key for screwing off and on the nuts.

We have had this scythe, fixed as above described, tried in our own garden; but it was found that the upper joint could not be made fast enough to keep the blade steady without the assistance of a Grass hook, and the latter, in addition to other inconveniences, would not permit the heel to be sharpened sufficiently well to render it capable of cutting short Grass with advantage. This circumstance induced Mr. BOYD to substitute a cogged joint, *i. e.* having a ratchet and key or tooth, so as to prevent the joint moving outwards; and now the invention answers perfectly, and is a very important improvement on the common scythe, inasmuch as it can be set on the spot in a minute or two, and to the greatest nicety, by the workman who is to use it. When the time and trouble required to set a new scythe, or the rendering an old one capable of being used by a second mower, are taken into account, the value of Mr. BOYD'S contrivance will be apparent; and we strongly recommend it for trial by the mowers of lawns. For hay it may be found too weak in the neck; but for short Grass it is sufficiently strong, and perfectly efficient.

IN the early part of the spring we gave a short account of some curious experiments, of M. VILLE, on the direct absorption of nitrogen by growing plants; these researches (which seemed to indicate that, to some extent at least, plants are able to absorb the nitrogen of the air in its separate and uncombined state, and therefore that they are not entirely dependent on ammonia and nitric acid for the supply of that important element) led to the publication of a second series of experiments, by MM. CLOEZ and GRATIOLET (p. 147). These gentlemen, without giving any minute details of the mode in which their experiments were conducted, stated that their results were in accordance with those of M. VILLE, and that they had arrived at the conclusion, that plants in growing, as it were, respire a certain quantity of nitrogen; that is to say, that they constantly exhale a small quantity of that gas, and that they languish and die if they are placed under circumstances in which they are unable to absorb a fresh supply of it, to replace that which is thus continually being given off. We did not at the time think the arguments of these authors conclusive or satisfactory, but as the subject is one of very great practical importance, we looked forward with a good deal of interest to the publication of further experiments and observations, on the absorption of nitrogen by plants. Recently MM. A. and W. KNOP have to some extent confirmed the observations of CLOEZ and GRATIOLET, or at least confirmed their experiments, for it does not by any means follow that the conclusions drawn from them are correct.

In these new experiments, there is one point of interest entirely opposed to the results of CLOEZ and GRATIOLET, and which appears to throw a good deal of light upon some parts of the subject. It will be remembered that these experiments are somewhat complicated, inasmuch as the plants which are the subjects of experiment are growing under water, and, therefore, in circumstances considerably different from those of ordinary land plants. CLOEZ and GRATIOLET found that when a cut piece of Potamogeton stem was exposed under water to the influence of light, gas was given off from only one of the cut surfaces, namely, that which was nearest to the root of the plant; this result is not confirmed by the experiments of MM. KNOP; they found that the evolution of gas, at either the upper or lower cut surface of the piece of stem, did not depend on its relation to the root, but, on the contrary, depended wholly on the known laws of hydrostatic pressure, the gas always being given off from that surface which was uppermost, and which was, therefore, least affected by the weight of the water in which it was plunged. In fact, the general result of their experiments appears to show, that under such circumstances, when plants are plunged under water, whether entire or cut in pieces, the evolution of gas is not so much regulated by the peculiar construction and direction of the cells and intercellular passages of the stem, as by the different degrees of resistance to its evolution, presented by the various degrees of pressure to which the surface of the plant is subjected. Hence, also, they are led to conclude, that the evolution of gas from such plants, when they are cut or wounded under water, does not prove that a similar evolution of gas is constantly taking place when the plant is in a sound and healthy state, but only results from the diminished pressure to which the gas in that part of the plant is subjected; it escapes from its weakest part—that part in which it is least perfectly confined.

These observations of MM. KNOP, which seem to have been carefully conducted, therefore fully justify the remark already made, that such experiments are far from satisfactory, and that it is not safe to deduce, from investigations of this sort, where plants are placed under forced and unnatural conditions, any general laws respecting the growth of plants. It is shown that under the peculiar circumstances of the experiment, plants do really absorb air through their leaves, which passes downwards towards the roots; but it is at the same time also shown, that this downward current of air is not a healthy function of the plant, but results entirely from the unnatural conditions in which it is placed. The main question remains just as it was before any of these experiments were published; for, even granting that the constant absorption and emission of nitrogen were proved, it would yet remain to be shown in what manner this is connected with the growth of the plant; for if it is only the case that plants absorb, and subsequently give off, the same nitrogen, and do not permanently retain, or assimilate any of it, the importance of free or uncombined nitrogen will not be proved; and we shall have to fall back again upon the old theory, that plants can only assimilate nitrogen when it is in a state of combination.

IN a late number of the "Botanische Zeitung," there is a notice by SCHLECHTENDAL to the effect that the Director of the Botanical Garden at Vienna has taken occasion of the publication of the annual Seed Catalogue to append a leaf containing a list of such species as have been received from other Botanical Gardens under incorrect names, and that he has made up his mind to adopt the same plan himself in future. So many difficulties are attendant upon such a practice, and so large a staff of scientific gardeners and professors, with all the accompaniments of a first-rate library and herbarium, for the accurate determination of every object under cultivation, that we do not think it probable that it will be very generally adopted. It is still, however, a step in the right direction, though one which cannot be fully carried out, in our own country at least, notwithstanding every wish to do so, till the more influential classes of our body politic have far more correct notions than they possess at present, of the importance of the less showy parts of natural science. Unfortunately, the taste of the present time is too much in keeping with such superficial views, but we still have hopes that better things are before us, and that the success which has attended the formation of the museum at Kew, within a space of time entirely without example in the history of such institutions, will in the end lead to some general results which may make that garden not only the first establishment of the kind beyond all comparison within the universe, which undoubtedly it is, but also a school of Botany equally without parallel.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No 39)

No. LV.—"If we be rightly instructed," as the gentlemen of the long robe say, our observations about the starling, magpie, parrot, *et hoc genus omne*, are unanswerable; inasmuch as no person will come forward to prove that these creatures do or can *understand* what they say.* How then *can* they "reason" about what they do not understand? The idea is absurd. Let us look upon this point as settled. There still remains for us to consider the claims of the Mocking-bird, and the "Talking canary;" of which, anon.

We have been asked, if we ever saw the head of a bird dissected,—and whether we ever examined the cells containing the brain? Most assuredly we have; and we most readily grant (what indeed ought to be all that can be required of us) that it is a beautiful contrivance of Nature so to furnish as much brain, and no more, than can answer the wants, requirements, and perfect happiness of each one of her 'gifted' family. Ever since we first made Natural History our study, we have dwelt upon these bountiful provisions of Nature with the fondest enjoyment. The reward attending such pursuits is inappreciable. But to return.

The mocking bird, though we *have* lately so "run him down," is a magnificent "improvement" on the parrot tribe. His brain gives evidence that his powers are great. He is highly gifted by Nature to enjoy himself, and the "organ of Mirth"† is the exact size of his head. Thus, his talent, or *forte*, lies in one thing *only*,—mimicry. To this end was he born; well has he fulfilled his mission. Hear how faithfully he is described by his biographer, WILSON,—an authority to whom all must bow, who love truth. "The instinct of this bird," says Wilson, "is peculiar to himself. He whistles for the dog; Cæsar starts up, and runs to meet his master. He squeaks out like a hurt chicken; the hen hurries about with hanging wings and bristling feathers, 'clucking' to protect her

* A correspondent reminds us, and we well remember the circumstance, that some years since a parrot in the Westminster-road was taught to utter *three consecutive words*. On *one* occasion, Polly repeated her lesson to admiration. Her master (a fishmonger) having demanded 2*s.* 6*d.* for a pair of soles of an intending purchaser, the latter made answer, "I'll give you 1*s.* 6*d.*" "Go to Bath!" shouted Poll. Whether the person addressed *did* go so far, we never heard tell.

† In phrenological parlance,—"The Organ of Imitation."

injured brood. The barking of the dog, the mewing of the cat, the creaking of the passing wheel-barrow, follow with great truth and rapidity. He repeats the tune taught him by his master, though of considerable length, fully and faithfully. He runs over the quiverings of the canary, and the clear whistlings of the Virginia nightingale, or red bird, with such superior execution and effect, that the mortified songsters feel their own inferiority, and become silent; whilst *he* seems to triumph in their defeat by redoubling his exertions." Did any one bird, in particular, do this; and were it not a natural gift *universally* bestowed upon *all* this tribe—none would acknowledge sooner than ourselves that there was an instance of "reason" produced. But alas! it is surely *not* so. *Ex uno disce omnes.*

The talking canary, our readers may remember, uttered the words very distinctly, "Pret-ty Jane!" and "D-e-a-r Mary!" Let us kindly imagine that some pretty, lovely faces, whose fair owners rejoiced in those endearing names, had by their witcheries taken their favourite's heart by storm. We have *one* instance on record of an "unlikely animal" having been heard to speak,—let *this* be recorded as *another* deviation from the general rule, caused by a "great occasion." This bird, be it known, was fairly worried to death in the course of a few weeks. Sometimes, he *would* lisp out the names of his two favourites,—sometimes, he would *not*. He would appear to have disapproved of "one shilling entrance" being charged, for strangers to listen to the burden of his song. He fell sick, was sent to Brighton for change of air!—a real fact—and there he died. One week previous, the sum of 100 guineas was offered for him,—and refused. Whether THIS bird had the gift of "reason," or not, WE will not say. Let our kind, but only half-converted readers, have the benefit of the doubt.

There could not perhaps be a more fitting season than the present, for us to enter our strongest protest against the excessive "tales of Wonder and Imagination," connected with animals, that from time to time find their way into print, to the great and serious detriment of science and truth. Let it ever be borne in mind, that even Truth itself becomes positive falsehood, *if it be presented in any other than its right relations.* There can be *no* truth but the whole truth! Whatever is recorded contrary to the law of Nature in any animal, and impossible to be traced to any sound principle connected therewith, must be regarded as apocryphal. It is just as impracticable for us to become acquainted with a perfect knowledge of animals, from popular and highly-coloured anecdotes and stories, as it would be to obtain an insight into human nature from the lavish outpourings of friendly partiality and parental fondness. A firm conviction of this truth, always induces me to relate nothing but what I can corroborate,—none but literal facts.

We might pursue the inquiry for ever, without getting at any result different from what has been already gained; and as regards our favourites, the birds, we have now cited almost as many cases as are required for proof of their allotted share of "instinct." However we shall, in our next chapter, introduce from our own personal observation, a very beautiful illustration of that Στοργή concerning which we have already spoken. It will satisfactorily establish *the truth* of all that we have already advanced; and it will prove, moreover, how good, how kind, how omni-present is that Being, 'who hateth nothing that he has made, but delighteth in the work of his own hands.'

"There is a special Providence in the fall of a sparrow,"

and it is delightful to watch how this Providence protects every member of her family,—from the minutely-small fluttering humming-bird to the enormous towering eagle.

There is *one* bird that appears strangely *un*natural,—the ostrich, who lays her eggs in the sand, and then incontinently leaves them to be hatched by the rays of the sun. In *this* bird, the Στοργή, or excess of natural affection, does *not* exist. "To justify the ways of God to man," it is remarked of the ostrich in the Sacred Oracles, that "she is hardened against her young ones, *because God hath not imparted unto her understanding.*" We should like to examine the brain of the ostrich, and see wherein it is different from that of other birds. We feel persuaded there would be *something* gained by the investigation, for—"Wisdom is justified of *all* her children." *William Kidd.*

## FOREIGN GARDEN GLEANINGS.

VEGETABLE MARKETS, BERLIN.—Market gardening is by no means in so advanced a state in Prussia as in France, and the vegetable markets of Berlin are far inferior to those of Paris, although the latitude of the two towns is nearly the same. At the time we left Paris, Cos and Cabbage Lettuces, Carrots, Cabbages, Broccolis, Mushrooms, and Asparagus, were abundant; and two months afterwards at Berlin we could only find a few Cabbages, Cauliflowers, and badly-grown Lettuces; on the other hand there was an abundance of roots of the the preceding year, an abundance of preserved Potatoes, but few new ones, large French Beans, and immense Turnip-rooted Cabbages, of which we brought away several specimens. Three months later Paris is in the third season; Berlin is only in its second season. The following were the principal vegetables at that time to be found in the markets; red and Portugal Cabbages, Swedish Turnips, Spinach, Sorrel, and considerable quantities of Cucumbers, grown on hot-beds, according to the custom in the north; many Melons, and especially Cantaloups; Purple Onions, Potatoes, Radishes of all sorts, few Lettuces, Artichokes and Cauliflowers. It seems not to be the custom to eat Haricots and Peas before the seed begins to ripen. The following are the principal fruits in Berlin: Cherries, Plums, early Pears, Apples, Peaches, the two sorts of Currant, a few Strawberries, and, lastly, plenty of Pine-apples, cut and in pots. The price of fruit and vegetables is about one-tenth less than in Paris.

FLOWER MARKETS OF BERLIN.—Florists abound in Berlin, but they are inferior as a class to those of Paris. We twice examined their markets, and were satisfied that their plants were, as well for variety as for elegance, decidedly inferior to those found in the French capital. That taste which is so remarkable in the French flower markets, is not to be found in Berlin. The prices are much the same in the two towns. We had almost forgotten the Pinks, of which Germans are so fond. Their favourite flowers are the varieties of Celosia, the red and yellow Cockscomb, and what we call bicolors and tricolors, and most charming effects are produced by the contrast of these plants. Myrtles and Pomegranates are more in demand in Berlin than in Paris; the latter especially, which are kept from flowering until the winter, are used for interior decorations. We wish the French florists would introduce into their own country Humea elegans, which so well deserves its name.

The Berlin florists do not, like the French, expose their flowers for sale in elegant shops; they place them on the floor and on each side of the steps leading to the store, which is nothing more nor less than a cellar; this method has, in our opinion, great advantages both in winter and in summer. *Masson's Report.*

## Home Correspondence.

*New Strawberries and other Fruits.* — The love of novelty and the love of money are truly prevailing characteristics of the age we live in, and the increase of these passions in a proportionate ratio is every day apparent in high-sounding puffs of advertisements, which are constantly victimising the public—not only those who are mere amateurs, but even those who are thoroughly initiated in the art and mysteries of gardening. There are few who follow out this pursuit with spirit but have been taken in more than once, twice, or thrice, by giving long prices for articles inferior to those they were previously in possession of. I speak feelingly, and I am quite sure that my case is not a solitary one. I think that the establishment of the Floricultural Society is in its sphere a great boon to the public. Henceforward, flowers which will not bear the ordeal of that association's censorship will not be purchased. Well would it be if an association could be formed of respectable nurserymen and gardeners, to decide upon the merits of new fruits; each kind to be sent for their inspection at least twice in the course of each of two successive seasons; they would probably exhibit them under favourable and unfavourable circumstances, and the verdict of such a body would be invaluable to the purchasing public. Individual opinion on such matters is not sufficient, however honourable, high-minded and far removed from suspicion the censor may be. The Josling's St. Alban's Grape was a proof of this; a verdict of superior excellence was pronounced upon that fruit by a well-known individual, to whose integrity I need not add my humble testimony. But it proved to be nothing but Chasselas Musqué, a Grape which everybody had been growing for years. In Strawberries, my experience has not borne out the assertions made respecting some of the kinds. I do not find the Black Prince worth culture, and have long dispensed with it. It is certainly early, but not earlier than Grove-end Scarlet; less productive, and not so fit for the cook and confectioner, on account of its colour. In the dessert, it will not be patronised at a season when large dinners, routes, and balls can be furnished with British Queens, of which everybody must make "two bites." As a late sort, it has no value with me, but probably if forced and turned out, it would, like other kinds, yield some late fruit. The Goliah Strawberry in like manner is with me acid, insipid, coarse, very large, and a shy bearer; instead of being superior to the "British Queen," it is as much inferior to that excellent kind, as the Queen of the Sandwich Islands would be in comparison with our august Sovereign; the Bicton White was another kind only valuable for its colour. If your readers refer to the Journal of the Horticultural Society, they will there find much such an estimate of the "tremendous bearer" and "superior to British Queen," kinds as I have experienced. I for one will buy no more new Strawberries from merely advertised descriptions. Myatt's Eleanor has been by some parties described as of "fine flavour;" it may, I think, prove valuable for preserving, but it is disagreeably acid for the dessert; it will, however, be useful, on account of its lateness. Myatt's Globe is a good and useful Strawberry, but not equal to Eliza or British Queen. Myatt's Mammoth is only worth growing for display; it is magnificent in appearance, but horrible in flavour. Prince Arthur will prove useful; it is, as the late Mr. Wilmot said of it, "as hard as a cricket ball," and will bear packing well. Unquestionably the British Queen is the best kind in cultivation, producing a good crop, if liberally treated, equal to any in size, and superior to all large kinds in its deliciously sub-acid flavour; being at the same time free from the coarse woolly texture which pervades all the former race of large Strawberries derived from crosses with the Chili Pine. *J. Henry Bailey, Nuneham, Oxford.*

*Orchids at Chiswick.* — I was glad to find that the Council of the Horticultural Society had in part adopted the suggestion I made some time since in the *Gardeners' Chronicle*, viz., encouraging the exhibition at their great shows, not only of collections of Orchidaceous plants remarkable for their good cultivation, viz., large specimens, but also collections of smaller plants. I feel assured that this will lead to the furnishing greater variety of these plants at the coming shows, and that many will be induced to send who may not have such specimens as are in the collections of Mr. Hanbury, Mr. Warner, or Mrs. Lawrence. I think it may be well that you should explain this to your readers, as many may not have understood the effect of the Society's programme. I understand that some object to the smallness of the prize offered for their collections inferior in size; but I do not think that many having plants to show, will be deterred by such a reason from exhibiting their collections. I assume that it is more the honour and credit, as cultivators, that induce collectors or their gardeners to send, than the mere amount of the prize to be gained. *Dodman.*

*Unusual Growth of a Potato Crop.* — A tuber of a favourite sort of Potato, the "Farmers' Glory," was planted late last spring, on the top of a heap of decayed leaves, that had been collected about three or four months, and were but slightly decomposed, and situated in a sheltered and shaded spot behind a Vinery. About Midsummer, the top showed extraordinary vigour, having made about a dozen strong and very lengthened shoots, trailing over the surface of the leaf-heap, some of which ultimately attained 7 feet, others 8, and one or two even 9 feet in length. On the 27th September, whilst still in a state of active growth, and having even a few flowers remaining, the top was cut off, and, including all main stems and side shoots, which were very numerous, it measured 396 feet, and weighed 24 pounds. As anticipated, the growth underground was very disproportionate to that above; the tubers, 32 in number, weighed but 2¼ lbs., and most of them were very small. Twice during the summer, about three gallons of strong liquid stable manure was given to the plant. There does not appear to be any practical value in this statement, and the object in recording it is merely the preservation of a physiological phenomenon, in the extraordinary development of the leaves and stem above ground, and which would appear to have been chiefly owing to a somewhat elevated temperature of the soil, from the slow decomposition of the leaves, and the attendant evolution of carbonic acid and ammoniacal gases, though the liquid manure would, doubtless, contribute an important share of stimulating nutriment. It may be added, that the tuber was a very large one, having weighed, when first raised from the ground, 24 ounces; and it had remained exposed to the light in my study from that time to that of its planting. Another tuber of the same sort, and raised at the same time, weighed 32 ounces, and both were grown in a field-crop. *G. Lloyd.*

*Fumigators.*—It has been suggested that iron tripods supporting deep basins or pans, with holes in them, to allow a current of air to pass through, should be used for holding the fire on which is placed the tobacco or tobacco paper for fumigating plant houses, &c. These would be found very inexpensive, and would quite supersede garden pots, which are generally used for the purpose, but they are not at all suitable, as the heat causes them to crack and fly about in all directions, causing accidents, and being the occasion of much loss and damage to the plants. *W.*

*Cryptomeria japonica.*—I quite agree with the writer of the paragraph at p. 710, who says that this interesting Conifer will form one of the chief ornaments of the pleasure-grounds and park scenery, if due attention is paid to the soil and situation in which it is planted. A wet place must be scrupulously avoided, for plants never thrive in it; while on dry ground, with well-ripened wood, although under ordinary circumstances peculiarly susceptible of frost, they will be found to resist its attacks. In 1848 I received a plant 3 feet high, from Messrs. Knight and Perry, for which I selected a soil rather rich and porous, thoroughly sheltered from the north and east winds, which I consider more injurious to the plant than any other. It has retained its original healthy colour, and is very promising, being now 9 feet high, 17 feet in circumference, and regularly branched from bottom to top. About two years ago I planted six smaller ones, within a mile of that just described; but they succeeded so badly that I have taken up those of them which were most exposed to the north-east winds, and planted them in partially sheltered situations. I remember seeing a Cryptomeria last winter, not 12 miles from here, planted in wet heavy soil, lying due north, and it looked as if it was quite dead. At present the glory of the park is a Taxodium distichum, which measures 66 feet high, and 12 feet in circumference, at 3 feet from the ground. Have any of your readers seen a larger one? *R. Lynch, Port Eliot Gardens.*

*Bleeding Beech Trees.*—What can I have done to put a stop to a disease which is making great ravages amongst our Beech trees? The bark splits perpendicularly for a foot, or perhaps 2 feet, and then the sap streams from the wound, blackening the whole side of the tree, which eventually bleeds to death, standing as if struck by lightning, with two or three of these deep fissures at each side. The soil is a light loam above, and stiff yellow clay below. All other forest trees thrive well, but the Beeches are gradually dying in the manner just described, and there will soon not be one

left in the place, unless some remedy can be applied. I may state that the gardener tells me that some of the Plum trees in the garden had the same disease some time ago, which he cured by applying yellow clay and manure to the roots; but he does not think it would do for the Beech trees. *J. M. E., Dublin.*

*Tree Leaves.*—It is a common thing for gardeners interested in the orderly appearance of "their grounds" to complain about the length of time the leaves hang on the trees this year—this complaint has been made by myself and others year after year; and though there are seasons in which Nature's operations in this respect are brought sooner to a close than in others, yet, on the whole, the difference is less than is often supposed. I cannot, however, help thinking that this season some counteracting agency must have been at work to retard them, as they are certainly 10 days or a fortnight later than last year; why they should be so I am unable to say; the fine weather we had in August and September and up to the middle of October, ought, in my opinion, to have ripened them, but such is not the case: that process is now performed in a forcible manner by the "hard weather" which we are just experiencing, and yet the Elm leaves hang on with a pertinacity that would appear to set ordinary frosts at defiance—but it is remarkable what effect that all-powereful agent has on some kind of trees. I have noticed Horse-chestnuts, not more than half denuded, to be completely so the morning of the first severe frost, their foliage lying in a mass as if raked together. It is singular that frost should have the power of detaching the petioles of this, and not those of other trees, from the incipient bud; but after all we shall not get the whole of the trees stripped so early as last year, though it may be accomplished about the same time as it was in 1849. *An Old Gardener.*

*The Season in the far North.*—I have been somewhat surprized to find the frost so severe in the south, as to enable people to fill their ice-houses; for here, about Fochabers, there has not been sufficient lowness of temperature to kill the Dahlias. There were showers of snow and hail on the 2d and 3d inst., but in sheltered places the Dahlias and Hollyhocks are nearly as fine as they have been all the season. Hybrid Perpetuals and Bourbon Roses are still opening their buds, and the common Chinas are flowering profusely. Potatoes are a good crop in this quarter, and generally free from disease. *J. Webster, Gordon Castle.*

*A Prolific Potato.*—One tuber weighing about 8 oz. was cut into eight sets and planted in the spring of last year; the produce raised last October, free from disease, was planted this spring; the produce this year, just dug up, without cutting or pulling the tops off till the beginning of October, amounts to 3½ sacks, weighing 698 lbs., with only 6 or 8 slightly infected with the prevailing disease. The quality is very good, but much better later in the season. The sort is a Red Kidney. *J. Alloway, Tattingstone House, Harkstead.*

*New Manure.*—We beg to inform you that this summer we have used the new patent Kopros, prepared from nitrogenous matter in combination with superphosphate of lime, and we find it very excellent, causing the plants to grow rapidly but robustly, and turning the foliage to a beautiful dark green colour; it is altogether well adapted for plants generally, but for those grown in pots it is invaluable. *J. Weeks, and Co., Chelsea.*

*The Cuckoo.*—I am very much surprised to find Mr. Kidd again asserting that the female cuckoo utters the well-known cry of the male; he might just as well assert that the female nightingale sings, for the cry of "cuckoo" is the *song*, and not the call-note of the bird; both sexes have the latter in common, but the song is peculiar to the male, and I distinctly affirm that the female *cannot* utter "cuckoo." The throat of the male is capable of great distension; and when singing, this part is swelled out as large as a hen's egg; but the throat of the female is incapable of similar distension, and, as a matter of course, she cannot produce the same sound. There is not the least difficulty in distinguishing the sexes when dead, by the structure of the throat. I must also express my utter disbelief that the cuckoo, under any circumstances, feeds its own. *Ruricola, November* 18.

*Thoughts in relation to a Theory of Vegetation.*—Reading in your paper respecting the sleep of plants, certain opinions which I have entertained for many years as to the moving cause which starts and sustains vegetable life, press themselves upon me; and I solicit the privilege of laying them before your readers, in the hope that they may find sympathy from some one who thinks for the pleasure of thinking. My theory is this, that the same cause which causes the ebb and flow of the tides, also originates the infancy of vegetable life—carries it forward to maturity, and afterwards conducts it back to decay. In other words, my opinion is, that the infinite variety of vegetable life which we see, results directly from the operation of a primordial law of the universe, which in the language of astronomy is called gravitation, and in that of chemistry affinity or attraction; that the light and heat of the sun perform a very secondary part, indeed, in first originating, and afterwards sustaining vegetable life; that these may be compared to the smiles and caresses of a mother upon her infant, which are indeed necessary concomitants of its health and happiness, but do not sustain its growth and vigour. My theory resolves itself into this; that vegetation is a process analogous to that of crystallisation regulated and controlled, accelerated or interrupted, matured or destroyed, by the law of a continually varying gravitation. This theory is suggested to my mind by the following reflections:—1st. The moon exercises an influence upon vegetable life of the same nature as that which the sun exercises.—2d. The tides of the ocean are due to the joint influence of the sun and moon; they happen twice in the day. They vary as to time and degree, because the joint influence of the sun and moon is a continually varying quantity. The tide of vegetation happens once in the year; being chiefly dependent upon the sun's annual periods, it is less susceptible of his daily ones. Nevertheless, these are not altogether imperceptible, as in the case of the sleep of plants, and of the phenomena of the Passion-flower. The moon's monthly periods are still more perceptible, as is witnessed by every farmer at full moon in the accelerated growth of his plants, and in their speedier ripening at harvest during the same monthly period. But it is the sun's annual periods that mark themselves most distinctly upon the vegetable creation. For no sooner does he begin to ascend in the heavens, in the middle of winter, than vegetation also prepares to start; and shortly after he has attained his annual meridian, vegetation ceases to make further efforts, and the juices of plants are matured into fruits, or fall back again into decay. The fruits of autumn may be compared to the produce of the secrets of the deep, which occasionally float upon its surface, and are either cast out upon the beach or swept back again by the receding tide.—3d. A belief in the influence of moon and planets upon vegetation has been more or less prevalent in all ages. In ancient times it occupied so prominent a place in popular belief, as practically to influence cultivation. It is only in these latter times, when the evidence of things not seen exert so little control over the human mind, that the notion of planetary influences has been classed among opinions which characterise an infantine state of mental attainment. Surely Sir Isaac Newton, who sought to trace the influence of the planets upon the destiny of mankind, could not be sceptical of their influence upon vegetation. But which of us now cares about knowing the ordinances of Heaven? To which of us now do the sweet influences of Pleiades convey an idea of good or evil? Or what man out of all our enlightened guides of modern public opinion would attach any value to the bequest of a blessing "of the precious things put forth by the moon."—4th. The fame of Sir Isaac Newton is associated chiefly with the discovery of gravitation by the fall of an Apple. But what was it that raised the Apple? Might it not be a modification of the same law? The law is the same for apples as for plants. We know that it is one and the same law which causes the ebb and flow of the tides, their motions being occasioned in the same manner, as we may make the beam of a balance to move either way by the transposition of one of the weights. We know that every particle of matter obeys the law of gravitation; and we know also, that all particles do not obey it equally. Let us conclude then, that this balancing between the earth and the heavens takes place with regard to every particle of matter. In a change of substance there will originate a necessity for a change of position, and change of position will again necessitate a change of substance; so that, by the simple law of gravitation, modified by the motions of the heavenly bodies, we have a source of constant activity kept up on the surface of our globe. If we have evaporation obedient to the call of the heavens, and the dew and the rain acknowledging subjection to the earth, why not also admit that the juices of the Apple are carried up by the influence of the same law which occasions the rise of the tide and the ascent of vapour; as we acknowledge that the Apple itself, when in a state of maturity, falls in obedience to the same law which occasions the descent of a drop of rain?—5th. What is it that supports the Rose which I now see in the air? The law of gravitation, according to the popular notion of that law, is fearfully hostile to it; it threatens every moment to crush the flower in ruin upon the earth, yet there it hangs, a beautiful emanation from the earth, and held in momentary equipoise by the law of gravitation. It is as a snowflake upon the great river of vegetation, a "moment white, then lost for ever." What is the resemblance between the growth of a Rose tree, and the ascent of vapour? Both ascend towards heaven in an imperceptible manner, and in an attenuated form. By the law of gravitation, the particles of vapour agglomerate and fall in rain upon the earth. In obedience to the same law the juices of the Rose tree ascend. So long as vegetation is young and vigorous, these juices take the form of leaves, and spread themselves out towards heaven. But so soon as these juices are matured, they take the form of seed or fruit, and become pendent towards the earth.—6th. It has often been a matter of curious speculation with me, to ascertain the reason why the fall of forest trees should be so frequent in March, when they expose so little resistance to the blast and so rare in summer, when they expose so much canvass in the shape of leaves for the wind to act upon. We cannot account for it, but by supposing that the leaves contribute to give stability to the tree in the same manner as its fins contribute to give stability to a fish in the water. The leaves are of the air in the same sense as the flakes of crystallisation are of the solution which contains them. Being of the air, they take hold of the atmosphere in the same manner as the roots, being of the earth, take hold of the soil. A little acid dropped into a solution of certain salts will give no inapt outline of a tree in the full pride of vegetation. But the resemblance is not confined to the appearance—the processes of formation in both cases have a family likeness. At first we have in both cases thin substances waving uncertainly in the element which sustains them. By-and-bye an agglomeration takes place. In the one case crystals are formed, in the other fruit is formed, and in both cases the results are deposited in obedience to the law of gravitation. A drop of water pendent from the extremity of an icicle resembles the fruit of the Vine, and a bunch of Grapes may be compared with the stalactites of a cavern. It might be curious to trace the effect of motion upon the conditions required by the law of gravitation. An arrow, a race-horse, a swift flying bird, a swift swimming fish, and a fast sailing boat have all a similar configuration, to enable them to accomplish the purposes for which they are formed. Perhaps it is giving too much latitude to the imagination to suppose that the same conditions impose the necessity of a similar configuration upon the fast growing Poplar; or that this is the reason why all plants elongate chiefly during the period of accelerated vegetation. *J.R.*

*Quick (Thorn) and Fruit-tree Planting.*—I have read with interest the numerous articles written by Mr. Cuthill, and amongst them that on the preparation of land for forest trees, &c., which I think good. But I cannot speak so favourably of his observations upon the cutting of young Quick hedges. Mr. C. says they should not be cut down till the second year after planting. Now, what would be the result of such a practice? Why, a dwindling, miserable plant the first year, and little better the second. The method generally practised is to cut down close to the ground at the time of planting; this I consider objectionable, as it deprives the young plants of too many leaf-buds at once, which are indispensable agents to call the roots into action. My plan is, to plant at the usual time, but not to cut down till the young buds are fairly started, say the beginning of May. The operation is then easily accomplished with a pair of strong shears. By this method, the roots are called immediately into action, and by reducing the tops to a few buds, they are enabled to send up strong shoots the first year. Mr. C. also remarks on the planting of fruit-trees, and seems to infer that they should not be headed down at the time of planting. Now, according to physiologists, and "practicals," the head of a tree should always be reduced in proportion to its roots, at the time of planting; this operation is, however, not often attended to with the care which it deserves. My practice is merely to lighten the head, by cutting back the extreme points to other well-placed shoots. By which means the top may be proportionately reduced, and, at the same time, leaving a good supply of buds, to call the roots into action; and the result is a healthy growth the first season, whereas, on the other hand, by leaving the top entire, the result is a great proportion of dead shoots, and those which are alive are miserable, half-starved things, each contending for a portion of support, which the roots, from being overdrained by an unequal head, are unable to supply them with. As to Mr. C.'s hints respecting Roses, it certainly would be bad practice to cut down at the time of planting. My plan is to leave the heads until the sap is in motion and the buds beginning to start, at which time the operation may be performed with safety. *Wm. Cox, Strensham Court, Nov.* 19.

*How to Crop a Small Kitchen Garden* (see p. 726.)—I have to thank "Vectis" for answering my questions, but it still appears to me that by his mode of cropping, the greater part of our most useful vegetables must be banished from the garden altogether, such as Brussels Sprouts, Broccoli, Cauliflowers, Spinach, &c., as no allowance is made for them, and he evidently does not grow them, or he would have had no occasion to say he had only Cabbage sprouts now, when he ought to have Cape and Walcheren Broccoli, Borecole, Brussels Sprouts, and Spinach. I do not see how these could be grown by his system of cropping without interfering with the rotation next year, as he could not well avoid having one of the Brassica tribe on the same spot where one of the same family grew this season, a circumstance which it seems to be his chief aim to avoid. Now if he can afford to dispense with these useful vegetables, I can assure him I cannot, and I think that the generality of your readers will be of my opinion. I stated that he had made a step in the right direction, because I feel well convinced that if cultivators of small gardens wish to grow every kind of vegetable usually grown in larger ones, they must adopt a system of placing one crop between another, as open ground is not always at command—a system which I pursue on a large scale; but before anyone can adopt such a plan with success, they must well understand the nature of the vegetables they wish to cultivate, which knowledge is only to be obtained by years of practical experience, or else by receiving instructions from one who has had such experience, without which they would be liable to fall into extremes, either by placing their crops at such a distance that no ground would be saved thereby, or else they would put them so near that one would spoil the other. *J. Steel, Clitheroe, Nov.* 19.—In my former article on this subject at page 726, after "I certainly only at present have the sprouts from the Cabbages," read *and a good crop of Broccoli.* This was omitted to be mentioned by me last week. *Vectis.*

*Glass for Horticultural Purposes.*—We all remember the time in which most garden structures were glazed with the old-fashioned common glass, with its undulating surface, and opaque appearance; after that came crown glass, first in large squares, and then in small ones, and to such an extent did the small square mania rage some 20 years ago, that a glazier's bill presented a formidable array of figures for squares put in; this mode continued with but little variation up to the period when sheet glass came into use, and I believe Mr. Paxton was about

the first to introduce the "long square" system, so very common at the present day. Well then, the removal of the duty on glass gave a new impetus to the sale of the article; and the inability of the manufacturers to meet the demands of the trade for a time kept the prices up, which led to an extensive importation of foreign glass of an inferior kind; and no doubt our own manufacturers, in their anxiety to compete with the foreigner in low prices, commenced making a similar bad article, which, finding a customer in the hothouse builder, on account of its cheapness, has led to most of the complaints we have heard about sheet glass, burning or scorching, whichever it may be called. Now, having had a good share of experience with all the kinds of glass mentioned above, and also once with a house glazed with coloured sheet glass (of which I shall speak hereafter), I have no hesitation in stating, that where sheet glass of good quality is used, and a sufficient ventilation provided, and attended to, it will never burn or injure the foliage of plants that will endure sunshine through any other kind. I have two pits, each 90 feet long, and a house of 50 feet, as well as some others, all glazed with sheet glass in squares of about 2 feet long, by 8 or 9 inches wide; and since they were put up three years ago, I have never observed anything in the shape of burning; true, I have at times in hot weather shaded Melons a little, but their health did not require it, as I never did so until their fruit was set. I have likewise fully exposed Pines, and I never observed a leaf of my Vines to flag in the hottest day of summer; in fact I consider the flagging, scorching, and other complaints laid to the charge of the sheet glass, to apply only to that of an inferior description, or what is more likely, to some other cause altogether; as for instance, defective ventilation, want of robust health, or something improper with regard to culture. In saying this much, I am by no means blind to the many cases in which sheet glass has failed to give satisfaction, but there might be much fewer, if every thing tending to good cultivation were present at the same time; and I would strongly advise those intending to build new houses, to pause and inquire before they too hastily introduce this new-fashioned "rough plate." I can hardly regard it in any other light than a retrograde movement; resembling as it does the old-fashioned "under duty glass of our grandfather;" its principal merit is what I would call its principal fault, it obstructs the light, rather than diffuse it [No, no], and for most purposes we have none too much of that necesary auxiliary to forcing in England. But as I have not tried it [We have], I would prefer the evidence of those who have, and if they who have had it in use a year or two would just tell us the condition it is now in, that would also enlighten us in the matter, as I cannot but think its rough surface must become exceedingly dirty in time [No], and eventually obscure more than its originators intended, independent of its bad appearance. There is nothing connected with gardening of more importance than glass; it enables us to enjoy the beauties of tropical climes (modified to a certain extent), and also furnishes our tables with the produce of more favoured lands, or that of our own at a time in which we could not obtain it without such assistance; everything, therefore, relating to that useful article must be of the greatest interest to the horticulturist, and so I make no apology for calling the attention of your readers to the subject. *An Old Gardener.*

*Heating by Hot-water Pipes.*—Mr. Corbett, of Downton Castle, has explained to me a method of heating hothouses, which had long suggested itself to him, and which he has put in practice in the warming of some recently erected for Mrs. Acton, at Acton Scott. He states that it answers to his fullest expectation, and from his account I think that it is likely to supersede every other plan, and ought to be made generally known. It is cheap, economical in fuel, and expeditious in raising and keeping up the desired temperature. This method is simply that of placing a piece of round wood in the inside of each length of piping, with studs, at equal distances, to keep it in the centre. The pieces of rounded wood being of such diameter that there will be about half an inch of water only in circulation throughout the whole length of the pipes. Wood may probably be the fittest material to place in the inside of the piping, being a non-conductor of heat. It may be well to state, that a 4-inch pipe contains 12½ inches of water in every inch in length; therefore, a piece of wood, 3 inches in diameter, will take up, or occupy, 7 inches of that pipe, leaving only 5½ inches for the circulation of water. *John Mearns, F.H.S.*

*Common Hardy Bulbs.*—I have for some time noticed the absence of many of the old common hardy sorts of garden bulbs, which, 20 years ago, were to be seen in greater abundance than they are now; I allude more especially to gardens of the middle and lower classes of society; their absence has not certainly been replaced by better things—were it so, then, the circumstance might be allowed to pass over unnoticed. I have settled in my own mind that one of the reasons of their disappearance is, their continual liability to be destroyed in digging or turning over the ground when their tops are not to be seen above the surface. Labels may be put where they are to be found, but these, from many causes, are often lost or get misplaced. Now, to avoid this, I have thought of a plan which I think would be very likely to prevent this, at a very trifling cost; it is as follows:—Get some of the common garden pots from 7 to 10 inches deep, rather straighter than they are generally made, but having no bottoms to them; place this pot in the earth up to the rim (or cover the rim altogether if you object to its appearance above ground) in this pot plant your bulbs, of whatever kinds they are, and I should think they would flower better, or at any rate quite as well, as if planted in the common way; when digging or turning over the ground it is obvious that they could not be injured, as the spade or fork striking against the side of the pot would give notice directly of the fact of the bulbs being close at hand. The cost of these pots need not be more than one penny each, and they would last for many years; and another advantage would be, you could give the bulbs a soil congenial to themselves, and different to that around, with a little trifling extra care and trouble. As I was passing the Bethnal-green-road, nearly opposite Abbey-street, the other day, I accidentally came across something of the sort of thing I am speaking of; it was a pot without a bottom to it, and it had a hole in the side. The object for which these were made was to raise seeds and various things, and which, by putting a piece of glass over the top, formed a cheap description of hand-glass; the price of the article was 1½*d.* each (size, about 7 inches deep, and 5 inches across the top); these articles might be turned to very useful purposes. I am going to give them a trial. *A. Burgess, Hackney.*

*Epidendrums.*—What is the species of Epidendrum mentioned in a former *Chronicle*, as figuring at the Horticultural show in China? I presume it is E. Chinense, which is very sweet, and blooms in winter. What is the particular green variety alluded to? Is it grown in this country? *Dodman.*

*Ivy on Brick Walks.*—An Ivy mantled wall is at all seasons of the year a subject of admiration to most beholders, and to lovers of the picturesque it must be a matter of interest to point out cases where its uninjurious effects on brick structures are manifested. The north wall of my residence has been clad with this beautiful climber for 30 years past, and three weeks ago, owing to neglect of timely clipping, a heavy gale tore down a breadth of 24 feet, disclosing, however, no hollow bricks, or creviced mortar joints, but a surface smooth as a deal floor; the bricks are of a soft nature, and the house an old one; at the south side of which, where no Ivy has been planted, the bricks (all out of one kiln) are for the most part crumbly and uneven. The north (Ivied) side of the house has been always perfectly free from damp, and I consider, contrary to the opinion of your correspondent, at page 725, that the roots of the Ivy absorb moisture from the wall, and undoubtedly, from the position of the leaves wrapping one under the other, it shoots off rain drops as effectually as does the thatch of a roof. *H. H.*

*Performances of a Thrush.*—Some three or four years ago, my gardener caught a young thrush, full grown and fledged but unable to make its escape over the wall, by reason of its being drenched by a thick drizzling rain then falling. In the course of the early part of the ensuing spring, the man being ill and confined to his bed, I went to see him, and during my visit I inquired how long they had had the robin which I heard singing. To my surprise, I was informed that it was the thrush, and on going over to the cage to satisfy myself, I observed him with his head downwards, and on one side, and his tail depressed, uttering the low warble of the robin, in precisely the attitude of one. The owners did not seem to think it extraordinary, because, as they said, he had been hung up where there were plenty of robins to teach him. But his acquired accomplishments did not end here, for, a few days afterwards, I heard him sing the notes of a linnet; besides which, I was told (though I never was favoured with an opportunity for establishing the fact by my own ears), that he occasionally crowed in imitation of a cockerel, but with what success I cannot say. This bird is still, I believe, in the possession of its captor's widow, and should any of your readers desire to know more on the subject, I will make inquiries. *J. F.*

*Coe's Golden Drop Plum.*—I have been an extensive grower of this excellent variety for years, and in my opinion it is not perfectly ripe until it has commenced to shrivel. It certainly may be eaten before that time; but, to my taste, it is not so richly flavoured as when it is slightly shrivelled. *W. Lewis.*

*Broccoli.*—About 40 years ago a Neapolitan vessel was driven on shore on the western coast of Cornwall, and the gentleman to whom the vessel was consigned sent me a packet of Broccoli seeds. I raised a crop from them in my garden, near Falmouth; they proved to be a green sort with very close heads, and averaged a full yard in circumference; the flavour was peculiarly fine, and, after the heads were cut, side shoots sprang from the stumps, which being planted produced heads equally fine. I grew them for or five years, and then, by my gardener's neglect, lost them. I have in vain endeavoured to procure the sort from our English seedsmen. Three years since I requested Mr. Knight, of the King's-road, to procure me some of the seed from Naples, but he forgot the commission. I venture strongly to recommend this sort as superior to any of the present fashionable ones. The plants I had were of the green kind. *John Gould, Amberd, near Taunton.*

*Plant found in a covered up Coal-pit* (see p. 694).—I have waded to the neck in water hundreds of feet beneath the surface of the earth, with an oil lamp stuck in my cap, in search of specimens of Rhizomorpha, and found them many yards in length; but I do not think that the plant that was found descending the old pit was one of that genus. I should be inclined to say that it was a blanched braken or Fern (Pteris aquilina). I met with a fine specimen of the same species of plant about a month ago, growing in a wood; it had forced its way through brushwood and was waving its decompound frond, like a small Palm tree, above its neighbours. When pulled up and laid upon the ground it measured 11 feet in length. So you see that the same kind of plant will push its way through difficulties, whether they are under the earth or above it. *Peter Mackenzie, West Plean, Stirling.*

## Societies.

LINNEAN, *Nov.* 18.—R. BROWN, Esq., in the Chair. Part of a paper was read by the Assistant Secretary, "On Two New Genera of Plants," by J. Miers, Esq. The first genus described belonged to the natural order Eriogoneæ. After criticising the structure of the order and its relation to Polygonaceæ, and assigning his reasons for placing these orders near to Caryophyllaceæ and Portulaceæ, the author described the new genus under the name of Tetraraphis. The only species was T. spiculata, a plant growing on the eastern side of the Cordilleras of the Andes. The genus was named from the four long spines of the involucre. A letter was read from Mr. J. Hogg, of Norton near Stockton, giving an account of the ripening of the Grapes of a Vine in the open air in his own garden. The latitude is 54° 35'. The Vine had been previously cultivated in a hot-house, and was placed out in the open air for destruction. Specimens of the leaf and flower of Victoria regia, and of the fruits of Cucumis prophetarum and Momordica charantia were presented by Mr. Robert Marnock. A collection of objects of natural history exhibited at the Crystal Palace, from Van Diemen's Land, were presented by Dr. Milligan, Secretary to the Royal Society of Van Diemen's Land. They consist of necklaces formed of a species of shell belonging to the genus Eleuchus; "native bread," a species of fungus, the Mylitta australis; gum from the Acacia mucronata; Kino from the Eucalyptus, and Blood-juice from an unknown plant, with a collection of several specimens of wood, from trees growing in Van Diemen's Land. The President observed that the catalogue of the Tasmanian collection at the Great Exhibition was, both for the accuracy and extent of the information it contained, the best that he had seen. Mr. Adam White exhibited specimens of lead from the lining of a cistern which had been bored by a small beetle (Anobium striatum). The specimens came from Dr. Gilbert of Harpenden. Mr. White mentioned other instances in which various species of Coleoptera had bored into lead. The object in all these instances seemed to be to effect an escape.

CHELTENHAM HORTICULTURAL AND FLORAL ASSOCIATION.—At a late meeting of this Association, the following alterations in, and additions to the existing rules, were proposed and carried: Ordinary members to consist of four classes, namely, annual subscribers of two guineas, one guinea, and half-guinea, and life members, donors of five guineas; the first to be entitled to 20 tickets, and to have three votes at all elections; the second, nine tickets, and two votes; the third and fourth, four tickets. Honorary members to be entitled to the privileges of the second class of annual subscribers. The omission of those portions of the sixth, seventh, and tenth rules referring to an extra show, to exhibiting in two classes, and to possession of plants two months before exhibition. Non-subscribers to be admitted for 3*s* 6*d.*, if tickets are purchased three days previous to the exhibition, and 5*s.* on the day. The altering of the present name of the Association to that of the "County of Gloucester and Cheltenham Horticultural Society."—*Cheltenham Journal.*

HAMMERSMITH CELERY SHOW, *Nov.* 18.—The annual exhibition of Celery was held on Tuesday last, at the Thatched House. About 25 heads were produced; they were mostly of a white kind known as "Lidgard's Own." The 1st prize for three heads was awarded to Mr. Lidgard, the 2d to Mr. Ashton, and the 3d to Mr. Green. It was imperative that each head should weigh at least 5 lbs., without root or "sprue," and that it should be well grown and blanched. The winning nine heads weighed 60 lbs.

## Notices of Books.

*A Treatise on the Cultivation of the Chrysanthemum.* By William Ivory, Gardener to the Rev. George Chetwode, Chilton House, Thame, Oxon.

WE have just received a copy of this excellent treatise on this useful autumn and early winter flower. Our readers will recollect the favourable account which was given of Mr. Ivory's Chrysanthemum growing, in our number of the 25th of April last. Since the appearance of that article, Mr. I. has been induced to give his experience in the form of a small pamphlet, from which we venture to make a few extracts. Speaking of "blindness," he says, "it is of the utmost importance to have the cuttings of a moderate growth and size, not the coarse flabby-leaved ones, similar to those produced from deep suckers; but such as are produced from the old stems just beneath the surface, which are firmer in their texture, and strike more freely. Indeed it is of the greatest moment to secure this condition, for success depends more upon securing plants of uniform growth, and so preventing their going what is called 'blind,' than upon anything else, as I have many times proved. Last season was a noted one with growers, inasmuch as great numbers of plants went blind. Some attributed the defect to one cause, and some to another; but I am satisfied that selecting improper cuttings has more to do with it than any other."

In addition to the state of the cutting, however, we are of opinion that undue stimulation of any kind will have the effect of causing "blindness" faster than anything else. The soil Mr. I. uses for the first potting is equal parts of loam and leaf-mould, with a little sand. In potting for the last time in the middle of July he uses 8-inch pots for blooming them in, with soil of three parts loam and one part rotten dung, placing only one piece of crock at the bottom of the pot for drainage. After the plants are stopped and the pots filled with roots, so soon as the side shoots are two or three joints in length, he gives them, for the first time, some weak

liquid manure, prepared by mixing either a bushel of sheep droppings or soot in a large tub of water, which must be well stirred up and then allowed to settle; he then well dilutes it again with soft water before using it, which is two or three times a week, but not oftener. Respecting thinning, Mr. I. says:—

"So soon as the side shoots are three or four joints long, look them over and reduce them to the number required. Such kinds as Annie Salter, Queen of Yellows, Defiance, L'Ange Gardien, and all with similar free habits, I allow from 12 to 18 shoots; if very fine blooms are required, thin them out to 12; if a larger number are desirable, they will carry 18, but which of course will be smaller; these plants look very beautiful when properly sticked out: such kinds as the Duke, Clustered Yellow, Queen of the Gipsies, Formosum, and Nonpareil, from 10 to 12 blooms.

"It should here be observed, with regard to those late kinds, the cuttings of which were directed to be put in by the third week in May, are also to be potted and stopped each time in advance of the early sorts, as the shoots require longer to mature themselves. In thinning out the shoots, leave them equally distributed, so as to form a handsome uniform plant; if suckers appear from the bottom, stop them just above the soil, as they may be useful after a time, in case a few of the bottom leaves go off. The Queen of Yellows is liable, after stopping, to produce two or three very strong shoots from the top, and grow quite away from the lower ones; these strong shoots must be removed as soon as they appear—if not, they will spoil the plants quite. I recommend to grow several plants of Vesta, Pilot, Nonpareil, and The Bride, where convenient, they being four of the finest ever raised, are distinct colours, and of good habit."

One of the chief features of Mr. Ivory's system of culture is the treatment of the plants after they are housed, when the weather begins to set in wet or frosty. He says:

"At this time, in most gardens there are empty Cucumber and Melon pits, or Vineries; now in those pits where a moderate bottom-heat (from 65° to 70°) can be secured, is just the place for them, to be plunged to half the depth of the pots—which heat is to he maintained until the buds begin to expand, or until the first week in November. The effects of the pots being full of firm sound roots, the bottom-heat, and dry air, will soon be perceptible. Before plunging the plants let the surface of the soil become quite dry, so that if bad weather sets in, the foliage will not be choked with damp, nor will mildew attack them, which is sure to be the case when surrounded by stagnant moist air. In watering the plants after plunging, be careful not to wet the surface of the soil in which they are plunged; I have proved the importance of attending to this. Give plenty of air day and night, only exclude from frost and rain both the foliage and buds, the last named in particular; for if wetted now, they are apt to be one-sided. In plunging, give plenty of room, and if in pits have the lights off as much as possible. At all times endeavour to secure a circulation of air; if this is not done, the foliage cannot prepare food for the bud, the footstalk becomes weak and lank, and the leaf turns yellow. Where bottom-heat cannot be secured, set the plants out thinly in houses, and by all means keep the air dry and moving, watering the roots at all times with water at from 65° to 70°, which will in some measure answer the purpose. Without bottom-heat I have never been able to produce blooms anything like in point of size and form, as with it. Those kinds which come semi-double in a usual way, will come perfectly double under this treatment; indeed, in all kinds it forces the centre out, so as to form a perfect flower, approaching in size and form a first-rate Dahlia. When the plants are plunged, lift them up now and then, as, if they root through the bottom, those roots in the pots will become inactive and die. As the centre of the blooms begin to come up, withdraw them from the heat gradually, and stick them according to taste. Many kinds are better left as they grow, unless intended for exhibition, when they must be secured to prevent bruising; but plants grown in this way, in a few weeks (the shoots being of equal strength, able to support themselves, clothed with foliage to the bottom, and 18 or 20 inches in height), are very different to manage, and move from place to place, to the naked lank things too often seen. If, in any stage of growth, mildew attack them, which is generally on the under side of the leaf, fill a common dredging-box with flower of sulphur, turn the plant upside down, then dredge it, and let it remain on; it will prove a safe and sure stop to its ravages, which, if neglected and allowed to spread, will certainly spoil the foliage. When the blooms are fully expanded (which they will be after the middle of November), keep the roots rather drier than usual, watering them in the morning; by this treatment the blooms will remain perfect for five or six weeks. I have had some kinds quite fresh up to the beginning of January."

Having treated of the management of the plants in detail, he concludes with the following *multum in parvo*:—

"Put in the cuttings from the middle of May to the middle of June, have all potted off by the middle of July, have them all placed in the blooming pots by the first week in August, and all stopped within the first 10 days of August; let all the plants be plunged into bottom heat (where convenient) and protected from wet and cold, by the middle of October, and if all goes on well, they will be in bloom by the middle of November; so that the whole time occupied, from commencing with the cuttings to the time of their being in full bloom, is about 20 weeks."

Such are some of the more interesting points of a treatise, the persual of which in its extended form we heartily recommend. We understand that Mr. I.'s plants are now in splendid bloom, and well worth inspection. They average from 18 inches to 2 feet in height, and have 12 blooms to a plant, as large and perfect as a Dahlia. Some idea may be formed of their size when it is stated that one can barely span the blooms over, and they are beautifully up in the centre.

---

*Fly-Fishing in Salt and Fresh Water* (Van Voorst), contains good directions for making artificial flies, and useful practical advice to fishermen who visit Ireland, especially as regards sea fly-fishing, and the preparation of winter flies. The author assures his readers that he has fished "on 365 days in the year, excepting, of course, on Sundays!"

---

*Layard's Popular Account of Discoveries at Nineveh* (8vo, Murray), is another of Mr. Murray's valuable contributions to "Reading for the Rail." The work is very skilfully condensed by the author, and will be most acceptable to those who have found his larger work inaccessible. It is illustrated with capital woodcuts and plans of excavations.

## FLORICULTURE.

Breaking Tulips.—Owing to the remarks made in the *Chronicle* of November the 9th, I am induced to make a few observations on the raising and breaking of the Tulip. I confess that the rectifying of Tulips is an interesting and "splendid mystery." But I think their variegation is really and strictly the consequence of poverty, as manuring or rank growing demonstrates beyond all doubt that such an injudicious process renders flowers once light and fine in strain, heavy and badly run. I as well as others have often been both deceived and grieved in my purchases, by only adding a name to my collection and not a variety. The only charitable construction I could put upon it was that the breeder had been broken by different individuals, at different periods, and at different places unknown to each other, each giving it a name, the consequence being that one variety being broken at different places and periods, received many names. Fifteen years ago, or thereabouts, I commenced raising seedling Tulips on the following plan, one I would strongly recommend to all who think of immortalising themselves by adding something really good to what we already possess in the Tulip. It is as follows: Early in the spring I sow my seeds in shallow boxes or pans of sandy earth. As soon as the young plants appear to change in the foliage, I take them all carefully out of the box, planting each little bulb exactly 6 inches apart, in a bed already prepared for them. Here they are marked and entered in my memorandum book, in the following manner:—

| | | | | |
|---|---|---|---|---|
| | | 1830. | | |
| No. | 5000, | from Polyphemus | ... ... | 50 roots. |
| — | 5001 | — Triumph Royal | ... ... | 100 do. |
| — | 5002 | — Surpass Carafalque | ... | 609 do. |
| | | 1831. | | |
| — | 5003 | — Pearl Brilliant | ... ... | 10 do. |
| — | 5004 | — Madame Vestris | ... ... | 225 do. |
| — | 5005 | — Strong's King | ... ... | 110 do. |
| — | 5006 | — Juliet | ... ... | 311 do. |

By this I find I have in two years added 1415 new seedlings to my stock. My object in using such high numbers, is to prevent jumbling the numbers placed at seedlings with those of my general collection. In the place where I first plant, exactly 6 inches apart, I never remove them from it, until they bloom and exhibit qualities worth taking notice of. By this method I prevent any possible mixture by annually re-planting. But the greatest point gained, is the facilitating their breaking, by remaining so long in the same place, as the breeder colour appears by excess of poverty to be more readily extracted, leaving what we call a rectified flower. As a proof of this, I have broken several, or rather, I have had several beautiful things broken, when first they showed bloom, that was on the fourth or fifth year from seed. There is one fact which I have to make known, hitherto, as far as I know, unknown to all Tulip raisers. It has been so clearly demonstrated to me, that I cannot allow the floricultural world to be ignorant of it; it is, that in preparing one of my seedling beds along the side of a line of Apple-trees, say at 6 yards from tree to tree, opposite and close to the roots of these trees, the number of flowers broken the first time blooming was so striking, when none, or next to none, were found in the intermediate spaces, that I could not overlook it, and therefore I at once concluded, with others of my friends, to whom I pointed it out, that poverty was undoubtedly the grand secret in Tulip breaking. *William Willison, Flowergate, Whitby.* [Thanks. Yours is just the kind of information we want.]

---

Stoke Newington Chrysanthemum Exhibition.—If ever the merits of a gorgeous, and for its season of blooming, unrivalled flower, were prominently and successfully established with the public by the energy of "the few," that flower must be the Chrysanthemum; and those "few" who have brought this pre-eminence about, it must be admitted by all, are the founders of the Stoke Newington Society, whose triumphs arrived at the very summit of perpetual fame by the productions last Thursday, submitted for the gratification of an immense assemblage, in numbers larger than hitherto known, not only from the immediate locality, but the neighbouring counties of Essex, Kent, Surrey, Sussex, Buckinghamshire, &c. The manor rooms, in which the exhibition was held, presented a spectacle of the greatest interest—one which must be long fixed in the minds of Flora's votaries that day assembled. This, the fifth annual meeting, even surpassed the magnificent display in the same locality last year, even now vividly in our recollection: Plants, cut blooms, company, and general arrangements, each vied with the other for mastery of excellence, and a perfect whole was the result; a more happy combination none could desire, and it will be well for the executive to try no radical change in their constitution, in seasons to come; rather let them be prompted by the old proverb, "to let well alone." We have an elaborate report preparing, but from the late hour ere our duties at the exhibition were concluded, we find it impossible to give the results in detail this week. Among the more prominent of the successful exhibitors, we find the names of Taylor, Scruby, Holmes, James, Sanderson, Elliott, Bundel, Merry, Croxford, G. Smith, Biscoe, Shield, Lochner, Callahan, Hatton, Williams, Chandler, Salter, &c. *J. E.*

---

Books: *G G.* Received with thanks, and will have early attention. *J. E.*—*C J P.* Too late for this week. *J. E.*

Catalogue Received from G. Rogers, Uttoxeter, Staffordshire. *J. E.*

Communications: *W E R.* We thank you for the offer, and will report on the subject in a day or two. *J. E.*—*J F W.* Next week. *J. E.*

Frost: *A.* It was so severe about London on Saturday night that much damage has been experienced in some places—17° are reported. *J. E.*

Tulips: *T.* If the soil has much settled, add sufficient to make the bed even with the side boards, provided always that by so doing you do not bury your bulbs too deep. *J. E.*

## Miscellaneous.

*Stacking Ice.*—Ice may be stacked—plain English ice, or snow well beaten down into a mass, after the Roman fashion, which answers for all economic purposes every bit as well. This is the mode of stacking ice or snow which has been found to succeed most thoroughly at Chatsworth; in the first place, let the owner of the dairy-farm select, not the coolest and shadiest spot, as he inevitably would do without better instruction, but the openest and sunniest, because driest, bit of ground he can find—the sunnier the better. At Chatsworth the first trials were made in shady places, and proved far less satisfactory, because a dry place is required, and the dryness which the sun occasions more than compensates for the temperature of its beams. The platform having been judiciously selected, dig all round it a sufficient trench, which is to contain the water that will, more or less, inevitably drain from the completed stack; let the bank of the trench be lower on the outer side, and, if necessary, a siphon tube may be put in to drain off any excess. The object of the trench is, firstly, to prevent any of the drainage water from spreading over the platform; therefore to keep the platform dry; and secondly, to preserve this drainage water, which is very cold, and can be used for making butter. Then lay over the whole platform a bed of straw, six or nine inches thick. Straw is a sufficient and convenient non-conductor, and ice wrapped in straw is tolerably well protected from external influence. Upon the straw bed make your stack, building up with sides perfectly upright. The sides are to be thus perpendicular, in order that whatever melts may at once flow into the trench and not soak into and spoil the ice which remains otherwise unmelted. If the stack happens to be long, partitions of straw should be inserted at convenient distances, for the protection of one part while another portion is in use. The stack being erected in this manner, coat round the whole outside of it, and thatch it with a straw defence of 18 inches thick. If you build the stack of snow, build it in the same manner, but take care to batten it down. A stack of ice or snow, so made and so defended, will remain good through the hottest summer, and will obviate the necessity for any ice-house. Remember that all this will be done in mid-winter, when your labourers have comparatively nothing to do; when your horses are eating their heads off; and your carttires are rusting from idleness. *Dickens's Household Words.*

*Victoria Regia in the United States.*—On the 21st of March last I planted, in small seed-pans, four out of the 12 seeds you sent to me. Three of these germinated as follows:—the 1st on the 10th of April, the 2nd on the 14th of April, and the 3rd on the 22nd of May. On the 24th of May one of the plants was transferred to the house constructed for it, and placed in a tank, of an octagon form, about 24 feet in diameter. The largest leaf was then 4½ inches in diameter. Fire-heat was applied till the 21st of June, and then wholly dispensed with till within a few days. The solar heat, with the house kept very close, was sufficient to raise the temperature of the water to 85°, whilst the atmosphere was about 10° higher. The temperature of the house and water, however, was materially below these points at times, there being occasionally as great a difference as 15°. Notwithstanding these great variations, and the low temperature at intervals, the plant flourished in the highest degree, and on the 21st of August produced a flower 15½ inches in diameter. Another flower succeeded it in a week, which was pronounced by the Committee of the Pennsylvanian Horticultural Society to be 17 inches in diameter; the petals being 7 inches, and the disc or crown of the flower 3 inches. For the past three weeks the plant has contributed two flowers a week, the ninth flower blooming this evening. The leaves have reached a diameter of 6½ feet. The salver edge made its appearance with the 24th leaf, and every successive leaf has been thus formed. This 24th leaf attained at maturity a diameter of 5 feet 8½ inches. It was the 27th leaf that measured 6 feet 6 inches. Since the plant has begun to bloom, the leaves are not so large; still they have reached 6 feet 2 inches in diameter. That we have succeeded in producing larger leaves and flowers than you have in England, I ascribe to the more favourable character of our climate. It is certainly more natural to the plant that the temperature of the air should be higher than that of the water. These conditions, you are aware, are reversed in England—an effect produced by artificial heat, which is of course less favourable than solar heat. I have in my kitchen

garden a small basin for catching the rain-water and overflow from the aquarium and other houses. It is about 8 or 10 feet in diameter. Into this basin I planted one of the Victorias, on the 25th of June last. The plant has grown remarkably well, the largest leaves attaining a diameter of more than 4 feet. It has not yet, however, bloomed, and may not, as cold weather is near at hand. Sash, blocked by whiting, has remained over the basin during the whole time. I am satisfied that we can flower the plant next season in this position. The third plant is still in the small seed-pan in which the seed was sown. The excitement produced by the successful cultivation of the Victoria on this side of the Atlantic has been very great, and I am happy to say that no one has affirmed that the glowing accounts of the plant were at all exaggerated. Indeeed, the universal sentiment is, that no tongue or pen can exaggerate it.—*Caleb Cope, in Hooker's Journal of Botany.*

*The Oxford Botanic Garden—New Houses.*— In the summer of the present year an addition was made to the establishment by the building of two stoves, the larger intended for aquatic, the smaller for Orchidaceous plants, which, with the propagating house contiguous, erected previously, constitute a range 84 feet in length, extending along the eastern side of the garden, in a direction nearly parallel to the river Cherwell. The former of the two new housss is built upon a new plan, with a ridge and furrow roof, composed of glass let into iron frames without columns to support them. It encloses a tank measuring 26½ feet by 17 feet, warmed by pipes of hot water traversing its centre. The depth of the water in the tank is 3 feet 6 inches, and a slight motion is given to it by means of two small overshot wheels, which may be made to revolve by the application to them of a minute jet of water. In the centre of this tank there is a mound of soil, previously burnt, into which is introduced the Victoria Lily, the plant about which so much curiosity has been excited ever since the period of its first flowering at Chatsworth. Round the margin of the tank may be also seen the following interesting aquatic productions of the tropics. The Nelumbium speciosum, the sacred Bean of Egypt, a plant of much historical interest, being figured on the sculptured monuments of that country, but no longer found there, though common enough in various parts of the East Indies. Its leaves, which are orbicular, sometimes measure 2 feet in diameter ; and its flowers, which are very handsome and fragrant, often exceed in their native country the size of 10 inches. The ancient Egyptians used the seeds, which are enclosed in a fruit like that of the Poppy, as an article of food. Another plant from Jamaica, with smaller leaves than the above, is also a kind of Nelumbium, a genus differing in the multitude of its pistils from the true Water-Lily, of which we have in the tank the following exotic species. N. cærulea from Egypt, a very beautiful plant with large blue petals ; rubra and stellaris from the East Indies ; dentata from Sierra Leone, nearly allied to the Nymphæa lotus of Egypt, with leaves ribbed on the back like the Victoria regia, and flowers with a green calyx, and numerous white petals ; odorata minor, a small fragrant species from North America ; and micrantha from the river Gambia, with elegant small white flowers, and viviparous leaves. Here also may be seen the Pistia stratiotes, a gigantic kind of Duckweed common in the ponds of the West Indies, the leaves of which in like manner float loosely on the surface of the water unattached to the soil ; two species of Pontedera, namely crassipes from Guiana, distinguished by the swelling petiole of the leaf, and cærulea from North America, the flower of which is analogous to that of the Lily, but has a naked perianth ; the Limnocharis Humboldtii, a plant with conspicuous yellow petals ; a fine specimen of the Papyrus already alluded to in the Guide ; another gigantic species of Sedge, from Madagascar, the Cyperus alternifolius ; the Jussieua grandiflora of Carolina ; and a curious tropical Fern, called Ceratopteris thalictroides, a native of both hemispheres, having its sterile fronds bipinnated, and its fertile ones contracted into linear revolute segments, both kinds being viviparous. The shelves on either side of the house contain several fine tropical plants, and a few handsome climbers are planted in the soil. The stove which flanks the Victoria house to the north is designed for all kinds of seedling plants, and for others in the earlier stages of their growth ; but the corresponding one to the south is reserved principally for tropical Ferns, and Orchidaceæ.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

In damp weather it is indispensable to give all the air possible ; but when rain is falling, this must be done without opening any sashes by which the latter can be admitted, as otherwise the damp will be increased instead of diminished thereby. This points out the utility of back as well as front ventilators in the upright walls, as by them a free circulation may be obtained in all kinds of weather. Where there is a deficiency of room for half-hardy plants in pots, as Tea-scented Roses, &c., during the winter, they may be plunged behind a north wall ; and if they can be protected by a temporary erection covered with tar-cloth, sufficiently high above their heads to shelter them from rain, without excluding air and light, it would be still better. There are hundreds of plants which our frosts will not injure, provided the sun never shines on them while they are in a frozen state; and the frost will have still less effect upon them if they are kept dry. See that the pots of all plants that are plunged in the ground have their rims covered an inch deep with the plunging material, to preserve them from the action of the frost ; and let an extra covering be laid over the Hyacinths and other bulbs which are plunged out of doors.

FORCING DEPARTMENT.

Cucumbers in pots for planting out should be kept growing steadily ; and when a shift into larger pots is required, let them have some lumps of half-decayed turf, a little well-rotted cow manure, and some flaky leaf soil. Plunge them in bottom heat in a light pit, removing all fruit and male flowers as they appear, and stopping the shoots at every second joint. Thus treated, the plants become strong and healthy, and when put out in a well-prepared bed, they produce fruit in a very short time and in great abundance. Those plants now bearing in boxes should have liberal treatment in regard to rich top-dressing and liquid manure, and only one or two fruit should be allowed on each plant at a time. French Beans require a temperature of 60° by night, and a rise of 10° or 15° by day, according to the weather. Air in moderation is also indispensable; for when kept too close, the plants soon become drawn and slender. Put successions of Sea-kale and Asparagus into suitable situations for keeping up a supply. We have already, in former Calendars, stated how these are best forced at this season. Small salads should be sown regularly, so as to maintain a constant supply. As these salads are so much in request, and so soon become shrivelled when cut at this season, we have adopted a plan of having a number of small boxes (about 14) 12 inches long, 4 inches wide, and 2 inches deep. We sow in these boxes every second or third day, and when any salad is required the boxes are sent into the house, so that it can be had perfectly fresh at the moment it is wanted to be served up. Boxes of Mint and Tarragon should be put into a mild temperature, so that a supply may be ready when required. Prepare beds of leaves for early Potatoes, spring Carrots, and Radishes.

FLOWER GARDEN AND SHRUBBERIES.

Most of the deciduous trees having now lost their leaves, advantage should be taken of all suitable weather for clearing them away, especially from the turf and gravel walks, that the first shower of rain may do away with the dirty and smeared appearance consequent upon the use of the besom or leaf-rake. After a sufficient quantity of leaves has been secured for fermenting purposes, and for decomposing into compost, the residue may be drawn into open spaces in the clumps, and covered with a little soil, to prevent their being blown about with the wind. In the course of the next twelve-months these leaves will rot, and next autumn they may be used as a top-dressing or mulching for newly-planted trees. Advantage should be taken of frosty weather to prepare the ground for planting trees or shrubs, by trenching well the clumps or spots which they are designed to occupy; and by carting or wheeling any necessary material on the ground while it is hard enough to bear the traffic. Actual planting however, must be deferred until the weather is favourable, as the roots cannot safely be exposed to frosty air. All plants recently removed should be well mulched with half-rotten leaves, or some other similar material, which will serve to dig in as a sort of manure in spring. Let all such plants be securely staked, as by nothing are they sooner injured than by being rocked about by the wind.

KITCHEN GARDEN.

Beds of Asparagus intended for forcing, should be at once covered with half-rotted leaves or manure, to prevent the ground being frozen, and so that they can be dug up easily in any weather. Those beds which are not intended for this season's forcing, should also receive their winter's mulching at the same time. The surface of the beds should first be lightly pricked over, and then a scattering of salt should be sown over them, at the rate of 1 lb. to the square yard ; and upon this, a coat of well-rotted dung should be laid about 5 inches thick. The alleys also between the beds should be well dunged, and forked over as deeply as it can be done, without injuring the roots which extend into them. Pits and Frames will require very careful attention during severe weather, as it will often be necessary, in order to prevent the effects of frost, to keep them closely covered up during the day, as well as at night. But if due attention has been paid to our oft repeated cautions to keep the inmates dry, they are in little danger of sustaining any injury, provided the covering be ample (excessive rather than otherwise), and also that advantage be taken of every favourable opportunity of admitting light and air, even if it be but for an hour in the middle of the day. Caution, however, must be observed in exposing the plants to the direct rays of the sun, as that can never be done with safety while the leaves are in a frozen state. In such cases, light should be admitted on the north side only, that they may be gradually thawed by the moderate warmth of the atmosphere.

State of the Weather near London, for the week ending Nov. 20, 1851, as observed at the Horticultural Garden, Chiswick.

| Satur. 29 | 48.5 | 36.5 | 42.0 | 14 | 0.56 | 2 | 1 | 4 | 3 | 3 | 9 | 2 | 1 |

The highest temperature during the above period occurred on the 28th, 1823—therm. 60 deg. ; and the lowest on the 29th, 1846—therm. 16 deg.

## Notices to Correspondents.

ACER : *C F P.* We will give you a full account of this presently. It is apparently as hardy as a Sycamore, and not unlike one.

BIRDS : *J C E.* Very early in the ensuing year. Do not buy your birds for breeding *until after Christmas;* they will then have got safely over their various ailments. We will answer your inquiries about the sky-lark, &c., by post.—*Observer.* Your bird never will be well, or sing freely, till you have ceased to feed him on fig-dust. We have spoken fully about this, on several recent occasions.—*Rustic.* You may try worms and small pieces of raw meat, but you will *not* get him to live beyond Christmas.—*J B.* Do not by any means give your bird loaf-sugar, and never attempt to let him bathe at this season. He evidently has the cramp, and his stomach is out of order. Scatter some powdered chalk on his sand, and keep him warm.—*Tyro.* His disfigurement is caused by the "agitation" peculiar to this season. His damaged tail will be restored in the spring.—*S P.* See *Gardeners' Chronicle,* Feb. 22, and the two subsequent numbers.—*Aliquis.* They are very affectionate birds, but their song is of little value. Still, as your children are so fond of him, keep him by all means.—*Hopeful.* Yes; the hedge-sparrow, or Dicky Dunnock, is a most merry little chorister, and well worth a cage. We have plenty of them in our garden all the year round.—*J. McPherson.* From 3s. to 21s. ; but if *you* have not a well-attuned ear, let some friend accompany you who has.—*Omicron.* They will not "open" before March. They will then continue in song until August.—*Expectation.* In a very short time ; it will form one of the *most* interesting of the whole series. — *Looker-on.* In six weeks from to-day.—*Forward.* Bullfinches are very easily tamed. Let the pair be placed in a good-sized cage, open in the front ; hang them moderately low, and take constant notice of them. They will soon recognise your voice, and repay your attention with evident marks of delight whenever they see you approach. They are most affectionate little creatures.—*M E S.* Your calamity is a common, but a 'heavy' one. These poor creatures, every way unfit for a cage, and to live in this country, get restless and fidgetty after a certain age. They then frequently fall to stripping off their feathers, and *so* obtain a "new excitement." All you can do is—to feed her low, vary the food, and give as much change of scene as possible, to divert the animal's attention. Take her out of her cage every now and then, and let your family cosset her. No other *Recipe* will CURE the evil habit ; nor can we venture to answer for this doing so. *W. K.*

BOOKS : *G R T.* The Part of Decandolle's "Prodromus," for which you inquire, has not yet been published. It is said to be delayed by Professor Dunal. There is no general translation of Mohl's works, but several of his treatises are to be found in Taylor's "Annals of Natural History," a capital periodical.—*E. L.* Paxton's "Cottagers' Calendar," and Whiting's "Flower Gardening for Ladies." ‡

CRICKETS : *R P* will thank some of our readers to inform him of a ready method of poisoning or otherwise destroying these pests.

FLOWER GARDENS : *W P P.* Plans cannot be described. Apply to your neighbour, Mr. Kemp, of Birkenhead, who will furnish a plan.

HEATING : *C M.* A stove without chimney, with prepared charcoal fuel, is not injurious to plants, provided it is not allowed to dry the air of the house.

NAMES OF FRUITS : *W H I.* 1, Wyken Pippin ; 3, 4, Hollandbury.‖—*M T B.* The Golden Harvey.‖—*Coombes.* 1, Dutch Mignonne ; 2, Braddick's Nonpareil ; 3, Early Nonpareil; 4, Royal Russet ; 5, 9, London Pippin ; 7, King of the Pippins ; 10, Braddick's Nonpareil ; 11, Reinette Blanche d'Espagne ; 12, Court of Wick ; 14, Blenheim Pippin ; 16, Rhode Island Greening ; 18, Coe's Golden Drop.‖—*W Thorpe.* The Apple raised near Maidstone has probably no name. It is a very handsome, tolerably large, roundish fruit, fit only for kitchen use.‖—*Thos N, and H A W.* Those not named were unknown.‖

NAMES OF PLANTS : *J Weeks.* Apparently one of the varieties of Celosia argentea.—*E G T.* The leaves seem to belong to Mespilus grandiflora, as far as we can judge ; but the identification cannot be sure without flowers or fruit.—*G Groves.* 1 and 2, Ficus reptans ; 5, Brachycome iberidifolia ; 4, Kaulfussia amelloides.—*Shem.* 3, Amaryllis Belladonna. The other two require a careful examination. We will tell you next week.—*M C.* Perhaps bulbs of Saxifraga granulata.—*R W K W.* Disandra prostrata.—*C M.* Fedia Cornucopiæ.—*W W Keane.* Such specimens are indeterminable. Besides, we never name Cryptogamic plants, having no relation to gardening.—*D J.* Setaria italica.—*A E G.* Amorpha fruticosa, Berberis trifoliata, Benthamia fragifera.—*John Brown.* Setaria italica, the small German Millet ; grains used for poultry feeding. This plant is common in India.—*J S.* It is not practicable to name such fragments with accuracy.—*M D D.* Æschynanthus grandiflorus and Boussingaultia baselioides.—*R F H.* 1, Hymenophyllum Wilsoni ; 9, Bryum rostratum.

PEARS : *B B B.* In the south of England, in rich warm soil, and in favourable seasons, the Marie Louise is produced very fine, and abundantly, from standards ; and the fruit is likewise better flavoured than from walls.‖

POOR-RATES : *A Victim.* We do not see why nurserymen should not pay poor-rates, as well as other people.

SEEDS : *A M S.* Sow them in peat, sand, and loam in February, in a hot-bed. Pot the bulbs in loam now, and put them into a greenhouse without water till they begin to grow, then give them a little, and increase it till they are in full vigour.

SHRUBBERIES : *R P.* Fill it up with Ivy, Periwinkle, and Berberis aquifolium, with plenty of common Laurels, Yews, Hollies, and Privet.

VINES : *E W.* By all means buy "Sanders on the Vine;" an excellent book noticed by us at p. 327 of the current volume. We have no further information concerning the Vacca Vinery. Perhaps our correspondent in Wales will tell us how he is getting on.

MISC. : *M H.* If you will send us your address and six postage stamps, the number will be forwarded to you. ‡—*J. S.* We never give prices, which is the business of advertisers. You will find the kind of information you want respecting Conifers in Knight and Perry's Catalogue, or in that published by the Horticultural Society, in late Nos. of its Journal, or in a catalogue sent out by Messrs. Lawson, of Edinburgh. ‡—*R F H.* See p. 134, 1850.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Turnip Manure, per ton | ... | ... | £7 0 0 |
| Superphosphate of Lime | ... | ... | 7 0 0 |
| Sulphuric Acid and Coprolites | ... | ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE PEAT CHARCOAL impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

FOSSIL BONES AND PSEUDO-COPROLITES
(FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD and Co., Artificial Manure Manufacturers, Ipswich, Suffolk.

ROYAL SOCIETY for the PROMOTION and IMPROVEMENT of the GROWTH of FLAX in IRELAND.—The ANNUAL MEETING of the Society will take place on Friday, the 28th inst., at 12 o'clock, in the Society's Rooms, Commercial Buildings, Belfast, to receive the Annual Report of the Committee, to elect Office-bearers for the ensuing year, and to transact such other business as may be brought forward. By order, JAMES MACADAM, Secretary.

Belfast, Nov. 22, 1851.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

ADULTERATION OF FOOD.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, begs to call attention to his ACHROMATIC MICROSCOPES (warranted good) which wil be exchanged if not approved of. These Instruments will define the Circulation of the Blood in the Frog's Foot, the Saw in the Sting of the Wasp, the Comb in the Spider's Foot, the beautiful form and varieties of Pollen in Flowers and their Structure, the Scales of the Butterfly's Wing, and also in many instances Adulteration of Food. It is a very interesting companion, and will pass away usefully many a leisure hour, the fund for observation being inexhaustible. Price for No. 1, 3l. 12s.; No. 2, 5l. 15s.; No. 3, 9l. 10s. A descriptive Book, sent post free, on receipt of three postage stamps. Prepared objects, 12s.; injected do., 30s per dozen.

THE BIRMINGHAM CATTLE AND POULTRY SHOW.—The THIRD GREAT ANNUAL EXHIBITION of FAT CATTLE and the various kinds of DOMESTIC POULTRY, will be held in the BINGLEY EXHIBITION HALL, BIRMINGHAM, on the 9th, 10th, 11th, and 12th of December next. Admission—To the PRIVATE VIEW, on Tuesday, December 9th, 2s. 6d.; on Wednesday, Thursday, and Friday, 1s.

**The Agricultural Gazette.**

*SATURDAY, NOVEMBER* 22, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Nov. 27—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Dec. 3—Agricultural Society of England.
THURSDAY, — 4—Agricultural Imp. Soc. of Ireland.

IN a remote part of one of the central counties of England there has been growing and maturing, during the last six years, courting little notice, intent upon utility and truth, rather than on fame, a patch of agricultural experiment—some ten or twelve acres in extent—which bids fair to do for the clay-soil husbandry of this clay-soil kingdom, what the tiny mushroom can do for the paving-stone of two or three hundred-weight;—lift it from its sluggish bed, burst the tough cement that held it down, push it bodily from the grave in which it lay, and, if need be, turn it right over, top-side down, —*double-dig it*.

To the almost lost and buried relics of the only absolute agricultural genius that this country ever knew, may perhaps be dated the first origin of an idea which has at last met with its worthy explicator: let there be a libation therefore to the name of JETHRO TULL, before a word be said or a praise be uttered upon a discovery, original enough after every honour paid to *him*—to place its present author in the foremost rank of English agricultural Improvers.

Let us put it as a problem. Be it required of you, O Struggler of the Clays! to grow upon four *half*-acres of your stiffest yellowest subsoil a crop at the rate of *forty-one bushels* of Wheat to each *half* acre, without manure, without a fallow, without a "leguminous or green crop intervening," as your leases have it,—nay *after a previous Wheat crop*, where a fallow had not been known in the memory of man, and where all the neighbouring wisdoms (those encouraging and enlightened prophets that you shall haply find around you, try it where you will!) have, with all the authority of established ignorance, promised you some two or three quarters to the acre for your pains, as 'the most *that* field ever did do or ever will do, new-fangle it as ye may!'

Yes. You smile. You don't believe it: or you believe it as a kind of conjuror's trick; a trick of words rather than deeds; a sort of thing that may do very well on paper, may do to line the columns of some teazing Chronicle or Gazette that *wo'nt* let you alone, that would fain persuade you there is actually still something more to be learnt in farming than you know already, and *have* known since you were a boy—that there are one or two things yet extant in heaven and earth undreamt of in your philosophy! O there's an accomplished infidelity about you, Mr. Practical: *robur et æs triplex* for the cunning spear to penetrate that shall carry conviction, or even the value of a doubt of your complete and perfect knowledge of all that can be said on Wheat-growing, home to your breast. It is hard to approach you, hard to cater for the thankless; hard to explain, and simplify, and popularise, truths that the ear rejects, for *within* there is nothing that responds. But even you know this, that hard duties must be performed, hard soils disturbed, hard stones broken; and after all, that there is something good and useful to be made and done, even with the hardest material, that there are tools tempered to act upon it, useful things to be made out of it, the more lasting and valuable because they were so hard. So shall it be with you, strong-hearted son of the soil! when the pernicious system has long passed away into forgotten history, that has made you what you *were*, let us already rather say than what you *are*.

Yes. There are still, it is believed, one or two things to be learnt, even in farming. We have not scaled the topmost pinnacle of possible knowledge, nor sounded every depth of practical attempts to meet impracticable times. Those two 'Mineral'-grinding 'Theory'-splitting individuals, LAWES and LIEBIG, may actually be coprolizing each other about *something*, after all! though what upon earth it is—don't let you and I cudgel our brains to know. It won't help to raise prices—that you may depend; and it won't lower the rent—that's certain. So what good *can* it do for *Farming?*

"Tu ne quæsiris scire, nefas, quem mihi quem tibi
*Finem* Dî dederint, Dobsonoe! nec *Rothamstonios*
Tentâris numeros! Ut melius, quicquid erit, pati!"

Alas! for the Art, in which those who do most truly need, at this most critical moment, all that is—all that can be known about its deepest extra-subter-subsoil mysteries, do most despise, and jeer at, and defy the whole catechism, the whole groundwork, the whole rudimentary axiom-page upon which each after-problem depends; without which every leaf of working-day experience is like a separate Chinese puzzle, without beginning, middle or end. Alas! for the perceptive and inventive powers that have been 'cribbed, cabined and confined"—say rather—stifled, stunted, stupified by sixty years—two generations—of 'price'-maintaining anti-*cost-reducing* Legislation.

How will you awaken it? By what ordinary trade-language shall you reach it? Tell the Cotton-spinner, the Silk-throwster, or the Flax-worker a new dodge to shorten, economise, or cheapen some tiniest process in his manufacture; he listens and inclines, *arrectis auribus*. The 'price' of his article in the market he well knows is Nature's making, not his, not anybody's; it lies far away out of his reach; it belongs to the dominion of a Power that not Kings nor Queens, nor Parliaments, nor even Squires can influence or reach: but the COST of PRODUCTION—aye! there you reach him home! Now you touch a string that *he* can fiddle to as well as any other biped with two hands and a brain to guide them: now you come to "something practical" —because you come to something possible, something which *has* been done, *is* done, and *will be* done again, as long as human brains shall retain their power, and human right-hands their cunning.

But how is it *afield?*—"If you please Sir, (*not to be angry!*) I can tell you how to grow more Wheat on half an acre without manure, than you grow on a whole acre, *with:* and how to grow it year after year on the same field, without injury to the soil, without 'exhaustion,' and *with* a profit of something like seven or eight pounds an acre."—— "What!—free-trading, 'price'-lowering, Peel-mongering, Whig-maintaining, Theorist'—What! You can, can you? Take your double-digging, and your triple rows, and your horse-hoeing, and your 'spaces' and your 'intervals,' to the —— place where TULL took his!—the house of a century's oblivion, death ungratified, fame unvindicated, labour unrequited! What have *we* to do with 'cost of production'? It's PRICE we want—what Queen—Lords—and Commons, with all the Squires to back them, and *all unanimous*, could not give, any more than they can give back the Last Century, or cotton-stockings again at seven shillings a pair,—it's *that* we want, and that we'll have; and anything that savours of the *other* road to profit, the vulgar road that all other trades are racing in, we *won't* have; not at *any price.*"

Is this—*is* this indeed—to be the song? Then good-bye Wheat-growing, for England. We're at a pretty pass already; fighting an up-hill fight against countries, *not* untaxed, *not* unindebted, *not* better soiled, *not* better tilled, or favoured than our own; that tune won't do; *but*, free from laws that curse the soil with intransferable stagnation, that tie a dead estate to a living man, and the living land to an unborn one, that say, Thou shalt not buy an acre of land without a lawyer's 'permit,' a conveyancer's 'Title,' as old as your grandfather's wig, and as useless, and of such expense, such arbitrary grotesquely disproportionate expense, that the 'title' to an acre may be twenty times its value, so that none can buy but he who can buy hundreds or thousands, to be '*occupied*' by other men—his 'tenants.' The German, the Frenchman, the Belgian, the Dutchman, the Norwegian, the Dane, the Swiss, the Tyrolese, the Lombard, the Tuscan, fights you with his *own* weapons, sticks his own plough or spade into his *own* field,

"*paterna* rura bobus exercet *suis*," buys his farm without a lawyer, and sells it as he pleases, without a scribbled sheep-skin for each acre. *Can you beat him?* can you *meet* him? with *your* feet trembling on another man's land, and his *standing* on his own? It is not 'taxes,' nor 'tithes,' nor 'poor-rates,' nor 'game,' nor 'malt tax,' nor 'currency,' nor any other of those worn-out old cat's-calls that have been shrieked and whooped from the gallery any time these fifty years. The question is simpler, shorter, and more direct, and therefore ever overlooked, as such usually are; the question is 'Free-trade in corn, without free-trade in Land?' You can't see it, Mr. Dobson, you think it's not *your* business. No! you've been blindfold too long. But *you will* see it. For seen it must be, and grappled with, too, before two more Sessions are over,——or ever the Grouse begin to fall in '53. But this is a digression.

A clergyman, a scholar, and a gentleman, yet, in spite of all these disadvantages, a practical as well as scientific agriculturist, starting from the point where Tull left off (and through lack of knowledge and opportunity, may without derogation be said to have failed), has discovered, and communicated in a pamphlet* of striking simplicity of language and practical style, a mode of growing Wheat which he has followed with unvarying success for six years. The only variation, at least, has been that in trying it on a new piece of ground, taken in hand and sown last autumn, the return this harvest has exceeded by seven bushels to the acre his normal return of 34 bushels hitherto regularly reaped from the alternate strips or beds of each acre, divided as it is into longitudinal sections, 30 inches wide, alternately Wheat and fallow, *without manure*, thus in fact growing the quantity of corn above-named not upon the whole, but upon half the acre.

The provoking part of it is that there is really no magic in it. It is as dry and matter-of-fact a piece of agricultural logic, as perfectly reconcileable with every true and accepted principle of vegetable growth and nutrition long ago generalised by Liebig, and particularised by Lawes, as if Mr. Smith had dropped like a ready-made 'conclusion' into his place, in the 'syllogism' of which they had respectively furnished the premises. Everything about the soil and atmosphere, everything about manures organic and inorganic that Liebig has said and Lawes has proved (*pace* the 'Mineral Theory,' most respectfully!) everything that Tull has *truly* said about Wheat, everything that everybody truly says about *double-digging*, 'if they could only afford it,' is simply condensed into action, and rendered visible, tangible, and practicable to the common senses and spades of mankind through this clever and comprehensive adaptation of 'the unities' of agriculture.

It has done not only for spade-husbandry in general, but for that expensive edition of it—*double*-digging—what the lever does for the human arm—overcome the burthen by *dividing* it. '*Cunctando restituit rem.*' Mr. Lawes finds that his land, with ordinary cultivation, without manure, naturally produces 17 bushels of Wheat to the acre. Mr. Smith doubles the cultivation (still without manure), and—exactly doubles the crop. There is a sort of moral neatness about this which is attractive. The only question was, *how* to double the cultivation, and not be beaten by the expense; and the solution of this puzzle is exactly the nonpareil of Mr. Smith's discovery. How to 'make an egg stand on its end' puzzled the Savans of Madrid for a good part of the 15th century, till One Man did it instanter, by a method so obvious and simple, that they were all ready to hang themselves. That many have got into a state of suspense, though not to that degree it may be hoped, upon the merits of the Smithian Wheat-system, may readily be imagined; but the experiments upon it in progress this year, in various parts of England, will go far to test its applicability to clay soils generally. The process itself is, however, one which actually bristles with texts of interesting discussion to the agriculturist; and to some of these we must revert very soon. *H*.

* A Word in Season, &c. J. Ridgway, Piccadilly.

## A REPLY TO LORD WHARNCLIFFE'S LETTER ON DRAINING.

[In the Royal Agricultural Society's Journal, 1851, No. 1.]

In the form of a letter to Mr. Pusey, Lord Wharncliffe has furnished an article in the last Journal of the Royal Agricultural Society "On Draining under certain conditions of soil and climate," in which the use of drains of 4 feet in depth, at wide intervals, in the direction of the slope, with intermediate drains of 2 feet in depth, at narrow intervals across the fall, leading at right angles into the upright 4 feet drains, is advocated as the perfection of draining under certain peculiarities of soil and climate.

As I take a very different view to his lordship, I shall presume to question the plans he has so confidently introduced; and as he speaks of his qualifications for directing draining with the strongest assurance, although it does not appear that he has had any other experience than that which his own draining has afforded him, I feel called on, in support of my own convictions, to refer to my experience as extending over 20 years, during which period I have professionally had to lay out, and personally superintend, draining in almost every variety of soil and situation; and further, I will confess to having become a convert to the deep parallel draining of Mr. Parkes, after having, in the dark, wasted much money both in shallow and deep draining.

If I did not know how ready many are to accept the authority of great names, and the mischief such an article appearing in the Journal is likely to effect, I should feel it a waste of time to point out the weakness of the reasoning, and the contradiction between the principles laid down and the practice adopted; and with all due respect to Lord Wharncliffe, should take for granted the unfitness of a person in his lordship's station, and with his limited experience, for a practical drainer.

It is not a little extraordinary that Lord Wharncliffe, throughout his letter, labours to impress his readers with his faith in deep draining, and in certain principles to which his lordship's practice is directly opposed. He commences by observing, "there are few instances in which I would now willingly stop short of a good 4 feet," and "the dominant direction should, in almost all cases, be that of the slope to be drained." "These appear to me to be axioms of the science;" and yet his lordship concludes by advocating 2 feet drains and putting these drains across the slope; but as his lordship fancies he has to deal with an exceptional case, it becomes necessary to examine his grounds for considering it in that light.

His lordship speaks of "his climate as being more moist and as having more rain, and more equable temperature than the generality of England," and "his land as being situated 600 to 900 feet above the level of the sea, and the soil to be strong, resting on a yellow clay, with beds of rock or shale impenetrable to water, terminating at a certain point, but not always within a descent of 4 feet." He describes his draining as having commenced with drains of 3 feet in depth and at 8 yards distance; these, he tells us, "produced a not unsatisfactory result." He "next tried drains of 3½ feet at the same distance, but here the cost was beyond the proper limit." (What that cost was he does not tell us.) He then "further increased the distance to 10 or 12 yards without perceiving much difference in the result." He then "divided 4 acres, draining one side at a depth of 3 feet and at 10 yards distance, and the other at 4 feet and 13 yards distance," and after three years his lordship cannot satisfy himself of any clear advantage on one side or the other; he adds, "there are parts on both halves of which the surface is undrained, although the outlets have never failed to do their duty." "These last facts, however," he tells us, "seem to have proved two things irresistibly. First, that to clear such ground of bottom water, deep drains are indispensable, and within rational limits, the deeper the better; and secondly, that in soils so circumstanced, the surface and the bottom drainage are two distinct things, of which, though the latter be complete and effective, the former may at the same time be a failure." He continues, "Looking then to the source of saturation from beneath, my conviction has been only thereby strengthened that it can be reached by deep drains alone. I accordingly adopted a depth of 4 feet in various localities, but then again immediately sprung up the difficulty of cost." (His lordship considers 4*l*. 10*s*. 8*d*. as the limit within which draining should, if possible, be kept, with a view to profitable improvement.) To meet this, his lordship informs us he has tried 4-feet drains at intervals of 16 or 18 yards, but refers to this experiment as not having completely answered. From these results he considered the problem unsolved, and he had to seek a system which, "without sacrificing the essential condition of depth, or unduly exceeding that of cost, would be better adapted for thoroughly effecting its object," and after instancing clays as close and deep in other situations said to have been drained by means of 4-feet drains, he asks "Why then should we meet with so much difficulty when it only forms part of a more manageable series, and is not unfrequently of a less apparent stubborn form?" and answers, "It strikes me forcibly that the true solution probably lies in the diversity of climate;" and his lordship thus continues, "To secure the full effect of thorough drainage in clays, there should be not only well laid conduits for the water which reaches them, but also subsidiary passages opened through the substance of the close subsoil by means of atmospheric heat and the contraction which ensues from it;" and after quoting from Mr. Whitley and Mr. Pusey on the difference of climate in Britain, he continues, "If, as Mr. Parkes and others say, the contraction and opening of stiff clays by atmospheric heat is necessary to the efficiency of deep draining, I think I have demonstrated such process in soils cannot be reckoned upon in ordinary years, and indeed can scarcely be said to occur more than once in a quarter of a century. It therefore seems indispensable to devise some system which may serve to secure the benefit of deep drainage without its help," and his lordship concludes by proposing "to draw off effectually and constantly the bottom water from beneath the clay, and from its substance, by means of drains of 4 feet every 18 or 20 yards, and to provide a vent for the upper water by cross drains of 2 feet every 8 yards, led into the 4 feet drains, and which he tells us may be done at a cost of 4*l*. 10*s*. 8*d*. per acre, whilst to drain with upright 4 feet parallel drains at 30 feet distance, would cost 5*l*. 7*s*. 9*d*. per acre, and at 36 feet, 4*l*. 9*s*. 10*d*. an acre;" and adds, "whilst the deep drains at 36 feet distance are the cheapest by 1*s*. an acre, the 30 feet distance is 17*s*. 1*d*. an acre dearer, and thus transcends the limits considerably, within which such work should, if possible, be kept with a view to profitable improvement."

Our readers will see from these extracts that Lord Wharncliffe has neither tried the deep parallel drains, at moderate distances, advocated by Mr. Parkes, nor the close furrow drains of the late Mr. Smith, and yet imagines he has secured all the benefit of both their systems, and supports his departure from admittedly correct principles wholly on the ground of the absence in his case of the variations of temperature and drought, necessary to produce those different conditions of the soil which are essential to its shrinking, and affording the cracks and fissures requisite for the action of deep drains to dry the surface.

I will not occupy time by entering into the curious reasoning by which his lordship arrives at his deductions. I leave his readers to judge how far "his facts" prove irresistible with relation to the occasion for the 2 feet and 4 feet drains, and for surface and bottom drainage as two distinct things. Nor will I enter into details of cost; although, as his lordship makes this so much a consideration, it might be worth while to show the errors into which he has fallen from his inexperience in this respect, and how much he might have saved by a uniform system of parallel deep drainage; nor will I enter into the mischief which is likely to ensue from bringing side drains of only 2 feet depth into others of 4 feet, and the difficulty of giving to such drains a secure junction. These are objections to the plan which every practical drainer will at once see. My object is rather to attack the theory, feeling as I do that the question with landowners seeking the improvement of their estates will not be one of saving a shilling an acre, but which plan will most effectually benefit their land; and to this view I will confine what I have to say.

As his lordship assigns as the sole reason for adopting so singular a plan of draining, the lesser variation of temperature and the greater amount of rain he has to contend with at Derby in contrast with Bedford, it may be well to enquire what this really amounts to.

At Bedford the mean monthly temperature in the year is stated to range between 38 and 64 degrees; whilst at Derby it is between 35 and 55 degrees, and the annual amount of rain between the driest and wettest situations in England is 24 and 47 inches. Were the variations of temperature and of dryness in the year at Derby really no greater than his lordship has described them, it could readily be shown that they are quite sufficient to produce those changes in the condition of the soil which are requisite for its cracking sufficiently to make deep drains effectual, but if greater be thought necessary it will be enough to point out that Lord Wharncliffe has been taking, for the purpose of calculating the effect of variations of climate upon soil, the mean of each month's variations, and not the actual highest and lowest temperature of the year, and has overlooked the fact that greater variations than he has allowed in the year are not unfrequent in the space of 24 hours. By Lord Wharncliffe's table, water would appear never to freeze and corn and fruit never to ripen at Derby, while on the other hand it is well known, not only that both these circumstances occur, but that it is absolutely necessary to agriculture in all countries to have variations of daily change as well as of season, in order to break and pulverise the clay and bring it into order for sowing; which changes, whether produced by alternations of heat and cold, or of wet and evaporation, are productive of shrinkings in the soil sufficient to produce those cracks which Mr. Parkes has shown, and which daily experience proves, give porosity to the stiffest soils.

I might extend this article by entering into explanations of the effect of evaporation at all seasons in assisting the draining, which his lordship has wholly overlooked, and show that any deficiency of heat from altitude may be more than compensated by the quicker evaporation which takes place in such situations; but space is wanting to me, and I feel that sufficient has been intimated to satisfy any reflecting person of the varying condition of all soils at different seasons, and to show that to admit of this altered condition is at once to allow the lands capability of being drained, while with respect to the larger amount of rain in certain situations, and its effect on drains, it must be evident that the descent of a larger quantity of water can have no other effect on drained land than to assist in establishing the cracks, making them permanent fissures for the escape of water, resembling those found to give vent to springs at the bottom of wells hundreds of feet from the surface.

We have now to examine the plan his lordship has put before the public as the *ne plus ultra* of good draining, and I will commence by describing the various practices which have led to so singular a violation of principles which meet with his lordship's approval.

According to his own showing, Lord Wharncliffe began his draining with no settled plans, and without any experience. He commenced by trying numerous plans of his own, none of which, by his own account, appear to have thoroughly answered; and it is to be regretted, on his own account, that throughout all his experiments he appears never to have tried that which,

had he studied the best authorities, would have been the first, namely, 4 feet parallel drains in the line of greatest descent, at intervals governed by the tenacity of the soil. It is probable, from his lordship's description of the soil, that 4 feet drains at 33 feet distances, and a cost of 4*l.* 10*s.* per acre would have been effectual.* It is clear that his lordship's error has been to draw information as to his draining wholly from his own experience, and, by his own showing, he has been learning from his failures. He first tried 3 feet drains at 24 feet and at 30 feet distances; next 3½ feet drains at 30 and 36 feet distances, and then 4 feet drains at 39 feet, 48 feet, and 54 feet distances. None of these experiments proved satisfactory, and in singular contradiction to the principles he lays down, he finishes with 4 feet drains 18 to 20 yards apart, combined with intermediate 2 feet drains, at 8 yards distance, crossing the slope into 4 feet drains.

It would not be too much to assume that some, at least, of the partial failures described may have arisen from the want of more practical knowlege in the overseer of the work, seeing that his lordship took the onus of the superintendence; for in not a few instances have failures, attributed in the first instance to too great depth, been detected to arise from the faulty execution of the work, wrong direction of the lines, imperfect levels, irregular cutting, negligence in laying the pipes, fraud, &c., and it will at once appear to our readers how much in this respect his lordship's draining, from his own showing, has been exposed to these causes of failure.

Were the removal of surface water the only end sought in draining, and could we suppose drains laid only 2 feet from the surface equally durable and out of harm's way, with drains laid further from all disturbance of the surface, and equally active in laying the land dry with deeper drains, his lordship's side-draining would only be open to the serious objections which always apply to draining across the fall, and to the waste of money which his plan involves in double draining the space aside the upright drains, from which the latter take the water (objections in themselves sufficient to upset all he has said in their favour); but in draining there should be other views, which happen to have been altogether lost sight of; namely, we should seek to give to vegetation the fertilising matter which is left behind in the perfect filtration of the water, and the advantages of higher temperature, and greater depth of soil for the roots to extend into — objects which are only to be attained by going deeper. Nor is this all; for whilst these benefits are to be gained only by deeper drains, the cost of really efficient draining on this principle is less than on the plan recommended; and even were it not so, the addition of 17*s.* 1*d.* per acre to the cost would be a consideration inestimably small in comparison with the advantages attaching to the greater perfection of a consistent and permanent principle of drainage.

Lord Wharncliffe has evidently been draining under the impression, natural to inexperience, that surface-water will not reach 4 feet drains, and that it is necessary to have drains for both the top and bottom water, in other words, he must have two holes in his granary for his cats, a big one for the mother and a lesser for the kitten—he will have 4 feet drains for the bottom water and 2 feet for the surface, not seeing that drains drawing off water at a level of 4 feet, must take that water from above, and lay the ground above them the drier, and in so doing give vent to water still higher, and thus produce those shrinkings and fissures in the soil which eventually afford all the vents necessary to let down the water from the surface.† His views are in accordance with the exploded use of pipes below and stones above, once thought necessary to give admission to the surface and bottom water, and which has led to such waste of money. I would refer his lordship to Mr. Mechi's letters, where he speaks of his experience in draining, and to the Report of the Lords' Committee on Draining, in 1849, where he will find instances of 8*l.*, 12*l.*, and even 19*l.* per acre having been expended to secure the imaginary advantages which are misleading him. In an article of this nature it is impossible sufficiently to enter into the reasoning in support of principles which even Lord Wharncliffe admits to be correct. There are works in which this is most convincingly done, and to which I would refer every one who has draining to do; I have alluded to the "Reports of the Lords' Committee on Draining;" I would also particularly refer to the "Essays on the Philosophy and Art of Land Drainage, by Mr. Josiah Parkes," the little work "Agricultural Drainage," from the Quarterly Review, No. 171, and to the "Report of the Commissioners of the Metropolitan Sewers, 1851." In all these the greater efficiency of deep drains in removing surface water, and the higher temperature given to clay soils by deep draining, are unanswerably shown, whilst experience is every where affording the test of the principle. The shallow draining advocated by Lord Wharncliffe has now become the exception, not the rule, and is in fact fast disappearing before the experience of the greater efficiency of deeper draining.

Lord Wharncliffe has gone to work, as is too often the case with land-owners in their agricultural improvements, with a very imperfect conception of the end in view, and with no settled plan; and having relied for information from his own experience, he has erred throughout, more or less, and will pay the penalty in the imperfection of his work. As his lordship has put forth his own imperfect practice as a guide for others, I feel bound to assure those interested in the subject that there is much more in the philosophy of draining than will be discovered in merely making mistakes. *Hewitt Davis*, 3, *Frederick's-place, Old Jewry, London, Oct.* 21.

* His lordship says, "our usual payment for cutting and filling per rood of 7 yards upon an average of the mattock or spade work in good or bad ground, barring hard stone, has been 1*s.* 3*d.*" Now in my experience in the stiffest clays in the kingdom the wages of late years have seldom exceeded 8*d.* the rod of 5½ yards, and have latterly been as low as 6*d.* I have draining executing at this time for 7*d.* and 7½*d.* in the hard Wealden and the London clays, where beds of stone or gravel are not unfrequent, and where the men look to getting 2*s.* 4*d.* per day; but certainly labourers look for higher pay when they have no blemen for masters, and in this instance his lordship may have paid a trifle for being his own foreman.

† Where can his lordship suppose the water comes from, which he tells us his 4 feet drains continue to discharge? Drains cannot take from a lower level, they can only draw from a higher; the water which his lordship admits his deep drains are constantly discharging, must be taken from above the level of his deep drains, and be thus kept from accumulating in the space between the surface and his drains. The shallow drainers appear not to know that except in the case of tapping springs, drains can only draw downwards.

## THE AMERICAN REAPING MACHINE AT NEWCASTLE.

The machine was first put into operation at Whorlton, in a field of Oats. The crop was rather a light one, and the nature of the ground, composed as it was of high ridges and deep furrows, was not the best suited most effectively to exhibit the capabilities of the machine; but, on being set in motion, it was soon apparent that it was well adapted for the work to be executed. When moving along level ground parallel to the ridge, the crop was admirably cut, but the machine having to pass over many of the ridges diagonally, in those parts the cutting was uneven. After a short trial at Mr. Robson's field, the machine was removed to a Wheat field on the farm of Mr. Nicholson, of Lough House, and there its performance was much more satisfactory. A portion of the Wheat had been cut by sickle, and, as usual, a great number of heads were left for "gleaners." A quarter of an acre having been measured off, the machine was put in operation on it, and the grain was cut in nine minutes, with short stubble, and remarkably clean, presenting a striking contrast to the other portion of the field. But, as being preferable to our own opinion, we subjoin that of the committee of the Farmers' Club, which was drawn up after careful deliberation, and conveyed in the following report:

We, the undersigned committee of the Newcastle-upon-Tyne Farmers' Club, appointed at a meeting held on Saturday, the 20th inst. at the Club Room, in the Literary and Philosophical Society, to report the result of a trial, made this day, of McCormick's reaping machine, met for that purpose at East Whorlton, a farm belonging to his Grace the Duke of Northumberland, in the occupation of Mr. Riddell Robson, and beg to lay before you the conclusions at which we arrived.

The first trial was made on a rather light crop of Oats; the ridges of the field were high, and the furrows correspondingly deep; notwithstanding these disadvantages, however, the work was equal to the expectations of the committee.

A second trial was made in a field belonging to T. H. Graham, Esq., occupied by Mr. Nicholson, bearing an average crop of Wheat. A portion was measured off, and exceedingly well cut, at the rate of an acre in 40 minutes.

The committee may state, generally, that the crop leaning to the machine or standing upright, was cut low and quickly, and that scarcely an ear of corn was ungathered to the sheaf; where the corn, however, was much laid or twisted, the operation of the machine was not certainly so efficient, and perhaps no piece of machinery can, under these circumstances, be expected to compete with the sickle.

William Stevenson, Throckley House.
Joseph Laycock, Lintz Hall.
William Nixon, Union Hall.
John E. Wilkinson, Dunston Lodge.
Hugh Taylor, Cramlington.
Sept. 22, 1851. William Glover, Hon. Sec.

Various descriptions of the machine have been published, but only an inspection can enable any one to form a correct estimate of its merits and capabilities. The machine consists of a platform, to the front of which the cutting apparatus is attached, and what is called a reel, composed of four planks or flappers, about 6 feet in length and 10 inches in width, set askew, connected at their extremities, at equal distances, by a hoop-shaped frame, and having some resemblance to the paddles of a steamer. The whole rests upon two wheels of small diameter, but of considerable width. From one of these the motion is produced, by the aid of cog and crank wheels. The machine is drawn by two horses, harnessed outside the platform by a pole, and driven by a man mounted on a seat behind them. Another man sits astride on a part of the framing, with his back to the horses; and, with a strong rake, throws off the corn as it falls on the platform. In front of the platform project a number of halbert-shaped forks of iron, about 4 inches in length, with spaces of 1½ inch between, across and within which spaces a set of horizontal lancet-shaped blades, with edges serrated like the old reaping hook, are driven by a crank wheel, which produces a rapid oscillating motion, by which the cutting is effected. As the machine is drawn forward by the horses, the reel revolves, and the flappers descending upon the corn draws it between the projecting forks, which serve to compress it, while the knives or saws, also set in motion by a crank wheel attached to the bearing wheel, easily cut it, and the revolving motion of another flapper throws it in a sheaf upon the platform, whence it is immediately removed by the raker to make way for another. The machine presents a front of about 5½ feet to the corn, and that breadth is consequently cut as it advances. The horses pass along the edge of the corn, without coming in contact with it. They appear to find the work moderate, though the machine cuts at the rate of an acre and a half per hour. The machine is free from anything that can be called complicated mechanism. In the trial of the machine which took place on Monday, its success was, in the opinion of nearly every practical farmer present, complete. It cut everything before it, leaving not a single ear behind. This was especially remarkable in the field of Wheat. The stubble was perfectly level, and cleaner than the neatest raking could make it. The corn was thrown upon the platform by the flappers in the best possible order for tying up; and it was delivered upon the ground in the same state by the man who raked it off, with great skill and regularity. We must not be understood to mean that it will cut corn upon all descriptions of land, and under all circumstances. Our observations apply to that portion of the Wheat field which was measured off, and which had the advantage of being level. When the crop is laid or twisted, the machine will not work so well until some contrivance is introduced for lifting the corn and presenting it to the knives. But its performance, even in those spots which were twisted, and in others which were artificially pressed down for the purpose of testing it, was satisfactory. All the corn which was laid about towards the knives, or laid sideways from them, was as well cut as by hand; though, when laid directly from the knives, it was imperfectly cut.

Of the general success of the experiment there can be no doubt. There never was an agricultural implement which on its first exhibition obtained the approval of practical farmers so generally as this has done. It is certainly, as Mr. Pusey has observed in the late number of the Journal of the Royal Agricultural Society, "the most important addition to farming machinery that has been invented since the threshing machine first took the place of the flail." The cost of Mr. M'Cormick's reaping machine is 28*l.* There is nothing in its material or construction to warrant so high a price; but the inventor, no doubt, is entitled to a reward for his ingenuity. We may, however, suggest for his consideration that the custom of the million at a moderate price may be more profitable than that of the hundred large farmers at an immoderate one.

The American reaping machine, which has thus burst upon us with so great an effect from the other side of the Atlantic is, strictly speaking, no novelty in design or principle. There have been several, of home manufacture, brought before the British public, and too soon forgotten. The first was made by Mr. Boyce 30 years ago; he obtained a patent for it; it cut corn close to the ground, by a scythe fixed to a horizontal spindle; but as there was no provision for gathering up the corn in parcels, it was regarded as a failure. Some years afterwards, Mr. Plunkett, a London machine maker, attempted to improve this machine by substituting for the scythes a circular steel plate, made very sharp at the edge, and knotched at the upper side like a sickle; this plate acted in the same manner as a fine-toothed saw, and was found to cut the corn better than the scythes of the original machine. Mr. Gladstones, of Castle Douglas, next tried his hand. He constructed a machine in principle similar to Mr. Plunkett's, but made it work much better by introducing a circular table, with strong wooden teeth notched below all round, which was fixed immediately over the cutter and parallel to it. The use of these teeth was to collect the corn and retain it until it was operated on by the circular cutter. The corn, when cut, was received upon this table, and when a sufficient quantity was collected, taken away by a rake or sweeper, and laid upon the ground, beneath the machine, in separate parcels. Of this machine a drawing and description appear in the 7th vol. of the Farmers' Magazine, p. 273. The next attempt was by Mr. Robert Salmon, of Woburn, Bedfordshire. He cut the corn by means of shears. Its best feature was that it was provided with a complete apparatus for laying down the grain in parcels as it was cut. Mr. Smith, of the Deanston Cotton Works, Perthshire, next came into the field. In the harvest of 1811 he tried a machine on a small scale, worked by two men. In 1812 he made another which was worked by one horse; but though he cut several acres of Oats, it was found that the horse could not move the machine on an acclivity with effect. In 1813 and 1814 he made other trials and employed two horses. An engraving of this machine is given in the 2nd vol. of the "Encyclopædia Britannica," from which we extract the following description:—

"The cutter of this machine is circular and operates horizontally; it is appended to a drum connected with the fore part of the machine, its blades projecting some inches beyond the periphery of the lower end of the drum; and the machine is so constructed as to communicate, in moving forward (the horses *impel* and walk in the wake of the machine quite clear of the grain), a rapid rotary motion to this drum and cutter, by which the stalks are cut, and falling upon the drum, are carried round and thrown off in regular rows. This ingenious piece of machinery will cut about an English acre per hour, during which time the cutter requires to be sharpened four times with a common scythe stone. The expense is estimated at from 30*l.* to 35*l.* If properly managed it may last for many years. We are sorry to learn that Mr. Smith has not found it convenient to prosecute his invention."

Mr. Smith, however, did again bring it out in 1837, but it did not come into general use. In 1829, the Rev. Patrick Bell, A.M., tried a machine of his making, at Gowrie, county of Forfar, cutting down Oats, Barley, and Wheat, on an uneven surface and a considerable declivity, taking a breadth of five feet at a time. The stubble was left from three to four inches long; and the corn was deposited on the ground in a very regular manner in the form of swathes; worked by one horse; cost about 30*l.* Mr. Stephens, in his Book of the Farm, says that by Bell's machine, corn may be cut at 3*s.* an acre, including binding and stooking. There were other machines. Stephens notices that of Mr. Joseph Mann,

of Raby Coat, in the Abbey Holme, Cumberland, who tried his invention in 1832. "The cutter is a disc of a regular polygon of 12 sides, and the gatherer a revolving drum with rakes, from the teeth of which a comb strips the straw, which then drops at one point of the machine in a continuous swathe. It requires horse power and a man to guide." Thus it appears that the reaping machine, which comes to us from America as an original invention, had its birth in England; that some of those which were not successful, though not so simple and effective in the cutting apparatus, were greatly superior in the property of depositing the grain on the ground without the clumsy and expensive process of the man and rake; and we think that, by and bye, one horse and a boy driver will be found sufficient for the work. While we attribute to the American machine all the merit that belongs to it, there is no need of lamentation that we derive it from a foreign source; for, independently of what we have stated, it is a further consolation that Mr. M'Cormick is himself a Scotchman, and so is his assistant, Mr. M'Kenzie. *Newcastle Journal.*

## Home Correspondence.

*Clipping Farm Horses and Bullocks.*—Having done this the last five years, I can confirm its utility, and even necessity, by my experience. If you doubt it, try it on one of a pair of plough horses, and in less than a week your horseman, however prejudiced, will beg to have the other clipped. I assume, of course, that the farm horses have a comfortable ventilated stable to lie in at nights, the same as our nag horses. Is it not strange that a farmer cannot consider the same principle applicable to both classes of animals? Where is there so much vigour, condition, and activity as in the London horses? who are all comfortably ensconced at night, their hay and straw cut, and their Oats bruised, and their water "chilled." I find it a good plan to clip my farm horses piece-meal, my man taking a slice off each daily—the change is less sudden. The same remark applies to bullocks. They certainly go on faster without their great coats, which were never intended for warm boxes or stalls, but Nature's open fields. Besides, I apprehend the hair requires daily nourishment, as much in proportion as any other portion of the body. The horses, instead of remaining wet all night, are dry in a few minutes. *J. J. Mechi, Tiptree Hall, Nov.* 4.

*Open Boarded Feeding Floors.*— Having, since my last, made many inquiries, I beg to state, first, that sawdust is a most excellent and useful absorbent; and, like the cut straw, becomes powerfully affected by the action of the manure. I use all I can get in the neighbourhood; and, although I have not tried it, I have no doubt tanners' refuse bark would be decomposed, and answer well under the floors. From 24 to 30 inches is deep enough for the pits, which should be under cover, and the building troughed. If in a sandy or porous soil, it should be of bricks set in cement. The pits under the bullocks should be at least 30 inches deep, especially if, as in my case, there are two in a box, 10 feet by 8 clear of the feeding trough. I think I said, before, 10 superficial feet for a sheep, and from 40 to 60 for a bullock, according to size, is ample space. In winter your pigs can hardly be packed too close, if well ventilated. Their shed must feel warm, or they will not pay during winter. Convenient sizes for lifting out are panes of spars about 7 or 8 feet by 5. If there is a deficiency of ashes, sawdust, or other absorbent, a drain for the liquid is desirable, but I prefer having the solid and liquid together. Cattle and sheep may be either loose or tied up on the floors. I prefer their being loose, unless quarrelsome. For fixing ammonia, I use gypsum from Mr. W. H. Potter, Clapham-road-place, London. I find it better and cheaper than the ground and expensive gypsum or stone. Some common salt, too, answers admirably for the purpose, and gives us, by decomposition in the manure the alkali so necessary for our crops. I have had abundant proof of this on my own and other cases. As to feeding, my young bullocks, weighing 400 lbs. net, get about 4 lbs. of Rape-cake, and 1 bushel of cut roots, and about 14 lbs. of cut Wheat-straw chaff, with 1 lb. of Bean-meal. My cattle eat 100 bushels, or 900 lbs. of fine cut Wheat straw chaff daily. It is put into large cast-iron pans, and the meal sifted amongst it, with 1 oz. of salt to each small bullock, and sufficient water to moisten it. The waste steam from the engine passes under and around these pans, and heats them; the next day the food is given to the animals quite warm, and the Wheat straw smells like brewing. I prefer warm water for every animal where available, because it saves the expense of heating it by the carbon of the food. Horses might drink warm water at any time, as is the case at the London breweries. It would be dangerous to give them cold water when heated, although the ploughmen are too apt to do so, and give them the "gripes." There is no doubt steaming roots and mixing them with meal, and giving them warm to pigs, is a good plan; although, to save expense, I give them raw Mangold and dry unground Beans, and access to water. I should mention that the planks or lattice pieces are 3 inches wide; they may have one clamp in the middle and one at each end. My numerous correspondents will excuse me if I adopt this mode of answering their queries. As to flies, you must and will have them where there is plenty of warmth and food, and breeding places in the manure. N.B. I can just now buy store pigs at about 4½*d.* per lb. with the offal, ready made, which is cheaper than breeding. It takes about 7 lbs. of meal to make 1 lb. of pork, net dead weight, and about 9 lbs. or more of meal or oil-cake to make 1 lb. of beef. The fact is, when you sell a pig you get paid for his skin at full price, and head and foot half price; whilst in a bullock you almost give away the skin, head, &c. If I remember right, the skin is about 15 per cent. of the net weight, or 8 per cent. of the gross weight. This is why I like pig feeding. I think it takes 160 lbs. of Turnips to make 1 lb. of meat, even with good management. *J. J. Mechi, Tiptree Hall, Nov.* 4.

*Storing Mangold Wurzel.*—In regard to this subject, I have to state that the method of storing is very simple, but I do not think quite so cheap as the estimates given in your Paper of the 8th. The price we give per acre for pulling, twisting off the tops, and loading into the cart, is 7*s.* 6*d.* per acre. We do not cut anything about them when taken up. And I think there is sufficient reason for this, because we know that Beet-root is best when taken up without the root being cut, as that allows the sap to escape, and Mangold is much of the same nature. We have no posts nor rails to store them between, but lay them on the ground, about 6 or 8 feet wide at the base, raising them up in a roof shape, as high as they will lie together; then we cover them up with rough straw, sufficient to keep out the frost. Afterwards they are thatched with straw as it is tied up from the threshing-machine. The machine being what is termed a bolting one, that is, the sheaf is fed in sideways instead of endways, and the straw comes out nearly straight, and fit for thatching. If there is any danger of the bottom of the heap lying too damp, we dig a small trench round it, or draw a furrow with the plough, turning the furrow from the heap; otherwise, if turned to the heap, it would catch the rain that falls on the roof, and convey and keep it among the roots. We have stored them between double rows of hurdles, the distance between the inside hurdles being about 6 feet, and the outside line about 3 inches from the other, the opening being filled with straw. But this requires a great number of hurdles, which are of little use afterwards. The other is less trouble, and answers equally well, for I am sure that we might have kept the last year's crop up to the present time, if it had been necessary. So you see the storing is simple, and you shall presently see that the consummation of them is equally so. We sometimes boil a few to mix up with bran or Barley-meal for young pigs, or sows with young, but we always let them have what they can eat raw, as they come from the heap, and the young ones soon learn to eat them without cooking. It is amusing to see a little pig standing on the top of a root nearly as large as itself, and eating it with a hearty good will: they soon declare themselves independent of the cook. For two years we have fed the large store pigs and dry sows on the raw root entirely; when the weather was dry we gave them plenty of water in their trough, but nothing else; and some of them have appeared quite fit for the butcher; but we should not think them fit to kill if only fed on this, because the flesh will not be so firm as if they have Barley-meal, or any other grain. I am aware that some have said Mangold is apt to make the sows slip, but with us this has not been the case; indeed, out of from 20 to 30 sows, we have not had more than two slips for these two years past, and that was proved to be from the rough treatment they received from their companions. Our fatting pigs have always as many of the roots as they can eat. One word more as to storing. All that we have to do is to keep out the frost and rain, and at the same time give them air (which they will obtain through the covering) and not have the roots at all injured. *Dorset Farm, Nov.* 10.

*Fossil Remains.*—A year ago last Christmas, I was engaged levelling down an old pit on my farm, situate at Middleton, in Suffolk, about three miles distant from the sea, as the crow flies, and four or five by the road from Dunwich. As I collect any fossil remains of shells and bones that I can get, I instructed my men, if they turned out anything curious, to save it for me, and accordingly when I went to see how the work was going on, a very beautiful (in my estimation) specimen of the ammonite was presented to me, which they had dug out. The soil in which they were digging was sandy, with a slight admixture of clay, and as far as our excavation went, which was equal to a pit face of about 200 square feet, it was perfectly barren of fossil remains, except the one above mentioned, which I ought to mention is not quite perfect, though sufficiently so to see a strong resemblance to the fossil commonly called "ammonite." The following paragraph in Sir C. Lyell's "Elements of Geology" (page 326) has raised three questions in my mind, viz.,—How did this fossil get there? Does it belong to this formation (a part of the tertiary)? and if it does not belong to this formation, to what does it belong? "As these Maestricht beds have been thought to be intermediate in character between the second and tertiary formations, it may be proper to mention, as opposed to this opinion, that the ammonite, baculite, hamite, and hippurite have been found in the maestricht limestone, genera which have not yet been detected in strata newer than chalk." No doubt a more experienced geologist than I have any pretensions to be, will easily solve my questions; but in case the circumstance as related above may afford any interest to others, I have ventured to forward it to you for insertion. *J. R. Markby, Halesworth.*

*Ireland.*—As a lover of peace, I would not approach the troubled waters of strife, unless it were to endeavour to screen them from the ruffling blast of contention. Mr. Goodiff's letters, and your comments, exhibit a dark picture of distress, which, alas! is but too true to the life. Under existing circumstances, emigration is undoubtedly one of the remedies for relieving the distress of the Irish. But we must allow that emigration or starvation is a sad alternative; it is a state that need not be, and which, therefore, ought not to be. But if landowners and land-agents will continue to neglect their duty and their interest; if the land should still remain ill-cultivated or uncultivated; if it is still to be sublet; and if, from want of better cultivation, the peasant be still doomed to exist upon Potatoes, then, until these evils cease, emigration must be a blessing to the poor starving Irishman; and, until those whose duty and interest it is to remove these grievances do their part, emigration should be promoted. But let them take a friendly admonition, or assuredly they will suffer severely from the evils which their own apathy has brought upon them. Let them consider that the working poor constitute the sinews of wealth; that labour, well directed, constitutes the chief, if not the only source of wealth. And let them strive to prevent that dire necessity which compels the poor peasant to desert the home of his fathers—the land where his love lingers; let him not be compelled to say:

> "Far, far from thee, my native home,
> An exile, I am doom'd to roam."

Let them consider that Ireland ought to be one of the fairest isles in the Atlantic ocean, since it possesses many peculiar advantages; its hidden treasures, untold, are incalculable. Even in its bogs the elements of prosperity are concealed; and labour, guided by science, is the key to unlock and the power to bring them forth. Deep draining—the manufacture of peat charcoal—the cultivation and manufacture of Flax—the cultivation of Beet and the extraction of its sugar—the adoption of the Belgian system of agriculture—and, where cultivation cannot be carried on, the more extensive breeding of sheep and goats; these, and other similar things, offer a fine scope for the profitable employment of labour and the investment of capital. Yet, with all its advantages, Ireland is still one of the most neglected, degraded islands under the sun. And while ignorance continues to keep its depressed inhabitants in their miserable condition, emigration must be a blessing to the poor creatures. It makes a fine opening for the influx of Scottish and English occupiers, who, with their enterprise, capital, and skill, will effect a complete reformation, converting many barren bogs into productive fields. This is a consummation greatly to be desired, and a good resulting from the calamitous famine, and the Act for the Sale of Encumbered Estates. But let neither Irish, English, nor Scotch capitalists imagine that their estates can ever be prosperous while they are living in another country, and annually draining these estates of that wealth which, like the dew of the earth, should revert to the place from whence it arose. Depopulation and emigration are, however, making a fine opening for colonisation by Scottish and English farmers, who should on no account emigrate to detached farms, but form large colonies, in which they would find mutual protection and assistance. The subject naturally suggests the consideration of the tenure and cultivation of English as well as Irish farms; and, in conclusion, I take the liberty to say that there is still great need of improvement in the letting and cultivating farms in England. Of this Binn's "Notes, on the Agriculture of Lancashire," noticed in your *Gazette* of the 1st of November, at p. 700, and many facts of which I am cognisant, in various parts of the kingdom, give abundant proof. If farms were properly laid out, rightly let, so as to promote the best cultivation, and that fully carried out, many farmers might be saved from ruin or emigration. But to effect this, we want more such men as the late Lord Leicester, and Mr. Blacker, and his noble employer, and a few more of the same character, now living, and striving to benefit their dependents and the whole community, both in England and Ireland. May their efforts be abundantly blessed, and their example generally copied, and may honest industry be liberally rewarded in our native country. *O. F.*

*Annual Vegetable Exhibition at Chislehurst, Kent: Nov.* 12.—This day the school-room in the parish aforesaid contains a good display of vegetables and fruit produced by cottagers. It is truly gratifying to behold the result of industry within the district of the Chislehurst Vegetable Society. Much credit is due to the cottager, as well as to the founders of the Society and managers—to the first for his produce, the second for its origin, and to the last for its progress. Although the vegetables and fruit are decidedly fine, the competition is not so great as one would imagine, compared with the extent of the district and its population. It is my humble opinion that the number of exhibitors may be increased many fold, simply by allotment ground, the benefit of which no one can deny. I think it not amiss to recommend every agricultural labourer without a plot or garden, and many there be I could point to in Chislehurst, to apply without delay to the liberal landlord in his immediate vicinity for a field where to exercise his spade and other implements for an hour or two of a morning or evening, independent of his daily occupation, instead of spending the time at an ale-house or elsewhere to no account. Presuming the industrious cottager in every agricultural district to be able readily, in this our highly favoured land, to obtain a piece of ground,—which surely no landlord would refuse him, insomuch as its use would no doubt greatly facilitate the difficulties with which the labourer has to struggle for pecuniary wants—tend to keep him and his family from falling in on the parish, and thereby increase the wealth and independence of our country—adapted to the growth of culinary vegetables. The next thing to be considered is the

way in which his time and the soil may be applied to the most profitable account. I would recommend the attention of the cottager to that cheap and useful little calendar by Sir Joseph Paxton, if more massive and expensive information is not within his reach. For previous years one copy has been purchased for the sum of 3*d.*, or 25 copies for 5*s.* Fifty copies, I imagine, would go a great way in one society's district, and 10*s.* out of the funds, distributed in the shape of the above little work, would not, I think, be badly bestowed. *J. G., Chislehurst.*

*Fleas.*—At p. 701, a correspondent complains of being infested with fleas, fostered, apparently, by his fat pigs. I once sent you an account of an efficacious mode of attacking wasps' nests, which seems to have been adopted with success by some of your correspondents; and if the following notice of a successful attack on fleas be not beneath your notice, perhaps you will give it currency. Our Bob, clever dog as he is at a rat, cannot contrive to rid himself of his fleas. Partly Scotch terrier and partly undefined mongrel, he is short-necked and short-legged as a turnspit. In spring and autumn, more especially, the fleas take up their quarters in two positions, one along his back and the other on his chest; where they increase and multiply to an extent sufficient to make the life of Bob very uncomfortable. I recommended some sweet oil (any oil would have answered) to be poured over the infested parts, and rubbed in with a rag, knowing how instantly fatal such an application would be to insect life. The application succeeded perfectly. I am told the dead fleas tumbled out by scores; and hundreds fell off him as the rubbing proceeded. He was afterwards washed with a solution of common soda, in order to get rid of the oil; and Bob has assumed the air of a decidedly comfortable dog ever since. *J. S. Henslow, Hitcham, Nov.* 10.

## Societies.

SAFFRON WALDEN, *Oct.* 22.—At this meeting Mr. MILES, M.P., alluded to the trial of the American reaping machine. It was first tried on Mr. Mechi's farm, but the weather was bad, and it was not considered a fair trial. Mr. Pusey, however, reported the trial experiment to the Council of Chairmen, and they determined to give the machines the two great medals. But at the same time Mr. Pusey advised that another trial should be made. It was made at Mr. Pusey's. Now mind the result. The two American machines came into competition. With M'Cormick's, Mr. M'Cormick was present; he worked it first, and it did its work most admirably, and perfectly to the satisfaction of Mr. Pusey and himself (Mr. Miles.) They then put Hussey's machine together; no one was there for it, but they got it into gear, and till they thought they had got it into the best gear they did not try it. The machine started; they found it as bad a machine as they thought could be invented for the purpose, and they then gave the great prize to M'Cormick's, and declined to give any prize to Hussey's. After a time they were taken into Yorkshire; Mr. Hussey was present, and Mr. Thomson, of Moat Hall, conducted the trial; they then found, on cross-furrows, the trial proved Hussey's far superior to M'Cormick's, and they asked that they should give him the medal; but to this he (Mr. M.) objected, as it was not the same machine that was shown in the Exhibition, and they could not say whether any alteration had been made in it or not. This would be stated in the Society's Journal, but as this was the first opportunity he had of explaining the matter, he thought it right to do so. Nothing could be better than the work of M'Cormick's machine, and with two pair of horses he had no doubt it would reap 16 acres a day. (Hear.) Now, as to Flax; it would be recollected that M. Claussen appeared before the Council of the Society, and having described his operation, they told him what they had to look to was a ready market for the Flax, and if the grower had anything to do with the steeping it would be useless to England. He then said he had invented a machine, for about 5*l.*, which the farmers could use at home, break the reed of the straw, and send it to the manufacturer; and he put down the produce at 8*l.* or 9*l.* an acre. But the machine was not forthcoming, nor was it certain that the process itself would succeed, for he found on enquiry that it was not perfect. But that there was something in it he had no doubt; and it behoved them to look at every penny, when a penny was to be turned. He was tired of the cry, "Cultivate, cultivate"—it sickened him to death, for he said the generality of the farmers had strained every nerve to do themselves and the country justice, and we saw them now without a remunerating price. The Royal Agricultural Society would do its duty, and would recommend to practical farmers nothing but what was for their benefit; but if they had progressed up to the present time, there might be a time when they could not do it, not from want of will, but from want of means. The farmers had strained themselves in their efforts to advance, and it was time to see whether something was not to be done, which it was not in them to effect, but for a higher power to carry on.

Mr. MECHI, after alluding to the delightful bond of union that existed between Lord Braybrooke, his family, and the neighbourhood, said they had heard something of the difficult position of the agriculturists, which meant, he supposed, the position of the landlord, the tenant, and the labourer; and also, as was observed by Lord Hardwicke, of the tithe-owner and the government. There were five parties concerned, but they would allow him to invert the order, and begin with the labourer, because he thought industry was the parent of capital and the labourer was the foundation of agricultural operations. (Cheers.) Now they were here to speak the truth; and he believed, from all the enquiry he had been able to make, that the condition of the agricultural labourer was most satisfactory. He was not alluding to the state of the poor-rates, because he knew the low price of produce had a tendency to diminish rates; but he said the labourer was in a prosperous condition. (Marks of dissent.) He should be happy to hear an objection, but he stated what he believed to be the truth, and why he believed it was this:—In Essex the estimate of a labourer's week's wages was the value of a bushel of flour—that had been the general rule of action; and as the price of a bushel of flour now was 5*s.* 6*d.*, and he heard they were giving 7*s.* 6*d.* a week in this neighbourhood, and in his own neighbourhood they gave 8*s.* and beer, it showed that the labourer was better off. (A person exclaimed, "The wages are not so high.") He knew there were some gave 6*s.* 6*d.* some 7*s.* 6*d.* some 8*s.* and 9*s.*; and probably the average would be about 8*s.* or 7*s* 6*d.* Well, then, it must be quite clear that wages being 7*s.* 6*d.* the labourer must be in a better state, and he was sure they were all delighted that it was so. (Hear.) Now he went from the labourers to the tenants; he knew this was ticklish ground, and in the first place he must state that the low price of the farmers' produce—he meant of corn, for meat was dear enough—certainly entitled him to all the deductions in the cost of his productions that he could fairly claim. They knew the great items in that cost were rent, labour, tithe, and government taxation. Now they could not complain particularly about labour; he did not think they did, and the labourer was well off; but he did think that rent should be reduced, if they were to have permanently a low price of corn, to something like a fair proportion to the price of their produce. He believed in many cases that had been done, and in many cases where it had not been done, it would be done, either from the good sense and calculations of the proprietors themselves, or from the stern force of compulsion and necessity. He came now to the tithe, and the clergy would find to their sorrow that they would sink or swim with the farmer; but the farmers must recollect that if they were paying the tithe rent charge on a high price now, they had that price and were bound to pay on it. He did not say whether it was right or wrong to fix the charge on so high a scale, but he wished the tithe were higher on the farmers, because it proved that they had had more, and they should all be sorry to see it so low next year. Then they came to the landlord, and in reference to this point he felt they were in a comparatively happy district, for he was sure the landlords he saw there were too much men of business to expect their tenants to pay their rent out of capital; but if the tenants got a proportionate reduction, he did not think they would be so badly off. They heard a good deal about agricultural ruin. Now in commerce, when they heard a man was ruined, when they looked for him he was gone, and his name was in the *Gazette*; but when he (Mr. M.) came here he still saw the same happy faces. (No, no.) He did not say all, but he saw a great many that he had seen before continuing in the same tenure. (A voice—"Not happy.") He could only say that he recognised those honoured names, the Claydon-, and the Webbs, and the Jonases, as being still there, and long might they remain. But he would not hear of their being ruined, because he did not believe it to be the case. (A voice—"Where is the balance-sheet?") In reference to that he would only say that in the course of a few weeks, at the request of the Society of Arts, he should lay before them a copy of his books, and he had no doubt that many would be happy to see that he had lost some money, if it should be so; they would then be made happy for once. But at all events, last year he had a valuation of his property, a very satisfactory one to him as a landlord, and this year they should have it as a tenant; but he would not anticipate, and till the next month he hoped they would restrain their impatience. The question had been asked—has agriculture done her duty? He denied that she had. If he took the state of cultivation in Cambridgeshire, he should feel happy on the subject of agriculture, because they had there men of great ability and great capital, who were an honour to their country in agriculture, and he honestly believed they were not losing money. But let them look at the general state of the country; go from one county to another and look at the reports on farming in the different counties of the kingdom, and he said that the almost universal complaint was, that good farming was the exception, and bad farming was the rule. He excepted parts of Norfolk and Cambridgeshire, but when they spoke of the whole kingdom, they spoke of Ireland, Scotland, and England, and if they had read the reports on the farming of the different counties, he thought as honest men they must come to the conviction that however high the agriculture of this country might stand, as compared with other nations, generally it was low compared with that perfection which existed in parts of this country. Let them recollect it was their duty to improve it. Look at what the manufacturers were doing; and manufactures were essential to their success. He had had at his farm this year crowds of foreigners from all parts of the world; he had talked with them upon the subject, and as to labour, he had gone into a comparison of its cost, both as to the money paid and the work done, and he could prove to them that the labour of England, taken by the quantity of work, was as cheap as any, if not the cheapest in the world. There was a fact for Mr. Jonas to look at. (Laughter.) He believed, therefore, so far as foreign labour went, they had nothing to fear. Then, as to the manufactures, trade and commerce of this country, let them look at the advantages the agriculturists possessed from these. He had said to these foreigners—"What do you do with your corn?" and they said—"We send it to England; we cannot afford to eat it ourselves, and we send it to you; it is with meat the same—it is half the price because we have no one to sell it to;" and the agriculturists in this country would be in the same state if they had not a district which afforded a market to send their corn to—he sent his corn to the manufacturing district; and therefore the greater the union between them the better for those two interests, and the happier for the country at large. (Cheers.) Then, again, look to the difference in practice in agriculture in different parts of the country. There was as much as 2½ per cent. difference, and this in any manufacture would cause its entire removal from one part to another, and he did not know whether 1½ per cent. would not do it. Essex, for instance, ploughed with two horses, and stood pre-eminent for ploughing, while in some other counties they used six in a line; and having appealed to a surveyor in Herts on the subject, he sent him the allowances made there for the ploughing on heavy land, and he found the first ploughing 13*s*, the second 11*s.*, the third 10*s.*, and the fourth 8*s.*; and he believed there were four ploughings for Wheat. (A Voice: "I don't believe it—it is not generally the case.") He gave no names, but this letter was dated from Herts last week. Then let them look at the extraordinary discrepancy as to the form and size of the fields, and the system of management. Look at Norfolk and Cambridgeshire, and they saw large fields. He knew a farm in Norfolk of 1000 acres in only four fields; he went into Devonshire, and he found there a farm that a gentleman told him the tenant had left, and he could not let it, and on inquiry what it was, he said it was a farm of 67 acres, and there were 27 fields. Thus he had 27 gates to open, had got 27 headlands, and 27 hedges full of trees, and then the tenant could not live. (Hear.) Was that a solitary instance? He appealed to a noble lord there, whether he did not know one whole parish in which there was an average of three-acre fields? Then what conclusion could they draw but that agriculture was in a most backward state, as compared to manufactures, and trade. This must be amended. He heard of landlords who could not let their farms, heavy undrained land; and when they were told to keep stock on it, could they, he would ask, keep stock on heavy land in winter, unless they had buildings to put it in? Then there were landlords who did not like to cut down their timber. But all this must come to an end before they could go to the country and show they had done their duty as agriculturists—and by agriculturists he meant the landlord, the tenant, and the labourers. Therefore, he said, let them go to the country with clean hands, and be sure they had done their duty before they complained. Then as to the management of their stock—he did not speak of the men there, for he called them the Napoleons of farming, and he said if all the country was farmed as Cambridgeshire was, the foreigner could not put his head in with his foreign corn. He believed they would have to produce corn as the manufacturer did his cotton; for the manufacturer sold to them at one time for 3*s.* 6*d.* that which he now sold to them at 6*d.*, and got a better profit. How was that done? Not by the old clumsy system of weaving by hand; but let them look to what had been done in manufactures, to the capital invested in machines, not only to make the article, but to make the machinery, as shown in the Great Exhibition. Then he said to the agriculturists, compare your own clumsy contrivances with this, and I do say agriculture is far behind in its application of steam power, in drainage, in fences, and timber—your buildings are badly placed, and before you can produce the article at a cheap price and in abundant quantity you must remedy all these things. With respect to taxation, he thought it did not require any conjuror to show that they bought all their things at the cheapest rate. (No, no.) Why his lady bought two beautiful dresses the other day for 7*s.* 10*d.*, and he bought an umbrella the day before yesterday for 18*d.*, a very good one. (Laughter.) He stated this to show that the expenses of the farmer were reduced in a great degree by the articles imported for his use. One word as to himself. It might or might not be fortunate that he was connected with agriculture; but he bought some farms, and finding them undrained and the buildings tumbling down, he said to the tenant, "Pay me a fair per centage, and I will do all that is required." The tenant said the farm was poor, and would not pay for it; to which he replied, "Then give it up, and I will do it myself." He did do it himself—and let them remember that the more capital they got from manufactures to lay out on agriculture, the more corn they would get, the more labour they would employ, and the less pauperism they would have—and he could only say that the expenditure of his money in agricultural pursuits was a thing he should never regret. He did not at all admit that good drainage, the removal of fences, and other things of this kind were unprofitable, but if they were he said the satisfaction was self-abiding that he had applied his money in promoting the contentment and the employment of his fellow-creatures, instead of investing it in foreign loans, and foreign speculations, as many would do if they believed all they were told as to the prospects of agriculture. (Hear.) By-and-bye he should have to talk to them about his balance-sheet and his own concerns, and he hoped many would benefit by it—he did not mean such men as Mr. Samuel Jonas, for he thought they had done all they could, and would reap the advantage of it. He had now to propose with great pleasure the health of the judges of the day. (Cheers.)—Mr. S. JONAS returned thanks, and said he felt proud in endeavouring to promote the objects of the Society, because the one class as landlords and the other as tenants were here combined to improve the social position and the morals of the people amongst whom they resided. Speaking there as a tenant farmer, it might be expected that he should make a few observations in reply to some of those that had been addressed to the meeting. Mr. Mechi stated that he complained loudly of the state of agriculture—of the bad state of the land, and the way in which much of it was cultivated; but could Mr. Mechi, or any man of business be surprised that the lands of England should be gradually going out of cultivation? that when the tenant farmers were deprived of a just remuneration for their skill and capital, he did find the land of the country in this state? As a commercial man, what actuated him in his pursuits but a remuneration for his capital? Mr. Mechi stated that the labourer was benefited largely by the present state of things; but he (Mr. J.) begged leave to differ from him; and he would ask, was the large decrease of population in Ireland, to the extent of two millions, a proof of the improved state of the labourers? He was sure many of them must have had their feelings sadly touched at seeing the crowds at the railway stations, who from the circumstances of the times were compelled to leave their homes, and seek in far distant lands that employment of which they had been unjustly deprived by the enactments of the Legislature of this country. Again, Mr. Mechi had spoken of the bad manner in which the land was drained; but were they to look to Mr. Mechi as a good example of the system of drainage? He (Mr. J.) had the compliment paid him, by that gentlemen or some one else, of having sent to him a publication by Mr. Mechi, in which he stated the manner in which he began at Tiptree Heath; he stated that in his first attempts at drainage, after having dug the ditches, he laid stones at the bottom; he was then at the expense, on the top of these stones, of laying the tiles; he covered them up, and when the rain came he rushed to his open ditches to see the result, and to his astonishment not a drop of water could be find in the pipes. (Laughter.) Was that the man who was to be held up as an oracle to them? (Cheers.) He knew of no man more overflowing with the milk of human kindness than Mr. Mechi, but he could not allow his statements to pass without some observations from him. (Cheers.)

### METEOROLOGICAL REPORT.—NOVEMBER.

* I think this storm must have travelled northward over France and the German Ocean, in which case the barometrical depression will have been greater at London than here, and the hour of minimum would be in the evening of the 15th. It was probably a cyclone of very considerable extent.

†‡ These depressions would be produced by small cyclones originating in the rear quadrants of the preceding storm.

¶ This is a storm of great diameter coming from the westward and southward, and tying a long way off to the northward.

Dorchester Nov. 20. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Exhaustion of a thoroughly Cultivated soil by the Wheat plant.*—Who has taken the trouble to follow the roots of a Wheat plant? Let a man do this; let a man do it in well-pulverised soil, 20 inches or 2 feet deep. He will see what an infinitely small portion of the inner surface of the soil is touched by the roots. Let him consider that, without touching that surface, the roots cannot take up and assimilate the nourishing solutions of which it is the vehicle; that the soil is infinitely divisible, and infinitely divided by this mode of tillage; and so is able to offer a perpetual change of surface, and therefore a perpetual supply of those substances, say of silicates or phosphates, sulphates or alkalies, which the plant requires. For myself, I see little cause for dread of exhaustion of the soil; and though, perhaps, the duration of these substances cannot strictly be called infinite, yet the period when the supply will cease is certainly so distant as to be indefinite. *A Word in Season.*

## Notices to Correspondents.

Bones, &c.: *G B.* Bones if roughly broken will heat and break down to powder if placed in a heap with damp sand.—Hay-seeds from a *good* pasture will make a good permanent pasture. It is not sufficiently preferable to sow Grass seeds without a corn crop, to justify the loss of that crop. If you sow without a crop the spring is still the proper season for sowing.

Cows, &c.: *Constant Subscriber.* Half a cwt. to ¾ of a cwt. of Carrots to a small cow, with 10 or 12 lbs. of hay, will be a sufficient daily ration. They had better be cut by a Gardener's or Moody's cutter. They had better be washed. Carrots are good for horses, to which they may be given at the rate of from 30 to 40 lbs. a day. The cultivation you name will be given next week.—*E D.* We would give her 3 lbs. of Bean-meal and 1 lb. of Linseed, daily, with the other food; and if she be a good milker she will use it in her produce and not in growing fat.

Italian Rye-grass: *H B.* It is best sown late in spring after the Barley is up, and hoe it in. It will come to a good bite towards the end of April. Rape may be sown after winter Vetches, just as Turnips are when sown on the flat, and they will be ready for the sheep any time in winter or spring. They are a much better spring food than Mustard. You may sow Italian Rye-grass immediately after harvest—by scarifying the stubble and clearing it, and waiting for a rain to moulder the soil and thereafter bush harrowing it in.

Manuring: *B B B.* Top-dressing is wasteful, but unavoidable; and this, or rather early in spring, is the best season at which it can be done on Grass lands, for evaporation is at its minimum.

Potatoes: *M M G.* The ground should be dug in autumn, and well exposed to frost, and *then* the Potatoes may be planted lazy-bed fashion, if you choose. But to lay tubers on the undug Grass, and cover them with the earth from the trenches, was unpardonable; and it is no wonder that the crop was destroyed by worms.—You may milk thrice a day with advantage.

Small Farm: *B.* Next week.

Watering places: *Caradoc.* On Deanston the main drains in their course delivered their water to an under-ground cistern or cesspool, and a pump placed there supplied cisterns for four adjoining fields. Something of that kind might suit you. Or a circular, saucer-shaped basin, pitched and otherwise water-tight, may be placed at the corner of four fields, the hedges of which, by means of iron fencing, may meet in its centre—a very neat arrangement of this kind we saw lately at Cirencester—and into this the drains may be delivered.

## Markets.

### COVENT GARDEN, Nov 22.

English Pine Apples continue plentiful, and Grapes, both foreign and English, are abundant. Small quantities of Pears are still brought from the Continent. The best English kinds fetch 2s. to 4s. a doz., and 3s. to 12s. per half sieve. They consist of Glout Morceau, Crassane, Beurré Diel, and Chaumontelle. Oranges are plentiful. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms remain stationary. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

FRUIT.

HOPS.—Friday, Nov 21

Messrs. Pattenden and Smith report that the market and prices continue good for middling and fine samples.

COAL MARKET.—Friday, Nov. 21.

Holywell, 16s. 6d.; Tanfield Moor, 15s. 6d.; Howard's West Hartley, Netherton, 16s.; Wallsend Haswell, 19s. 6d.; Wallsend Hetton, 18s. 6d.; Wallsend Gosforth, 18s. 6d.—Ships at market, 17.

SMITHFIELD, Monday, Nov. 17.

The supply of Beasts is shorter, and prices on the average better; yet it is difficult to quote higher for inferior qualities. A good clearance is effected, owing to the favourable weather. The number of Sheep is smaller, and late rates are fully maintained; indeed, some of the choicest kinds are rather dearer. The number of Calves is quite equal to the demand, and trade generally is no better. From Holland and Germany there are 1643 Beasts, 5060 Sheep, and 247 Calves; from Scotland, 150 Beasts; from Norfolk and Suffolk, 120; from Ireland, 170; and 2400 from the northern and midland counties.

| Per st. of 8 lbs.—s d s d | | Per st. of 8 lbs.—s d s d | |
|---|---|---|---|
| Best Scots, Herefords, &c. | 3 8 to 3 10 | Best Long-wools | 3 6 to 3 10 |
| Best Short-horns | 3 6 — 3 8 | Ditto Shorn ... ... | |
| 2d quality Beasts | 2 6 — 3 0 | Ewes & 2d quality | 3 0 — 3 4 |
| Best Downs and Half-breds ... | 4 0 — 4 4 | Ditto Shorn ... ... | |
| Ditto Shorn ... ... | | Lambs ... ... | 0 0 — 0 0 |
| | | Calves ... ... | 3 0 — 4 0 |
| | | Pigs ... ... | 3 4 — 4 4 |

Beasts, 4805; Sheep and Lambs, 24,060; Calves, 300; Pigs, 480.

Friday, Nov. 21.

We have a fair supply of Beasts to-day as regards numbers, but the quality of it is very middling. Trade is dull, and the average of prices lower. A few choice Scots make 3s. 10d., but in so few instances that we are not justified in quoting it. There are a few more Sheep on offer to-day than on Friday last, and the demand is small; consequently the advance experienced on Monday is not maintained. Although the number of Calves is not large, it exceeds the demand; prices are about 2d. per 8 lbs. lower. Indication of change in the weather causes a dull sale for all kinds of stock. Our foreign supply consists of 501 Beasts, 1900 Sheep, and 160 Calves. The number of Milch Cows is 120.

| Best Scots, Herefords, &c. | 3 6 to 3 8 | Best Long-wools | 3 6 — 3 8 |
|---|---|---|---|
| Best Short-horns | 3 4 — 3 6 | Ditto Shorn ... ... | |
| 2d quality Beasts | 2 4 — 2 10 | Ewes & 2d quality | 2 10 — 3 4 |
| Best Downs and Half-breds ... | 4 0 — 4 2 | Ditto Shorn ... ... | |
| Ditto Shorn ... ... | | Lambs ... ... | 0 0 — 0 0 |
| | | Calves ... ... | 2 10 — 3 10 |
| | | Pigs ... ... | 3 0 — 4 4 |

Beasts, 1240; Sheep and Lambs, 4889; Calves, 275; Pigs, 485.

MARK LANE.

Monday, Nov. 17.—The supply of English Wheat by land carriage samples to this morning's market was small from Essex, and but moderate from Kent; the white was taken off at an advance of 1s. per qr., but we cannot alter our quotations for red. There was rather more inquiry for some of the finest qualities of foreign; these commanded the extreme prices of last week, but other descriptions are comparatively neglected.—Picked samples of malting Barley sell readily at last week's rates, but secondary sorts are difficult of disposal; foreign grinding is very scarce, and rather dearer.—We raise our quotations for Beans and Peas 1s. per qr.—There is a fair sale for Oats at fully last week's prices.—Fine barrel Flour is in good request at our quotations.

Friday, Nov. 14.—The arrivals of grain and Flour this week, either English or foreign, are very small; English Wheat fully supports our quotations of Monday, and although the sale of foreign was limited, extreme prices were realised on the business transacted.—The value of Flour is firmly maintained, and for American barrels there is a good demand. We observe no alteration in the value of Barley, Beans, and Peas since Monday.—The Oat trade is very firm, and in some instances 6d. per qr. more money is paid.—There are but few floating cargoes on the coast unsold. Two of P. Odessa Wheat not arrived have been taken for the Continent, at 33s., cost, freight, and insurance. For Galatz corn, 27s. is asked.

Liverpool, Tuesday, Nov. 18.—At our market this morning fine white American and high mixed Dantzic Wheats were held 1d. per 70 lbs. over previous rates, but the advance was not freely paid, and all other descriptions of foreign, upon a slow limited demand, remained without any decided change in value; whilst farmers' new Wheat, of which there was a further good supply, moved readily at late rates. Malting Barley being scarce, and Malt in few hands, both were quite as dear as last week; grinding Barley, on the contrary, was in limited request, and rather cheaper. Best new mealing Oats improved ½d. per 45 lbs., all ordinary qualities being dull and depressed in value. Oatmeal was saleable at an advance of 3d. per load.——Friday, Nov. 14.—At our Corn Exchange to-day, fine white foreign Wheat was in moderate, though not in lively request, at a trifling advance over late rates; whilst good English Wheat was taken freely by our local millers, and commanded the full rates of Tuesday. States and Canadian Flour continuing to meet a ready sale, general qualities were again 3d. dearer. Although in Barley, Malt, Beans, and Peas, little business was apparent, prices remained unvaried. Oats, being scarce, were the turn dearer, and Oatmeal supported our last quotations. Of Indian Corn, either on the spot or floating, no sales were reported to-day.

HARTLEY'S PATENT QUARRY GLASS, FOR GLAZING CHURCHES, CHAPELS, SCHOOLS, &c.—The above beautiful description of Glass is an adaptation of Hartley's Patent Rough Plate Glass, with a diamond (or quarry pattern); thus avoiding the use of window leads entirely.

Being in single plates, it is impervious to rain, and causes perfect freedom from draughts, which, coupled with its thickness, tends to create an uniformity of temperature within the building. Attention is also directed to its durability, non-transparency and cost; for, although three times the thickness of crown-glass, the one-eighth thick costs less than common lead lights; we can, therefore, with confidence recommend it as an economical, useful, and beautiful article for the glazing of churches, chapels, schools, &c.

Prices to be had and samples to be seen at James Phillips and Co.'s, 116, Bishopsgate-street Without, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

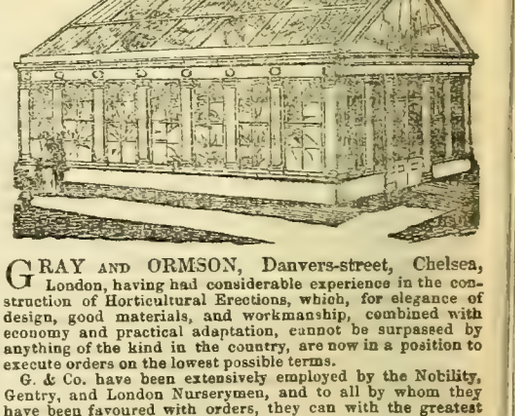
Milk Pans, 2s. to 6s. each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. Weeks and Co., King's-road, Chelsea, Horticultural Architects, Engineers, and Builders. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. Weeks and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their Victoria Regia Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

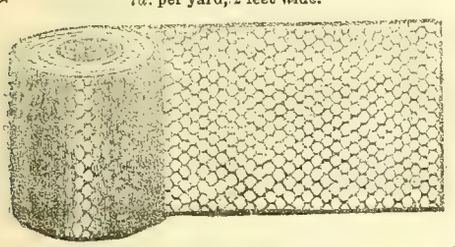
HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY and ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

DOMESTIC SANITARY MEASURES.—Places in Gardens rendered as comfortable as the best-constructed water-closets by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Sold only at Fife and Co's Scientific Repository, 26, Tavistock-street, Covent Garden, London, sole depôt for the Patent Hermetically-Sealed Inodorous Chamber Commodes, 1l. 4s., 2l. 6s., and 3l.; also improved Portable Water Closets, with pump, cistern, and self-acting valve. Orders by post attended to.

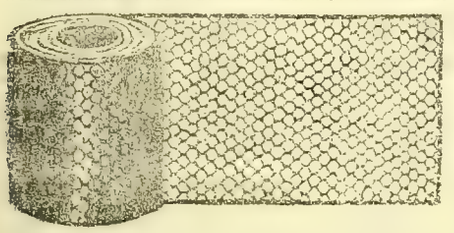


GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1⅝ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.
J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

CONSERVATORY.

TO BE SOLD, very cheap, a second-hand CONSERVATORY, 70 feet long, by 20 feet wide.—For particulars and to view, apply to Mr. HENRY TOBY, Glebe-place, King's Road, Chelsea, near London.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.



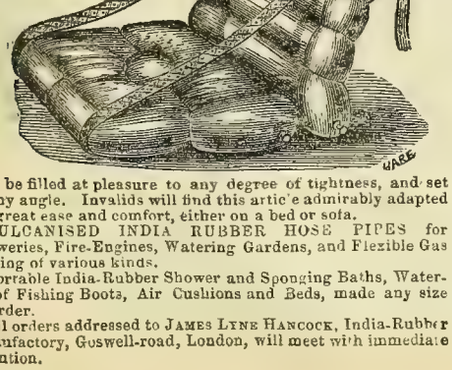
GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, .. | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1⅝-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1⅝-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1⅝-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

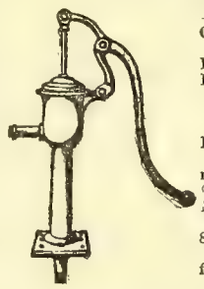


| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each; Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 41, Skinner-street, Snow-hill, London.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.



This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it

may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.
VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.
Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.
All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

TO HORTICULTURAL & FLORICULTURAL SOCIETIES.
BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Rick Cloths, with Poles, &c., complete. Marquees and Tents on hire. Netting and Bunting for Fruit Trees. Orders, per post, duly attended to.
Address BENJAMIN EDGINGTON, 2, Duke-street, Southwark.—A Warehouse, 208, Piccadilly.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.
JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.
Every description of Machinery for Raising Water, Fire Engines, &c.
The usual allowance to the Trade.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—CRINILENE has been pronounced by thousands to be the only preparation that can be relied upon for the restoration of the hair in baldness from any cause, preventing the hair falling off, strengthening weak hair, and checking greyness, and for the production of Whiskers, Moustachios, Eyebrows, &c., in a few weeks with certainty. It is elegantly scented, and sufficient for three months' use; will be sent, post free, on receipt of 24 postage stamps, by Miss DEAN, 48, Liverpool-street, King's-cross, London. Testimonial: Dr. Thompson says—"It is a beautiful preparation, and the only one I can recommend."

CROSBY HALL VAULTS, No. 35, BISHOPSGATE-STREET-WITHIN.—CURRALL and SON beg to invite public notice to their STOCK of OLD BOTTLED WINES. They being desirous to secure that patronage which wines of the first quality, at fair and remunerating profits, will maintain, respectfully submit the annexed list of cash Prices:—

| | Per doz. | | Per doz. |
|---|---|---|---|
| Port, old bottled .. | 36*s.* and 42*s.* | White Port in pints, bottles and package inclusive .. | 30*s.* |
| Ditto, six years in bottle .. | 48*s.* | Sherry (excellent dinner wine) .. .. .. | 28*s.* |
| Sherries, pale and brown .. | 36*s.* | Port, superior draught | 28*s.* to 33*s.* |
| Ditto ditto .. | 42*s.* to 48*s.* | | |
| Marsala .. .. .. | 24*s.* | | |
| Champagne (1 doz. cases) | 54*s.* | | |

PALE BRANDY, 60*s.* per doz.; bottles, 2*s.* per doz.; hampers, 1*s.* per doz.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF, and the HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt. Admission, 1*s.* On MONDAYS, 6*d.*

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. The fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLANDS' MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the human hair, is too well known and appreciated to need comment. For Children it is especially recommended, as forming the basis of a beautiful head of hair, and rendering the use of the fine comb unnecessary.—Price 3*s.* 6*d.*, 7*s.*; family bottles, equal to 4 small), 10*s.* 6*d.*, and double that size, 24*s.* per bottle.
N.B. Each bottle of the genuine article has the words—ROWLANDS' MACASSAR OIL, engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.
Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Druggists.

"WHERE SHALL WE GO THIS MORNING?" Such is usually the query over the breakfast table with visitors to London. Let us answer the question. If you can admire the most beautiful specimens of Papier Maché manufacture which are produced in this country, displayed in the most attractive forms—if you want a handsome or useful Dressing Case, Work-Box, or Writing Desk—if you need any requisite for the work table or toilet—or if you desire to see one of the most elegant emporiums in London, then you will go to MECHI'S, 4, LEADENHALL-STREET, near the India House, in whose showrooms you may lounge away an hour very pleasantly.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

FRIGI DOMO.—A perfect protector against frost, a non-conductor of heat or cold, and cheaper in price than baize matting. A canvas made of prepared hair and wool, adapted to many horticultural and floricultural purposes, for covering up, where a fixed temperature is required. It is 4½ yards wide, and of any required length at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, Oxford-street, London.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.
Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars, London; and 36, Seel-street, Liverpool.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.
METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS. DR. BARKER continues to supply the afflicted with his Celebrated Remedy for this alarming complaint, the great success of which for many years past renders any further comment unnecessary. It is easy and painless in use, causing no inconvenience or confinement, and is applicable to every variety of single and double Rupture, however bad or long standing, in male or female, of any age. The remedy, with full instructions for use, will be sent post-free, to any part of the Kingdom, on receipt of 7*s.* in postage stamps, or Post-office Order, by DR. ALFRED BARKER, 48, Liverpool-street, King's Cross, London, where he may be Consulted Daily from 10 till 3 o'clock (Sundays excepted.)

"PITTAR'S PATENT POCKET UMBRELLA," Manufactured only by WADDINGTON and SONS, 1, Coleman-street, London.—This most useful, perfect, and portable Umbrella, made under her Majesty's Royal Letters Patent, is of such a superior mechanical construction, that it is made to open and shut with ease and expedition; its length, when folded, is 13 inches, its diameter 1½ inches, and weighs only 14 ounces, and is rendered a perfect covering for the shoulders without interfering with the hat. It can also, when extended be used as a common walking Umbrella.

HEAL AND SON'S EIDER DOWN QUILTS are made in three varieties—the BORDERED QUILT, the PLAIN QUILT, and the DUVET. The Bordered Quilt is in the usual form of bed quilts, and is a most elegant and luxurious article. The Plain Quilt is smaller, and is useful as an extra covering on the bed, or as a wrapper in the carriage, or on the couch. The Duvet is a loose case filled with Eider Down, as in general use on the Continent.—List of Prices and Sizes sent free by post, on application to HEAL and SON'S Bedding Factory, 196 (opposite the Chapel), Tottenham Court Road, London.

WATER POWER.—The proprietors of an invention of great practical importance to Millers, are ready to communicate with parties wishing to add to their WATER POWER, or suffering from an insufficient or variable supply. In hilly districts, streams now perfectly useless, may be made easily available for working mills or machinery for agricultural or manufacturing purposes.—Apply to "the Patentees," Hammond's Country Newspaper Office, 27, Lombard-street, City.

THE ONLY PERFECT STOVE!—All who study Health, Comfort, and Economy, should throw aside their old Stoves, and replace them with the PATENT PORTABLE VENTILATING SUSPENSION STOVE, which consumes only *Three Farthings worth of fuel per day*, and is universally admired for the delightful temperature it produces, and for the extraordinary manner in which it purifies the air. It is strongly RECOMMENDED BY THE FACULTY, and is adapted for Bed-rooms, Churches, Chapels, Schools, Halls, Libraries, Greenhouses, Shops, Warehouses, &c. Prospectuses to be had free by post. In operation daily at DEANE, DRAY, and Co's, London-bridge.

250 STOVES, AND 325 FENDERS, all differing in pattern, forming the largest assortment ever collected together, are always on Sale at the Show Rooms of WILLIAM S. BURTON. They are marked in plain figures, and at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.* Bronzed Fenders, complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.* Fire-irons, from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other patent Stoves with radiating hearth plates; and Kitchen Ranges.
WILLIAM S. BURTON is enabled to sell at these very reduced charges from three simple causes, which he is most anxious the public should understand and appreciate.
First. From the frequency and extent of his purchases.
Second. From those purchases being made exclusively for cash.
And last, not least, from the non-allowance of the usual discount of 10 or 15 per cent. to architects, builders, &c., on the amount of goods sold through their recommendation, by which arrangement the price of such goods is of course enhanced to, at the very least, the extent of the discount.
WILLIAM S. BURTON has just completed some extensive alterations in his premises, by which he has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the Show of GENERAL FURNISHING IRONMONGERY, including cutlery, nickel silver, plated and Japanned wares, so arranged and classified that purchasers may easily and at once make their selections.
Catalogues with engravings sent (per post) free. The money returned for every article not approved of.
39, OXFORD-STREET (corner of Newman-street), Nos. 1 and 2, NEWMAN-STREET, and 4 and 5, PERRY'S-PLACE.
Established A.D. 1820.

## *SALES BY AUCTION.*

GREENHOUSE AND HOTHOUSE PLANTS.
VERY RARE AND CHOICE RHODODENDRONS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. T. Whalley to offer by Auction, at Fairfield Nursery, Liverpool, on the following days, viz.:—TUESDAY, the 25th, WEDNESDAY, the 26th, and THURSDAY, 27th Nov., the whole of his valuable Collection of choice and rare RHODODENDRONS, including R. argenteum, barbatum, Falconerii, fulgens, Dalhousianum, Wallichii, and many other varieties figured by Dr. Hooker, and also from Major Madden's very valuable collection from Thibet, &c. Also a large quantity of fine and large Rhododendron hybridum, crossed with especial care from R. arboreum rubrum, arboreum album, campanulatum, cinnamomeum, zeylanicum, with R. alta-clerense, corriaceum, pictum, Victoria, &c.; also crossed with Azalea sinensis, Perryana, indica alba, &c., together with a fine stock of Azalea indica seedlings, Camellias, Pelargoniums, Calceolarias, Chrysanthemums, Lilium lancifolium, extra fine, and a large general stock of Greenhouse Plants. Above 200 Grape Vines in pots from eyes, Carnations, Pinks, Auriculas, fine Standard Dwarf and Moss Roses, Dahlias, and Herbaceous Plants. A large quantity of Standard and Dwarf Fruit Trees, together with Evergreens, and the whole of the Nursery Stock remaining unsold. Also a large Conservatory, four Hothouses, Frames, Hand-glasses, a large Iron Roller and Second-hand Mowing Machine, and sundry utensils in trade. Catalogues, with full particulars, may be had on the 17th, at the Nursery; the Seed Warehouse, 12, St. George's-crescent, Liverpool; from the Auctioneers; or free by post, on receipt of two postage stamps.

TOTTENHAM.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to public competition by Auction, on the premises, Whitehall, Tottenham, on MONDAY, the 1st December, at 11 o'clock, by order of the Proprietor, in consequence of the Land being required for building purposes, a valuable assortment of very fine EVERGREENS, specimens, consisting of large Hollies, Aucubas, Phyllireas, Arbor Vitæ, Laurels, Laurestinus, Portugal Laurels, Box, Red Cedars, Arbutus, Magnolias, Rhododendrons, and a large variety of Ornamental Trees, Fruit Trees, and Shrubs; also a capital Greenhouse, with Stages, &c.; together with about 1 acre of excellent Turf.—May be viewed one week prior to the sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

OAK, ASH, AND FIR TIMBER.—HOLMBURY HILL, NEAR DORKING, SURREY.

MESSRS. TROLLOPE are instructed to sell by Auction, at the Black Horse, Gomshall, Surrey, on TUESDAY, Dec. 2, at 2 for 3 o'clock precisely, 289 Oak Trees, 306 Oak Saplings, 28 Ash Trees, 177 Ash Poles, 50 Firs of large dimensions, and other Trees, with their lop, top, and bark, now standing on the Farm of "Soldens," in the parish of Ockley, Surrey, four miles from the Gomshall station, on the South-Eastern Railway, from whence they may be removed with facility to any part of the kingdom.—Catalogues may be had at the Black Horse, Gomshall; White Horse, Dorking; White Hart, Guildford; of the Auctioneers, 15, Parliament-street, Westminster; at the Belgrave Office, 18, Grosvenor-street, Eaton-square; and of Mr. JOHN MACE, on the Farm, who will show the timber.

EXTENSIVE SALE OF MULBERRY TREES, EVERGREENS, AND OTHER NURSERY STOCK.

MR. D. A. RAMSAY will sell by Auction, on the Premises, King's-road, Chelsea, near London, on TUESDAY, Nov. 25, and two following days, at 12 o'clock, without reserve, by order of Messrs. Dennis and Co., in consequence of the expiration of the Lease, the celebrated collection of MULBERRY TREES of all sizes, well worthy the attention of the Trade. Fine Evergreens, Rhododendrons, Yuccas, Jessamine, Ivies, and other Climbers in Pots, Prize Gooseberries, Orchidaceous Plants, erection of Greenhouse, and the whole of the remaining Nursery Stock. May be viewed prior to Sale.—Catalogues will be forwarded on application as above, or to the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

GREAT SALE OF VALUABLE NURSERY STOCK, IN CONSEQUENCE OF A PORTION OF THE LAND BEING REQUIRED FOR BUILDING.

MR. J. RAWLINGS has received instructions from Mr. Adams, to sell by Auction, on the Premises, Kensington-road (opposite the west end of the Great Exhibition), on MONDAY, Dec. 1, and seven following days, at 11 o'clock each day, the whole of that extensive and unequalled Stock of large Evergreens, Ornamental Trees and Shrubs, comprising Green and Striped Hollies, Common and Irish Yews, Phillyrea, Alaternus, American and Chinese Arbor-vitæ, Aucuba, Common and Portugal Laurel, Cedrus Deodara, Cedar of Lebanon, &c., all of which are from 3 to 10 feet high. Handsome specimens of Coniferous Plants, including Abies, Pinus, Picea, &c., with large Thuja filiformis, Taxodium pendulum and nuciferum, 6 feet high. A splendid collection of specimens of about 60 species and varieties of Oak, such as is not to be met with in any other establishment. As also a magnificent tree of Salieburia adiantifolia, 20 feet high, and many other objects of interest and value, which cannot be enumerated in an advertisement.—May be viewed prior to the sale. Catalogues (1*s.* each, returnable to purchasers) may be had on the Premises; of the principal Seedsmen; and of the Auctioneer, 50, Hoxton-square, and Ebenezer Nursery, Shacklewell, London.

PARADISE NURSERY, HORNSEY-ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises, opposite the new intended Finsbury-park, or to Messrs. PROTHEROE and MORRIS, American Nursery, Leytonstone.

FARM TO LET, NEAR ELY, WITH IMMEDIATE POSSESSION.

TO BE LET, by Private Contract, from Year to Year, or for a term, a compact FARM, consisting of 140 ACRES of first-rate Land, with substantial Farm House and Farm Buildings standing thereon. The Farm is in good cultivation, and consists of about 100 Acres of Highland Pasture, Arable and Fen Land lying within a ring fence, and about 40 acres of Fen Land detached. The Farm-house and homestead join a good turnpike-road, and the Ely station of the Eastern Counties Railway and the navigable river Ouse are within a distance of two miles.—N.B. The landlord will pay the tithes and drainage taxes. For further particulars, a personal application must be made to Mr. MARSHALL, Solicitor, Ely.—Ely, November 22.

WANTED, A PARTNER, who can advance from 1,500*l.* to 12,000*l.*, to join one of the most extensive Collieries in Lancashire. The Mines are in full working operation, with Railway, Waggons, Boats, and everything complete. The coming-in Partner might either take an active part or not.—Apply to X. Y. Z., 7 and 8, Exchange, Arcade, Manchester.

## KOSSUTH IN ENGLAND.

This day is published, price One Shilling, AN AUTHENTIC

# LIFE OF HIS EXCELLENCY LOUIS KOSSUTH,

GOVERNOR OF HUNGARY.

WITH A FULL REPORT OF HIS SPEECHES DELIVERED IN ENGLAND, AT SOUTHAMPTON, WINCHESTER, LONDON, MANCHESTER, AND BIRMINGHAM;

TOGETHER WITH

HIS ADDRESS TO THE INHABITANTS OF THE UNITED STATES; TO WHICH IS PREFIXED AN ESSAY ON THE CHARACTER AND POLITICAL PRINCIPLES OF KOSSUTH.

*Illustrated by Sixteen beautiful Engravings.*

London: BRADBURY AND EVANS, 11, Bouverie-street.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

"Mr. Murray's meritorious Series."—*The Times.*

Now ready, complete in 76 Parts, post 8vo, 2*s.* 6*d.* each, or bound up in 37 vols.,

THE THEORISTS CONFUTED; or Practical Farmers Vindicated. With a Reply to Mr. Mechi—"Tiptree Hall Farm is a Settled Question."

By W. W. GOOD, Practical (Suffolk) Farmer.

"Much as our friend Mr. Mechi has been criticised and commented upon in various journals, and in the speeches of individuals at public meetings, we have never met with any remarks containing a tenth part of the searching criticism and merciless exposure of the fallacies put forward by him, as will be found in this volume."—*Mark Lane Express.*

"Mr. Good has studied the system of which Liebig is the representative, not only in books and laboratories, but in the midst of nature, under the exigencies of actual business."—*Athenæum.*

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nurserv, Woking, Surrey.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (½ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Nov. 29.

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their Descriptive Catalogue, with the treatise on the "Cultivation of American Plants," can still be had by enclosing six stamps for postage.

Gentlemen requiring the services of a Landscape Gardener can procure such by applying to the Advertisers.

Bagshot, Surrey, Nov. 29

LARGE SURPLUS STOCK OF FOREST TREES, SHRUBS, &c., NOW ON SALE AT RENDLE'S NURSERY, PLYMOUTH.—ESTABLISHED 1783.

WILLIAM E. RENDLE AND CO., NURSERYMEN *and* FLORISTS *to her Most Gracious Majesty the Queen, have a* LARGE SURPLUS STOCK *of* TREES AND SHRUBS *more than they require for their usual sale, and will be sold at very low prices.*

*** For prices, see front page, Nov. 1, 1851, of this Paper.

*Our Autumnal Catalogue of Forest Trees, Shrubs, and Fruit Trees is just published, and can be obtained for one penny stamp.*

WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.

BASS AND BROWN beg to refer to their Advertisement of CHOICE GERANIUMS, in the 2d page of each number of *Gardeners' Chronicle*, of Sept. 27th and Oct. 11th. The plants are exceedingly fine and vigorous. With immediate re-potting, they will make good specimen plants for exhibition next season, with abundant blooms, and will be found very cheap. They also, in the same Advertisements, beg to refer to their select list of NEW PLANTS. Also NEW CHRYSANTHEMUMS, AZALEA INDICA, &c., of which they have a choice assortment, strong and vigorous, and offered at low prices.

12 splendid Stove Plants, for winter and early spring flower, for 20*s.* 12 beautiful Greenhouse Plants, for do., 15*s.*

Catalogues on application. Goods free to London, or any part of the Ipswich line to Norwich, and extra plants, gratis, for orders of 40*s.* and upwards. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CEDRUS DEODARA,

For planting Avenues, single specimens for Lawns, or mixing with Fir and other plantations, grown from seed, either in or out of pots.

MAULE AND SONS respectfully inform Gentlemen about planting, that their immense stock of this most desirable Hardy Ornamental Tree consists of well-grown plants from seed, of all sizes, suited for the above purposes, which are offered by the dozen, hundred, and thousand, on moderate terms. ☞ Prices forwarded on application.

The curious in seminal productions will find by inspecting M. and SONS' Stock, many pleasing peculiarities of foliage in their present state of growth.—Stapleton-road Nurseries, Bristol.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 1*s* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. American Native, 10*s.* 6*d.* do. Early Manley, 10*s.* 6*d.* do. Early Ash-leaf Kidney, 10*s.* 6*d.* do.

For Testimonials, see *Gardeners' Chronicle*, Nov. 8, p. 705.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

MESSRS. J. MYATT AND SONS have a Stock of the VICTORIA or RABY CASTLE CURRANT, and can supply good strong Plants at 25*s.* per 100; extra strong, 2 years old, 5*s.* per dozen. Also, a good Stock of 2 years planted Rhubarb roots.

MYATT'S LINNÆUS ... ... 10*s.* per dozen.
MYATT'S VICTORIA ... ... 10*s.* „ „
MITCHELL'S ROYAL ALBERT

Smaller 1 year planted Roots, at 50*s.* per 100.

Manor Farm, Deptford, Nov. 29.

NEW GARDEN SEEDS,
SAVED THIS SEASON.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, beg respectfully to state that they are now receiving from some of the most careful growers a choice assortment of

NEW AND GENUINE SEEDS,

Of first-rate quality; and as the season is fast approaching when a fresh supply of seeds will be required for the Kitchen Garden, they take the liberty of recommending the proprietors of every garden whether extensive or small, to procure without delay a copy of

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY,

*Which cost more than One Hundred Pounds in its production, and has been most favourably noticed by some of the most eminent Horticulturists of the day, as well as by the Editors of the leading Garden Publications.*

*It contains 24 folio pages, and is the same size as the* GARDENERS' CHRONICLE.

It contains a Descriptive Catalogue of the best Culinary Vegetables in cultivation, with the time of sowing, height, and other useful particulars, as well as the quantities furnished by WILLIAM E. RENDLE and Co. for their Collections; also a Descriptive Catalogue of all the choicest and best varieties of Agricultural Seeds; and an excellent Descriptive List of all the newest and choicest Flower Seeds.

It likewise contains a COMPLETE CALENDAR OF OPERATIONS in the Kitchen Garden for every month in the year, in a concise and useful form.

*Copies can be obtained from any Bookseller in town or country, price Fivepence, through Messrs.* BRADBURY *and* EVANS, *the London publishers.*

*Copies will also be sent gratuitously on receipt of Six penny postage Stamps (to pay the postage), on application to* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

*Our Stocks, Early Peas, Beans, Radish, and Carrots are already in, and can be supplied at once.*

BEST LANCASHIRE GOOSEBERRIES, named, at 15*s.* per 100.

Also, APPLES, PEARS, CURRANTS, RHUBARB, &c., in all the best varieties, and at equally moderate prices.

Carefully packed, to carry any distance, or for exportation.

H. BIGLAND and Co., Manchester.

A COMPLETE ARBORETUM.

C. LODDIGES AND SONS beg to state that they are now supplying the above, comprising upwards of 1200 species of TREES and SHRUBS, correctly named, for 50*l.*, cash on delivery; and as their collection of hardy plants will have to be dispersed this season, in consequence of the land being let for building, they most respectfully suggest that all persons contemplating the formation of a COMPLETE ARBORETUM should make early application, as the stock of some species is very limited.—Hackney, Nov. 22.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, will be happy to forward his New Autumn Catalogue (post paid), on application. It is also post paid throughout America, Austria, Belgium, France, Germany, Holland, and Prussia.

E. G. H. can supply plants of the following (for description see page 27 in the above Catalogue).

The New Raspberry Belle de Fontenay, 7*s.* 6*d.* each; Weigela lutea, or Middendorffiana, 10*s.* 6*d.* each; Hesperis Matronalis Flora Plena (Double Crimson Rocket), 2*s.* each.

Tropæolum azureum, 2*s.* 6*d.* each; T. tricolor, 2*s.* 6*d.* and 3*s.* 6*d* each; T. Hockerianum (true), for winter flowering, fine, 3*s.* 6*d.* each.

Cremont's Perpetual Strawberry, 1*s.* each, or 9*s.* per dozen.

SUPERB NAMED AND MIXED ASSORTMENTS OF ANEMONES, RANUNCULI, GLADIOLI, TULIPS, IRIS, CROCUS, LILIUM, IMPORTED DUTCH HYACINTHS, &c., with a large Collection of other Roots.—For BASS AND BROWN'S Priced Advertisement of the above, see *Gardeners' Chronicle* of Nov. 8th and 22d, or Catalogues sent free on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

HUNTER'S PROLIFIC CUCUMBER.—This handsome and delicious variety obtained, in June last year, with fruit upwards of 30 inches in length, the Silver Medal at the Botanic Gardens, Regent's-park; and a Certificate of Merit at the Exhibition in July. It has also been awarded Four Prizes at the Highbury Exhibitions. It is white spined and an extraordinary bearer. To be had in packets of seven seeds, at 5*s.*; or three seeds at 2*s.* 6*d.*, of Mr. HUNTER, 5, King-street, Islington; and at J. G. RENWICK'S Seed Warehouse, 107, St. John-street, Smithfield, London.

ROSES.—Paul's QUEEN VICTORIA, Paul's ROBERT BURNS, and other new sorts, direct from the Raisers, at the same prices as charged by them.

Also Géant des Batailles, Robin Hood, and other established favourites, including the best of the Perpetuals, Bourbons, &c., if left to our selection (which will ensure satisfaction), at 20*s.* per dozen, standards; or 12*s.* per dozen, dwarfs. Also common sorts of dwarfs, 5*s* per dozen.

JOHN SUTTON and SONS, Nurseries, Reading, Berks.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, CONIFERÆ, ROSES, ORNAMENTAL SHRUBS, FRUIT AND FOREST TREES, &c., may be had on application, by enclosing two postage stamps.—Windlesham Nursery, Bagshot, Surrey.

PINE PLANTS.—For Sale, a quantity of PINE-APPLE PLANTS of all the approved varieties, to insure a succession of fruit; they are fine, clean and healthy.—For particulars, apply by letter to W. HARDIE, at the Gardens, Castle Ashby Northampton.

HAMILTON'S NEW EARLY PEA, THE NOVEMBER PROLIFIC, 2*s.* 6*d* per quart.

WARNER'S EARLY CONQUEROR, 1*s* per quart.

GREGORY'S EARLY HANGDOWN BEANS, 9*d.* per quart.

LORD KENYON'S FAVOURITE CUCUMBER 1*s.* per packet.

And all other favourite sorts of Kitchen Garden Seeds, Catalogues of which may now be had for two postage stamps, on application, addressed, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

WILLMORE'S SURPRISE GERANIUM.

JOHN AND CHARLES LEE beg to announce that they have purchased the entire stock of this extraordinary novelty of Mrs. Willmore, of Edgbaston, near Birmingham, and they intend offering it to the public in the autumn of 1852, when they will have proved its qualities as a bedding plant, which they believe to be first-rate; and opportunities will have been afforded at the various Flower Shows of witnessing what may be regarded as a floral wonder.

Mrs. Willmore has stated her belief that its parentage lies between Geranium erubescens and a Hollyhock. Our great Horticultural authority, Dr. Lindley, repudiates the idea, but acknowledges it to be an extraordinary production. Messrs. LEE hope to produce such proof as may possibly stagger the learned Doctor's opinion, if it fails to convince him. For the present, suffice it to say that the structure of the plant is different to anything to be found in the Geranium; the roots are quite unlike any of the class, and the seed pods are formed more like a Hollyhock than a Geranium. The flowers are semi-double, and the whole truss of a monstrous form. Allowing it to be no more than a mere sport from the Geranium, its merits far exceed anything hitherto introduced as a gay border or bedding flower.—Nursery, Hammersmith.

TRANSPLANTED THORN QUICKS AT HALF PRICE, FOR READY CASH.—SELLING OFF.—The Remainder of the Stock of Transplanted Thorn Quicks, the property of the late Mr JOHN M'CRAITH, Nurseryman, of Kilkenny, will be cleared off this present season, at the following greatly reduced prices. Two years old Transplanted Thorns, 14 to 18 inches in length; circumference 3-8ths to 7-16ths; 9*d.* per 1000. Three years old, transplanted: length, 17 to 24 inches; circumference, 8 to 10 16ths; 1*s.* 3*d.* per 1000. Four years old, transplanted; length, 23 to 25 inches; circumference, 5 8ths to 1 inch; 1*s.* 8*d.* per 1000. Quantities of 100 000 and upwards delivered carriage free in Dublin or Waterford. Apply to Mrs. SUSANNA M'CRAITH, High-street, Kilkenny

LISTS OF SEEDS, PLANTS, &c.

PETER LAWSON AND SON beg to state that the following may be had at their Establishment, 1, George the Fourth Bridge, Edinburgh; or from their Agent, J. C. SOMMERS, 159, Fenchurch street, London:—

| | |
|---|---|
| Agricultural Seeds. | Herbaceous Plants. |
| Garden Seeds. | Florists' Flowers. |
| Flower Seeds. | Dutch Flower Roots. |

Lawson's Treatise on Grasses, 4to, pp 48, 1*s.*
Lawson's Fruit Trees, 4to, pp. 83, 1*s.* 6*d.*
Lawson's Coniferæ, or Fir Tribe, 4to, pp. 104, 1*s.* 6*d.*
Also, Synopsis of the Agricultural Products of Scotland, in Parts, at 1*s.* each; or in 2 Vols., 7*s.*; First, now ready, 5*s.*

GERMAN SEEDS.

MESSRS. PLATZ AND SON, SEED GROWERS, Erfurt, Prussia, inform the trade that their CATALOGUE for 1852 is now ready, and may be had on application of their Agent, Mr. ROBERT KENNEDY, Conservatories, Covent Garden, London. The universal approval which their Articles have obtained induce Messrs. P. and SON to solicit a trial of the present year's Stock, which includes many new and interesting varieties.—Erfurt, November 28.

FEATHER GRASS.

WANTED, any quantity, if of approved quality. Sample, and price per pound, addressed to R. Y., Office of this Paper.

ORNAMENTAL PLANTING.

C. LODDIGES AND SONS most respectfully call the attention of Noblemen, Gentlemen, and Public Companies, engaged in Ornamental Planting, to the undermentioned List of TREES and SHRUBS, which they are enabled to offer at an extraordinary reduction in price (for cash only), the land upon which their arboretum is planted being required for building.

Fine trees, from 4 to 10 feet high, of the following genera comprising a great number of species: Acer, Æsculus, Alnus, Amygdalus, Betula, Cornus, Corylus, Cotoneaster, Crataegus, Cytisus, Fraxinus, Mespilus, Populus, Prunus, Pyrus, Robes, Robinia, Salix, Sorbus, Spiræa, Tilia, Ulmus, 4*s.* per dozen named, or a selection from the above, 25*s.* per 100 unnamed, and highly recommended for rough planting.

American Oaks in great variety, 10*s* per dozen.

AMERICAN PLANTS.

Azalea pontica, fine bushy plants well set with bloom, 10*s.* p. doz.
„ Ghent and other varieties named. 18*s.* per doz.
Rhododendron ponticum and varieties (very fine), 10*s.* per doz.
„ campanulatum, 2 to 4 feet diameter, 10*s* 6*d* to 42*s.* each.
Andromedas in collections, 18*s.* per doz.; Vaccinums ditto, 12*s* per doz.

N.B. Packing will be charged as low as possible. Post-office orders made payable at Hackney.—Hackney, Nov. 29.

IMPORTANT TO ALL WHO HAVE A GARDEN.

## CHALLENGE COMPARISON AND COMPETITION. CARRIAGE PAID.

All orders above 5*l.* carriage paid to London, Liverpool, Birmingham, and Edinburgh, and all the intermediate Stations within 150 miles of the Nurseries, upon any line of Railway whatsoever. To those ornamenting their Gardens or Grounds, this is an advantage seldom offered.

SELECT HARDY HERBACEOUS PLANTS AND ALPINES.

100, own selection, two of each kind, 30*s.*; or our selection, in 100 varieties, 42*s.*

100, purchaser's selection, one of each kind, 42*s.*

100 Alpine or Rock Plants, 42*s.*

The above extends over 1000 species and varieties, selected from the choicest collections in the country, warranted second to none for beauty and display. Having an immense stock, they can be furnished at these low prices.

AMERICAN PLANTS, FLOWERING SHRUBS, ORNAMENTAL TREES, AND EVERGREENS.

Purchaser's, or our selection, from list, per 100, 2*l.* 10*s.*, one of each.

Own do. do. per 100, 1*l.* 10*s.*, two of each.

This Nursery has long held high celebrity for possessing a splendid stock of Flowering Shrubs and Ornamental Trees, extending over 800 species and varieties of the finest selection; and for quality, correctness in naming, and health, not equalled by any. To Gentlemen forming Arboretums, or adding desiderata, this is an opportunity never before offered.

HOLLYHOCKS.—No. 1, fine double kinds, all shades of colour, for exhibition, 9*s.* per dozen; 50*s.* per 100. No. 2, for border display, 6*s.* per dozen; or 30*s.* per 100. These are selected from the finest collection in the country.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or 10*s.* per 100, fine. 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*; or 12*s.* 6*d.* per 100.

PORTUGAL LAURELS, 1½ to 2 feet, 20*s.* per 100; fine, 3*s.* per dozen. 2 to 3 feet, extra fine and bushy, 30*s.* per 100; 6*s.* per dozen.

EVERGREEN PRIVET, fine, 2 to 3 feet, per 1000, 40*s.*; per 100, 5*s.* 3 to 5 feet, strong, 45*s.* per 1000; or, per 100, 6*s.*, healthy and fine grown.

LIMES, per 100, 4 to 5 feet, 30*s.*; 5 to 6 feet, fine, 40*s.* per 100, fine avenue trees.

HORSE CHESTNUT, 5 to 6 feet, 30*s.* per 100; 10 to 12 feet, 50*s.* per 100, splendid.

ROSES, 50 splendid sorts, Standards, fine healthy stuff, per 100, 5*l.*; or 18*s.* per dozen, own selection. 100 superb sorts of Dwarf Roses, in 100 fine varieties, 50*s.*; or 9*s.* per dozen, own selection; mixed, 30*s.* per 100, or 6*s.* per dozen.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.

50 first-rate sorts, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.

50 do. purchaser's selection, 3*l.*; or 18*s.* per dozen.

ERICAS, 50 of the finest sorts grown, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.

" " purchaser's choice from list, 3*l.*; or 18*s.* per dozen.

CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21*s.*; or 15*s.* per dozen.

" " purchaser's choice, 1*l.* 5*s.*; or 18*s.* per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25*s.*; 50 fine for 15*s.*; 25 for 8*s.*, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.

CINERARIA, from the choicest sorts, per packet, 2*s.* 6*d.*

PANSY, do. do. do. 1*s.* 6*d.*

HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1*s.* 6*d.*

FRUIT TREES.

A selection of the choicest description for show, 4*s.* per doz.

The stock extends over 50,000, and is fine and free grown.

CURRANTS.—May's Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25*s.*; or per doz., 4*s.*

Black Naples, the finest black (no other sort grown), 12*s.* per 100, 2*s.* 6*d.* per doz.

Red Grape and Champagne, fine, 10*s.* per 100.

White Dutch, large and fine, 12*s.* per 100, 2*s.* per doz.

APPLES.—Fine clean Standards, 10*s* per doz., 70*s.* per 100.

" " Dwarfs, 8*s.* per doz., 50*s.* per 100.

" Dwarf trained superior kinds, 2*s.* 6*d.* each, or 24*s.* p. doz.

The collection is very choice, from the Horticultural Society.

PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.

PLUMS and CHERRIES.—All the leading sorts, standards, 18*s.* per doz.

" " Dwarfs, fine, 9*s.* per doz.

" " Dwarf trained, 3*s.* 6*d.* each, or 36*s.* per doz.

APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5*s.* each, 50*s.* per doz.

RASPBERRIES.—Fastolff, 3*s.* per doz., 16*s.* per 100.

" Antwerp Red, 2*s.* per doz., 12*s.* per 100.

" Monthly, or Double-bearing, 12*s.* per 100, 2*s.* per doz.

STRAWBERRIES.—Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3*s.* 6*d.* per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to JOHN MAY, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

---

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

---

THOMAS HANDASYDE, Glen Nurseries, Musselburgh, by Edinburgh, begs to intimate that he has now fine plants of his new Seedling PANSY, Maid of Athens, ready for sending out, at 5*s.* each. The Gardeners' Gazette of the 19th July gave the following description :—"Pansies: *T. H. Musselburgh.* Your seedling came to hand in good condition; upper petals rich purple, of velvet-like consistency, lower ditto broadly margined with the same; centre pretty straw colour, shaded with ultra-marine from the margin; blotch, same tint, veined with black; eye, bright gold; brow white, well raised, and finely arched; size desirable, and shape good." Also,

HANDASYDE'S PANSY Duke of Perth, per doz. 18*s.* 0*d.*

" Merry Monarch, do. ... 18 0

With all the leading show flowers of the season, of which Catalogues may be had. Fruit, Forest, and Ornamental Trees, with many of the more rare Coniferæ, Evergreens, and deciduous flowering Shrubs; Roses, Carnations, Pinks, Hollyhocks, Phloxes, Fuchsias, &c.

Garden Seeds for early sowing. Orders respectfully solicited.

---

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

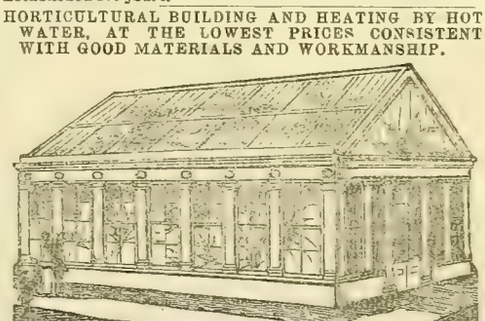
| | | | | | | |
|---|---|---|---|---|---|---|
| 6 inches | by 4 | and 6½ | by 4½ | ... ... ... | 13*s.* | 0*d.* |
| 7 " | 5 | and 7½ | by 5½ | ... ... ... | 15 | 0 |
| 8 " | 5 | and 8 | by 5½ | ... ... ... | 15 | 0 |
| 8 " | 6 | and 8½ | by 6½ | ... ... ... | 17 | 6 |
| 9 " | 7 | and 10 | by 8 | ... ... ... | 20 | 0 |
| 12 " | 10 | and 13 | by 9 | ... ... ... | 20 | 0 |

And many other sizes, or cut to order in various thicknesses. Cases containing large Sheets, in 100, 200, and 300 feet, at 21*s.* per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

In sizes under 15 inches ..... 6*d.* per foot.

" " 35 " ..... 8*d.* "



" " 50 " ..... 9½*d.* "

" " 75 " ..... 12*d.* "

Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

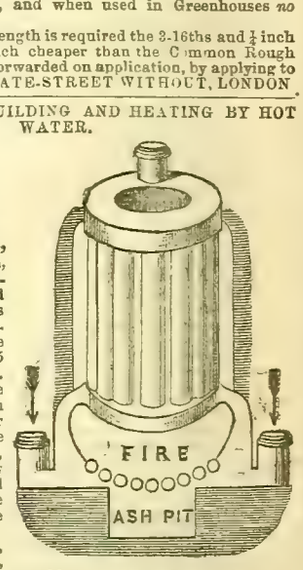
GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

---

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1½ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.



J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

---

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

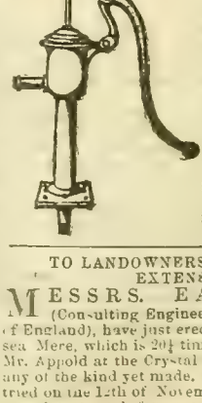
J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

---

WARMING AND VENTILATING.



D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

---

ENGLISH TIMBER cut to any length and scantling at from 2*s.* 4*d.* to 3*s.* per foot for Oak or Ash, 1*s.* and upwards for Elm; Oak Sash Sills from 2½*d.* per foot; Foreign Timber, Dantzic, at 55*s.* per load; Yellow Deals from 3*d.* per foot; Floor Boards, ⅞ in. and 1 in., yellow batten, at 12*s.* 6*d.* and 15*s.* All other descriptions equally low.—Apply to Mr. MAY, 90, Leadenhall-street, London.

---

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0

Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London. Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

---

TO LANDOWNERS AND AGRICULTURISTS.

EXTENSIVE DRAINAGE.

MESSRS. EASTON AND AMOS (Consulting Engineers to the Royal Agricultural Society of England), have just erected an APPOLD PUMP at Whittlesea Mere, which is 20½ times larger than the one exhibited by Mr. Appold at the Crystal Palace, and five times larger than any of the kind yet made. This powerful pump was publicly tried on the 12th of November, in the presence of the landed proprietors and farmers of the county, assisted by several scientific gentlemen, and at various lifts from 1 to 10 feet. At two to three feet, it raised 101 tons of water per minute (which would cover an acre of land one inch deep); and at five feet, it raised 75 tons per minute.—Grove, Southwark.

HOME GROWN SEEDS, CARRIAGE FREE.—The great advantages of purchasing SEEDS OF THE GROWERS are the *superior germinating quality, trueness to the sorts, and economy of price.* These advantages have now been afforded by us to *retail* as well as wholesale purchasers for several years, and are fully appreciated by the public, as is shown by the numerous recommendations we are receiving from our customers in all parts of the Kingdom.

*We have now the pleasure of announcing that our New Seeds are all harvested and arranged for delivery, and respectfully solicit early orders, which will have the preference of scarce sorts.*

Catalogues may be had on remitting two postage stamps.—Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

NEW ARAUCARIA, "ARAUCARIA COOKII."—This extremely rare species, just introduced for the first time from New Caledonia, is described in the last Number of the "Journal of the Horticultural Society," by Dr. Lindley. The stock consists of only a very few plants from seed, 6 to 9 inches high, and quite healthy. Ten guineas each.

NEW HARDY SHRUB—NEILLIA THYRSIFLORA, a native of Nepal; grows about 6 feet high, producing beautiful white flowers 10*s.* 6*d.* each.

AMYGDALUS PERSICA, *sanguinea plena*, double crimson peach, from China, quite hardy. Dr. Lindley, in describing it, says, "It is a very fine and handsome plant." Three guineas each.

AMYGDALUS PERSICA, *alba plena*, double white Peach, from China. This and the above are exceedingly ornamental plants, either in the open ground or in pots, constituting handsome objects for winter and spring decoration in the conservatory. Three guineas each.

R. GLENDINNING, Chiswick Nursery, near London.

HYACINTHS AND OTHER DUTCH ROOTS *now on Sale at RENDLE'S Nursery and Seed Establishment, Plymouth, at Reduced Prices; a Descriptive Catalogue of which can be had in exchange for one penny stamp.*

All orders above 2*l.* pre-paid to any Station on the South Devon, Bristol and Exeter, or Great Western Railways.

WILLIAM E. RENDLE and Co., Florists to her Majesty, Plymouth.

*** Our Descriptive Catalogue will be found useful, as it contains some good cultural advice.

MITCHELL'S MATCHLESS WINTER PARSLEY.—J. M having saved a much larger quantity of Seed this season than last, can offer it to the public at a much reduced price. Wholesale, to seedsmen, 1*s.* 3*d.* per lb.; any quantity under 10 lbs. will be charged 2*s.* per lb. Can be sent to any part of the World, on receipt of a Post-office order, made payable to JOHN MITCHELL, Ponder's-end, Enfield, Middlesex.

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter.* An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7*s.* 6*d.*
Extra ditto, with flowering buds ... ... 10 6
Usual discount to the Trade.
Clapton Nursery, London, Nov. 29.

**The Gardeners' Chronicle.**

TILL SIR JOSEPH PAXTON* proposed his Crystal Palace, little had been done in the application of glass to garden structures, beyond what had been in practice for half a century. The repeal of the Excise duties had enormously increased the consumption of glass, and had caused its quality to be materially improved, but had led to no novelty of application. The combination of wood and iron, which was so happily hit upon in Hyde Park, has, however, now suggested to Mr. CHARLES EWING, gardener to O. F. MEYRICK, Esq., of Bodorgan, in Anglesea, the idea of constructing garden-walls also of glass and iron only. The plan is to have iron uprights firmly fixed into the ground, and faced with glass on both sides, the space between the two faces being occupied by trees planted and trained in the usual way. The glass is all moveable, so that perfect ventilation, as well as perfect shelter, is secured.

We hope to be able next week to give full details concerning this novel mode of construction, which seems likely to cause a complete revolution in the manner of managing plants under glass, provided, as we understand to be the case, the price at which the glass walls can be put up is less than that of common brick walls. Models of the walls will be exhibited next Tuesday, at the meeting of the Horticultural Society, in Regent-street, on which occasion an explanation will be offered of the peculiarities of Mr. EWING'S plan, and, we believe, some estimate of the actual cost. The Horticultural Society and several private persons have determined upon making immediate trial of the plan, so that we shall not have to wait long for results.

THE undoubted excellence of some of the articles exhibited in the United States' division of the Crystal Palace, seems to have led people to imagine that everything from the other side the Atlantic must deserve attention. We regret our inability to confirm this notion; but truth obliges us to declare that North America is as fertile in rubbish as the mother country itself. From this judgment we cannot except the beehives, which one of our correspondents has imagined to be superior to all others.

It is perfectly true that a hive and live bees were exhibited in the American department, and were said to have been brought across the Atlantic. They were shown in one of the worst sort of wooden hives—a collateral one of three square boxes, somewhat on the plan of NUTT'S. The centre or stock-box was full of very old comb, with a few bees in a weak state; the left-hand box was empty, except a few dead bees; the right-hand box (which alone had the communication between it and the stock box open) contained a small quantity of comb. On the top of the centre box was placed another square box, containing fine comb and honey of good colour; but there was no communication open between it and the stock, and it appeared to have been put there only for effect. When we first visited this hive the stock was in a very weak state; on attempting again to examine it, later in the season, the hive was so closed that we were unable to get at it; but judging from the bees as seen from the outside of the building, the stock still appeared to be no better.

Since the close of the Exhibition, we have noticed another hive in the American department, not included in the Official Catalogue, and not observed by us during the time the Exhibition was open. It is a square box of wood, 13 inches square, and 11 inches deep, inside measure; has two strong bars across the middle, with the intention of supporting the combs; above this box, which is intended for the stock hive, are two long boxes with glass ends; these are covered with a box similar in shape, but rather smaller than the stock hive. This hive is slightly made of $\frac{3}{4}$ inch boards, is badly contrived, and is ill adapted to the requirement of bees.

There were also two hives of American origin exhibited in the agricultural department, and such as no experienced bee-master would have thought of using: nevertheless one if not both had been tried under high patronage, and had signally failed.

It is not a little curious that although the extremes of temperature are much greater in the United States than in England, yet, neither of the three last hives were of substance or materials to resist even the changes of temperature experienced in our own country.

It is clear, then, that North America has contributed nothing to the apiarian. It would seem, indeed, that in the United States, as in this country, the last thing which inventors think of, is the nature of the insect for which they have to provide. We may as well, therefore, take this opportunity of pointing out what we conceive to be the fundamental principles by which bee-keepers ought to be guided, in the choice of a place for their hives, and to which all else is subordinate, except the structure of the hive itself, to which we shall advert on a future occasion.

Any shed or other building will answer the purpose of an apiary, in which the following conditions can be secured. 1. Perfect shelter to the hives from the sun and wet. 2. A firm place in the ground, and so low in height as to be as much as possible under the wind, and yet to admit of the hives being placed from 15 to 20 inches from the ground. 3. Free access to the *back* of the hives, with an aspect avoiding the morning and mid-day sun, but placed towards its setting. 4. The sides and back, if enclosed, not to be fitted so close as to prevent a free circulation of the air at all times around the outside of the hives; the door or shutters to be so contrived that they can be opened or shut without the least disturbance to the bees by jarring or grating. 5. Freedom from all rustic or other ornament that can harbour spiders or other enemies. 6. A place where the bees are as little exposed as possible to disturbance of any kind, more particularly in front of the hives. 7. Not to be placed on Grass, but to have sand or fine gravel beneath it, extending to at least a yard in front.

A very convenient bee-house may be made as follows: six uprights of $2\frac{1}{2}$ inch quartering, placed three in front and three at the back, the back ones about 8 or 10 inches higher than the front, with a space between the front and the back ones rather wider than the hives, about 20 inches, the two middle ones placed so as to admit two hives with a space of about 3 inches between the hive boards on each side of them. This will make two spaces between the three uprights of about 40 inches each; about 15 inches from the ground the six uprights should be framed together. This frame will be the support for the hive-boards; between this frame and the frame of the roof, height should be allowed for the hives, their boards, and the covers of the glasses, leaving also sufficient room for removing these covers from the glasses without disturbing them. This will be about 20 inches for the front uprights from the lower frame, and 28 or 30 for the back ones. The roof should be framed on the top of the uprights, slanting from back to the front, and projecting over the front uprights about 12 inches; this may be thatched with straw or reeds, or covered with feather-edge boards: reeds are the best. It may have doors hung, or loose shutters fastened with buttons for the ends and back. These should not reach the roof by about 2 inches, so as to let the air pass freely under it. When all is framed together, the lower part of the uprights should be placed in the ground 8 or 9 inches deep and well rammed in; the uprights will have been left long enough for this purpose in addition to the 15 inches. It should then have three coats of paint, finished stone colour, and will be ready to receive old stocks next February, or new hives and swarms in the next season. Such an apiary will contain four hives, as many as should ever be allowed in close proximity; but it may be repeated at short distances in the garden as frequently as may be required. *Y.*

WEEDS.—No. I.

THIS is a subject of much interest, equally to the proprietor of a large estate, the occupier of a suburban villa, and the humble citizen, or labourer who cultivates his plot of allotment ground.

Weeds are to all the bane of cultivation, adapting themselves to every variety of soil, situation, and circumstances. Poor and barren soils produce their peculiar weeds; while rich and highly cultivated ground is favourable to the growth of a formidable host of these pests. Even the hardest rocks and walls produce them, and they seem to be fitting instruments for the fulfilment of the curse imposed on fallen man, that he should eat bread by "the sweat of his brow."

The pleasures of cultivating a garden have been in all ages extolled and descanted upon by the "wisest of men." They, too, have been sung by our poets, but alas! for human happiness! they are not unalloyed; weeds will spring up and choke the finest flowers; our gayest, sweetest friends, are oft nurtured with a Nettle in their hearts.

Weeds are the most constant, the most enduring of "forget-me-nots." They follow us in the first bright days of spring and the heats of summer; they attend us in the declining days of autumn, and are not wanting when winter spreads his icy mantle over the face of Nature; they grow in the tropical climates of our stoves, and flourish around our ice-houses. From whence do they come?

In the course of my experience as a gardener, I have not unfrequently met with persons who have thought that weeds are produced by some mysterious agency. I have heard it said, that certain land was subject to such and such weeds and always would be—true enough! because the weeds were allowed to seed, year after year.

When we remember that all weeds, in addition to their facilities for propagation, by division of the roots or creeping stems, are endowed with the power of reproduction by seed to an almost unlimited extent, the importance of getting rid of them in their infancy must be obvious; the labour of doing this may at first be considerable, but it will be the forerunner of a sound, sensible, and permanent economy, if persisted in for a few years.

It does not appear to me that true economy consists in letting the surfaces of the ground become covered with weeds and moss, and then using expensive applications to destroy them; but rather in steady and uniform perseverance in thinning the ranks of the enemy, giving no quarter. It is an old adage that,

"One year's seeding
Makes seven years' weeding."

Also that,

"One year's good weeding
Will prevent seeding."

I can vouch for the truth of this old distich from practical experience, having fully tested the truth of it; and the recommendation of Dr. Lindley, in answer to a correspondent, "that there is nothing like hand labour," exemplified by a boy "at half-a-crown a week," is in my humble opinion most correct.

Many persons may object to this on the score of not having sufficient hands to do it. But be it remembered, that although a reduction of necessary labour may effect a temporary saving and negligence of the "bits of Groundsel," the day of retribution will certainly

* It may be interesting to many of our readers to know that at last we have a good likeness of this gentleman, executed in lithography, after a Daguerreotype by Mr. KILBURN, of Regent-street. Nothing can more faithfully represent the fine and thoughtful features of the original, than this admirable drawing by Mr LYNCH. It is published by HERING and REMINGTON, of Regent-street.

come; and even the next generation may lament the effects of "one year's seeding."

It is purposed in this paper to treat firstly of the weeds which infest cultivated ground, as kitchen and flower gardens; secondly, those which disfigure lawns; and thirdly, those which daily "beset our paths."

*Weeds which infest cultivated Garden-ground.*—The most troublesome of this numerous tribe are the Groundsel, Chickweed, Shepherd's Purse, Bistort, Nettle, Couch Grass, Coltsfoot, Bindweed, Dead Nettle, Dandelion, Sow Thistle, and Docks.

The gardener, by his deeper system of cultivation, possesses an advantage over the farmer, for the annihilation of a crop of weeds, as all the above may be got rid of by deep trenching, say to a depth of 2½ feet, excepting that pest the Bindweed. Although the farmer can loosen and aerate to a considerable depth by the subsoil plough, he cannot bury the roots of perennial weeds at a sufficient depth to insure their destruction. His remedy, therefore, consists in the processes of fallowing, giving repeated harrowings, and the tedious operation of hand-picking.

To cleanse a foul and "well-seeded" garden, after having trenched down the surface, with its vegetation, let it be frequently cropped, digging and stirring the soil to various depths, to bring the latent seeds near enough to the surface to vegetate; and when they have done so, apply the hoe in their infancy from time to time. Let all crops be grown in drills, for the sake of facilitating the operation. If you can prevent it, do not allow weeds to go to seed in the hedges or fences, and never pass a "bit of Groundsel" but with a feeling of zealous indignation. Such a system will in a few years rid you (comparatively) of weeds. I have pursued the course I recommend for some years, and my labour for destroying weeds is not a tenth part of what it was. There never was a fouler garden than I found it, and I believe there are few now where weeds are scarcer. "Vincit omnia labor" is truly applicable to this result.

While upon the subject it may be well to mention, that for a light crop of weeds the newly-invented hoe, or the blade of an old knife, makes one of the best tools for use. This is not mere theory, but was first noticed to me by Mr. Myatt, of Manor Farm, Deptford, whose reputation as a market gardener needs no comment from me.

The danger of procrastination has not any more apt illustration than the evil consequences which result from neglecting a crop of weeds, because they are only small ones—mere "bits." We should ever bear in mind how they deprive our crops of the fertilising matters which we may, at considerable expense, have deposited in the soil, and at no period are they so exhausting as when the flowers are developed, and the seeds forming. When in this state they choke and destroy, and fail not to leave behind them unmistakeable evidence that we have not yet learned to act upon the advice of our immortal poet, who says—

"Be wise to day,
'Tis madness to defer."

*H. Bailey, C.M.H.S., Nuncham, Oxford.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 40.)

No. LVI.—We have very successfully travelled thus far, on our journey of inquiry into the "universal Law of Nature;" and we were not wrong in believing that fair argument, urged in a kindly tone, would give us a peaceable hearing from those who felt really interested in arriving at the truth. We will now at once resume the thread of our discourse; having, for the time at least, silenced those few quibblers who imagined they knew better than our old writers, and men possessed of more experience than themselves, "what was what."

The more closely we pursue our observations, and regard the operations of Nature in her handiwork, the more food shall we have for reflection as well as admiration. Every creature, it is evident, was sent into this world for the purpose of self-enjoyment, as well as for the benefit of mankind; and thus we find them "gifted," each with a talent peculiar to themselves. Hence, they can converse together, act together, plan together, live together; and establish a code of laws which their various societies are, one and all, bound to respect and to obey. "What less," asks Derham, "than a good, a supreme intelligence, could thus endow irrational animals with such various *instincts*, equivalent *in their special way* (here is 'a distinction with a difference') to reason itself? Insomuch that some from thence have absolutely concluded that these creatures have some glimmerings of reason. But," adds he, "it is *manifestly* Instinct, *not* Reason they act by; *because we find no varying.* Every species doth naturally pursue, *at all times, the same way* (our *own* argument), without any tutorage or learning. Whereas Reason, *without instruction*, would OFTEN vary; and do that by *many* methods, which Instinct doth by *one* alone." Considering this point settled so far, we will now address ourselves to a most interesting branch of our subject,—the grand end for which our friends, the birds, were brought into the world; and first let us consider *how* they lead forth their family, when ready to quit the nest. Much profitable instruction lies concealed beneath.

That Nature implants "obedience"—a quality in which most of the children of mankind are sadly deficient—in young birds, is self-evident on such remarkable occasions as these. Fortunately, it is not many weeks since I myself witnessed a case of the kind; I can, therefore, speak boldly to the point. A little wren (Troglodytes vulgaris), who had built her nest—I say *her* nest, because I never could observe that her mate ever assisted in its formation—in a very snug corner under my aviary window, laid some eight or nine eggs, and hatched them all, save one. This one I found subsequently in the nest. It was not fecundated. I may add, that the nest was not more than four feet from the ground, but artfully built in the corner of a fluted pillar.

The cunning stratagems of this little creature to escape my eye, as I passed to and fro before her nest—I could not attend to my poultry without continually passing it—have often amused me. For a long time I pretended to know nothing about it, and whenever My Lady Artful has flown off, or rather slipped off at my approach, I have studiously avoided taking any notice of her. I always observed, however, on such occasions, that she would patiently wait until I was gone before she re-entered her dwelling; unless indeed I stayed in the vicinity unusually long; and then, my back being turned towards her, she would noiselessly glide in. It was not until her young were hatched, that I openly recognised her whereabouts. I hardly need tell my readers, that had this tiny creature been aware of my privity to her place of concealment when the eggs were first laid, she would have decamped. Her instinct would have told her there was an enemy to be avoided. The voice of Nature, however, when once the cares of incubation were over, and the cries of her children heard, caused her to brave *all* for their sakes, and to protect them at any hazard.

My first recognition of her ladyship—a day or two after her family were hatched, and my watchful eye as she flew hither and thither with spiders in her mouth, caused her some anxiety. She observed, however, that I never took any advantage of her; never attempted with undue curiosity to pry into her dwelling; and that I never offered her any cause of offence. This led very quickly to a degree of pleasing familiarity, which all who have studied the nature of birds can well understand. She was always glad to see me, listened with the sprightliest of motions to any tune that I might whistle, and really seemed pleased to show me a bunch of spiders that she had twisted between her mandibles. When my eye was fixed on the nest—then would she descend, feed her young, and immediately set out for a fresh supply. Her attentions were unremitting; her motherly care an example for all woman-kind.

As the children increased in bulk, I thought I would venture just to peep in at them. One morning, whilst so engaged, the anxious mother returned with a mouthfull of dainties. It is quite true that she exhibited no symptoms of fear whatever. On the contrary, she seemed well-pleased to find me admiring her offspring, who, I believe, numbered eight. It was a sweetly-pretty sight, to see how methodically they were all disposed in the nest; nor did they venture to move forward or backward. They were all-but ready to take wing. Three mornings subsequently, I found, at a very early hour, that the whole family had just bid good-bye to the nest for ever! They were all safe over-night; and on first missing them, I imagined that some cat had made them her prey. The nest, however, remained intact; and in it, the unfruitful egg before referred to.

My eyes were instantly turned upwards to the lofty Firs, skirting the bottom of my garden, and towering above the aviary. There, sure enough, were all the happy family, including the Mamma; and, on this occasion, the Papa also. It was the very first time I had seen him, although his voice was always audible, since the commencement of building the nest. Do let us pause one moment, to imagine what *must* have been cheerfully, patiently, and perfectly performed by the little mother—totally unassisted I believe by her mate from first to last! Here is something for us to reflect upon for a life-time.

But as Nature made nothing in vain, and has a design in all she does, I made accurate observation that whilst the maternal parent was refitting and recruiting, their Papa was the principal instructor of the children from the moment of their quitting their cradle. The whole family acted evidently in concert. I saw him early and late, teaching, feeding, and instructing them; and, not to be tedious, in some six weeks, or less, after their birth, they had arrived at comparative maturity.* Herein Nature's laws are provident. Her motto with the feathered tribe, is—"Bis *dat qui* Cito *dat.*" When the autumn has ended, Her work has been perfected. Her children have attained "their majority."

From what has been said of this one bird, a very fair judgment may be formed of the rest. One law prevails, one instinct impels, and Nature's uniform course of action is vindicated. Enough has now been adduced for our purpose, as connected with the common order of birds. Of those gifted with an increase of sagacity,—all, be it borne in mind, *needful* for the possessors,—we shall speak anon. Wonder and admiration await us at every turn; and every living creature we behold, the more carefully it is considered, the more do we marvel at its inherent excellence:—

"In some are found
Such teachable and apprehensive parts,
That Man's attainments in his own concerns,
Matched with *the expertness* of the brutes in theirs,
Are oft-times vanquished, and thrown far behind."

Who better than the poet Cowper himself, who penned these expressive lines, could bear us fully out in all that we have advanced? Who than he had more ample opportunities for tracing Nature in all her graceful and amiable footsteps? *William Kidd.*

* All the members of this diminutive but "Happy Family," are, I am pleased to say, still inmates of my garden—some one of them frequently paying us a friendly visit at the window, to share in our good cheer. Their approach is duly heralded by a "pet" canary, who, from within, sings loudly as they respectively make their appearance. We always get a song *in return* for favours granted.

## WINTER COVERING FOR HOTHOUSES.

The inhabitants of plant and fruit houses require for their healthy development, heat, air, light, and moisture. To provide such houses with the means of obtaining the necessary amount of these essential elements, every plan appears to have been brought into operation which the skill of the architect and cultivator combined could devise; and certainly hothouse building has arrived at a state approaching perfection. Yet, it seems to me that one important point is still neglected. While ample means are provided for obtaining heat, we seldom find any plan adopted for efficiently retaining it. A large quantity of warmth is absorbed by opaque walls and other surfaces of a properly glazed hothouse during a winter's day of bright sunshine. At that season, such a state of weather by day is usually followed by a cold frosty night, a clear sky; and in fact, by every circumstance favourable for the escape of the heat which was generated in the houses by the rays of the sun. Now the practice of the gardener (I must say generally, as it is not universally the case) is to find a substitute in fire-heat, instead of endeavouring to retain the more wholesome warmth afforded him by the sun. It must not be inferred that I wish to establish an idea that fire-heat ought to be dispensed with; but I am confident that if hothouses were provided with an external covering, which would in some measure prevent radiation, much less of that kind of heat would be needed; and for what are called greenhouses, principally furnished with Heaths and New Holland plants, it would be found necessary only to apply it in extreme cases.

"Whatever checks radiation from a body keeps it warmer." I am informed, on good authority, that a thermometer exposed to a clear sky has been proved to fall 7° lower than another within a few yards of it suspended under a cambric pocket handkerchief, all circumstances, with the exception of the handkerchief, being equal. Passing clouds, however slight, prevent radiation from the earth's surface. Clouds have two important offices to perform in regard to heat, namely, those of keeping the earth and its inhabitants warm in winter by preventing radiation, and cool in summer by shading from the burning rays of the sun. A covering acts upon a glass house, as respects heat, just as a cloud acts upon the earth. It is used by gardeners for shading, but in the case of preventing radiation it is generally neglected. The reason for this probably is, that if shading were neglected in summer, the evil would soon show itself, in the shape of burned leaves; whilst the injury arising from the non-application of winter covering is not so apparent, where the means of heating by fire are at command.

The objections which I have heard urged against covering are, its expense in the first place (balance the saving of fuel against this and see which way the scales will turn), its liability to be blown about, torn to pieces, and breaking glass, the inconvenience attending putting it on and taking it off, and its unsightly appearance when off. Now in these times when gardeners can invent and build "Crystal Palaces" of gigantic size, surely it is possible to contrive something for covering a glass house of any dimensions, that would be liable to none of these objections. Something cheap and elegant, that could be easily applied and removed, and when off, instead of having an untidy appearance, would be somewhat ornamental. *G. Buchan, Trentham.*

## Home Correspondence.

*Orchids for the Million.*—I think the Cœlogyne Wallichii will be soon grown as easily as a pot of Crocuses, and it may be brought into flower from October to January, and probably may be made to flower twice a year. All that is required is to grow it fast in heat—a hotbed, if the leaves are shaded from the sun, would be quite sufficient, and then to give the plant a long rest as soon as it has completed its growth. It propagates very freely, and is an abundant bloomer; the flowers last a long time. I suspect that four or five years hence this will be grown in the nurseries as common as Cyclamens, and other beautiful winter and early spring flowers. C. maculata, as at present cultivated, is not a free blooming plant; but as it is only the larger bulbs which produce blossoms, my gardener suggests that this plant should be grown in mould richer than that which is in general use with respect to these plants. *Dodman.*

*Victoria Regia.*—At this late period of the year it may be interesting to know that we have this day (Nov. 22), a beautiful flower on this queen of aquatics in our open heated pond, and that there is another bud which is on the eve of expanding. *J. Weeks and Co.*

*Disease in Cucumbers.*—Both these and Melons have been suffering here from a disease which has been common in this quarter for these last three years. In 1850 some Melons were subjected to microscopic examination, but nothing explanatory of the cause of the affection could be detected. No traces of fungi could be found, and therefore it was believed that some external influence must have been the cause of the evil. I was unable to satisfy myself, however, that this was the case; and, upon cutting up a Melon that was gathered at the same time as those previously examined, I found a greenish mould covering the gummy excrescence, and descending into the flesh of the fruit; and, judging from Mr. Graham's description, I believe the mould to be identical with that which he has dis-

covered on his Melons. I am of opinion, however, that this mould is the effect, and not the cause, of the disease; and I think that nothing like fungi being discovered in the diseased Melons first examined, tends to strengthen this opinion. The Melon I myself examined was cut from the same plant as those upon which no fungi could be found, and it appears to me that, being kept a little longer than the others, fungi had made their appearance. This induced me think that the fault lay at the root; not in the shape of disease, as the plants were luxuriantly healthy, but in the food they took up and assimilated. I was the more strengthened in this belief as a Cucumber, growing in a large pot of dry lime rubbish and leaf-mould, was free from disease. This year's experience, however, has proved that I was wrong; for Cucumbers that have been grown in the same material were this season, utterly worthless, from disease, and no application of any kind to the root (and many were tried) seemed to exercise any ameliorating influence. Finding this to be the case, I had recourse to sulphur, which certainly had a powerful effect; for, by its means, I have been able to cut good Cucumbers from plants from which, before I used the sulphur, I could not cut one that was not more or less diseased. I regret that the experiment was made too late in the season for any positive conclusions to be arrived at. But I would recommend a second trial of it. I applied it by filling the pit, in which the plants were, with the fumes from a hot flue, and by making a sort of paint of sulphur, lime, and clay, and using it round the walls of the pit. *John Middlemiss, Bentham Hill, Tonbridge Wells.*——I beg to inform "An Old Gardener," that in October, 1846, my plants were as badly, if not worse, diseased than I ever saw them. I dressed the frames as described at p. 694, the same month. In the first week in November, I made up my seed-bed, and in due time the seed was sown. I never had plants cleaner and more healthy through the winter; and in February, 1847, I cut fine fruit. So confident am I of success, if the means that I have used be strictly adhered to, that I no longer dread that once formidable enemy. I forgot to mention in my last that the flower-pots must be all washed in scalding water, before they are put into the frames, and the thermometer immersed in the same. *Thomas Webster, Shouldham Hall Gardens, Norfolk.*

*Tree Leaves.*—In addition to what has been stated by "An Old Gardener," at p. 741, I observed on the 20th instant, in driving along the road from Boston to Spalding, in Lincolnshire, that many of the trees retained their foliage after the severe frost of the preceding day; indeed the country had still the appearance of autumn, the plantations wearing their autumnal tints and the Quick hedges full of leaves. Several of the "oldest inhabitants" of the district allege that this will be a severe winter, in consequence of the reluctance of the trees to part with their clothing. *C. P., Boston.*

*New Strawberries.*—Mr. Bailey has suggested, at p. 740, an admirable scheme for testing new fruits, which is, that an association be formed to decide upon their merits—each kind to be sent for inspection at least twice in the course of each of two successive seasons. Thus far I agree with him. It is well known that a great many people get disappointed in regard to new fruits, which is principally owing to parties who advertise them being over anxious, and not giving themselves time to prove the quality of their productions. I do not, however, agree with Mr. Bailey in discarding so many magnificent varieties of Strawberries, most of which I have tested. I think that it is doing the raisers of such fruits great injustice. I will not say that the varieties which Mr. Bailey discards will not prove useless, if he oblige them to feed on what they really do not like. In most cases we find that both hybrid fruits and flowers require treatment different from their parents. What constitutes one variety of Strawberry may not constitute another—hence the difference in flavour, &c.; showing that unless you have the proper constituents proportionably in the soil it is impossible to arrive at perfection. The first two varieties (Mr. Cuthill's Black Prince and Kitley's Goliah) which Mr. Bailey speaks of as being useless with him, are really—I was going to say, the most useful to me. I will say conscientiously that there cannot be too much said in favour of them. When I first came in possession of Mr. Cuthill's Black Prince, I own that I was not over sanguine as to its merits, but after giving it a third trial I am quite satisfied about its being a valuable variety, both as a forcer and for the out-door quarter. The Goliah is worthy of its name, it is not only a fine large fruit, but with me it is also excellent in flavour; it is particularly good for forcing, being an excellent setter, and it ripens a little earlier than the British Queen. A few years ago we much wanted some seed varieties of Strawberries, and now we may say with confidence we have got them, so all that remains for us to do is to study their nature and wants. I am of opinion that we are not patient enough with our new fruits: I speak particularly with reference to the Strawberry. *J. M.*—Mr. Bailey's article upon the formation of a society for the censorship of new fruits, similar to the National Floricultural Society, merits attention. I have no doubt that such an association may yet be established, when the buyers of fruits will reap great advantage in not being imposed upon, by purchasing what they may have had in their possession years before, as in the case of the so-called Cuthill's Black Prince Strawberry, a variety deserving a far better name than that given to it by Mr. Bailey; but at the same time it is not new. I have known it for the last 15 or 16 years to be extensively cultivated by the market gardeners about Aberdeen, and others throughout the country; being as I understand raised by a market gardener here, and named Black Seedling, which name it still retains in this district. In Edinburgh, I believe it goes by the name of Malcolm's Seedling. So that here is an instance of the multiplicity of names, which ought to be all cut down to that first given it, viz., Black Seedling. Mr. Cuthill himself acknowledged some time ago, in an article in your columns, that it was given to him by a friend who had received it from Aberdeen. This, together with his description, led me to suspect it to be identical with the Black Seedling, and prevented me from purchasing it. I stated my opinion to several nurserymen, who mentioned that I ought to make it known, but this I always delayed, thinking some of the Aberdeen growers would do so who might know the raiser's name and its exact history, and it was only at the Tarriff Horticultural Society's Show, in July this year, when some of the fruit was exhibited by an amateur, who received his plants from England under the new name, that I was fully convinced that I was right. I may add that it possesses all the good qualities Mr. Cuthill has given it (except lateness, which I know nothing about) but it is an abundant bearer, of excellent quality either for table or preserve, and very early, if well cultivated. As yet I have seen nothing equal to it at the period in which it comes into use. *P. Farquhar, Aberdeenshire.*——The Black Prince is, I think, very unjustly condemned by Mr. Bailey. I have grown it the last four seasons, and consider it the best early Strawberry that we have, and it certainly is a most prodigious bearer. I never knew it fail. On the 14th of last June upwards of half a peck of fine fruit was gathered from a bed in my garden, containing only 37 plants—runners of the previous year. Of Goliah I know nothing, but I consider Myatt's Eleanor a splendid variety. It is certainly, when well grown, the handsomest Strawberry we have; and although rather acid, is a very fine flavoured fruit, and unequalled for preserving. *Henry Doubleday, Epping, November 26.* [We should think that these conflicting opinions indicate pretty clearly what degree of unanimity would be experienced in the proposed new society.]

PAMPAS GRASS (GYNERIUM ARGENTEUM).

*Pampas Grass* (*Gynerium argenteum*).—Amongst the many rare plants to be seen out of doors, at Dalkeith Palace Gardens, is a fine specimen of this Grass, which has been in flower all through the autumn. (See annexed woodcut.) To those who admire the beauty and elegance of Grasses when in bloom, the Pampas is well worth going two days' journey to see. Its rapid growth and elegant habit make it a very attractive and ornamental object for fringing the sides of lakes or rivers. The leaves grow in tussocks; and the large culms, which are 2 inches in circumference, rising from the root, being crowned with 2 feet or more of a panicle, of a fine silvery grey, give it a magnificent appearance. The panicle is in the form of that of the beautiful Arundo phragmites. This admirable Grass will be found to be a great acquisition to the ornamental Gramineæ of this country. *D., Dalkeith.*

*Mr. Ivory's Chrysanthemums* (see p. 742).—As I have seen Mr. Ivory's plants, I feel it to be my duty to bear testimony to their excellence, for they were truly magnificent, by far eclipsing any of the London growers' productions which I have had the pleasure of seeing. *John Patterson, gr. to the Baroness Wenman.*

*An Oak growing on a Beech.*—Having accidentally discovered the inclosed specimen of Beech and Oak leaves growing on the same tree, and, as you will observe, on the same twig, the circumstance being new in this part of England, at least to the men I employ, I will thank you to mention in your Notice to Correspondents whether it is common in any other country. *An Old Subscriber.* [Two small errors lurk here. Firstly, the plant is a Hornbeam, not a Beech-tree. Secondly, the "Oak" is not an Oak, but an accidental variation in the form of the leaves of the same Hornbeam, a circumstance with which naturalists are familiar.]

*Plane Tree Timber.*—A correspondent inquires, at page 725, as to the qualities of the wood of the Plane tree. At Bessingley, near Bridlington, in the East Riding of Yorkshire, are some book-cases and other furniture made out of the wood of a Plane tree that was

killed by a cold spring about 25 years ago, when, I believe, the Plane trees throughout England were very generally killed, or much injured. The wood that this furniture is made of is of a yellowish colour (more of a lemon yellow than the wood of the Maple), mottled here and there with brown, and without much figure. It has stood well, and has not hitherto, I believe, been attacked by worms. *C. W. Strickland, Tadcaster.*

*Hints to Persons making a Garden.*—A garden calculated to grow not only a variety of plants, but a variety of sorts of plants, ought to contain within itself rock, wood, and water, sand, loam, clay, and a surface undulating, or sloping in different directions, so as to give the greatest choice of aspect. These conditions do not necessarily require a large extent of ground, though space is, of course, desirable. It is also a great advantage when such requisites of situation are found naturally, and have not to be contrived and patched up by art. For classing and cultivating plants of particular countries, or of similar qualities together, each class in a soil and locality the most favourable to it, such a division of garden ground as is above pointed out is indispensable. Space will ultimately be economised by it, and the interest and utility of the garden greatly increased, whether the principle of the classification adopted be simply the constitutional nature of the plants,—as wood, rock, maritime, or desert plants ; or whether it be combined with a geographical distribution according to their native countries. The latter arrangement in large pleasure grounds and places where the climate admits of the culture of a wide range of species, might be adopted with success. We see commonly plants of all countries, Europe, Australia, China, America, and Africa, growing side by side indiscriminately ; memory would be assisted and science advanced by grouping them according to their respective natures or natural habitats. It is to be hoped that these hints may be followed up. *S.*

*Josling's St. Alban's Grape.*—In justice to Mr. Thompson, permit me to offer a few remarks on this Grape, which has been again brought into notice by Mr. Bailey. When it was first "let out" it had the advantage of a high commendation from Mr. T., which doubtlessly caused a greater sale for it than it would otherwise have had, from the fact that Mr. T. is justly regarded as the highest authority on fruits in this country. I believe that I was the first person who drew his attention to, and pointed out to him that I could see no difference between Josling's St. Alban's and the Chasselas Musqué. At the same time I sent Mr. T. fruit of each variety, and he unhesitatingly pronounced that he could see no distinction between them. Extraordinary, however, as the thing may appear, I observed from the same Vines a marked difference between the two sorts this last season, Josling's St. Alban's being by far the better Grape of the two : and I am not the only person who has observed the same thing this last season, when both varieties have been grown in the same house. I may add that two Vines of each variety grow in the same Vinery here, and I cannot account for such a marked distinction existing, unless the age of the Vines has something to do with it. Perhaps some of your correspondents can throw more light on the matter. *C. Ewing, Bodorgan, Anglesea, Nov.* 24.

*Rough Plate Glass.*—The invitation of your correspondent, "An Old Gardener," leads me to offer a few remarks on this subject, concurring as I do with him in the opinion that everything relating to that useful article (glass), must be of the greatest interest to the horticulturist. I would, however, premise that the question is not so much whether sheet glass is to be preferred to Hartley's rough plate glass (the only rough plate that I I am acquainted with), as which of all the several kinds of glass that have been used, or are now in use, will best answer the gardener's purpose. I believe that I am correct in saying, that many intelligent gardeners prefer crown to sheet glass, having tried both ; the reason for this may be, the one supposed by your correspondent, viz. :—that the sheet glass they used was of an inferior quality ; query, could this be the case at Bowood, (see Spencer's complaint) ? To mismanagement, or want of proper ventilation, the burning or scorching could scarcely in their case be attributed. Others, again, have tried the rough plate, and have found, that whilst it combines all the advantages of the crown and sheet glass, it seems to them to possess some which belong not to either of the two last named. Do you ask for proof of this ? my reply is—look at the plants which have been grown under rough plate glass. Had there been any deficiency of light, the Erica would have certainly discovered it during the long winter months ; the forced Strawberry would not have assumed so sturdy an appearance, or put on a livery so green : the Vine could not have produced leaves and wood, and fruit, which excited the admiration and commendation of practical and intelligent gardeners. Some of the many stove plants which have been transferred from sheet to rough plate would have doubtless proclaimed their sufferings, had they experienced any ; so far, however, from this being the case, the majority improved in appearance, and not one can be said to have exhibited suffering. It must then be allowed, that whatever theoretical disadvantage may be assumed, no practical one has yet been discovered in the substitution of rough-plate for sheet glass. It might be rash to to venture further than this, if the argument were only for victory's sake ; but as my object is to induce others to give the horticultural world the benefit of their opinions and experience, I shall proceed to state what I consider to be the peculiar advantage which rough-plate possesses over every other kind of glass, or, as least, over crown and sheet glass. We are all ready to allow with "An Old Gardener," "that we have none too much of that necessary auxiliary, light, to forcing in England." In this consists the peculiar advantage of rough plate. That necessary evil, shading, which must be resorted to in many cases where sheet glass is used, may be almost, I believe altogether dispensed with, except, perhaps, in the case of Orchids. Now, granted that a gardener be ever so attentive, and that the blind is run up whenever a cloud passes over, there are many bright days, sometimes even weeks, when the blind must be lending its protection for several continuous hours ; and if the sum of these be taken, it will be found that plants under rough plate have enjoyed a much larger proportion of light during the year than those under crown or sheet glass, accompanied with blinds ; unless it be received as an axiom that diffusion of light of necessity implies considerable diminution. This, however, I have endeavoured from facts to show cannot be the case, since plants the most susceptible to diminution of light seem to thrive as well under rough plate in the winter months as under sheet glass ; and here, I may ask, is it no advantage to have the benefit of this additional light and heat at a time when the plants are carrying on those processes which, in their own bright climes, they perfect, not under a blind, but under the fullest exposure to every ray of light and heat that can possibly reach them during the day ? One word as regards the condition of rough plate, after two years' use; if there be any change at all, it becomes to the eye somewhat more transparent. It has no greater affinity for dirt than any other glass, nor am I conscious of its possessing any disadvantage peculiar to itself. Like all other glass it will crack with frost, if the laps are not puttied : to neglect this is to commit a serious mistake. I do not remember to have seen a leaf scorched or burnt under this glass ; still I can conceive it possible that, by ingenious mismanagement, such a result might be arrived at. If any of your correspondents would favour us with their experience and opinions on the application, of glass, whether crown, sheet, or rough plate (without fire-heat), to Peach walls, and describe the mode of application, and the result, I feel sure that many of your readers would feel obliged, and none more so than myself. *H., Bristol.*——I can speak with some confidence of the merits of Hartley's rough plate, from a trial of one year. In September, 1850, I built a new house, and glazed it with Hartley's glass, and it has far exceeded my expectations. The light is gently diffused ; it never scorches, and requires no shading (no slight merit during the last hot summer), and the forced Strawberries in the spring ripened a fortnight earlier than those in an adjoining house, glazed with small sheet glass. I have since built another house this autumn, and glazed it with Hartley's glass, so satisfied am I with its excellence. I had almost forgotten to add, that its rough surface has no tendency to become dirty. My squares are 30 by 11, and I have now 800 feet of it erected. *J. J. C., Fair Oak.*—— The following is an extract from a letter of one of our customers who has used Hartley's rough-plate since 1849 :—"I am glad to say that I still more and more admire Hartley's rough plate glass, and have on all occasions recommended it ; many friends of mine have ordered it, and like it very much. I only wish I had used it for all my roofs. I have used it for all sorts of plants, raising seeds and cuttings, and find that it requires no shading whatever. It admits sufficient light and heat for all purposes, and I am convinced that the true Hartley's patent rough plate must give universal satisfaction." *J. Phillips and Co., Bishopsgate street.*

*Rhododendron Javanicum.*—This fine Rhododendron is now in flower at Killiow, near Truro. One spike has 15 flowers on it, of a beautiful bright orange. It is, I am told, the first plant of the kind that has blossomed in Cornwall. *Edward Randall.*

*What is Pruning ?*—This is a question which, in the discussions on that subject, has been little attended to. There are two operations on forest trees, very different in their principles and results, both of which usually pass under that name. The most common, which may more properly be termed "lopping," is the rude practice of cutting off branches large and small indiscriminately, to increase the length of the stem ; the other, which is properly "pruning," is the stopping or shortening gradually by successive annual amputations, such branches as are tending unduly to enlarge themselves ; and, by diverting the sap from the proper central leading stem, to form a spreading and unsightly head. This is an operation which, if commenced at an early period of its growth, and completed before the age of 20 years, cannot be injurious to the tree or derange its economy, like that of suddenly depriving it of large branches in a state of luxuriant growth. Some of the branches of 2 inches in diameter and under, treated in this manner, may be destined to be eventually removed when the flow of sap to them has been sufficiently deadened, and the stem of the tree sufficiently enlarged to render the wound relatively small. But in by far the greater number, probably 19 in 20, the branch, when sufficiently shortened by a clean diagonal or slanting cut, at a properly placed leading twig, is left to cicatrise and remain permanent. This operation is particularly suited to hedgerow and avenue trees, where elevated heads and clean elongated stems are important ; but may be occasionally useful in park trees, to stop an ambitious or unruly limb, and even, but there very sparingly, in plantation trees. If pruning be begun, however, as it ought to be, in the nursery, and the main growth of the plant directed to the central stem, the after pruning of trees will be rarely and sparingly required. The best season for pruning I conceive to be after midsummer, when the sap having been elaborated in the leaves is beginning to descend and be distributed for the material of next year's growth ; and when the vital economy of the plant will be least deranged by the operation. The results of pruning performed on this plan, I have found very satisfactory, and the most unpromising and unsightly heads gradually brought in a few years into a symmetrical form, without any perceptible checks to the luxuriant growth of the tree. When the wound is one inch or more in diameter, a little boiled tar or Fleming's paint laid on with a brush, will prevent the growth of Moss or fungus until closed. No doubt the new wood formed over the wound does not unite with it ; but this is of little consequence when the wound is small, and in avenue or park trees, cultivated rather for ornament than for timber ; and I think the operation performed on the system now advocated, does not deserve the hard terms in which "pruning forest trees" is spoken of by some of your correspondents. It is proper to state that different trees require different degrees of pruning. The Lime and Horse Chestnut may be pruned pretty freely without injury ; next to these, the Ash and Beech ; then the Elm and Sycamore ; the Oak requires milder treatment, the amputation of the two or three last annual shoots of a branch will sensibly check its growth ; the Birch bears pruning least of any, and should rarely be touched. *J. S. H., Perthshire.* [Our correspondent understands this subject as we do, and he will see by referring to various leading articles published in our columns, that when we have exclaimed "Prune not at all," it has always been with reference to the barbarous process of hacking and lopping.]

*A Destructive Snow Storm* has lately occurred in this part of Norfolk. On the 18th inst. the grounds were strewed with branches and limbs of trees, many of them being of great size, and the damage done in the pleasure grounds is great. Amongst timber trees, Oaks have been the principal sufferers, and it is distressing to see so many fine trees which have long been admired for their size and beauty, so ruthlessly shorn of their fair proportions. The storm commenced on the night of the 16th. At half-past 10 the thermometer stood at 34°, the wind being north-west. It was squally occasionally through the night, gleams of lightning being seen, with sleet and snow falling, according to the varying of the temperature. At mid-day, on the 17th, the snow was 9 inches deep ; about that time the havock among the trees began ; the cracking and occasional falling of branches gave warning that it was unsafe to pass beneath them, and this morning (the 18th), a doe was killed by one of these falling limbs. Many of the smaller ornamental trees have been laid prostrate with the snow. The damage done amongst the shrubs cannot yet be ascertained, but some of the larger evergreens have suffered severely, especially the Cypress tribe ; one fine red Cedar (Juniperus virginiana), a tree of great size, is almost completely destroyed, three large limbs having been torn off, one of which was some 3½ feet in circumference. The damage done in the open park is much less than that in the pleasure grounds and shrubberies, where it is more sheltered. Previously to the storm the trees were drenched with moisture, and many of the Oaks were covered with leaves, which may account for the greater destruction among them. From the fall of sleet and snow, and the temperature varying but little from 34°, an enormous weight of snow and ice adhered to the trees ; and such being the case, it is not surprising that many should have been laden beyond their powers of resistance, and that results such as I have described should have taken place. The loss of valuable property here by the occurrence is considerable ; several fine Oaks are so much disfigured that it will be necessary to take them down. *Thomas Elliott, Elmham Hall Gardens, Norfolk.*

*Potatoes in Perthshire.*—The disease has touched the crop more lightly here than in most places reported. In my farm, in gathering and subsequent turning and picking, about four bolls out of 80, or five per cent. of diseased tubers were found. The report in the *Gardeners' Chronicle* of an experiment last year with diseased sets, induced me to give it a trial on a small scale. The produce (which I preserve for seed next year) was about 3 bushels, out of which only 10 diseased tubers appeared. *J. S. H., Perthshire.*

*Ice Stacks.*—I observe that you have given an extract from Dickens's "Household Words" on stacking ice ; and as the subject is particularly interesting at this season, I beg to ask if any one can explain the cause of failure in an attempt to preserve ice in the following way :—In December, 1849, I obtained permission from my employer to make an ice-house, the general plan of which was furnished by the *Gardeners' Chronicle* some years ago. A spot was selected where the ground was somewhat sloping, and a circle marked out 14 feet in diameter, in which were placed upright posts 5 feet high, and at the distance of 2 feet apart ; at 2 feet within this was placed another circle of strong stakes, the space between which and the posts was then carefully filled up with straw, and the whole firmly bound together, thus forming a circular straw wall 2 feet thick ; a layer of small roots was then placed on the ground inside, and on these a layer of straw 9 inches thick ; 20 cart-loads of excellent ice were then put in, well broken and rammed down, and the whole was covered with a thick coat of straw. The roof was then put on : strong rafters were nailed on to the outside posts joining together in a point at the top, and thatched with straw 18 inches thick ; the whole was done in so substantial a manner that the house is standing now, as

sound as ever, and so confident was I of success, that I could have "laid my life" on the result. However, about the beginning of the following July, a hole was cut in the straw, and on entering, not a particle of ice was to be found. The only reason I can assign for the failure of this experiment is the want of a current of air passing over the ice, by means of which the superincumbent moist air might have been driven off. I am not one of those who deny every attempt at improving and simplifying matters connected with rural economy, but I cannot help thinking that there has been too much theorising on the subject in question. *E. J., Oxon.* [Do not you suspect that you have allowed air to reach your ice somehow ?]

*The Nightingale; "Can a 'Hen' Nightingale Sing?"*—Your well-meaning correspondent, "Ruricola," has, at page 741, raised a curious question; or more appropriately speaking, he has "found a mare's nest." With the laudable view of attempting to correct what he imagines to be 'an error,' *he* has advanced a sad error indeed; and one which cannot be too soon corrected. He harps upon the 'impossibility' of a *hen* nightingale 'singing!' Let me assure him (for it is a pity that such assertions should get abroad), that both I and several other nightingale-fanciers known to me, have had hen (love-sick) nightingales, caught early in the season, that have "sung" sweetly,—not indeed with the volubility of the male, for the formation of the larynx forbids of course such an extent of power; nor for any length of time. Let us, to speak within compass, say their occasional "songs" have lasted for some 10 days after they were caged. There are also *other* hen birds which 'sing.' For instance, young hen robins (early in the autumn), and hen canaries, are frequently heard to sing. It is true that their song—for 'song' it is, and *not* their 'call-note'—is necessarily small. If "Ruricola" will at his leisure refer to some of your earlier "Notices to Correspondents," he will therein find 'advice' asked on behalf of ailing canaries, which, "although 'hens,' yet *sing sweetly.*" *W. Kidd, New Road, Hammersmith, Nov.* 26.

## Societies.

Botanical of Edinburgh, *Nov.* 13.—The President, in taking the chair, alluded to the success which had attended the meetings of the Society during the bygone session, the increased zeal for botany among the members, and the numerous donations made to the Herbarium and Botanical Museum in Edinburgh. He urged on the members the desirableness of renewing their exertions this season, and he particularly invited the young members to record the observations which they made, and thus render them available for the purposes of science. He concluded his address by alluding to the deaths which had taken place among the members of the Society since last meeting, and in an especial manner referred to the labours of the late Dr. Neill, Mr. David Steuart, Dr. Bromfield, Mr. James Nicol, and Mr. James Cunningham. All of these gentlemen, in their different departments, had done much to forward the science of botany. Several donations to the Library and Herbarium were announced. The chairman exhibited a specimen of the fruit of Tomato, in which five separate succulent carpels were included within a single fruit, an appearance similar to what is frequently exhibited in the Orange. He also produced examples of Zostera nana, from the shore of the river Blyth, in Northumberland, which had been sent by Mr. Storey, of Newcastle, for the Society's Herbarium.—Mr. G. Lawson exhibited a fresh specimen of the immature fruit of Victoria Regia, grown in the Stove Aquarium at the Garden of the Royal Botanic Society of London, Regent's Park. The following papers were read.—1. *On the Gulf Weed (Sargassum bacciferum.)* By S. Mossman, Esq. 2. *On the Correspondence between the Angles formed by the Veins of the Leaves and those formed by the Branches of the Stem.* By Mr. William Mitchell, Edzell. Communicated by the Rev. Dr. M'Cosh. These, more especially the latter, being very long, will be given, as soon as room can be afforded them, in another part of this paper. 3. *On Fossil Woods from Antigua and Australia.* By R. Bryson, Esq.—Mr. Bryson exhibited examples of silicified woods from Antigua and Australia. The former being both exogenous and endogenous, while the latter were coniferous. Some of the specimens were about a foot in diameter, and were beautifully polished by Mr. Young. Mr. B. made some remarks on the process of silicification, and pointed out the difference of appearance presented by the woods. Some were completely opalised and hard throughout; others had portions either extenal or internal, which were less completely silicified, and in a friable state. In this latter state the Australian woods showed the coniferous structure, while the opalised forms did not show discs under the microscope.—Mr. Anderson showed several fossil leaves from the tertiary formation, belonging to dicotyledonous plants.—Mr. J. B. Davies produced the following specimens from Mr. Lawson, jun., who remarked, in a letter accompanying them, "I send a few novelties which may perhaps be interesting. Some new varieties of curiously-marked Kidney Beans from Portugal; Tea grown in Portugal; also Turmeric root; new Turnips and Radish from France, the white variety is the earliest I have ever heard of, being ready in three weeks, I understand; specimens of the Bromus Schraderi and canadensis, showing very abundant foliage at this season; this Grass has been long known to botanists, but there seems great difficulty in making our agricultural friends believe in its value; Isatis Indigotica, as employed in China for dyeing Tea."—Mr. Fortune remarked, that the Early Turnip was common in China, and had probably been imported into France, whence Mr. Lawson had obtained it.—Mr. Davies also exhibited specimens of Elymus hordeiformis affected with ergot, and a variety of Elymus canadensis with a branching spike of several heads.—Mr. Stark exhibited growing specimens of Portuguese plants, amongst which was a beautiful species of Linaria, apparently allied to L. supina or L. alpina, but with large flowers of a rich purple.—At the request of the President, Mr. Fortune gave some interesting information relative to the manufacture of Tea in China, and also in regard to the Tea plantations belonging to the East India Company, in the Himalaya.—D. Oliver, Esq., jun., was elected a Fellow, and six candidates were proposed for election at next meeting.

## FLORICULTURE.

*Glenny's Garden Almanac for* 1852. Cox, King William-street, Strand.

This, the thirteenth annual issue, opens with a modest preface, the text being "Good wine needs no bush." "Progress of Floriculture" begins that portion of the book with which our duty is most concerned; without entering into the discussion, we wish the progress of floriculture to be rapid; that some matters are to be set right, there can be no doubt; but it is best done by avoiding aught that may injure the cause we all advocate. There is a vigorous drilling of the Royal South London Floricultural Society's Committee, concluding with the assurance that "all is meant for the best." A strong and loyal defence is given of Dahlia "King." "Showing other people's Productions" is an appeal to men's feelings, written in the right spirit. New Dahlias, 15 in number, are enumerated; some of them have been already noticed in our columns. On the criticisms against the National Floricultural Society, it is not our intention to comment; we are not its director. Although, upon the whole, this Almanac ventures upon less than usual, yet it will be found serviceable to the inexperienced, and a good remembrancer for all. *J. E.*

Stoke Newington Chrysanthemum Exhibition, *Nov.* 20.—In our last we only recorded the names of the successful exhibitors, promising that a more extended report should follow; we, therefore, proceed to redeem our promise. Five years since Mr. James, Mr. Holmes, and some few friends, ventured the establishment of a flower show in "dreary dark November," a month especially unfavourable for such meetings; yet, in the face of numerous disadvantages, our Chrysanthemum friends had no fear, they knew the capabilities of the flower they had pledged to foster, they foresaw that a flower-loving public must appreciate even the effort made to dispel the gloom by which Nature's face at that time is surrounded. To such attention, therefore, our favourite flower, which cheats the winter of half its dreariness, owes much of its present perfection and beauty. The meeting, some account of which we are now about to give, far surpassed the sanguine expectations of even its most enthusiastic supporters; plants and cut blooms being all they could possibly have desired.

Class I. Single specimen plants, grown with one stem only: 1st, to Mr. Scruby, with Defiance; 2d, to Mr. Bundel, with Madame Cameron; 3d, to Mr. Elliott, with Pilot. These plants were truly examples of the very highest cultivation—from a single stem, some inches clear above the pot, the laterals had started; these again and again feathered, until as a whole, plants, some 4 to 5 feet high and 15 to 18 feet in circumference, were the result. They were amply furnished with foliage—plump, healthy, and vigorous. The flowers on the specimens could not have numbered less than 300, and of these there were scores fit for exhibition as single blooms, so that floral profusion had not detracted from individual quality. Specimens such as these placed side by side, had a charming effect—the first was white, the second reddish crimson, and the third a deep rose; these plants, with one or two duplicates, occupied a raised platform, filling one side of the room. Immediately in the front, but standing on the floor, were arranged four specimens for the prizes offered by Mr. Bird: these were contributed by Mr. Scruby; the sorts were Pilot, Vesta, Clustered Yellow, and Annie Salter. They were in 11-inch pots, and were capital specimens of good management.

Class II. Six pots of distinct varieties, size not exceeding 11 inches, there being no limit to the number of plants in a pot. Four collections responded to the invitation. They came from Messrs. Holmes, Elliott, Scruby, and James. All exhibited the application of much skill. Mr. Holmes and Mr. Elliott were placed equal first. Mr. Holmes's six plants were only some 2 to 3 feet high, while Mr. Elliott's were from 5 to 6 feet; both collections possessing, however, many qualifications which constitute perfect specimens—very healthy, clean, full, well flowered, and judiciously varied. Mr. Holmes staged Annie Salter, Queen of England, and Madame Cameron, as the back row, with Vesta, Pilot, and Defiance for the front. Mr. Elliott arranged Vesta, Madame Cameron, Annie Salter, Madame Poggi, Pilot, and Minerva; 3d, to Mr. Scruby, with Madame Cameron, Annie Salter, Defiance, Lucidum, Pilot, and Lysias; Mr. James produced Vesta, Madame Cameron, Defiance, General Negrier, Annie Salter, and Madame Poggi. These four collections occupied two sides of the room in double lines, and with the single specimens already alluded to, produced altogether a most charming effect. So admirably was each collection arranged, and so kindly did each exhibitor study his neighbour's interest, that we dare not allow the circumstance to pass unrecorded.

The cut flowers were ranged on two long tables; to the right the twenty-fours and sixes, to the left the twelves and sixes; and although there was little space to spare, each collection found ample room. The total number of collections staged for competition was 36, and when we state that in many instances the Metropolitan Dahlia stands were used, some idea may be formed of the *tout ensemble*. We can further add, that of the 500 blooms so exhibited, there were many whose circumference exceeded 20 inches; ye Dahlia growers, think of that! more than 6 inches in diameter.

Class III. embraced 24 cut blooms of not less than 12 distinct varieties, nor more than two blooms of any one variety. Mr. Taylor, who delivered a lecture on the culture of the Chrysanthemum for cut flowers, a full report of which is published at p. 151 of our present volume, justified the instructions he so ably advanced by receiving the first prize; his blooms were staged in three rows of eight, the varieties being Beauty, King, Campestroni, Queen of England, King, Goliath, Beauty, Queen of England, Racine, Phydias, Pio Nono, Defiance, Golden Clustered, Phydias, Defiance, Clustered Yellow, Formosum, Sydenham, Cyclops, Guillaume Tell, the Duke, Pio Nono, Plutus, and Sydenham; 2d, to Mr. Scruby, with Madame Chauvière, Beauty, Queen of England, Cloth of Gold, Madame Hardy, Orlando, Madame Hardy, Queen of England, The Duke, Pilot, Defiance, Madame Chauvière, Clustered Yellow, Pilot, Defiance, Orlando, Phidias, Annie Salter, Dupont de l'Eure, Annie Salter, The Duke, Dupont de l'Eure, Beauty, and Clustered Yellow; 3d, to E. Sanderson, Esq., with Queen of England, Pilot, Goliath, Clustered Yellow, King, Goliath, Beauty, Queen of England, King, Defiance, Cyclops, Imperial, Beauty, Sydenham, Phidias, Clustered Yellow, The Warden, Phydias, Temple of Solomon, Louis Napoleon, Vesta, Temple of Solomon, Vesta, and Lysias; 4th, to Mr Elliott, with Cloth of Gold, Pilot, Beauty, Queen of England, Pilot, Lucidum, Vesta, Queen of England, Rabelais, Orlando, The Duke, Beauty, Phidias, Annie Salter, Defiance, Princess Marie, Phydias, Defiance, The Duke, Rabelais, The Warden, Formosum, Dupont de l'Eure, and Annie Salter; 5th, to Mr. James, with The Warden, Queen of England, Clustered Yellow, King, The Warden, Campestroni, Queen of England, Lysias, Defiance, Sydenham, The Duke, Two-coloured Incurved, The Duke, Lysias, Beauty, Vesta, Nonpareil, Formosum, Christine, Vesta, Dupont de l'Eure, Formosum, Clustered Yellow, and Pio Nono; 6th, to Mr. Merry, with King, Queen of England, Goliath, Golden Clustered, King, Queen of England, Goliath, Golden Clustered, Beauty, Princess Marie, Gem, Phidias, Gem, Beauty, Jenny Lind, Dupont de l'Eure, Sydenham, Defiance, The Duke, Formosum, Dupont de l'Eure, Annie Salter, and Sydenham.

Class IV. Twelve cut blooms, distinct varieties: 1st, to Mr. Taylor, with Goliath, King, Beauty, —— (?). Phidias, Clustered Yellow, Queen of England, Formosum, Madame Laborde, Pio Nono, Duchesse d'Abrantes, and Defiance; 2d, to Mr. James, with Goliath, King, Queen of England, Lysias, Nonpareil, Clustered Yellow, Christine, Defiance, Vesta, Dupont de l'Eure, Formosum, and Sydenham; 3d, to Mr. Scruby, with Madame Chauvière, Princess Marie, Queen of England, Annie Salter, Pilot, Madame Hardy, Goliath, Orlando, Beauty, Clustered Yellow, Dupont de l'Eure, and The Duke; 4th, to Mr. Croxford, with Goliath, Pilot, Queen of England, King, Phidias, Beauty, The Warden, Clustered Yellow, Two-coloured Incurved, Sydenham, The Duke, and Dupont de l'Eure; 5th, to Mr. G. Smith, with Cloth of Gold, Madame Chauvière, King, Clustered Yellow, The Warden, Defiance, Guillaume Tell, Pilot, Phidias, Annie Salter, The Duke, and Princess Marie; 6th, to Mr. Biscoe, with Beauty, Defiance, King, Phidias, Cloth of Gold, Campestroni, Formosum, Madame Poggi, Vesta, Annie Salter, Sydenham, and Clustered Yellow; 7th, to Mr. Shield, with Pilot, Beauty, General Marceau, Cloth of Gold, Clustered Yellow, Zoé, King, Orion, Defiance, Phidias, Annie Salter, and The Duke.

Class V. Six cut blooms, distinct varieties: 1st, to E. Sanderson, Esq., with Goliath, Queen of England, Defiance, Beauty, The Duke, and Aristides; 2d, to Mr. Scruby, with Princess Marie, The Duke, Clustered Yellow, Goliath, Beauty, and Lysias; 3d, to Mr. Croxford, with Beauty, Queen of England, Pilot, King, Clustered Yellow, and Lysias; 4th, to Mr. Taylor, with King, Beauty, Clustered Yellow, Phydias, The Duke, and Defiance; 5th, to Mr. G. Smith, with Campestronii, Christine, Defiance, Golden Clustered, Queen of England, and Vesta; 6th, to Mr. Biscoe, with Lysias, The Warden, Beauty, Phydias, Goliath, and Dupont de l'Eure; 7th, to Mr. Callaghan, with Beauty, Cyclops, King, The Duke, Phidias, and Formosum; 8th, to C. P. Lochner, Esq., with Christine, Orlando, Queen of England, The Duke, The Warden, and Golden Clustered.

Class VI. Six cut blooms, distinct varieties, competed for by members who had never taken a prize for cut blooms: 1st, to Mr. Hutton, with Formosum, Queen of England, Beauty, The Duke, Golden Clustered, and Defiance; 2d, to Mr. Shield, with Annie Salter, King, Beauty, The Duke, Clustered Yellow, and Formosum; 3d, to Mr. Williams, with Orlando, Cloth of Gold, Beauty, Campestrouii, Sydenham, and The Duke; 4th, to Mr. Aldridge, with Madame Chauvière, King, Annie Salter, Phidias, Queen of England, and Formosum. Extra prize offered by Mr. James for four distinct Anemone flowered varieties: 1st, to Mr. Taylor, with Marguerite d'Anjou, Gluck, Fleur de Marie, and Madame de Godereau; 2d, to Mr. G. Smith.

For 6 plants of Pompons: 1st, to Mr. Taylor; 2d, to Mr. James. Collections not for competition were contributed by Messrs. Chandler, Wandsworth, and by Mr. Salter, Hammersmith; the latter bringing all Pompons. The most distinct were, Piquillo, Nanette, Cybèle, Pouledetto, Golden Drop, Circé, Criterion, Asmodie, Sacramento, Solfaterre, and Marie Vougel. Mr. Batten was also a contributor.

Having now finished our report, we will take this opportunity of announcing that a five guinea Silver Cup is offered for six plants at the show in 1852. This is the gift of an officer of the Society. This induced another offer of a five guinea Cup for 24 blooms at the same show, by Mr. James, the treasurer. Both these prizes are to be in lieu of the Society's money prizes, whereby its funds will be spared some few guineas. Other Silver Cups are in contemplation. Further, Mr. Salter signified his intention of offering prizes for new flowers. The inducements, therefore, in the year 1852 will be great. The receipts at the door this year amounted to over 40*l.*, and this for one flower! On account of so liberal a return the prizes were of greater value than any hitherto awarded. It is but just to state that during the evening every claimant was fully paid. We have only to add that at the dinner at the Rochester Castle in the evening, where we had the honour of presiding, the greatest harmony prevailed, and that there was a full meeting. *J. E.*

Edinburgh: *C T.* We could scarcely believe its insignificance. Your jottings will be acceptable. *J. E.—R S.* Many thanks for the enumeration. *J. E.*

Gladioli: *J Speed.* The following we know to be good, and are, we believe, in the trade; not so those produced and rewarded at the National Floricultural Society, which remain, so far as we know, in private hands—the raisers': *Ramosus Tribe*—Ramosus, Dr. Lindley, General Cavaignac, General Van Welden, Insignis, Oscar, Prince Albert, Queen Victoria, Sir Robert Peel, Van Gagern, Vitellinus, Wilhelmus, Magnificus, and Rosa Mundi. *Gandavensis and Floribundus Tribe*—Gandavensis, G. amabilis, G. splendens, G. Duc d'Ursel, Psittacinus sanguineus, Brenchleyensis, Viridis, and Ne plus ultra. *J. E.*

Illustrations: *W H, Hackney.* The Plates for February, Part 13, were—Grapes, Ericas, Heliotrope (Gem), and Billbergia Moreliana. *J. E.*

Old Hotbeds. Most valuable for top-dressing in early summer; protection from excessive wet is desirable; if frozen through, it is improved. *J. E.*

Report: *J I C.* Highly important, and in strictest confidence. *J. E.*

## Miscellaneous.

*Dr. Planchon* has been appointed Professor of Botany in the Medical School of Nancy. *Garten Zeitung.*

*The Potato Disease.*—Of the atmospheric influences of bye-gone ages, we have no other record than is afforded in the remains of the animals of that period. These mostly possessed a powerful crushing or masticating apparatus, which enabled them to subsist on branches of trees; whilst in those of later date may be traced characters progressively partaking of the nature of the present class, which feed almost entirely on food of a nitrogenous property. The vegetable kingdom may, therefore, be supposed to have undergone a change calculated to produce these results; and it is within our remembrance that, when a boy, in Devon, the nature of the Potato was totally different to the root now raised

there—it having almost lost its mealy character; whilst grain and all other plants of a nitrogenous kind have increased in quality in a corresponding ratio. That this change is referable to some cause is beyond doubt; and we think that its demonstration is both simple and easy. On the operation of combustion and respiration, we need not dilate—it being well determined that, for every 27 parts of carbon converted into carbonic acid, 73 parts of oxygen are abstracted from the atmosphere; whilst hydrogen combines with oxygen in the proportion of 1 to 8. Coals, wood, and turf or peat—the principal articles of combustion—contain a considerable proportion of hydrogen; but in order to simplify the question, although our argument will damage thereby, these materials will be considered as composed of carbon only—any estimate, in fact, that may be formed of the amount of ammonia generated being little more than approximative, and must unquestionably fall very far short of the actual quantity. Of the amount of fuel consumed before the Potato disease made its appearance we have not by us any statistical account; but it may be observed that Newcomen's engine was introduced in the year 1705; and with the improvements that have been made on it, including those by Watt, continued in use only as a land engine until 1807, when Fulton practically applied the steam-engine to the propulsion of a boat; and from that period steam vessels have progressively increased in number; and with their increase steam has been applied to the locomotive and other purposes, consequent on the rapid improvements towards civilisation that have been developed within these few years; whilst furnaces of all kinds have kept pace with the appliances of steam. That the Potato disease has increased in virulence with the increased consumption of fuel is unquestionable. We will, therefore, endeavour to trace what are the conditions necessary to the production of this epidemic. The following statement, on the authority of Professor Ansted, will give an approximative estimate of the amount of coal raised, and therefore consumed in the world; and to it is added the respective coal-fields:—

| | Tons. | Square Miles. |
|---|---|---|
| British Islands ... | ... 32,000,000 ... | ... 12,000 |
| France ... ... | ... 4 150 000 ... | ... 2,000 |
| Belgium ... ... | ... 5,000,000 ... | ... 520 |
| Spain ... ... | ... 550,000 ... | ... 4,000 |
| Prussia ... ... | ... 3,500,000 ... | ... 1,200 |
| United States ... | ... 4,000,000 ... | ... 113,000 |
| British North America ... | — ... | ... 18,000 |
| Total ... ... | 49,200,000 | |

Or about 50,000,000, to which is to be added wood, peat, and other combustible materials, also the carbon consumed in respiration, which certainly may be taken at 10,000,000 more, making a gross total of 60,000,000 tons; 60×73=4380÷27=162,000,000 tons of oxygen abstracted from the atmosphere; and if to this be added the 60,000,000 tons of fuel, or carbon, it will give 182,000,000 tons of carbonic acid generated. Now, it is self-evident that for every volume of oxygen abstracted from the atmosphere, there must be four volumes of nitrogen liberated; and although it is of rather less specific gravity than oxygen, its weight may be assumed at four times 162, or 648,000,000; and as this gas combines with hydrogen in the proportion of 5 to 1, we shall have a general annual increase in the amount of ammonia generated in the formation of snow, and brought down to the earth, of no less a weight than 777,000,000 tons. That rain and snow-water invariably contain ammonia is unquestionable; and although our principles were communicated to the editors of the "Philosophical Magazine" so far back as 1844, in the Journal for October, 1851, will be seen an article extracted from the *Comptes Rendus*, expressive of surprise that in hailstones, analysed by the writer, should be found ammonia and black matter, analogous to the carbon of the vegetable kingdom. That such an amount of accumulating matter, to which should be added the increase of ammonia of putrefaction, should induce a putrefactive disease in a non-nitrogenous plant, under particular conditions, may readily be conceived; and it is but reasonable to assume that the amount of moisture that passes through a plant should be in proportion to the evaporating influence in the atmosphere. In 1846 and 1847, when the evaporating influence was great, and the earth was negative, the Potato disease prevailed; but with a similar amount of evaporation in 1849, and the earth positive, it totally disappeared. If, then, our position be correct, the remedy for this epidemic is self-evident—the abstraction of the ammonia being all that is requisite: and in 1847 we suggested to a friend that, for the preservation of his crop, he should plant the esculent between Cabbages—a highly nitrogenous plant; and in half of a plot of ground which he so treated he had not half a dozen rotten tubers; whilst in the corresponding half, but without the Cabbage, he had not as many sound. We are also informed by Mr. Bickerton, an experimental farmer in Wales, that he has tried the plan with singular success. *F. Coxworthy, in the Mining Journal.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Besides the usual ripening of Gloxinias, Achimenes, and other bulbous and tuberous-rooted plants, there are many other stove plants which require placing in a cooler temperature during the season of rest. Under this head will be included Clerodendron squamatum, and similar species, Allamanda, Aphelandras, Vincas, and various others which have done flowering; and which, as the late autumn and winter flowering plants go out of bloom, should be subjected to a cooler and drier treatment, until the proper season returns for their new growth; taking care that they are not allowed to become altogether dry—or loss of roots and death will be the consequence. If a stock of young plants has been reared, many of the older ones may be discarded, thus making room for others which it is more desirable to preserve. Let every exertion be made not only to keep in check, but also to eradicate insects, especially the "mealy bug," and those of the scale family. They breed more or less all the year round, but more slowly at this season than during spring and summer. If, therefore, vigorous and persevering endeavours are made to destroy them, by examining the plants, if possible once a week, their numbers will be so much reduced in the spring, that sufficient time may be spared, even in that busy season, to cure effectually this worst of all garden nuisances. The best of all tools and materials for this purpose are the sponge and syringe, with hot water (110° to 130°) and soft soap. Let every tie be unfastened, as these are their favourite hiding-places during winter; and where wire trellises are used, they should also be thoroughly washed with hot water.

FORCING DEPARTMENT.

Peach-house.—Those who intend to have Peaches in their first house ready by the middle of May, should commence forcing immediately. If the greater part of the roots are in the outside border, it should be covered with dry litter, Fern, or tree leaves, which in their turn should be kept in their places, and nearly concealed by a slight sprinkling of earth. The interior temperature should be very moderate at first, commencing at 40° as night temperature and increasing very gradually until the season is fairly turned; the day temperature may rise 10° by fire-heat, and 15° to 20° by sun-heat. Unless the weather is very damp, a slight syringing may be given every day with tepid water; and when the weather turns out very fine, the operation may be repeated. It must, however, be distinctly understood that these syringings must not be construed into deluging, but that the water is to fall on the plants like fine dew. The early Peach-house, or a pit under similar treatment, will be excellently adapted for starting Strawberries to produce a very early crop; but the latter should, if possible, be plunged into a bed of leaves or some other material, to give a gentle bottom heat; and if such can be introduced into the Peach-house, the warmth and moisture therefrom will be beneficial to the Peaches also. A pit, however, is preferred for the Strawberries, as they can there have the mild bottom heat, and still be near the glass. Fig-house.—Let the shoots be untied, and if any pruning is necessary, it should be performed at the same time; but if proper attention has been paid to stopping the shoots during summer, very little pruning with the knife will be required; in fact it will be confined to removing a few shoots where they are too crowded to admit of their being properly trained. The shoots should be cleaned and washed over with sulphur and soft-soap, taking care not to injure the buds when performing these operations. The walls, woodwork, and glass, should be thoroughly cleaned; and any necessary painting, colouring, or other repairs, done forthwith.

FLOWER GARDEN AND SHRUBBERIES.

The flower garden being now cleared of all its summer occupants, the beds neatly forked up, and the turf, &c., put in order, let the walks have their share of attention, raising any low places, to give them an uniform shape, and to throw off the wet into the side drains. When they are dry, let the roller be frequently passed over them, as by making the surface of a well-formed walk firm, the wet will pass off more freely, and it will consequently be in less danger of injury by the frost. The enjoyment of a garden during winter, depends so much upon the state of the walks, as regards smoothness and dryness, that too much attention can scarcely be paid to them.

HARDY FRUIT GARDEN.

Whenever the state of the weather will permit of the soil being worked, it is a great advantage to fork the ground about the fruit bushes lightly over, and at the same time to work in some well-rotted manure amongst the roots; the same operation buries the leaves, and gives to the whole a neat and orderly appearance. The requisite pruning, staking, and tying should be first performed, to prevent the necessity of treading upon the ground, after it has been forked. If the Raspberry canes were not thinned in the autumn, they should now be reduced to four of the strongest on each stool, rejecting any which may have been deteriorated, by producing fruit in autumn; and, as a matter of course, entirely removing all the old canes. The stakes should then be examined, and renewed, if necessary, fixing them perfectly upright in straight lines, and cutting them to one uniform height, that the whole may bear evidence of good workmanship. When forking in the top-dressings, a little pains should be taken to destroy the embryo suckers which are visible on any of the roots.

State of the Weather near London, for the week ending Nov. 27, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 30th, 1835—therm. 58 deg.; and the lowest on the 5th and 6th, 1844—therm. 14 deg.

## Notices to Correspondents.

Back Numbers: *J L.* You can have the numbers: please to remit 12 postage stamps.

Begonia cinnabarina; *M B.* will thank some of our correspondents to inform him how to manage this Begonia, so as to make it flower. He has had a plant for nearly eight months, and it has neither blossomed nor yet grown well. He adds, that several of his neighbours have had it for the same length of time without any better success. He has tried it in the Pine stove and in the greenhouse, the soil being sandy loam and peat.

Birds: *E.* If it be indispensably necessary to fumigate the plants after the manner you propose,—it will be desirable to *try* the effect produced on your birds by the smoke arising from the tobacco paper. If, on the first and second experiments, no ill consequences result, you may occasionally do as you suggest; but we frankly tell you, *if* you can avoid the necessity, do so. The birds most likely to be affected would be the love-birds. At this season, groundsel should be supplied about once a week. The *bath* should be altogether discontinued. Your aviary and conservatory being in such close proximity, is unfortunate.——*G B*, Try Millet seed.—*Anne T.* Boiled milk is far preferable, at all times, to the use of saffron.—*Maria T.* It is entirely brought on by an exposure to cold. If you really *must* have an open cage, drop a silk handkerchief, "for pity's sake," over the poor little sufferer at bed-time.—*George.* The average is four years.—*Fright.* Let the cat be killed at once, by all means. 'Life for life,' in such a case as *you* describe, is "sound doctrine."—*Alicia.* It is simply weak, from the tedious process of moulting. Be patient till Christmas.—*John.* From 12 to 17,—occasionally 22!—*Alexander.* A young bird, hatched during the present year, is worth 5*s*. When two years old, he is worth 10*s*. Of course, some of this tribe are better than others. You must exercise good judgment in your selection.—*Sarah N.* No birds are more sagacious and none more readily tamed. Offer him something tempting, from your own fair hand, and his good sense will doubtless prompt him to accelerate what you so much desire.—*Stephen.* They are pretty creatures truly, but the burden of their song induces greatly to melancholy.—*J C E.* Want of space prevents our prefixing and repeating the names of the several birds about which we are consulted. As you are a regular subscriber, you can suffer no individual loss.—*J T.* Your favour is received, and shall have attention.—*J F*, whose letter referring to the "Instinct" of a particular bird has just reached us, has our very best thanks. The matter as well as the manner of the communication are *not* lost upon us. We shall know how and when to avail ourselves of our valued friend's kind hint. Will he be so kind as to wri again, enclosing "facts" and "authorities?"—*J J.* Your humanity equals your good sense. To "slit the tongue" of this poor inoffensive bird would, indeed, be, as you say, both cruel and unlawful. Besides, the operation, if performed, would be *quite useless.* It is high time *such* "vulgar errors" were exploded! *W. K.*

Books; *H M.* If he understands botany he may use the book you mention, but not otherwise. He had better study Lindley's "School Botany" in the first instance.—*Reader.* Moore on the "Melon and Cucumber." ‡

Clematis: *L X Y.* Propagate it by layering in September.

Cotoneaster microphylla: *W P.* Rot the pulp off your seeds in sand till February, and sow them then, as you would Whitethorn haws. ‡

Fruit trees: *J M M.* Coe's Golden Drop Plum requires a southern exposure, in order to acquire full perfection. Earlier Plums are better suited for a northern aspect. ‖—*W P C.* You may shorten your newly-planted Apple and Pear trees a little now, but certainly not in March. ‖

Insects: *G S W, Gloucester.* The small beetle found in the cork of your Port-wine bottles is the Cryptophagus cellaris, an insect generally found in cellars and similar damp places. The grub was doubtless that of the little moth Gracillaria W. flava, which is often very destructive to the corks in wine cellars. We know no other remedy against the latter than to resin the whole of the exposed parts of the corks. *W.*

Names of Fruits: *P F.* 1, Blenheim Pippin; 2, 8, Margil; 4, Cockle Pippin; 5, Reinette du Canada; 12, Norfolk Beaufin; 14, Bedfordshire Foundling; 15, Easter Beurré. From some others the numbers were detached.‖—*W D F.* 3, Comte de Lamy; 41, Knight's Monarch; 5, Alfriston; 6, Trumpington or Eve Apple. ‖—*J S, Bath.* Your seedling Apple is very like the King of the Pippins. ‖

Names of Plants: *Enquirer, Cork.* It appears to be a bit of Teucrium fruticosum.—*Shem.* 1 is certainly Plectranthus fruticosus, which only forms a woody stem when old and in a dry hot climate; 2 is one of the many varieties of Veronica Teucrium.—*A H.* We know nothing of Arbutus magnifica.—*J A.* 2 is a colourless variety of Lycaste Deppei; 1 is probably a new Promenæa; at least it seems different from Pr. xanthina, but the specimen was ruined by bad packing. Flowers should be wrapped in tissue paper, without cotton wool, and enclosed in damp brown paper in a box strong enough to prevent their being crushed.—*A B C D.* Iberis gibraltarica. You may strike all such plants as you name by putting cuttings under hand-glasses in August, and leaving them till they are rooted. But much time will be saved by going at once to a nurseryman.—*E M.* Collinsia tinctoria, a nice hardy annual.

New Pine-apples: *J S.* We consider the discussion you wish to raise premature. Wait till they have fruited, and then let us know what you think of their quality. ‡

Plantations: *A Sub.* Grub up all the Elms. Leave as many of the Firs as you can, and fill up the spaces between them with more Spruce and Scotch Firs, intermixed with Pinasters, Hollies, Yews, and common Laurels. If the plantation is well thinned, and the ground well trenched, this new plantation will soon give shelter; by degrees the old Firs can be removed, if necessary, and the growth of the Hollies, Yews, and Laurels can be encouraged till they form a screen.

Plunging Material: *H I O.* The most suitable material for plunging pots of cuttings in, over a hot-water tank, is cinder-ashes, or these mixed with sawdust. As to the proper depth for a plunging bed, that depends on whether you want a brisk heat or only moderate warmth. From a foot to 15 inches is deep enough for most purposes. ‡

Wistaria: *A C R.* Leave untouched all the shoots except the unripe end, which should be cut back.

Misc.: *G.* 31, Great Winchester-street, Broad-street City. ‡

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any re-sales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | |
|---|---|
| Turnip Manure, per ton ... ... ... | £7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE PEAT CHARCOAL impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

FOSSIL BONES AND PSEUDO-COPROLITES
(FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD and Co., Artificial Manure Manufacturers, Ipswich, Suffolk.

ROYAL SOCIETY for the PROMOTION and IMPROVEMENT of the GROWTH of FLAX in IRELAND.—The ANNUAL MEETING of the Society will take place on Friday, the 28th inst., at 12 o'clock, in the Society's Rooms, Commercial Buildings, Belfast, to receive the Annual Report of the Committee, to elect Office-bearers for the ensuing year, and to transact such other business as may be brought forward. By order, JAMES MACADAM, Secretary.

Belfast, Nov. 29, 1851.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO HORTICULTURAL & FLORICULTURAL SOCIETIES.

BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Rick Cloths, with Poles, &c., complete. Marquees and Tents on hire. Netting and Bunting for Fruit Trees. Orders, per post, duly attended to.

Address BENJAMIN EDGINGTON, 2, Duke-street, Southwark.—A Warehouse, 208, Piccadilly.

MILK, CHEESE, AND BUTTER.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, advises any one who keeps Cows to send two postage stamps, and obtain a description of his LACTOMETER, with its uses, and the results of experiments with it upon different Milks. Lactometers, complete, in a mahogany box, 10s. 6d.; Do., with cheaper fittings, 7s. 6d. and 5s.; Hydrometers for testing sulphuric acid, 5s., 7s, and 10s. No consumer of acid should be without one, as it is often sold highly diluted. Saccharometers for Brewing, with tables, 5s., 7s., and 10s. Pediment Barometers, from 1l. each. Wheel Barometers, from 1l. 1s. each. Packed carefully for the country, there being nothing to fear of them getting out of order, as they are warranted to be properly made and good instruments.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars, London; and 36, Seel-street, Liverpool.

GUANO.—For SALE, by Private Contract, 130 tons Guano, per Cleopatra, from Eagles' Rocks, South Seas, in lots to suit the convenience of purchasers. Sample and analysis to be seen at the Brokers.

CHAS. SUTHERLAND and Co., 24, Mincing-lane, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE GENERAL MEETING will be held, at the Society's house, Hanover-square, on SATURDAY, the 13th December, 1851, at 11 o'clock, in the forenoon.

By order of the Council,
JAMES HUDSON, Secretary.

London, November 29 1851.

THE BIRMINGHAM CATTLE AND POULTRY SHOW.—The THIRD GREAT ANNUAL EXHIBITION of FAT CATTLE and the various kinds of DOMESTIC POULTRY, will be held in the BINGLEY EXHIBITION HALL, BIRMINGHAM, on the 9th, 10th, 11th, and 12th of December next. Admission—To the PRIVATE VIEW, on Tuesday, December 9th, 2s. 6d.; on Wednesday, Thursday, and Friday, 1s.

CATTLE SHOW, 1851.—THE PRIZE CATTLE SHOW of the SMITHFIELD CLUB and Exhibition of Implements, Seeds, Roots, &c., commences TUESDAY MORNING, and closes FRIDAY EVENING, Dec. 9th, 10th, 11th, and 12th, BAZAAR, King-street, Portman-square. The space appropriated to the Show is nearly double that of former years, and the arrangements are marked by the usual attention to the comfort of visitors.

SMITHFIELD SHOW.—NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS will be exhibited. Improvements have recently been made in the Top-dresser and Cultivator, and the prices reduced. Applications for Catalogues, &c., to be made only to Mr. GABRIEL, Surrey Chambers, 24, Arundel-street, Strand.

SMITHFIELD CATTLE SHOW.

W. SKIRVING, Walton Nursery, Liverpool, begs to acquaint his friends and the public, that he will attend at the ensuing Smithfield Cattle Show, to exhibit Roots of his Improved Swede and other Turnips, and to take orders for the seed of them and all other approved kinds of agricultural seeds. W. S. will also exhibit specimens of these three new and highly interesting hardy trees, Araucaria imbricata, Cedrus Deodara, and Cryptomeria japonica, of which he holds an extensive stock, of various ages and sizes, all grown from seed in the open ground and transplanted into beds or pots in the Nursery.

# The Agricultural Gazette.

*SATURDAY, NOVEMBER* 29, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 3—Agricultural Society of England.
THURSDAY, — 4—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 11—Agricultural Imp. Soc. of Ireland.
FARMERS' CLUB—December 1: Botley.

SOME of our readers may remember seeing reference some weeks ago to a sample of AUSTRALIAN GUANO, received from a correspondent in Van Diemen's Land. It was described as being a fibrous half rotten mass of feathers and earthy matter, profusely intermingled with brown-coloured crystals.

We have been favoured by Mr. WAY with the following analysis of it, made at the request of the Earl of DUCIE, President of the Royal Agricultural Society of England, which we insert here for the information of those who may be within reach of the article.

| | Per Cent. |
|---|---|
| Moisture ... ... ... ... ... | 31.55 |
| Animal matter and salts of ammonia ... | 19.74 |
| Sand, &c. ... ... ... ... ... | 3 11 |
| Phosphates of lime and magnesia ... | 31.36 |
| Sulphate of lime ... ... ... ... | 3 45 |
| Sulphates and chlorides of potash and soda ... | 10.79 |
| | 100.00 |

The small crystals dispersed through the guano are ammonio-phosphate of magnesia.

| | |
|---|---|
| Nitrogen ... ... ... ... ... | 4.58 |
| (Mean of two determinations.) | |
| Equal to ammonia ... ... ... ... | 5.56 |

Mr. WAY states: "The sample is of better quality than one that I before examined from the same parts of the world. It is, however, considerably inferior to the old Ichaboe variety; and as that kind was sold at 7l. per ton, I do not think the present sample is worth more than 4l. 10s. or 5l. at the outside."

THE Irish are not the only people to whom EMIGRATION will afford relief from the pressure of population on their existing means of subsistence. There is another branch of the Celtic race who are in the same predicament, arising principally from the failure of the Potato. Like the peasantry of Ireland, they labour under the unfounded imputation of idleness. The idleness of both is the creature of unfavourable circumstances; for, remove those circumstances, and place them in situations where there is scope for their exertions, and no people can work harder than the Celt of Ireland, or the Celt of Scotland.

The indolence of the Irish sprung in a great measure from the Potato, and the facility which it afforded for obtaining a subsistence with little exertion. It is to them what a fine climate is to the inhabitants of tropical and sub-tropical countries. It is what Buckwheat is to the Breton peasant "the symbol of agricultural misery, and the most detestable culture; and, with the Chestnut, the triumph of improvidence and idleness."

Of the Scottish Highlander, the author of "Flax: its culture and preparation in Scotland, Ireland, and Flanders" speaks in the highest terms as an acute, moral, virtuous, and exemplary people, excellent payers of rent, and possessing patience, activity, industry, and perseverance. He speaks thus of them: he says, "from long experience as the manager of extensive and populous estates in the Highlands and Islands of Inverness, Argyle, and Ross, and as the superintendent of more than half of the kelp manufacture which formerly flourished on the western coasts of the Highlands, and the shores of the Hebrides. If at any time they were idle," he adds, "it was because they had not sufficient employment, being merely engaged in taking care of their little stock of sheep and cattle, and cultivating their limited crops." This is the picture of their condition, when settled on the least barren portions of their mountain homes, the green alluvial tracts which margin the glens and valleys of the interior, as the cultivators of small patches of land, their social condition intermediate between the hunter, pastoral, and agricultural state. From these homes they were dislodged by the high prices of the revolutionary war, which gave a greater value to their holdings, as appendages to large sheep farms, than as separate occupations, with their inefficient culture, under a climate unsuited to cereal crops. Some emigrated to the United States and British America, where they became, for the most part, prosperous landowners, and were enabled to establish their families, however numerous, in the same independent circumstances. The greater portion flocked to the barren promontories of the western coast, to follow a mixed agricultural, fishing, and manufacturing life—the manufacture being the preparation of kelp, from the sea-weed, which rendered the most barren and rocky coast more valuable than the richest land. On those sterile and sea-beaten promontories the Potato necessarily became the staple food. There, as in similar situations on the W. and S.W. of Ireland, there is no alternative between the Potato culture and pasturage. While the kelp trade flourished, and the Potato yielded food, the condition of the highland population appeared to be improved by their removal to the fishing villages of the coast. But the kelp trade departed, leaving behind it all the evils attendant on a commercial revolution. It received its first check from the loss of the monopoly of the home market, by the removal of those impediments which the war had thrown in the way of commercial intercourse. Its death-blow was given by the advance of science, and by improved chemical processes, which superseded both home-made kelp and foreign barilla, by the extraction of soda from common salt. This improvement has conferred incalculable advantages on the community, through the manufactures of glass and soap, by the supply of cheap soda, which is one of its products, and through the bleaching trade, by the supply of cheap chlorine, which is another. It has given also a great stimulus to the manufacture of sulphuric acid, which is necessary for the attainment of these results, and by the reduction in the price of sulphuric acid, consequent on improvements in the mode of making it, to which that stimulus gave birth; it has indirectly benefited the community through various other manufactures; but it has ruined one branch of the industry of the Highlands: and the return of peace, by removing impediments to the prosecution of the herring fisheries by foreign nations, has injured the other.

The population to which the kelp trade and the fisheries afforded the principal means of subsistence was now thrown back on its agriculture; and had the Potato continued sound, the agriculture of the Highlands might have benefited by the cessation of demand for kelp, and for herrings for exportation. Both might have been advantageously applied as manure, upon soils whose natural sterility demands some extraneous aid. But the cup of Highland suffering has been filled to the brim, by the failure of the only food which regions so bleak and barren are capable of producing in sufficient quantities for the wants of a population now rendered redundant. Manfully have the people of the Atlantic coast of Scotland struggled, year after year, against the complication of evils entailed upon them by the blight which has fallen upon their commerce and their agriculture. They have struggled in silence, relying chiefly on their own resources, and receiving comparatively little of that aid from the public treasury, and from eleemosynary contributions, which has been lavished so profusely on the more clamorous Celt of Ireland, not on the inhabitants of the sterile portions alone, of those which, like the Western Highlands of Scotland, can grow nothing but the Potato—but on the population of its most fertile districts, where the Potato ought not to be the exclusive food of the people. "The same stroke," says Mr. MILLER, in the *Witness* newspaper, "which did little more than slightly infringe on the comforts of the people of the Lowlands, utterly prostrated those of the Highlands; and ever since, the sufferings of famine have become chronic along the bleak shores and rugged islands of at least the north-western portion of our country. * * * It has dissipated the last remains of

capital possessed by the *people* of the Highlands, and placed them in circumstances of prostration too extreme to leave them any great chance of recovering themselves; or rather in circumstances from which, in the present state of the country, recovery of them as a *people* is impossible." Emigration appears the only present available remedy; and an act was passed in the last Session, to enable part of the money advanced under the Land Improvement Act, to be employed in assisting emigration from the Scottish Highlands. It is satisfactory to know that comfort and independence await those who may avail themselves of such assistance to establish themselves in North America. We know not whether it is proposed to confine this aid to settlers in the British colonies—a limitation more easily enacted than enforced—but whether in the States or the British provinces, Professor JOHNSTON found, during his recent tour, that industry and sobriety rarely failed to place the agricultural emigrants, who refrained from speculating in the lumber trade, in comfort and independence. It is satisfactory, also, to those desirous of improving their condition, without dissolving their British connections, to know that these advantages are quite as easy of attainment in Canada and New Brunswick as in the United States.

Mr. MILLER, who appears to look with regret on the emigration of a large portion of the Highland population, is able to suggest no other practicable remedy for their distress. Their restoration to the valleys of the interior he found barred, in 19 cases out of 20, by those green patches being bound by lease to some extensive sheep farmer, and as little available for the present emergency, even to the proprietor, as if they lay in Canada or the United States. We may add, that pasturage, being the natural application of such mountainous districts, will always be the most profitable; and that the most profitable will always be the prevalent application of the soil in any country under an advanced state of civilisation. His other proposed remedy, that of enlisting some 20,000 Highlanders in the British army, is barred by an obstacle which he has stated himself—the decay of the old martial spirit of the Highlanders, and the reluctance of the population to enlist.

A more feasible substitute for emigration is that proposed by Mr. BROWN, in the pamphlet on the Flax culture before alluded to, namely, the revival of the cultivation of Flax and of its preparation and conversion, which once flourished in the Highlands, he says, as a domestic manufacture. To their revival, however, in that form, there are formidable obstacles. The linen trade, like the manufacture of kelp, has undergone a revolution. The spinning-wheel and the hand-loom have been superseded by steam-driven machinery; and if Flax is to be raised in the Highlands, it must be to supply the mills of Dundee, Leeds, and Belfast.

The cultivation of Flax is also in a revolutionary state.

It has long been evident that, in order to extend the growth of it in Britain, a division of labour is necessary, which shall separate the cultivation of the crop from the preparation of the fibre. With the improved processes, the old system of steeping will be unable to compete. At the head of these new processes we place SCHENCK'S patented system of steeping in hot water, as it has been in successful operation for some years, and produces an article for which there is an established market; whereas the commercial success of CLAUSSEN'S short fibre or Flax-cotton has yet to be proved. If therefore the soil of the Highlands be, as Mr. BROWN says (and he ought to know), adapted to the growth of Flax, to be exchanged for the food it will no longer yield, the introduction of the Flax culture must be effected by the formation of establishments for preparing the fibre from straw, to be purchased of the grower, and for employing the present redundant population in spinning it by machinery. This will be to fall in with the current; it is vain to attempt to stem it by the re-establishment of a domestic manufacture, to be conducted on the old expiring system, which rendered the farmer a mere weaver, raising his own food and raw material.

## STEAM FARMING.

WE are much indebted to your correspondent, "C. W. H.," for drawing attention to the cultivation of land by steam. He argues rather too strongly against employing any of the known methods of preparing the soil; we need more to combine them with any new systems, according to the circumstances and work to be done, which, we require to keep in mind, imply various operations, acting upon a substance constantly varying, as wet or dry, steep or level, of uniform texture, mixed with stones, or with an iron-bound pan. It is of no use attempting too great a uniformity of action under such a variety of circumstances, but the object should be, to prepare a machine fitted for performing the different works, in the best manner. The saw-mill is a most useful invention, but requires modifications to meet particular circumstances; we cannot, in this country of knotted cross-grained wood, use the one or two toothed saw, successfully used in America at immense velocity, where the wood is soft and uniform in grain, and free of knots. Nor can any wood be brought with safety to the power-driven saw, without the previous squaring of adze and hatchet; then it has to be hauled up and placed upon tables with guides, wheels, and rails. In the same way we must, by manual and horse labour, by tramways and rails, by levelling, straightening, and lengthening our fields, and by bringing the soil to some degree of uniformity of texture, prepare the way for the steam-plough, and, moreover, so arrange the different working parts of it as is best suited for the particular work it has to do. Steam-power is exerting a nearly uniform energy, and we must have regard to the opposing obstacles, so as to interpose compensating contrivances, as well as to see that the tool, put for its use, is the best suited for the purpose; and after doing what we can to prepare the soil, as well as the machine, all our ingenuity will be required to provide against the shocks and strains which will take place. Several steam-ploughs have been invented, which, under favourable circumstances, are said, for I should mention that I have not seen them in operation, to do their work in a way which gives every encouragement for extending the application. The plan usually adopted has been, to place the engine at one end of the field, along which it gradually moves, as the plough which it drags up at right angles to itself, by a chain, requires a new breadth of land. Where the land is intersected by canals, the engine has been placed in a vessel and proceeds as before. Several machines have also been invented, where the part which works the soil is attached to the frame-work on which the engine is placed, to which it is connected by gearing, so that the whole machine is intended to be self-moving over the land, working as it advances, or rather retires. It certainly is most desirable to see such a machine marching at a regular pace along the length and breadth of the field, doing its work regularly, deeply, and efficiently, leaving behind it a well-prepared seed-bed, while, at a nimbler pace, a lighter machine dibbles in seed, giving its portion of manure as it does so, or distributing the seed with all the regularity of a self-moving spinning machine, and at a later period again to see it making a clean sweep, and folding up, as it were, the tall grain; all this we may hope to see, but to accomplish it, under the less favourable circumstances than the jenny, we must proceed with due consideration of all the difficulties to be overcome. On steep land there can be no profit in attempting to make a self-moving machine travel over the field, and so hopelessly exhaust the power. While on flat well-prepared land, in place of the stationary engine and moving plough, a self-moving machine might be profitably employed to do the deep and heavy work; and on the steep land, and for light work on the prepared land, the stationary, or rather, the same engine, say with a revolving drum, in place of its cultivator, placed at the side or end of the field, would drag along its detached tender at a much quicker pace than it could possibly move itself, as well as disturbing the soil less. The consideration of the best forms of the engine, and manner of placing it on its carriage, the way in which this carriage should move on the land, and in what manner the working part, or cultivator, should be attached, when the machine is self-moving, and when it is stationary; then the kind of cultivator to be employed for performing all the different preparatory operations, as well as those for finishing the work, should all be treated of; but I fear that I can do little more than make the outline. Before proceeding with such remarks as I can offer on these subjects, and having pointed out the necessity of preparing for the steam-plough, let us indulge in a sort of vision of a steam-worked farm. There is no finer sight than an extensive roofed-in station on any of the great lines of railway. The high airy space, well lighted from the roof, which is even elegantly supported, prevents all feeling of inconvenience or closeness from being under cover, while great indeed are the advantages; everything can be done and kept in greater order and regularity than in the open air, as, being independent of the weather, there need be no rushing about to get under cover, or leaving property to be destroyed by wet; and the whole lighted up at night looks like a great hall. Now, picture the innumerable advantages of such an edifice as a farmstead, how well adapted for our climate. The whole might be entered by a large archway, either at the end or sides; on each side ranges of byres, stables, and every necessary building, either under separate roofs of their own, or under the one large roof, and of different stories in height; some mere open lofts, others more enclosed, for granaries, and other purposes. A large space in the centre, and at a lower level than the sideways, which would be broad on each side, and paved, would be divided into pens for cattle, sheep, and pigs; another part is a more open straw yard, for the young stock. Down the centre, and above the heads of the animals, there is a line of rail, communicating with the straw and the root houses, and the place where prepared food is mixed. The waggons which run on this line are provided with funnels, by which each animal's ration is discharged into the trough below, while from the lowest part of the feeding courts runs another line of rails, by which the whole dung can be conveyed to the land. The dung is thus well prepared, being trodden by the cattle, and neither washed by rain nor dried by sun. In the centre, parts on a level with the roadways are allotted for carts, and frequently would be seen loaded ones, even to the greatest height, either ready for an early start, or late brought in, while cranes are ready to hoist up the grain, and weighing machines are at a convenient side of the entrance, suspended above, and out of the way may be seen harvest cart frames and implements. Towards one end of the whole farm station, is a thin partition which separates the parts alluded to from the covered stack yard, thereby securing the crops in a more speedy and less, in the long run, expensive way, saving time and labour of thatching and clipping; then the wet days can be employed in the barn, when it might be unsafe to break up a stack if outside, and expose it to the wet. The sides of the part for stacks and the upper parts of the whole are fitted with moveable louvred blinds, so that ventilation and free access of air can be regulated. As the whole is to be well lighted with gas, made at the gasometer outside the premises, which can be put up for a moderate sum not exceeding 50*l.*, the work inside can be carried on to any hour that is required. Above the whole is an elevated cistern supplied by a force pump, worked by the engine: from this pipes run to the cattle pens, stables, and wherever water is needed, as well as nozzles in several places, to which hose are attached in case of fire, and for washing out the whole place, as well as washing out byres and clearing drains. One feature of the whole is, that galvanised corrugated iron is much used for the sides, divisions, and roof. It is strong and durable, and of good appearance, and should be made at a cheaper rate. I have before advocated its use for fences. It need scarcely be added that the greatest order and regularity prevails in such an establishment, and the time and work is so well marked by the large clock and bell, that the very impatience of the cattle, if not supplied with their food at the appointed hour, helps to enforce regularity. I may remark, in passing, how great an improvement it would be to cover in stable courts, or even a space in front of the coach houses; just take a look on a rainy day at the operation of yoking the horses to a carriage, or on a wet night when some friends' carriages are there, standing out exposed to the wet; a dim lantern, flickering about, rather adds to the confusion, by frightening a young horse, the whole is hastily done and harness imperfectly buckled; compare all this with the advantages of being under cover and properly lighted, besides many other, that of exercise in winter. But to return to the farm. Manure is now our great munition, with which to fight free trade, consequently house feeding and the culture of feeding crops are rapidly extending; for this, the steam farm, with its station, is most particularly adapted, both in the preparation of food and housing the animals; and as carrying in the crops is heavy work, on this house system the rails are well suited for this. Parts of these plans are fitted for farms of all sizes, though to carry them out fully implies a large farm, the expense would then be found to be by no means excessive, if we compare it with the outlay on different buildings and keeping them up, if the land was portioned out to small farms, and it would perhaps be found to be the least expensive where new buildings had to be erected. One effect of modern speculative propensities is, that men of capital are on the look-out for safe investment; and land is one kind of security in which there is confidence, but which, unless in good order and well farmed, makes but a small return. Capital will turn to land, and consequently to farming, which is being made a study and profession, instead of being looked upon as a natural gift along with acres. Another reason for the improved farming of land is, that proprietors are now obliged to exert themselves to obtain any rent. It is therefore the more interesting to examine into every suggestion for carrying on the operations of the farm. Connected with the buildings is the steam-engine, which, in this case, would require to be of more power than usual, giving motion to all the most approved machinery for grinding, bruising, threshing, chopping, and other operations, as well as to a circular saw and boring-tools, where gates, hurdles, and carpenter work is done. Flour is prepared, and, at the option of the men, they can purchase at a low rate such quantities as suits them, of the pure unadulterated article; and a barrack, with board, is kept, under regulations and advantages, for the single men, from whose kitchen the others may purchase rations at fixed rates. The churn is worked by the steam power, nor is it allowed to pass in pipes without heating the poultry-house, after which the pipes convey it into a small apartment where there are many coils of pipe; this is what gardeners call a Polmaise heating place; the air is admitted by a large grating, and, after being heated, is driven by fanners into a sort of barn or drying-room, where corn and hay is laid on large wooden, bottle-rack looking stands, while ventilators carry off the moist air; and the dried fodder being removed, is replaced by other in a less favourable state. The laundry-maid from the house, with her linen, also claims a day occasionally. The food for the cows and pigs is also steamed, while the latter sometimes have the benefit of a warm bath. Most of these, and other operations, may be seen at work at many admirably-conducted farming establishments; but the steam system has to be yet further extended. We have supposed the station complete; we have now to turn to the lines of rail. There would be a trunk line, going from the buildings, through the centre of the lands to the furthest field, and from it sidings to each field, to which a moveable set of rails can be attached, so as to bear the wag-

gons, with manure and crops, to and from a central part of the field. Where possible, the main line should have an incline outward from the steading, and the engine be so placed as to it, that its hauling power may be used to the best advantage. In this way waggons started would, by their own impetus, run to their destined siding, under the control of the breaksman, where a man with his horse had other waggons to send back, while those brought were being driven to the field along the temporary line. To save turn-tables, several of which would be required at the buildings, the sidings should branch off in such time as to give a good sweep into the field. The rope from the engine would haul the waggons up the incline, and turn them into their proper places—those with roots to the house for the purpose, for dung to the line before mentioned—while the peculiar harvest truck, with a moving stack, were hauled up to a stage which was nearly as high as the large roof, thence the stack is thrown down to the part allotted for the covered stack-yard, through sliding panels in the roof. There would also be trucks for carrying common carts, from which they would be driven to some less accessible part. Along the trunk line may be seen an iron pipe of considerable dimensions, for the purpose of conveying water, or liquid manure, either to cisterns in suitable places, from which, or from the main pipe direct, the liquid is distributed over the fields by portable tin pipes, or flexible hose. The main pipe is provided with contrivances for stopping or changing the course of the contents. In practice, several contrivances would occur, which would simplify the operations, and lessen the expense, without endangering the safety of such a line as this.

The remarks on the steam farm have led me away from those on the machine for working the land. As far as one can judge of a machine from drawings, the best I have met with, of a steam plough, is one patented by Usher, of Edinburgh, a description of which, with plates, will be found at page 70 of the 51st volume of the "Mechanics' Magazine," the whole appears to be well arranged, and compactly put together. The plough itself is also improved, and revolves; other implements can be substituted. The method by which the frame carries the working part appears good, as it can be raised or depressed; and by the addition of strong springs to this part, accidents from concussions, which would be fatal to an unyielding tool, might be, in a great degree, guarded against. The work done by the common plough by horse labour, is only one part of the operation of tilling the soil, it must be followed by other implements. It would be a great improvement if the first operation could be made more complete, consistent with no great increase of draught, as few farm operations are profitable, except in particular circumstances, which require more than two horses. The advantage of the plough is, that it can be made to pass quickly along, taking off a uniform slice of earth, and turning it over; in this latter the various grubbers are defective as a first work, although suitable enough after other preparations on the earth. The plough leaves the slice of earth too smooth in many soils, and the part immediately below the sole of the plough is quite beaten down; to this, at competitions, it would be well to direct attention. There was a plough exhibited with a short fork attached, which worked at the side of the plough, with a sort of digging motion; the intention was to turn out Potatoes; by reversing the fork, and making it act downwards, it might be made to break up the earth, after being turned over with the plough. The necessity of making the first work more complete is still more urgent with the steam cultivator, but there is a limit to this. Time is an important element in agriculture, both in regard to the operation and to the farmer's pocket; climate and other circumstances will seldom allow sowing to follow immediately upon breaking the land, and the action of the air is one of the best harrows, and its aid is required before implements can be employed to the best advantage to reduce the land to a seed-bed; it is not necessary then to attempt to complete the work at one operation, but to leave it in a better state than it is by the common plough. The spade in proper hands is a much better cultivator than the plough, as in using it several operations are combined; it is driven into the ground by the leverage of the handle, the spadeful is loosened, then lifted and turned over, then receives some thrusts, which leave the surface regular, yet sufficiently open to admit the air; to render the work more complete, a fork is used in the space left by the spade, to it the same motions are given, and the soil is deepened and loosened without being turned up. This combined action appears to be the best to follow, as far as possible, with the steam cultivator, which would ensure regularity of depth, for the drawback to the use of the spade and fork is, that their proper use depends upon the moral character as well as upon the physical strength of the workmen. As your Paper cannot well be taken up with sketches, any further remarks on the subject will be best made by going over a sort of descriptive plan of a machine, having reference to what has already been stated. I would again refer to Usher's, as giving the best idea of the whole machine. It would consist of a locomotive furnace and boiler, on the most improved form, particularly as regards compactness, together with considerable power. I would have an engine on each side, so as to give greater uniformity of action to the working tool, to which it is connected at each end. These should be mounted on a strong frame work, as low as possible, consistent with passing any obstacles. When in action, it would move on the unbroken ground; the working part would therefore be attached behind, where there would be sufficient platform for the attendants. The cistern and receptacle for fuel must take up as little space as possible. Another strong frame, which carries the working implement, is to be attached to the main frame, as in Usher's, by strong pivots, and the same apparatus for raising and depressing, with the addition of compensating springs. There is also the wheeled gearing necessary for giving motion to the machine itself; 1st, at one uniform rate; 2d, means to detach this power from the wheels of the machine, to communicate it to the cultivating or hauling part; and 3d, means of giving a forward movement to the whole at regular intervals. This last has reference both to the action of the working implement, and to the advance of the machine when hauling. The machine is intended to be used in various ways, according to that which is best suited to the work it has to do, and the state of the land. On level prepared land it is to move along the surface, working as it goes; or it is to be placed in the middle, and, by hauling, work to a centre; or placed at the end of a field, is gradually to advance, as if dragged up a working tool; or, to shorten the distance of haulage, it is to run on a tramway, with the implements attached at some distance by chains. The hauling apparatus must then be so arranged as to work at best advantage at different angles, or the machine must have a turn-table within itself.

Another important thing is the manner in which the whole shall rest and move on the ground. Large broad wheels, almost rollers, first occur; if the motion was continuous, these would be best; if only intermittent, it would be difficult to move the machine, which must necessarily be of considerable weight, out of the hollow made even by a large wheel. It would be possible to invent a means by which each wheel should carry two tramways, which were alternately, by a rotary motion, or by a side lifting motion, placed before the wheel. When placed at the end of a field, a tramway could be laid. A sort of sledge-frame, with low broad wheels, might be useful in some cases; whatever plan is adopted for this part, that of making the engine haul itself up seems one of the most efficient, unless it is placed on rails. It will be found in practice to be of consequence to attend to the kind of gearing by which power is communicated to the working part; flat chains working on pins and flat sides appears to be one of the best. The great cause of the failure of steam carriages on common roads, which in theory is quite feasible, was the concussions and connecting the power by rigid means. Mechanics are accustomed to overlook, or at least not to give sufficient thought, to the difference between a fixed and steady engine, with a moving part and the material to be operated upon brought to it, and an unsteady engine with a moving part brought to the work, and that very partially prepared for it.

We now come to the cultivator itself; in this, as before shown, I incline to follow the combined action of the spade and fork for the principal implement, and so far back as 1844 made a sketch of the motions and means of producing them. In the Exhibition I found an implement which, without explanation as to its manner of working, I was not surprised that it found no favour. The machine I allude to was one by Mr. G. Thompson, of Westminster, who has carried out very much the desired motions, and only required the forks attached. I propose that a series of spades should be attached by arms, cranks, and guides, to a main axle, in such a way that the greatest leverage power shall begin to act on the spade, at the time it begins to enter the ground; after its being forced to its full depth, the spade is carried on and upwards, then the point is lowered so as to lodge the contents; the turning over, unless the earth would do so of itself, I am not prepared for, after which it is moved up to the highest point; but before it has reached that the forks have begun to make a similar movement, only going deeper and rising more perpendicularly, so as to stir the soil without lifting it. From seeing very hastily Mr. Thompson's machine, it is to be hoped that the practical difficulties are nearly overcome. During this operation the machine is stationary, but when the forks begin to come out of the ground, the forward motion of the engine assists in the work, and the spade is already down for its next slice. This would be used with the intermittent motion of the whole, and the forks or spades could be used alone. For continuous motion of the whole a different kind of implement must be used. On this I have little to say, but may mention that a sort of Archimedian screw-blade, with a rotatory and spiral motion, has occurred as one plan, these screws should act in a slanting direction, so as to throw out the earth. The blades of the screw would much resemble the mould-board of the common plough, and at the end should be pointed and have a sharp half-turn to enter and hold the ground. For detached implements, such as would be used by hauling, many of those now in use could be adapted, more particularly by combining two, such as a crusher and a dibbling machine, or some of Dr. Newington's with a sowing machine followed by a roller. The means of transmitting power to one of these detached machines, so as to make it a more efficient cultivator, should also be thought of. To obtain power on the machine it must either be of very considerable weight, or else the tool must so catch hold of the soil as to compensate for want of weight, such as the plough. Though many difficulties must occur, yet they have already been partly overcome; and it is the pride of our country that the talents of our practical men never fail in bringing any useful undertaking to a successful issue. Experiments with any machine of the kind must be attended with very considerable expense; while, even if completed, the demand must be limited and slow. It would therefore appear to be a very fit object to which societies and individuals should hold out some encouragement to practical men.

I have extended these remarks to great length, which have little novelty to recommend them. If, however, what is brought together is the means of drawing the attention of those capable of devising and executing machines for the speedier and less expensive cultivation of the land, it will be a great satisfaction. *Forester.*

## AGRICULTURAL CHEMISTRY.

Who shall decide when doctors disagree? Not certainly unlearned dabblers in science; nor do I pretend to do so. Here we have the great expounder of agricultural chemistry and the great practical agriculturists at issue, like sages of old on the colour of the chameleon, and perhaps with as little cause of difference. The question is simply that of the sufficiency of inorganic matters applied to the soil, in the common acceptation of the terms, as manures. It does not admit of question that where a soil is deficient in inorganic matters the supplying of them becomes necessary; Mr. Pusey will not deny this, nor that inorganic substances are essential in the fabric of vegetable and animal organism.

It is a speculation, perhaps rather fanciful, of Liebig, founded on facts, that is questioned—the sufficiency of certain inorganic matters for an abnormal production, and applied as manures—that has been taken up by Mr. Pusey, whose experiments Liebig considers inconclusive, and in which opinion, if, as I believe, we may draw from his writings that in the application of inorganic matters as manures, he presupposes the presence of a sufficiency of organic matters, he must be considered correct. In his manure for Wheat, Oats, and Barley he only offers certain inorganic matters as substitutes for the "animal manures, which act by their inorganic constituents."

The subject has been introduced into the columns of this paper by such powerful hands, perhaps I should say heads, that it may be considered an impertinent work of supererogation in one so humble in all his attainments to mix himself up in it, but I think it well to endeavour to induce a consideration of this subject, lest, from the experiments of Mr. Lawes, a too hasty conclusion may be come to, that Liebig has been wrong in his evidences, because he may appear to have erred in an inference from them. I think the general rule to be drawn from Liebig is, not that inorganic matters are sufficient of themselves to vegetation, merely aided by atmospheric influences, but that they are essentially requisite in its development; for, in asserting the great principle of their essentiality, he admits the very great influence of carbonic acid and ammonia, and devotes much space in his work on agricultural chemistry to the detection of ammonia in the atmosphere; and in his discovery of it in maple sugar, ascribes its presence there to have been derived from the roots—a conclusion I am disposed to question, as it would be more readily obtained through the leaves. He says, "Carbonic acid, water, and ammonia, contain the elements necessary for the support of animals and vegetables. The same substances are the ultimate products of the chemical processes of decay and putrefaction. All the innumerable products of vitality resume, after death, the original form from which they sprung. And thus death—the complete dissolution of an existing generation—becomes the source of life for a new one." Could we have a more decided assertion of the requirement in the soil of animal and vegetable manures. But, again, he says, "The roots" (before the production of leaves) "perform the functions of the leaves from the first moment of their formation: they extract from the soil their proper nutriment, namely, the carbonic acid generated by the humus" —humus, or mould, a product of the decay of vegetable matter. "By loosening the soil which surrounds young plants, we favour the access of air, and the formation of carbonic acid." "When a plant is quite matured, and when the organs by which it obtains food from the atmosphere are formed, the carbonic acid of the soil is no further required." It is now that the recently applied manures cease to influence the growth of plants; the organic matters supplied have done their work, they have promoted a large abnormal development of leaf—of vessels—to take in the organic matters that are freely offered to them in the atmosphere and in exhalations from the soil; the great business of the roots is now to drink up water from the depths of the earth and the inorganic matters they find dissolved in it; they have gone below the region of organism. The great object in the application of manures is to obtain this large development of leaf; and, as by the more than admission, by the direct assertion of Liebig, the matter most essential to this end is carbonic acid, an organic matter—the application of organic manures is, according to him, more efficient than inorganic ones could be, and this is no more than Mr. Lawes has proved.

Neither does Liebig, although finding ammonia in the atmosphere, do any discredit to its utility applied as a manure; for he says, in speaking of the employment of bone-dust, dried dung, lime, ashes, &c., as portable manures, "Although by these means the necessary phosphates are furnished to a soil, and solid animal excrements rendered unnecessary, they have led to the neglect of the liquid excrements, that is, of the urine of men and animals, which is thus completely lost

to agriculture. The urine of man, into which all the nitrogenous constituents of animals are finally deposited, is completely lost to the fields. This most important of all manures, so properly estimated in Flanders, Germany, and China, is altogether lost to the English agriculturist." I do not find, that I can recollect, that Liebig attributes a large early development to the application of inorganic manures, and we cannot doubt that on an early and large development will depend, all other things being equal, the future growth of a plant; a plant early nourished must exceed in its future growth that which has not been so stimulated, both from the increased number of leaves, and from their enlargement, the capacity of a plant to drink in food, organic food, from the air is increased, while the larger size of its roots, proportional to the overground growth, will enable it to take up a larger column of water containing a proportional amount of inorganic matters. In the rearing of animals we may find an analogical proof of this, if proof were necessary; the animal well fed when young will, in its after growth, always excel that which has been stinted. The inorganic materials of a plant bear so small a proportion to its organic components, that it would appear more requisite to supply these latter; and the more so as in giving these to the soil in the form of manure, we also give the former, perhaps, in a proportional quantity, and by the action of the organic matters so given, we bring so much of the inorganic ones in the soil into a fit state to be imbibed by the plants (roots or leaves I enter not now into the discussion), as these organic matters can act upon.

But it is to be remarked, that even in soils to which, either from their composition or from the locality, inorganic matters do not appear to be necessary, their application is attended with much success, as in the instance of lime and salt, the first experiments in which were tried in Scotland so near the sea-side that the sea water, somewhat evaporated, was used for slacking the lime. At Aghada, situate on the tongue of land that forms the south-east boundary of the Cove of Cork, a retired captain of the East India Company's naval service, used with perfect success lime and salt compost on poor well worn stubbles, by no means prime land; and he assured me he had better crops from it of Potatoes, Wheat, and Clover, than from his yard and stable-dung, or from the Cork town manure.

In the burning of land, where much of the organic matters of the soil are dissipated, and which takes place on many of the poorer soils of Ireland at short intervals, large products of Potatoes and Oats are obtained without any organic matters ever being supplied; the plan is to pare and burn the surface, to plant Potatoes, followed by Oats. The land is then left without seeds to recover a sward as it may, which it does in four or five years, and is then again burned and cropped as before. The pasturage it affords is scant enough; and as Liebig remarks of the fruitful corn land around Naples, "The animals fed on these fields yield nothing to these soils which they did not formerly possess. The weeds upon which they live spring from the soil, and that which they return to it as excrement must always be less than that which they extract. The fields, therefore, can have gained nothing from the mere feeding of cattle upon them; on the contrary, the soil must have lost some of its constituents." He before had observed, "Corn has been cultivated on this land for thousands of years, without any part of that which is annually removed from the soil being artificially restored to it."

Land is recovered by mere fallowing it, either worked or unworked, and in Ireland it is a most common practice to leave exhausted land to recover itself, without seeds even, and which it does do in a few years, and is then able to give a fresh succession of crops.

Liebig found the *modus operandi* of inorganic matters, and their importance to the vegetable economy, little known and less appreciated. I do not recollect any notice of them in the older writers, with the exception of some confused notions of the action of lime, phosphorus, &c., by practical writers, and even the scientific ones seem to have had very ill-defined opinions; it was "not determined in what way salts assist vegetation, whether by hastening the putrefaction of animal substances contained in the soil, or by attracting the humidity of the atmosphere." The experiments of Giobert led him to believe "that though beneficial to the growth of some species, and requisite to the health of others, earths are not capable of affording any considerable nourishment to the plant." Sir H. Davy apprehended a loss of vegetable food by exposing the soil to the action of the air; fallowing seems to have been used solely for destroying weeds. Agriculture was only an art, it remained for Liebig to introduce it as a science. Impressed with the importance of his researches, anxious to force them on the farmers' notice, his mind absorbed in the wondrous data he had found, and carried away by enthusiasm (ever an attendant on genius), it was easy to glide from demonstrable truths to visions of fancy, and it was natural to endeavour to impress on the minds of others the truthfulness they held in his. Liebig has erred, I think, in laying too great stress on the application of inorganic matters as manures, so as to lead to the belief (which I doubt of his entertaining) that they may supersede the use of vegetable and animal matters in this connection. *J. M. Goodiff, Granard.*

## Home Correspondence.

*Correspondence on the Clover Failure.*—[We have been favoured with the following letters between Mr. Lawes and Professor Henslow on this subject, and are glad to have the opportunity of so effectively bringing the subject again under the notice of our readers.]

*To Professor Henslow.*—Dear Sir,—Following your advice, I drilled about 6 acres of land with red Clover last spring, without any corn crop, and manured the land with 20 or 30 different manures. There was a good crop all over, and in some places, where particular manures had been applied, a splendid crop. It was cut in August, at which period the ground was perfectly covered over; soon afterwards the Clover commenced decaying in small patches over the whole of the field; and as far as I can judge, the decay is equally distributed over the best and worst manured portions; the decayed spaces are not very extensive at present, and I have had sticks placed at the extremities to mark the progress. This field was Clover two years ago. I should wish very much to have the benefit of your advice, if you could contrive to come here for a day or two at any time during the winter, as I think a careful inspection of the plants might enable you to form some opinion respecting the cause of the disease. At present, I think the decay is arrested, but I fully expect to find it extending rapidly in the spring. It is very singular that this plant should be the only agricultural plant which I find any difficulty in growing every year upon the same soil; it will require the combined efforts of physiologists and chemists to make a full solution of this interesting problem. *J. B. Lawes, Rothamsted, St. Alban's, Nov.* 20.——*To J. B. Lawes. Esq.*—Dear Sir,—Instructive as your experiment undoubtedly is, excuse me for saying it is not precisely the one I have suggested. I have been desirous of knowing how Clover comports itself when sown with and without Barley, all things else being the same; your experiment is very suggestive, for it seems to show that its being sown with Barley is not always (if it ever be) a cause of those failures of which agriculturists frequently complain. If the cause of these failures is to be sought, as I have long suspected, in the peculiar treatment which this plant receives, its own peculiar constitution being considered with reference to that treatment, we must not only inquire what effect its being sown with Barley has upon it, but what may be the effect of its being mown earlier or later by a few weeks or even days. I could wish you had left a moiety of each parcel of this field unmown, to see whether such portions were also liable to go off, as well as those which were mown in August. Better still if you had mown at intervals a little piece at a time. There are many plants esteemed to be perennial, which, under culture, scarcely last more than two, three, or four years; and possibly, Clover will not bear the treatment to which you have subjected it, and recover sufficiently to last for two years. I can easily fancy a difference of a few days in the period of mowing a plant of this sort might make all the difference to its successful cultivation. Possibly the sap prepared for the peculiar functions of a second year's growth may not have been stored in the roots, and your removing the stems too early may have intercepted the process. Many plants will not bear being pruned except at particular stages of their growth. Pray take these ideas as they occur, for I am sure you are not likely to regard such suggestions, as many farmers would be apt to look upon them, worthless, if they were not followed by an immediately favourable result; as your experiment stands—it affords us only one fact, viz., that Clover sown with 30 different manures, and mown in August, is liable to go off. If you had grown half the field with Barley and half without, at successive intervals, the interest of the experiment would have been greatly enhanced. Viewing the question physiologically, without regard to the chemistry involved in the manuring, I think the experiment should be repeated under the form here suggested, and I would repeat it on the very same ground without adding one particle more of manure to the soil. *J. S. Henslow, Hitcham, near Hadleigh. Nov* 24.

*Game.*—First, let me have a few words with "W. F. G. F." I thank this gentleman for his letter in general; but I am sure he will excuse me, if I observe, how provoking and disheartening it is, after an advocate, like myself, has been contending for a certain point through a series of letters, for some gentleman to start up, like one of the Seven Sleepers, and state, that the chief point on which the whole question turns has been entirely overlooked. "W. F. G. F.'s" complaint is exactly of this kind; for had he paid attention to all I have written on this subject, he would have found that at the commencement of this discussion I undertook to prove that game, taken in the aggregate, was of much more value than injury to the country at large, and that game-preserving gentlemen were public benefactors; and at the same time I also particularly stated that game could not be preserved without the employment of gamekeepers. "W. F. G. F." would also have found, that, when my opponent replied, that tenant farmers would be the best keepers, I answered that tenant farmers neither would nor could preserve the game; for I said, if one would, a hundred would not, and so for want of keepers all the game would be destroyed off their lands. And does not Mr. Cuthill himself admit this, in his letter of November 1st? wherein he asks "what has become of all the hares and rabbits round Manningtree and Wix." Now, Mr. Cuthill knows very well that some 14 years since around Manningtree and Wix the game was well preserved by two most excellent landlords, whose absence from this neighbourhood, from that time, has been greatly lamented by all farmers. Then, in my parish of Wix, we had plenty of game, and several game certificates were taken out in it; but now game has become so scarce, that, although we have 3000 acres of land under the plough, divided into farms, on an average of 200 acres each, not one tenant farmer takes out a certificate, since there is no game for them to shoot. But my friend asks, "What is become of the game round Manningtree and Wix?" What! Why, those amiable gentlemen, the armed midnight bandits, have stolen the whole for want of game preservers. But, my friend writes, that because he considers game to be nothing but wild animals, their destruction is a great blessing; but do my parishioners consider its destruction a great blessing? No such thing; but a great loss, for many valuable reasons, both to my parish and the neighbourhood. But my worthy opponent asks if I have turned poacher and snared them all, as they are not even mentioned in my reply to him. In answer to this inquiry, I assure the curious inquirer that when I steal hares and rabbits, I shall also steal geese and turkeys, and the first hamper full I shall obtain in that way I will make him a present of. But my friend denies that the excuse I made for him was a correct one; yet I made it in mercy or in kindness to him, and I really think he should so have received it. But I will let the reader judge between us. Mr. Cuthill asked me this important question: "How was it," said he, "that game preservers, on becoming farmers themselves, always gave up preserving?" When I replied that such was not the fact, but just the reverse; for that I knew several gentlemen who preserved game, and that, with one single exception, all of them farmed a part of their estates, and some of them farmed extensively; and I now repeat that such is the case at the present time; and I defy a refutation of what I write. But to get my friend out of his dilemma, I made the only excuse for him I could, namely that his informant had deceived him; but now he tells us that no one could deceive him, for "on this subject he had received no information from any living creature." Then, Mr. Cuthill, allow me politely to inform you that you have deceived yourself; for I know in Essex and elsewhere many game preservers, and every one of them is an extensive farmer, with the exception I have above stated. Mr. Cuthill informs us that garden cultivation will destroy all wireworms and slugs; but I say, not always, and in all places, though it may in some places. But farmers cannot garden cultivate; and if they could, near woods, without pheasants and partridges, I defy them to keep down the millions of insects which are bred in such localities; and for lack of game, three extensive and well educated nursery gardeners of my acquaintance keep flocks of bantams in their gardens solely for the purpose of destroying the insects which are injurious to their crops. But come, let us reason together a little further. You inform us that when a boy you lived on an estate on which you say, and I quote your own words, "I candidly own that every one of the servants, tenants and all, were downright poachers." From that notable estate, or "after that," you write, "I was head keeper and head factotum to my lamented friend James Smith. But when shooting time came on we had to travel a few fields before we got a shot, showing that I was a bad keeper." A bad keeper, aye, sure enough you were, a bad keeper indeed. I have heard much of that celebrated Mr. James Smith, as being known through the world for his shallow draining; but the man who could go to an estate for "a head keeper and head factotum," whereat every person on it, both tenants and servants, were downright poachers, must have had brains much shallower than his drains. But my worthy opponent still proceeds, and we must follow him, though I assure him that a sense of duty alone compels me in this instance to do so. "But I have known," continues he again, "bailiffs who were anxious men, encourage poachers, and wink at their visits; they were as blind as bats when they saw men poaching." I know not how blind bats are; but I know that they see better in the dark than most men can in the light, and hence they are not so blind as the bailiffs were who closed their eyes whilst poaching thieves stole and carried away their masters' property. But "my reverend opponent will tell me," adds Mr. Cuthill, "that those bailiffs were dishonest; but I say no; for, like me, they look upon hares and rabbits as nothing but wild animals, the destruction of which is a great blessing." My good Sir, do reconsider this last sentence, and try to blot it out of your memory, though it is indelibly fixed upon paper. It matters not what you and bailiffs may choose to call your employers' property; nor can any name you may apply to game vindicate the conduct of stewards on an estate who encourage poachers to steal it, or to shut their eyes whilst the rogues, in their vocation, are carrying it away. By the same rule, bailiffs may call a sheep a wolf, or a pig a fox, or a goose an eagle, and thus encourage poachers to thieve them, and wink at their visits; the principle in each case being the same precisely, if I have any judgment in such matters. I must however repeat that I have read with much interest many of my friend Mr. Cuthill's valuable communications, and I trust I shall live to read many more of them, but I should wound my feelings were I to say that he is equally successful in his defence of poaching. *Geo Wilkins.* [We have been forced materially to abridge this communication.]

*The Phosphate Nodules of Felixtow, in Suffolk.*—In a late number of the *Agricultural Gazette*, an interesting lecture of Dr. Daubeny has been published, showing how modern chemistry has been directly and indirectly serviceable to agriculture. In noting some of the steps by which the chemical compositions of the phosphate nodules in the red clay has been ascertained, he observes:—"The next step in the investigation was to ascertain the chemical constitution of the nodules themselves, and this was effected through the exertions of Mr. Browne, of Stanway, &c." Dr. Daubeny will, I trust, excuse me for saying this statement is incorrect. Reference to the extract from my letter to the *Bury Post*, of 3d July, 1845, published in the *Agricultural Gazette* for 1848, p. 180, will show him that Mr. Potter first analysed these nodules, and detected 56 per cent. of the phosphate of lime in them. I am afraid that I am in some measure responsible for a few misapprehensions that have occurred respecting the facts of the case, from allowing a passage in my original communication in the "Geological Proceedings," to stand after Mr. Potter had made known to me the results of his analysis. I have there stated:—"I am not aware whether any analysis has ever yet been made of them." This was the fact at the time the paper was written, and had been transmitted to the Geological Society. But before it was read, I happened to be in Cambridge, and met Mr. Potter in Mr. Deck's shop. I pointed out to both these gentlemen, practical chemists, the conclusion at which I had arrived respecting the probable origin of the nodules, and alluded to the possibility of their becoming serviceable in agriculture, according to the recently-published remarks of Liebig on coprolites. Mr. Potter, to whom I presented specimens, undertook to analyse them, and to report to me the result at the approaching meeting of the Geological Society, when my communication was to be read. This he did, and I stated to the meeting the analysis he had made, and exhibited the phosphate of lime he had procured, and which I still possess. His analysis appeared at the time singularly confirmatory of the views I entertained. This analysis ought, certainly, to have accompanied my paper; but Mr. Potter requested me to suppress it, and not to allude publicly any further to the subject, until he should have made such enquiry as might satisfy him whether it would be worth his while to make arrangements for procuring the nodules for an important ingredient in his artificial guano. I consequently was silent, in order that he might have the first chance in any speculation that might arise out of

the discovery. Months passed away, and Mr. Potter seemed to make no effort towards securing his opportunity; when I received a letter from Mr. Lawes, asking for information respecting the nodules, I wrote immediately to Mr. Potter, and I remember telling him, that as I was no speculator myself, and merely regarded the question scientifically, I did not feel justified in withholding from Mr. Lawes the information I had given himself. I quite forget whether it was on account of Mr. Potter or Mr. Lawes, that I visited Felixtow expressly to satisfy myself that I was not misleading them with respect to the abundance of the nodules, and the facility with which they might be procured. I had become acquainted with Mr. Smith there, who was in the habit of collecting iron pyrites on the coast, and I showed him the nodules in the cliff, and enquired at what rate he thought they could be collected. He named 10*s.* per ton as the probable price, and I believe it was on this information that Mr. Lawes wrote to him for the 2 tons which, as I have stated, he afterwards analysed. Whether this happened previously to Mr. Solly's visiting me in the progress of his enquiries, alluded to in Dr. Buckland's report to the Agricultural Society, I do not recollect; but certainly Mr. Solly's analyses were undertaken subsequently to that of Mr. Potter; and I think also subsequently to those of Mr. Lawes. I have not heard from Mr. Potter since I informed him of Mr. Lawes' application, and I have never yet had the pleasure of seeing Mr. Lawes, though we occasionally correspond about agricultural experiments. Mr. Browne first suggested to me the probability of these nodules being derived from the London clay, his own judgment being guided by his having seen something of the sort from the London clay at Hampstead; but it was not till shortly after my letter to the *Bury Post* that I received full confirmation of the correctness of his conjecture, by obtaining phosphate nodules from the London clay in the railway cutting at Colchester, as I stated at the Oxford meeting of the British Association. I will not trespass upon you by allusions to the many interesting analyses that have been made, and the conclusions at which we have now arrived respecting these and other concretions of phosphate of lime, my object being to point out the cause which has prevented Dr. Daubeny, Dr. Buckland, and other inquirers from recognising Mr. Potter's analysis as the first positive information we received of the phosphatic character of these nodules. *J. S. Henslow, Hitcham, Nov.* 20.

*English and American Churns.*—The alleged superiority of the new American churn over English churns has led to some trials being made, in order to test their comparative merits. The claim put forth in favour of the American churn by its inventor or patentee, is, that it produces butter in from six to 12 minutes, while the English churn is said to require half an hour and upwards to complete its work. This claim of superiority of the American is stated to arise from the different form of the dasher, and from the means provided, by a hole in the lid, for the admission of a constant supply of fresh air into the churn. It is, however, further set forth as important that the temperature of the cream used should be brought to 60°. There being here three conditions stated as necessary for the conversion of cream into butter, in the shortest possible time, viz., the particular form of dasher, the large supply of fresh air, and the temperature of 60°, it becomes interesting to determine whether the successful result arises from one or other of these conditions, or from the combination of the three. Having this object in view, four trials have been made with an English and an American churn, simultaneously, with cream from the same stock in each respective instance. The English churn used was of the ordinary form of square box churn, with the cross dasher of open bars, and the lid fitting close. If filled up to the line of axis of the dasher, it would hold 10 quarts of cream. The American churn, if filled up to the corresponding line, would hold six quarts. The results of the several trials are stated below; and it will be observed, that in two of them the cream used was divided between the churns, proportionately to their sizes, and in the other two equal measures of cream in each.

| Date. | Churn. | Cream used. | Time occupied. | Butter produced. |
|---|---|---|---|---|
| | | Quarts. | Minutes. | lbs. ozs. |
| Oct. 7 | English | 5⅝ | 8 | 5 15½ |
| | American | 3⅜ | 8½ | 3 9 |
| „ 10 | English ... | 4 | 7½ | 3 6 |
| | American | 4 | 12 | 3 4⅝ |
| „ 14 | English ... | 5⅝ | 5 | 5 7 |
| | American | 3⅜ | 7½ | 3 8 |
| „ 17 | English ... | 3 | 6 | 2 14 |
| | American | 3 | 12 | 2 10 |

It will be here seen, that in each of these trials (and they are all that have yet been made with these two churns, in corresponding conditions) the English churn brought butter in the shorter time. It appears unnecessary to look further to prove that there is no merit whatever in the form of dasher, and the air-vent in the lid, put forth by the American, as the grand discovery, entitling to a patent. In the temperature being at 60° lies the whole secret, if secret it be, for this is no new discovery, and is not patentable if it were. If our English dairymaids be furnished with thermometers, and instructed to bring their cream to 60°, by the addition of so much boiling-water as may be necessary for that purpose, they need not seek for American churns, nor occupy the long and uncertain time which they have hitherto done in producing butter. *Hampstead.*

*Farm Accounts.*—In the farming account I sent you, you asked if the machinery was credited. It was not; but it was not charged; so that, as it ought to appear on each side of the account for 1850-51, it would not affect the result. Your other suggestion, about credit being given for new implements, would somewhat modify the loss. The accounts and suggestions I refer to appeared in the *Agricultural Gazette* of Oct. 25. I hope next year to send you a more satisfactory balance-sheet. Your correspondent, "E. Hulme," page 699, in your last Number, would find a wide difference between his theory and practice. *Urban.*

## Societies.

Eydon Village Industrial Club, *October* 17.—*The Autumnal Show of the Industrial Club recently established in that village*—The object of the Club is to mark out by small prizes the best specimens of grain, vegetables, fruit, flowers, roots, needlework, and any work of ingenuity; also to reward good character in service in young persons under 24 years of age. The following statement shows how generally and warmly the Club is supported by the inhabitants. The population of the parish is about 620, and at the recent show 30 labourers, 27 tradesmen, and 8 persons of the class of farmers exhibited 208 lots of articles, some of the vegetables and roots being very superior. Two Cucumbers were shown, one being 19½ inches long, the plants from which they had been cut having produced 206 fruit since the 5th of May last. The following letter was given to each member:—

As we have united ourselves in an Industrial Club, I think it not in any way unbecoming in me, as your clergyman, and one of the original promoters of our Club, to take the part in our autumnal show, of addressing a few words to you on the cultivation of our land. I am not going to put before you any new-fangled notions, or to recommend any experiments by which you may very probably suffer loss; but my object is to put before you a few facts, upon which the industrial working of your brain may lead to the increased industrial working of your hands. For your inspection, there are three samples of straw:—No. 1 is from one of the centre rows of the 4-acre piece of Wheat, cultivated by the Rev. Samuel Smith, of Lois Weedon, having a row of Wheat 12 inches distant from it on each side. No. 2 is from an outside row, having on one side a row of Wheat at 12 inches distance, and on the other side a row of Wheat at the distance of 3 feet. You will perceive No. 2 to be much stronger, thicker, and firmer, than No. 1. No. 3 is the produce of one grain of corn, grown by William Pipe, of this village, in his garden in 1845. There are 88 stems from this one grain. This one corn was put into the ground in his garden by his wife, with no other seed near it; it was carefully cultivated, and, as it tillered, mould was put around and on the crown of it, the effect of which was to make it throw up additional stems. I do not mean to say that all these stems ripened good corn, or that such a plan could be followed out in general practice, either in a garden or a field; but if you let your brain industriously meditate on the above facts, and the straw you may now see, you cannot fail of being struck with the advantage of space. But space, if left untouched, will produce weeds, thereby making the land foul, and be injurious to the Wheat crop; Mr. Smith, therefore, of whose small farm all of you have heard, and some of you have seen, works his 3 feet space as a fallow, digging and turning it over once during the winter, and by hoeings preventing the growth of weeds in the spring. His principle therefore, or the foundation of his plan, is space and fallow. The practice of a fallow is as old as anything of which we have record. In the Bible (Leviticus, chap. xxv.), we read that the Israelites were commanded to give their land rest every seventh year. In every country, however uncivilised or thinly inhabited, all the land is, at certain times, fallowed. In England, so valuable is the restoration of land by fallow considered, that to obtain it, farmers are willing to be at the expense of frequent ploughings, and the loss of a year's crop, incurring thereby, in expense of work done and loss of crop, a cost of not less than 9*l.* or 10*l.* per acre, to be made up by the extra produce of the succeeding crops, till the return of fallow. The great novelty of Mr. Smith's system is that he has hit upon a clever plan of fallowing about half of his land every year, and so mixing it with his growing crop as to give that the immediate benefit of the fallow. By these means, he makes his cultivated part (about half the acre), produce about as much as an acre ordinarily does. I am inclined therefore to think that, as Mr. Smith annually restores and cleans his land, without losing a crop, that his plan of fallowing is not so expensive as at first sight it may appear; for with regard to weeds, I believe the truth of the old adage, that prevention is not only better, but, in the long run, cheaper than cure. Consider then the above facts, whether they do not establish the benefit of space and fallow. Now for a few facts, to call your attention to the beneficent power of the Almighty, in giving such a productive quality to Wheat, the chief food of man. The 88 stems of No. 3 each produced an ear, some full and good but others not; average however each at 30 grains, and there will be a 2640-fold produce. Mr. Smith, in his published account, has sowed about 2 pecks per acre, obtaining, in three successive years, an average produce of 34 bushels, or 136 pecks, being about 6-fold. Last year, however, he sowed about 1 peck to the acre, obtaining a produce in head and tail Wheat, 41 bushels 3 pecks, or 167 pecks, being a produce of about 160-fold. Now what is the return for seed in common farming? Usually 2½ bushels or 3 bushels are sown per acre, and if the average produce be 3½ bushels, it is about 12 fold. In a rich Wheat-growing district in France, the yield was considered the last summer to be about 15-fold; if the yield were the same in England, the crop would be considered to be heavy; yet we see there is a power in Wheat of producing very much more, and how little does man usually make of the extraordinary productive qualities which the Almighty has bestowed on Wheat. In a few days I expect to be in possession of an extraordinary produce from one ear of Barley. I will mention only one more instance of the produce of an acre of ground, on which Mr. Smith has, this year, by interlining with space and fallow winter Beans and Mangold Wurzel, obtained of the former 7 qrs. 4 bushels, with a crop of about, by guess, 12 or 14 tons of Mangold Wurzel. These are facts upon which it would be well for us industriously to employ our brains. I do not take upon myself to recommend any plan of cultivation, but we must wonder, and admire the bounty of the Almighty, and confess that we do not sufficiently take advantage of it. There is an old proverb of "waste not, want not." If we cannot grow more corn, let us consider whether we do not waste much, which may bring on want. *Francis Clerke. Eydon, Daventry, Oct.*

## Miscellaneous.

*Small Farm System.*—We have had occasion several times to discuss in the columns of the *Athenæum* the "great or small farm question;" or, as the French say, in language much more expressive, the question of the *grande ou petite culture*. During the last nine or ten months the *Morning Chronicle* has contained a series of very able papers from a special correspondent, whom the conductors of that paper despatched to France for the express purpose of investigating the state of French agriculture. The mission of this correspondent has now been brought to a close; and in a very interesting and able paper recently published in the *Chronicle*, he has given a *résumé* of his proceedings, and of the conclusions at which he has arrived. We can refer to this paper only as far as it bears on the cultivation question. The writer seems to be quite satisfied that where the occupier or owner of a small patch of land can cultivate it with the spade, a minute division does no harm. He says:—"The rule which strikes me as applying to the matter is this: Where spade-husbandry can be legitimately adopted, there the extreme sub-division of land loses much, if not all, of its evils. The reason is plain:—Spade-husbandry, while it pays the proprietor fair wages, also in certain cases developes in an economical manner the resources of the soil." This testimony is of great importance. On the general question of the *morcellement*, the writer is much less positive. He says:—"Are small properties, then, in cases in which spade-husbandry cannot be economically applied, injurious to the social and industrial interests of the community in which they exist? The following propositions appear to me to sum up what may be said on either side of the question.—1. Small landed holdings undoubtedly tend to produce an industrious population. A man always works hardest for himself. 2. Small landed holdings tend to breed a spirit of independence, and wholesome moral self-appreciation and reliance. On the other hand, 1. Small landed holdings, by breeding a poor and ignorant race of proprietors, keep back agriculture, and injure the whole community of consumers. And, 2. Small landed holdings tend to grow smaller than it is the interest of their owners that they should become. Capital borrowed at usurious rates of interest is then had recourse to for enlarging individual properties; and the result is, the production of a race of involved, mortgaged, and frequently bankrupt properties. With these simply stated propositions, for which there is the amplest evidence, I take my leave of the subject." It is only fair to add, that the researches and writings of the correspondent of the *Chronicle*, whose words we have now quoted, will certainly form an epoch in the discussion in this country of the social questions relating to the present state of France. Two years ago, M. Blanqui was commissioned by the Academy of Moral and Political Sciences to investigate personally the "situation of the rural population of France." M. Blanqui has already made several partial reports of his proceedings to the Institute; and he is described as having made considerable progress in the regular and official treatise in which it is his intention to embody the results of his inquiry. As some evidence, however, of the effect produced in M. Blanqui's mind by what he has seen and heard of the *petite culture* in France, we may quote a sentence from one of the papers which he has laid before the Academy. "It is the division of property—mother of the *petite culture*—which has principally contributed to develope in the soil of France so rich a variety of productions; and which alone explains the ardour with which so many new proprietors have lavished on the land the treasures of their intelligence and activity." *Athenæum.*

## Calendar of Operations.

### NOVEMBER.

Lammermuir Sheep Farm, *Nov.* 22.—Much to the comfort, we doubt not, of all concerned, the sheep bathing was completed by the middle of the month. The jacketing and breeking of the hoggs was also got through a few days ago. For the benefit of the uninitiated, we may state, that the later operation consists in sewing a piece of thin linen cloth over the tails of the ewe hoggs, or such young ewes as are thought too weak to have lambs, but which cannot, at the same time, be conveniently removed beyond the reach of the rams. At the end of the season, these breeks are taken off without delay, washed, and laid aside for another year; their presence, though necessary when the hogs winter beside the ewes, being both troublesome and injurious to the wearers, when permitted to remain long on. From "use and wont," the 22d of November has become the fixed day for admitting the rams to the ewes in this district. On some of the less exposed grazings, where crosses with the Leicester are bred, this is done about a fortnight sooner; and as these crosses are generally shown at the earlier lamb markets, the plan is good, provided there be a sufficient supply of Turnips for the ewes, for some weeks before, and during lambing; but on the higher grounds, when the spring is late, and the sheep have generally to shift for themselves, the middle of April will be found sufficiently early for lambs. We never permit the rams to remain out above six or seven weeks, when they are brought back into some convenient inclosure, and fed upon Turnips, during the remainder of the winter and spring months, as we do not like to see this important division of the stock get into low condition at any season. According to the nature of the ground, we allow between 40 and 50 ewes to each ram, besides keeping a few in reserve in case of accidents. For some time the shepherds will require to be upon the alert, both to prevent the stronger sheep monopolising an undue number of ewes; and as each ram has his locality assigned him, to see that they do not wander beyond their proper beat; and that none of the ewes are grazing at any great distance from their lords. The condition of hill sheep at this season being a matter of much consequence, we may state, that upon the whole, there is very little cause for anxiety. Perhaps we could have wished to have seen the Cheviot hoggs somewhat fuller in flesh—though it cannot be said that they are below an average in this respect—and as far as the ewes are concerned, we are satisfied. Much, of course, depends upon the nature of the coming winter; already there are some ominous symptoms of a severe one, but as the same things are observed every autumn, we patiently wait the issue. On the arable part of the farm, the labour consists in ploughing Oat stubble for Turnips, which, but for sickness among the horses, would have been finished ere this; carting out manure to be spread and ploughed in immediately; providing the young cattle and a few sheep with Turnips;

threshing Oats for fodder, and carting part of the grain to a neighbouring mill, to be made into meal for the shepherds and other farm servants. A spade's-man kept on the farm has been repairing all the stone fences. During fresh weather, he will be employed making and cleaning out pasture drains, and during frost, quarrying stones for a new sub-division fence. *A Lanarkmuir Farmer.*

METEOROLOGICAL REPORT.—NOVEMBER.
*(Continued from p. 749.)*

Continuation of preceding storm.

* A storm coming from the westward, and travelling eastward.

† This storm must have come from the southward, lying a long way to the westward, and on approaching this country have curved to the eastward, across England.

‡ This storm came from the westward, and crossed England to the eastward.

Dorchester Nov. 27. *F. P. B. M.*

*(To be continued.)*

## Notices to Correspondents.

BIRMINGHAM POULTRY SHOW: *E S, G W, Clericus, and others.* I will endeavour to answer all your queries under one head. A subscriber's card admits at any time during the Exhibition. The entries are more than 1000 in number. All the competing pens are not made up of perfect specimens, but the best of every breed in England will doubtless be there. I consider 50*l.* a prohibitory price for three fowls, but if any one will give that sum they must be sold. It would not be ridiculous if a larger sum were named, because the object in doing so is apparent. "Emily" may satisfy herself it is an "exhibition for ladies," by visiting it. Tuesday is the best day, as it is a private, consequently a select day. I do not know the intrinsic value of the large Silver Medal. It was last year very handsome and very well executed. Being an exhibition advertised for four days, an "intended large buyer" will easily understand he cannot be allowed to remove his purchases till the close. I am not aware whether the North-Western Railway Company will run special trains. It is by far the largest and best exhibition of the sort I ever saw; and I do not believe any one who has not seen it can imagine what it is, compared with anything else of like nature: it is the Crystal Palace to the time-honoured Bartholomew Fair. *J. Baily*, 113, *Mount-street.*

BREWING: *G P* says, "I intend to try a nine gallon cask of ale, made of sugar instead of malt, adopting Donovan's proportions of sugar and Hop as for a 1) gallon cask; and shall make use of 'Agricola Cæsariensis's' suggestions of the muslin bag to inclose the Hops, and dissolved isinglass. Will he obige me by stating what quantity of isinglass should be dissolved for my nine gallon cask? and what time should be allowed for fermentation at this season of the year before the cask is permanently driven in? Will it be necessary to wire the corks of the bottles? I generally brew a 60 gallon cask at a time, and hitherto of malt and Hops. Supposing I should prefer the use of sugar, what quantity of sugar and Hops should I make use of for draught ale? as bottling so large a quantity would be inconvenient, and when would such 60 gallons be fit for use?"

CABBAGES: *Discipulus.* 1. *Do the open or hearting taint the butter the most?*—Good butter is made from cows fed on either, but perhaps the firm part of the Cabbage is more likely to give a bad taste. 2. *Do Cabbages taint butter more in summer or winter?*—In summer Cabbages are generally free from decayed leaves, which cause a bad taste in the butter; but if care is taken to remove these, we do not think that either in summer or winter can the bad taste be often traced to feeding on Cabbages. 3. *Does it matter whether the Cabbages are given just after milking, or at any other time?*—In winter, Cabbages are sometimes given just before milking; we give them when the cows will eat them up clean. 4. *Will any article put into the milk or cream prevent the tainting?*—In a dairy where excellent butter is made, a tablespoonful of chloride of lime, diluted in a quarter of a pint of water, is put to two gallons of cream, just before churning; another remedy is, 1 oz. of saltpetre, in fine powder, to the same quantity of cream; or half a tea-spoonful of the latter is also put into a pail holding about three gallons, before milking. 5. *Do Cabbages taint most when in the vigour of growth or when quite ripe? Ex.: Drumheads in December or after?*—It would be a waste of food to use them before they are fully grown; but if too ripe and decayed, they are the cause of tainting. 6. *Can you give any directions for preventing the tainting?*—If you find Cabbages that are free from decayed leaves, or in fact anything else, cause your butter to taste, feed your cows upon something else; and be attentive to cleanliness, both in the dairy and in feeding the cows. In winter time a few Carrots given to the cows will improve the taste and colour of the butter. With reference to Cabbages or white Carrots given to each cow, we should say from 50 to 70 lbs., but the quantity must vary with the other food given; we should not feed solely on either. Cabbage seed must be sown in beds in the latter part of July or August, and the young plants pricked out before winter, to come in for early planting. The plants from seed sown early in the spring succeed these, but the autumn sown, we believe, give the heaviest crops. We prefer the Drumhead Cabbage to all others. *H. R.*

CATTLE: The only specific breeds that receive particular articles in the "Cyclopedia," are the short-horns, Herefords, and Devons, with the Ayrshire and Jersey cattle as dairy breeds. All other breeds will be described in the article "Ox," by Mr Wilson, of Edington Mains.

COCHIN CHINA EGGS: *Animal Bib. Impl.* See our advertising columns. Mr. Baily, of Mount-street, answers most of our poultry correspondents.

CHEMICAL QUESTION: *G B.* We are unable to answer it. You should apply to a chemical periodical on the subject.

"DRUMMOND'S PATENT ANTI-METALLIC CHURN:" *A Constant Sub.* We do not know it.

HOPS. &c.: *W K.* asks, "Has the bine of the Hop and the stalks of Beans ever been tried for manufacturing purposes, if treated on the principle which Chevalier Claussen applies to Flax?" [We believe it has been tried, but not successfully, as material for the paper manufacture.]

INSECT DESTROYER: *S Myers.* You should advertise it.

LIQUID MANURE CARTS: *G F.* Mr. Chard, Milk-street, Bristol, late Mr. Stratton, can, no doubt, give satisfactory information on the liquid manure carts made by Mr. Stratton, which were probably the best.

LIQUID MANURE TANKS: *A Landlord* says—"I shall feel much obliged to any of your correspondents who will inform me, from experience, what is the size required for a liquid manure tank for a farm of 300 acres of average land, farmed on the four-shift course. In Mr. Ewart's essay (Journal of the Royal Agricultural Society of England, vol. xi., p. 248), it is stated that 10 feet in diameter and 20 feet deep is a proper size; but in his treatise on agricultural buildings (p. 16), 8 feet diameter and 12 feet deep is counted sufficient. Now, as the former of these is about two and a half times the capacity of the latter, it is evident that if the smaller one is large enough, the larger one is considerably larger than is necessary; and as I am about to construct tanks on some of my farms, any information tending to discover what has practically been found to be the golden mean with respect to size, will be esteemed a favour. [No tanks at all is the right method. This, with the adoption of box-feeding in stables, as well as in feeding-stalls, is the most economical mode of manure management.]

ONE ACRE TO SUPPLY WINTER FOOD FOR THREE COWS: *Ab Initio.* ½ to Cabbages = 10 tons; ½ to Carrots = 5 tons; ½ to Mangold Wurzel = 16 tons. ½ after the first cut Cabbages in September to Rye = 1½ tons. In all 32½ tons, or 650 cwt., which is more than 1 cwt. a day for three cows during the half year, between September and April, which is all they will want in the way of green food. You must give them a little hay with it, or some straw-chaff with Bean-meal and Linseed. Put all your manure on the arable land, and buy guano as well. If you break up pasture this winter you can lay it down again in any future spring.

PIGS: *A B C.* We do not remember having previously received your inquiry. You had better apply to Mr. Moore, of Colesbill, near Farringdon.

POND MUD: *Eboracensis.* We would not carry it a mile; but if it be close by we should be glad to use it, unless, indeed, the land were already rich enough, which is a possible thing. It is not a saleable article.

SMALL FARM: *R.* "How you can turn the field to the best account," is a great deal too general a question to ask. With six acres you can easily keep a "cow or two." You may grow Wheat and Potatoes enough for your family, and do this as well; by cultivating Cabbages, Vetches, and Lucerne, as summer food; and Cabbages, Mangold Wurzel, Carrots, and Rape, as winter food. If you have the back numbers of this Paper, look at the schemes of cultivation there given.

SWELLING: *D.* The ointment of biniodide of potass is the best for removing enlargements; but in the case in question, excision by the knife will probably be most advisable. *W. C. S.*

TANNERS' WASTE: *S N.* We should prefer composting it with the lime to using the two separately. It is only in the case of ammoniacal manures that there is loss by mixing the lime and the manure together.

YEAST: *B M P* says, "Will any reader of the *Agricultural Gazette* kindly inform me how to get the bitterness out of yeast?" He uses 6 lbs. of Hops to 8 bushels of malt, and the yeast spoils all the bread, and gets sour very soon.

# Markets.

## COVENT GARDEN, Nov 29.

The supply of English Pine-apples is well kept up, and Grapes, both foreign and English, are plentiful. Small quantities of Pears are still brought from the Continent. The best English kinds fetch 2s. to 4s. a doz., and 8s. to 12s. per half sieve. They consist of Glout Morceau, Crassane, Beurré Diel, and Chaumontelle. Oranges are plentiful. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are dearer. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

HOPS.—FRIDAY, Nov. 28.

Messrs. Pattenden and Smith report that there is a better trade for Sussex Hops, and prices have advanced 5*s.* per cwt. since this day week; there is also a steady demand for other sorts, at a shade more money.

| | | | |
|---|---|---|---|
| Mid & East Kents | 140s to 252s | Yearlings ... ... | 95s to 112s |

| Sussex ... ... | 105s to 126s | | |

POTATOES.—SOUTHWARK, MONDAY, Nov. 24.

The committee report that the during the week the supply, both coastwise and by rail, has been very limited, which has caused an advance in price for all sorts of Potatoes. The following are this day's quotations:—York Regents, 70s. to 80s.; Scotch do., 60s. to 75s.; Kent and Essex do., 65s. to 80s.; ditto Shaws, 60s. to 65s.

SMITHFIELD, MONDAY, Nov. 24.

Although there were fewer Beasts, prices are no higher; indeed, middling qualities are scarcely so saleable as of late. The number of Sheep is larger; trade is generally dull, especially for big Sheep, owing to the changeable weather. Calf trade is heavy, at about Friday's prices. From Holland and Germany there are 390 Beasts, 4910 Sheep, 175 Calves, and 23 Pigs; from Spain, 240 Sheep; from France, 90 Sheep and 4 Calves; from Norfolk, 100 Beasts; from Ireland, 150; and 2400 from the midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|

| | | | | | Calves ... ... | 2 | 10 — | 3 | 10 |
| | | | | | Pigs ... ... | 3 | 0 — | 4 | 4 |

Beasts, 4763; Sheep and Lambs, 27,890; Calves, 227; Pigs, 460.

FRIDAY, Nov 28.

The supply of Beasts to-day is small, but equal to the demand. Monday's prices are with difficulty maintained; 3*s.* 10*d.* is an extreme quotation, and only realised in a few instances. We have, for the time of year, a fair supply of Sheep. Trade is exceedingly dull, at about the same prices as on Monday last. Good Calves are scarce, and fully as dear; inferior qualities are lower, and it is difficult to effect a clearance. From Germany and Holland we have 187 Beasts, 1050 Sheep, and 182 Calves; from France, 120 Sheep and 6 Calves; from the midland counties, 300 Beasts; and 105 Milch Cows from the home counties.

| Best Scots, Herefords, &c. ... | 3 | 6 to 3 | 10 | Best Long-wools . | 3 | 4 — | 3 | 8 |

Beasts, 716; Sheep and Lambs, 3520; Calves, 262; Pigs, 430.

MARK LANE.

MONDAY, Nov. 24.—The supply of Wheat from Essex and Kent to this morning's market was moderate, and sold slowly at the terms of this day se'nnight. Foreign was in limited retail demand only, but fully former prices are insisted on. Floating cargoes continue in demand for the Continent, but they are very scarce.—The value of Flour remains unaltered.—A few picked samples of Barley brought last week's prices, but other descriptions of malting were the turn lower; grinding sells readily.—Peas are scarce, and white boilers bring 3*s.* per qr. more money.—Beans fully maintain late rates.—The Oat trade is firm, and the advance of Friday fully established.

FRIDAY, Nov. 28.—The arrivals of all descriptions of grain continue small; to-day's market was thinly attended, and the inquiry for Wheat limited; nevertheless, holders were indifferent as to selling, and on the little business done extreme prices were realised. There continues to be some inquiry for floating cargoes for the Continent.—The trade for spring corn of all descriptions is very firm at Monday's quotations.—The arrivals of Oats are very short, and in some instances higher prices are realised.—In the value of Flour there is no alteration.

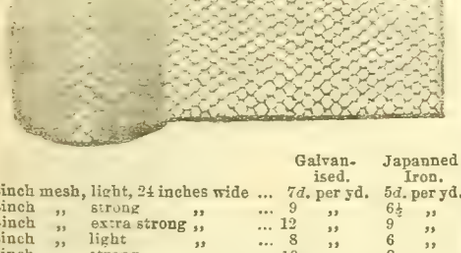
LIVERPOOL, TUESDAY, Nov. 25.—At our market this morning there was a good display of samples, principally of the fine descriptions of American Wheat, and having a moderate attendance, there was a fair amount of business in this grain at the full prices of Tuesday last; farmers' Wheat at the same time realising the highest quotations. American Flour sustained the improvement of Friday, whilst choicest marks of French and Irish brought extreme rates. Malting Barley and Malt, in the absence of supply, are unchanged in value. Grinding Barley rather cheaper. Oats command full prices, and Oatmeal is 3*d.* per load dearer. Beans and Peas in fair request. Indian Corn more sought after at the reduction of Friday.—FRIDAY, Nov. 21.—Having few country millers at our Corn Exchange to-day, the transactions in any descriptions of foreign Wheat were limited in amount; nowithstanding, the sales effected were at the full rates of Tuesday; whilst farmers' Wheat was in good request, and the turn dearer. Barley and Malt ranged precisely the same as last market day. Beans and Peas were held on rather higher terms but which were scarcely attainable. Oats and Oatmeal, upon a moderate demand, supported our last currency. Indian Corn in slow request at a further decline of 6*d.* per qr.

## J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.



This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

## GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

THE TEETH AND BREATH.—A good set of Teeth ever insures favourable impressions, while their preservation is of the utmost importance to every individual, both as regards the general health, by the proper mastication of food, and the consequent possession of pure and sweet breath. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTIFRICE, stands unrivalled in its capability of embellishing, purifying, and preserving the Teeth to the latest period of life. It will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the Teeth firmly in their sockets; and from its aromatic influence impart sweetness and purity to the breath. Price 2s. 9d. per box. Beware of spurious imitations. The genuine article has the words, "A. ROWLAND and SONS, 20, Hatton Garden," engraved on the Government stamps affixed on each.—Sold by them, and by Chemists and Perfumers.

DOMESTIC SANITARY MEASURES.—Places in Gardens rendered as comfortable as the best-constructed water-closets, by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Sold only at FIFE and Co's Scientific Repository, 26, Tavistock-street, Covent Garden, London, sole depôt for the Patent Hermetically-Sealed Inodorous Chamber Commodes, 1l. 4s., 2l. 6s., and 3l.; also improved Portable Water Closets, with pump, cistern, and self-acting valve. Orders by post attended to.

BERDOE'S superior OVERCOATS, combine with every other quality essential to a really respectable article, the established reputation of being thoroughly impervious to rain, and are supplied at charges the lowest possible for first-class garments. A very large stock for selection, also of riding and driving capes, shooting jackets, and of the waterproof pallium, the well-known light overcoat for all seasons, long regarded as one of the most gentlemanly, economical, and valuable garments ever invented. Price 45s. and 50s. An assortment of Boys' overcoats, at from 25s. to 35s., also kept. No slop or inferior goods kept.

96, New Bond street, and 69, Cornhill (only).

FORD'S EUREKA SHIRTS.—"The Great Exhibition has produced a multitude of novelties which have alternately delighted and astonished the world. How many of these will survive for any practical purpose is a question. It is another question if any one of them will bring half the practical comfort of a good shirt. Mr. FORD, of the Strand, has an invention of this kind, which is a material improvement upon the old plans, and for positive enjoyment is worth one ten-twentieths of the marvels of the huge building in Hyde-park."—*Atlas.*

FORD'S EUREKA SHIRTS are not sold by any Hosiers or Drapers, and can, therefore, be obtained only at 185, Strand. They are made in two qualities, the first of which is 42s. the half dozen, and the second quality 30s. the half dozen. List of Prices, containing an illustration, with directions for self-measurement, sent per post free.—RICHARD FORD, 185, Strand.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the style of a room finished for occupation.

FRIGI DOMO.—A perfect protector against frost, a non-conductor of heat or cold, and cheaper in price than baize matting. A canvas made of prepared hair and wool, adapted to many horticultural and floricultural purposes, for covering up, where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, Oxford-street, London.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF, and the HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt. Admission, 1s. On MONDAYS, 6d.

250 STOVES, AND 325 FENDERS, all differing in pattern, forming the largest assortment ever collected together, are always on Sale at the Show Rooms of WILLIAM S. BURTON. They are marked in plain figures, and at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s. Bronzed Fenders, complete, with standards, from 7s. to 3l.; Steel Fenders, from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s. Fire-irons, from 1s. 9d. the set to 4l. 4s. Sylvester and all other patent Stoves with radiating hearth plates; and Kitchen Ranges.

WILLIAM S. BURTON is enabled to sell at these very reduced charges from three simple causes, which he is most anxious the public should understand and appreciate.

First. From the frequency and extent of his purchases.

Second. From those purchases being made exclusively for cash.

And last, not least, from the non-allowance of the usual discount of 10 or 15 per cent. to architects, builders, &c., on the amount of goods sold through their recommendation, by which arrangement the price of such goods is of course enhanced to, at the very least, the extent of the discount.

WILLIAM S. BURTON has just completed some extensive alterations in his premises, by which he has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the Show of GENERAL FURNISHING IRONMONGERY, including cutlery, nickel silver, plated and japanned wares, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues with engravings sent (per post) free. The money returned for every article not approved of.

39, OXFORD-STREET (corner of Newman-street), Nos. 1 and 2, NEWMAN-STREET, and 4 and 5, PERRY'S-PLACE. Established A.D. 1820.

THE ONLY PERFECT STOVE!—All who study Health, Comfort, and Economy, should throw aside their old Stoves, and replace them with the PATENT PORTABLE VENTILATING SUSPENSION STOVE, which consumes only *Three Farthings worth of fuel per day*, and is universally admired for the delightful temperature it produces, and for the extraordinary manner in which it purifies the air. It is strongly RECOMMENDED BY THE FACULTY, and is adapted for Bed-rooms, Churches, Chapels, Schools, Halls, Libraries, Greenhouses, Shops, Warehouses, &c. Prospectuses to be had free by post. In operation daily at DEANE, DRAY, and Co's, London-bridge.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

CROSBY HALL VAULTS, No. 35, BISHOPSGATE-STREET-WITHIN.—CURRALL and SON beg to invite public notice to their STOCK of OLD BOTTLED WINES. They being desirous to secure that patronage which wines of the first quality, at fair and remunerating profits, will maintain, respectfully submit the annexed list of cash Prices:—

| | Per doz. | | Per doz. |
|---|---|---|---|
| Port, old bottled | 36s. and 42s. | White Port in pints, bottles and package inclusive | 30s. |
| Ditto, six years in bottle | 48s. | Sherry (excellent dinner wine) | 28s. |
| Sherries, pale and brown | 36s. | Port, superior draught | 28s. to 33s. |
| Ditto ditto | 42s. to 48s. | | |
| Marsala | 24s. | | |
| Champagne (1 doz. cases) | 54s. | | |

PALE BRANDY, 60s. per doz.; bottles, 2s. per doz.; hampers, 1s. per doz.

MOVEABLE COVERED SHEEP-FOLD, made in pieces 6 ft. by 4 ft., forming a fold any required length, 8 ft. wide. A firm article, put together with strap bolts and nuts, and covered with tarpauling roof. Easily erected or removed. Price of a fold, 24 ft. by 8 ft., 6l.; or 5s. per foot run.

SUBSTANTIAL POULTRY HOUSE, to fix against a wall, 9 ft. by 4 ft. 6 ins., with wire panels in front and sides, and tarpauling roof. Price 2l. each. Any ordinary labourer can erect them in two hours.

WIRE SHEEP PEN ON WHEELS, 6 ft. square, to feed off a lawn by a sheep. Price 2l.

WIRE RABBIT CAGE AND BREEDING BOX ON WHEELS, to have rabbits on a lawn. Price 2l. 14s. each.

One of each kind kept erected for inspection, and drawings sent on application.

ROBERT RICHARDSON, 21, Tonbridge-place, corner of Judd-street, New-road, London.

GARDEN FRAMES, GREENHOUSES, PITS, &c.—TRANSPARENT SHEETING, a substitute for Garden Mats, admitting light to plants, and keeping out frost, 1s. per yard, runs nearly two yards wide; thick canvas ditto, 1s per square yard; large waterproof capes, to protect a man from wet while stooping down, 3s.; cart and waggon covers, 2s. per square yard; made-up horses' loin cloths, driving aprons, &c.—R. RICHARDSON, 21, Tonbridge-place, New-road. N.B. 3000 London Police Waterproof Capes, fresh dressed, 18s. and 24s. per dozen, for gardeners and farm labourers. A small Fire-engine for sale, price 10l., with a quantity of hose, &c., complete for use.

## THE FOLLOWING WORKS ARE ALWAYS ON SALE AT THE OFFICE OF THIS PAPER.

Price 3d., or 5s. for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle*. A single copy sent free by post on receipt of seven postage stamps.

## SALES BY AUCTION.

TOTTENHAM.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to submit to public competition by Auction, on the premises, Whitehall, Tottenham, on MONDAY, the 1st December, at 11 o'clock, by order of the Proprietor, in consequence of the Land being required for building purposes, a valuable assortment of very fine EVERGREENS, specimens, consisting of large Hollies, Aucubas, Phillyreas, Arbor Vitæ, Laurels, Laurestinus, Portugal Laurels, Box, Red Cedars, Arbutus, Magnolias, Rhododendrons, and a large variety of Ornamental Trees, Fruit Trees, and Shrubs; also a capital Greenhouse, with Stages, &c; together with about 1 acre of excellent Turf.—May be viewed one week prior to the sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE.

500 Standard and Dwarf Roses, a selected assortment of American Plants and Ornamental Trees, a first class collection of Dutch Bulbs &c.

MESSRS. PROTHEROE AND MORRIS are directed to sell by Auction, in the large room, at the Mart, Bartholomew-lane, on THURSDAY, December 4, at 12 o'clock, the above, which are in the finest condition, and particularly worthy the attention of the public.—May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

GREAT SALE OF VALUABLE NURSERY STOCK, IN CONSEQUENCE OF A PORTION OF THE LAND BEING REQUIRED FOR BUILDING.

MR. J. RAWLINGS has received instructions from Mr. Adams, to sell by Auction, on the Premises, Kensington-road (opposite the west end of the Great Exhibition), on MONDAY, Dec. 1, and seven following days, at 11 o'clock each day, the whole of that extensive and unequalled Stock of large Evergreens, Ornamental Trees and Shrubs, comprising Green and Striped Hollies, Common and Irish Yews, Phillyrea, Alaternus, American and Chinese Arbor-vitæ, Aucuba, Common and Portugal Laurel Cedrus Deodara, Cedar of Lebanon, &c., all of which are from 3 to 10 feet high. Handsome specimens of Coniferous Plants, including Abies, Pinus, Picea, &c., with large Thuja filiformis, Taxodium pendulum and nuciferum, 6 feet high. A splendid collection of specimens of about 60 species and varieties of Oak, such as is not to be met with in any other establishment. As also a magnificent tree of Salisburia adiantifolia, 20 feet high, and many other objects of interest and value, which cannot be enumerated in an advertisement.—May be viewed prior to the sale. Catalogues (1s. each, returnable to purchasers) may be had on the Premises; of the principal Seedsmen; and of the Auctioneer, 50, Hoxton-square, and Ebenezer Nursery, Shacklewell London.

BATTERSEA.—CHOICE NURSERY STOCK, &c.

MR. D. A. RAMSAY will sell by Auction, on the Premises, Lower Clarement Nursery, Stewart's-lane, near the Duchess of York, Battersea-fields, on TUESDAY, December 2, and following day, at 12 o'clock, by order of Mr. FISHER, the ground being required for other purposes, a large assortment of Evergreens, viz:—Laurestinus, well set with bloom, Laurels, Hollies, Arbor Vitæ, Alaternus, Box, Privet, Phillyrea, Euonymus, &c., about 400 yards of Box Edging, a large quantity of Yews, 3 to 4 feet, Poplars, Limes, Planes, Weeping Willows, and other choice Ornamental Trees, Standard and Dwarf Roses, Pinks, and Lilies. A quantity of Mangold Wurzel, Heifer in Calf, Hay, Manure, and other Miscellaneous Stock.—May be viewed one day prior to Sale, and Catalogues had of Mr. FISHER, 2, York-street, Battersea-fields; at the Duchess of York; or of the Auctioneer, Brompton Nursery Ground, Fulham road, Brompton.

MR. GEORGE FULLER is instructed to sell by Auction, at the Essex Arms Inn, Watford, on WEDNESDAY, the 10th of December, at 12 for 1 o'clock, under the direction of N. W. Senior, Esq., one of the Masters of the High Court of Chancery, a large fall of very superior Timber, of immense length and girth, comprising 900 OAK, 797 ELM, 695 ASH, 1362 BEECH, 300 FIR, 154 CHERRY, and 215 others, with their lot, top, and bark, now growing on the Thellusson Trust Estates in the parishes of Aldenham, St. Stephens, King's Langley, Bushey, Ellstree, and Rickmansworth, being within 14 miles of London, close to water carriage, and accessible by capital roads. The Timber may be viewed 14 days prior to sale, on application to the tenants, and catalogues had gratis at the Chambers of the Master Senior, Southampton Buildings, Chancery-lane; of Mr. George Fuller, Land and Timber Valuer, 4, Raymond Buildings, Gray's Inn; T. W. Budd, Esq., 33, Bedford-row; John H. Benbow, Esq., Stone Buildings, Lincoln's Inn; at the Auction Mart, London; of Mr. Whitley, the Bailiff, at Aldenham; the Red Lion Inn, Aldenham; Essex Arms, Watford; Swan, Rickmansworth; Great Red Lion, St. Alban's; Bell, Hemel Hempstead; Salisbury Arms, Hertford; the Western Hotel, Bristol; and George Hotel, Portsmouth.

OAK, ASH, AND FIR TIMBER—HOLMBURY HILL, NEAR DORKING, SURREY.

MESSRS. TROLLOPE are instructed to sell by Auction, at the Black Horse, Gomshall, Surrey, on TUESDAY, Dec. 2, at 2 for 3 o'clock precisely, 289 Oak Trees, 306 Oak Saplings, 28 Ash Trees, 177 Ash Poles, 50 Firs of large dimensions, and other Trees, with their lop, top, and bark, now standing on the Farm of "Joldens," in the parish of Ockley, Surrey, four miles from the Gomshall station, on the South-Eastern Railway, from whence they may be removed with facility to any part of the kingdom.—Catalogues may be had at the Black Horse, Gomshall; White Horse, Dorking; White Hart, Guildford; of the Auctioneers, 15, Parliament-street, Westminster; at the Belgrave Office, 18, Grosvenor-street, Eaton-square; and of Mr. JOHN MACE, on the Farm, who will show the timber.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

WANTED, a GARDEN, in the neighbourhood of London, enclosed, and from 1 to 2 acres in extent.—Apply to A. B., 15*d*, Fleet-street, London.

LONDON to DUBLIN (*viâ* HOLYHEAD) in THIRTEEN HOURS and a HALF.

Three communications daily on week days; two on Sundays. Sea passage Four Hours and a Half. First class, 3*l*; second, 2*l*. Return tickets (available for a fortnight), first class, 4*l*. 10*s*.; second 3*l*. Children under twelve, half-price.

For full particulars of the booking-through system between England and Ireland, see "Bradshaw's Guide," page 122; "Wallis's Irish Guide," page 20; "Fisher's Irish Guide," page 2.

THE AGRICULTURIST'S CALCULATOR: A SERIES OF TABLES for LAND-MEASURING, DRAINING, MANURING, PLANTING, WEIGHT of HAY and CATTLE by MEASUREMENT, BUILDING, &c, Adapted to the use of all engaged in Agriculture or the Management of Land.

"The 'Agriculturist's Calculator' seems to me the most perfect of the Agricultural Ready-Reckoners I have seen."—*J. C. Morton, Editor of the Agricultural Gazette.*

"It is my opinion that the Work will be of the greatest advantage to all connected with Land."—*Thomas Balmer, Commissioner for the Duke of Richmond.*

BLACKIE and SON: London, Edinburgh, and Glasgow.

MURRAY'S MODERN COOKERY.

Now Ready, in a large Type, with 100 Woodcuts, Post 8vo, 6*s*., strongly bound,

MODERN DOMESTIC COOKERY, Founded upon principles of ECONOMY and PRACTICAL KNOWLEDGE, and adapted for PRIVATE FAMILIES.

"The value of 'Murray's Modern Domestic Cookery' consists in its plainness and practicability. The experimental and impracticable character of the fashionable modern cookery books has led us to fear that a great deal too much of the national time would be wasted in culinary trifling. For the honour of British cooks, and for the comfort of British digestion, Mr. Murray comes forward to the rescue."—*Literary Gazette.*

London: JOHN MURRAY, Albemarle-street.

MURRAY'S READING FOR THE RAIL.

This day, with numerous Woodcuts, Post 8vo. 5*s*.,

MR. LAYARD'S POPULAR ACCOUNT OF HIS DISCOVERIES AND RESEARCHES AT NINEVEH. Abridged by HIMSELF from his larger Work. New Edition.

"The various attempts that have been made to give popular descriptions of Mr Layard's great discoveries, have taught him and his publisher the necessity of placing an abridged account of them in a popular form before the public. Well has he executed the task, and well has the publisher brought the work, adorned with numerous woodcuts, before the public."—*Economist.*

London: JOHN MURRAY, Albemarle-street.

CAMELLIAS.

CAMELLIAS, well set with flower-buds, fine healthy plants, 30*s.* and 42*s.* per dozen. Larger sizes at moderate prices.

The CHRYSANTHEMUMS are now in full bloom.

CHANDLER and Son's Nursery, Wandsworth-road, London. Post-office orders payable at Kennington-cross.

RHUBARB.

MITCHELL'S ROYAL ALBERT } Strong Roots,
MYATT'S LINNÆUS ... ... ... } 50*s.* per 100.
MYATT'S VICTORIA ... ... ... ...

WILLIAM MITCHELL, Enfield Highway, Middlesex.

LILIUM LANCIFOLIUM, TULIPS, RANUNCULUSES, ANEMONES, AURICULAS, AND GERANIUMS.

HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and TO HIS MAJESTY THE KING OF SAXONY, begs to state that he continues to supply the above FLOWERS of the finest quality, and at very moderate prices. H. GROOM would remind the admirers of the beautiful LILY (LILIUM LANCIFOLIUM), that this is the best season to plant the different varieties, and he would particularly recommend them as highly ornamental for the Shrubbery and Parterre. They are quite hardy.

His CATALOGUE may be had on application.

LISTS OF SEEDS, PLANTS, &c.

PETER LAWSON AND SON beg to state that their priced list of Forest Trees, &c., may be had at their Establishment, 1, George the Fourth Bridge, Edinburgh; or from their Agent, J. C. SOMMERS, 159, Fenchurch-street, London.

Synopsis of the Agricultural Products of Scotland, in Parts, at 1*s.* each; or in 2 Vols., 7*s.*; First, now ready, 5*s.*

BEST LANCASHIRE GOOSEBERRIES, named, at 15*s.* per 100.

Also, APPLES, PEARS, CURRANTS, RHUBARB, &c., in all the best varieties, and at equally moderate prices.

Carefully packed, to carry any distance, or for exportation.

H. BIGLAND and Co., Manchester.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, CONIFERA, ROSES, ORNAMENTAL SHRUBS, FRUIT AND FOREST TREES, &c., may be had on application, by enclosing two postage stamps.—Windlesham Nursery, Bagshot, Surrey.

BASS AND BROWN beg to refer to their Advertisement of CHOICE GERANIUMS, in the 2d page of each number of *Gardeners' Chronicle*, of Sept. 27th and Oct. 11th. The plants are exceedingly fine and vigorous. With immediate re-potting, they will make good specimen plants for exhibition next season, with abundant blooms, and will be found very cheap. They also, in the same Advertisements, beg to refer to their select list of NEW PLANTS. Also NEW CHRYSANTHEMUMS, AZALEA INDICA, &c., of which they have a choice assortment, strong and vigorous, and offered at low prices.

12 splendid Stove Plants, for winter and early spring flower, for 20*s.* 12 beautiful Greenhouse Plants, for do., 15*s.*

Catalogues on application. Goods free to London, or any part of the Ipswich line to Norwich, and extra plants, gratis, for orders of 40*s.* and upwards. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW FORCING CARNATION.

GAINES' FLORIBUNDA, ROSE FLAKE, large Flower, will bear Stove Heat, and expand well. This flower will be a great acquisition to the bouquet in the spring. N. G. begs to announce he can supply good strong plants of the above at 2*s.* 6*d.* per pair. His Descriptive List of Show Pelargoniums and fancy varieties, &c., is just published, and can be had, by applying at the Nursery, Surrey-lane, Battersea.

NEW DAHLIAS.

E. SPARY begs to announce to his Floricultural Friends, both English and Foreign, that he intends sending out, the first week in May, 1852, the below named DAHLIAS, which E. S. can confidently recommend as constant and desirable show flowers.

ABSOLAM (SPARY'S).—Clear amber, first-rate form, and petals very constant (an acquisition in its colour). Height, 4 feet; Plants, 10*s.* 6*d.*

VICTORIA (COOK'S).—Pale primrose, tipped with lilac; exquisite form, and good centre. To exhibitors will prove a desirable light flower. Height, 4 feet; 10*s.* 6*d.*

JOHN DAVIES (COOK'S).—Crimson, occasionally shaded with puce; symmetrical fine form; petals high in centre. Always to be depended on. Height, 4 feet; 7*s.* 6*d.*

A Descriptive Catalogue of select new and old varieties of Dahlias will be ready in January; Camellias, Geraniums, Fuchsias, Cinerarias, Verbenas, and a variety of other plants; Hamburgh Vines, and other sorts (in pots), from E. S.'s celebrated stock; Bouquets, Seeds, &c.

Queen's Graperies and Nursery Ground, Park-street, Brighton.

EDWARD TILEY begs to inform the Nobility, Gentry, and Public generally, that he can yet supply a few fine Plants of the following:—

OTHELLO—NEW CARNATION CLOVE, 5*s.* per pair, or 3*s.* per plant.

BLACK WALLFLOWER NEGRESS, 5*s.* per plant.

VIOLA ARBOREA, or perpetual Tree Violet (true), large plants, 6*s.* per dozen; smaller ditto, 3*s.* per doz.. or 1*l.* per 100.

RUSSIAN SUPERB (true), very fine, 3*s.* per dozen.

WHITE RUSSIAN SUPERB (true), very fine, 3*s.* per dozen.

For further particulars of the before-named varieties see *Gardeners' Chronicle* of Nov. 15, 1851. They will be forwarded, postage and package free, on receipt of the amount by post-office order or penny postage stamps.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath, Somerset.

TO NURSERYMEN, PLANTERS, &c.

J. OGDEN begs to offer from 3000 to 4000 fine well grown TREES, from 10 to 15 feet high, comprising grafted English Elms, Birch, Ash, Beech, Limes, Horse and Spanish Chestnuts, English Oak, Italian Poplar, Hornbeam, Mountain Ash, Purple Beech, &c. &c. Several hundred Spruce Firs, 6 to 9 feet.

Also a fine collection of SPECIMEN WEEPING PLANTS, and a general assortment of Nursery Stock. Nurseries adjoining the railway station.—Coventry, Dec. 6.

CUTHILL'S BLACK SPINE CUCUMBER, 1*s.* per packet; his SCARLET FLESH MELON, 1*s.*; LISIANTHUS RUSSELLIANUS, 1*s.*; BLACK PRINCE STRAWBERRY SEED, 1*s.*

Also, his BELGIAN POTATO TREATISE, of 56 pages, containing 12 articles on the best Fruits and Vegetables, price 2*s.*; or by post, 2*s.* 4*d.* A PAMPHLET ON MARKET GARDENING ROUND LONDON, 1*s.* 6*d.*; or by post, 1*s.* 8*d.*

"Every one connected with gardening should read these pamphlets."—*Dr. Lindley.*

JAMES CUTHILL, Camberwell, London.

NEW GARDEN SEEDS,
SAVED THIS SEASON.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, beg respectfully to state that they are now receiving from some of the most careful growers a choice assortment of

NEW AND GENUINE SEEDS,

Of first-rate quality; and as the season is fast approaching when a fresh supply of seeds will be required for the Kitchen Garden, they take the liberty of recommending the proprietors of every garden, whether extensive or small, to procure without delay a copy of

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY,

*Which cost more than One Hundred Pounds in its production, and has been most favourably noticed by some of the most eminent Horticulturists of the day, as well as by the Editors of the leading Garden Publications.*

*It contains 24 folio pages, and is the same size as the* GARDENERS' CHRONICLE.

It contains a Descriptive Catalogue of the best Culinary Vegetables in cultivation, with the time of sowing, height, and other useful particulars, as well as the quantities furnished by WILLIAM E. RENDLE and Co. for their Collections; also a Descriptive Catalogue of all the choicest and best varieties of Agricultural Seeds; and an excellent Descriptive List of all the newest and choicest Flower Seeds.

It likewise contains a COMPLETE CALENDAR OF OPERATIONS in the Kitchen Garden for every month in the year, in a concise and useful form.

*Copies can be obtained from any Bookseller in town or country, price Fivepence, through Messrs.* BRADBURY *and* EVANS, *the London publishers.*

*Copies will also be sent gratuitously on receipt of Six penny postage Stamps (to pay the postage), on application to* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

*Our Stocks, Early Peas, Beans, Radish, and Carrots are already in, and can be supplied at once.*

W. E. RENDLE and Co. have made arrangements to supply all the new descriptions of SEEDS that may be advertised in this Paper during the ensuing season.

YEWS FOR HEDGING, &c.

EDWARD SANG AND SONS have for SALE a large quantity of YEWS of a size suitable for making hedges. The plants are of fine quality, three years transplanted, and from 9 to 21 inches in height. Prices moderate.

Kirkaldy, Dec. 6.

WILLMORE'S SURPRISE
GERANIUM.

JOHN AND CHARLES LEE beg to announce that they have purchased the entire stock of this extraordinary novelty of Mrs. Willmore, of Edgbaston, near Birmingham, and they intend offering it to the public in the autumn of 1852, when they will have proved its qualities as a bedding plant, which they believe to be first-rate; and opportunities will have been afforded at the various Flower Shows of witnessing what may be regarded as a floral wonder.

Mrs. Willmore has stated her belief that its parentage lies between Geranium erubescens and a Hollyhock. Our great Horticultural authority, Dr. Lindley, repudiates the idea, but acknowledges it to be an extraordinary production. Messrs. LEE hope to produce such proof as may possibly stagger the learned Doctor's opinion, if it fails to convince him. For the present, suffice it to say that the structure of the plant is different to anything to be found in the Geranium; the roots are quite unlike any of the class, and the seed pods are formed more like a Hollyhock than a Geranium. The flowers are semidouble, and the whole truss of a monstrous form. Allowing it to be no more than a mere sport from the Geranium, its merits far exceed anything hitherto introduced as a gay border or bedding flower.—Nursery, Hammersmith.

TRANSPLANTED THORN QUICKS AT HALF PRICE, FOR READY CASH.—SELLING OFF.—The Remainder of the Stock of Transplanted Thorn Quicks, the property of the late Mr. JOHN M'CRAITH, Nurseryman, of Kilkenny, will be cleared off this present season, at the following greatly reduced prices. Two years old Transplanted Thorns, 14 to 18 inches in length; circumference 3-8ths to 7-16ths; 9*d.* per 1000. Three years old, transplanted: length, 17 to 24 inches; circumference, 8 to 10-16ths; 1*s.* 3*d.* per 1000. Four years old, transplanted; length, 23 to 25 inches; circumference, 5-8ths to 1 inch; 1*s.* 8*d.* per 1000. Quantities of 100,000 and upwards delivered carriage free in Dublin or Waterford. Apply to Mrs. SUSANNA M'CRAITH, High-street, Kilkenny

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, will be happy to forward his New Autumn Catalogue (post paid), on application. It is also post paid throughout America, Austria, Belgium, France, Germany, Holland, and Prussia.

E. G. H. can supply plants of the following (for description see page 27 in the above Catalogue).

The New Raspberry Belle de Fontenay, 7*s.* 6*d.* each; Weigela lutea, or Middendorffiana, 10*s.* 6*d.* each; Hesperis Matronalis Flora Plena (Double Crimson Rocket), 2*s.* each.

Tropæolum azureum, 2*s.* 6*d.* each; T. tricolor, 2*s.* 6*d.* and 3*s.* 6*d.* each; T. Hockerianum (true), for winter flowering, fine, 3*s.* 6*d.* each.

Cremont's Perpetual Strawberry, 1*s.* each, or 9*s.* per dozen.

NEW NURSERY CATALOGUE,
By post for Two Postage Stamps.

WILLIAM YOUNG begs to inform the public that he has just published a DESCRIPTIVE CATALOGUE of his Stock, which consists of a fine collection of Conifers, Hardy Ornamental Trees, Evergreens, Flowering Shrubs, American Plants, Roses, Fruit and Forest Trees, &c.

Milford Nurseries, near Godalming, Surrey.

PRINCE ALBERT PEAS, and EARLY ASH-LEAVED KIDNEY POTATOES, at 6*s.* per bushel, delivered free of expense at the Bredon station, on the Birmingham and Gloucester Railway. Four bushel bags, 2*s.* each.—Address to Mr. ARTHUR STOW, Bredon, near Tewkesbury.

CUCUMBER SEED FOR THE MILLION.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to state that he has a large stock of SEED of this year's growth, and that he can recommend it as an excellent bearer, growing from 14 to 18 inches long; it is a hardy kind, and will do for early forcing or cold frames. Forty seeds will be sent on the receipt of 12 postage stamps; 2*s.* 6*d.* per oz. to the trade.

This Advertisement will not be repeated.

STORY'S NEW FUCHSIAS, &c.

JOHN DOBSON begs to inform the admirers of the FUCHSIA, that he is now prepared to receive orders for the FOUR NEW SEEDLINGS raised by W. H. Story, Esq., Whitehill, Newton Bushel—they have been seen by several excellent judges, and pronounced first-rate, in every respect—for prepayment only, but no money received till the plants are ready. Orders executed in strict rotation. Early orders are requested, as the stock is limited. Catalogues, with full description, may be had by enclosing one stamp.

J. D. is also now sending out Mr. Beck's new Seedling Pelargoniums of 1850; also 12 unequalled varieties for 42*s.*, and 12 good and distinct varieties for 21*s.*; also varieties of other raisers. No charge for hamper or package. Carriage paid to London, and plants given in to compensate for long carriage.

J. D.'s General Descriptive Catalogue of Pelargoniums, Fuchsias, Verbenas, Phloxes, Cinerarias, Antirrhinums, &c., with a Catalogue of Kitchen Garden Seeds, is now ready, and may be had in exchange for two stamps.

J. D. also begs to say that, having so many inquiries as to his mode of growing the Pelargonium, that he will shortly publish a cheap treatise on that favourite flower.

Hollyhock Seed saved from the best named sorts, in packets of 100 seeds, 1*s.* 6*d.*, or in exchange for 20 stamps.

Antirrhinum Seed saved with great care from the best varieties, in packets, sent in exchange for eight postage stamps.

Woodlands Nursery, Isleworth.

HOLLYHOCKS AND ROSES.

JOHN CHATER AND SON can still supply most of the leading varieties of Hollyhocks in cultivation on reasonable terms. Also 12 fine Show Roses, 2 feet Standards, for 12*s.* (six summer and six Perpetuals). Strong Climbing Roses, 4*s.* 6*d.* per dozen; double major white Rockets, 2*s.* 6*d.* per dozen; superb named Hollyhock Seed, in packets of 200 seeds, 1*s.* 6*d.* Catalogues of the above may be had, on application, by enclosing a postage stamp. 12 fine Show Pansies, 10*s.*

Nursery, Haverhill, Suffolk.

VERY FINE SPRUCE FIRS, &c.

WOOD AND INGRAM beg to offer the above, 2 to 3 and 3 to 4 feet high, and well furnished, at from 25*s.* to 30*s.* per 1000; and if 10,000 are taken, 10 per cent. less will be charged.

BRITISH OAKS, transplanted, 6 to 8 feet high, and admirably adapted for planting in woods, &c., from 55*s.* to 60*s.* per 1000.

LIMES—splendid plants for avenues, &c., from 6 to 12 feet high, and feathered from the bottom, from 25*s.* to 80*s.* per 100.

HUNTINGDON ELMS, of all sizes, from 3 to 20 feet, at from 10*s.* to 100*s.* per 100.

PORTUGAL LAURELS, some fine standards, with stems, from 3 to 4 feet, 4*s.* to 5*s.* each.

W. and I.'s general Catalogue of Forest, Ornamental, and Fruit Trees, Evergreens, &c., may be had on pre-paid application. Amongst the Fruit Trees may be named some splendid plants of the Stanwick Nectarine—some established in pots and well adapted for forcing purposes, at 21*s.* each.

Huntingdon Nurseries, Dec. 6.

LANDSCAPE GARDENING.
EXCLUSIVELY PROFESSIONAL.

MR. THOROLD, of Norwich, offers his services to the Nobility and Gentry as a LANDSCAPE AND ORNAMENTAL GARDENER, in the highest style of the Art, including Decorations around a House, forming Water, Approaches, Picturesque Scenery, &c.

## STANDISH AND NOBLE, NURSERYMEN, BAGSHOT, SURREY,

Solicit attention to the following List of ORNAMENTAL PLANTS, selected from their general Nursery Stock. The greater portion are growing in the open quarters; and, from being periodically transplanted, their safe removal may be relied on. Every Plant sent out will be a healthy, robust specimen; the heights given afford but a slight criterion of their general character. To those having a star prefixed they invite special attention, as being remarkably fine, and fit for producing immediate effect. Gentlemen about to plant extensively would be repaid by making a visit to the Nursery.

All kinds of Ornamental Trees and Shrubs supplied. A fine Collection of Roses selected with reference to late autumnal blooming. Also of the best kinds of late-flowering hardy hybrid Rhododendrons, to the cultivation of which especial attention is given.

*Gentlemen requiring assistance in laying out or improving their grounds may procure the services of a competent person by applying to the Advertisers.*

With the exception of such names as are printed in italics, the whole of the plants in this list are perfectly hardy.

The number of inches named refer to the heights, unless otherwise stated.

ABIES BRUNONIANA, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*, each.
,, JEZOENSIS, one year's seedlings, 2*l*s. each.
This is one of the last novelties in Conifers. It forms a noble tree of 120 feet in height, and of very distinct character.
,, DOUGLASII, 20 to 36 ins.. 5*s.* to 10*s.* 6*d.* each.
ARAUCARIA IMBRICATA, 6 to 9 ins., 1*s.*; 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.*; 24 ins., 5*s.*, each.
*AZALEA*, "*Glory of Sunning Hill*," 2*s.* 6*d.* to 5*s.* each.
The best double variety in cultivation.
,, OVATA, a hardy evergreen, 6 to 9 ins., 2*s.* 6*d.* each.
,, *VITTATA*, a specimen of this unique variety was awarded a Knightian medal, when exhibited last April at the rooms of the Horticultural Society. The ground colour of the flowers is white, which is beautifully striped with purple, after the manner of a Carnation. It is a very free bloomer. 9 ins., 21*s.* each.
ABELIA UNIFLORA, new and distinct. A very free bloomer, 10*s.* 6*d.* each.
BUXUS sp., from north of China, round leaved, 10*s.* 6*d.* each.
,, ,, long leaved, 15*s.* each.
BERBERIS FORTUNII, 9 ins., 1*s.* 6*d.*; 12 ins., 2*s.*; 18 ins., 3*s.*; 24 ins., 5*s.* each.
,, DARWINII, 7*s.* 6*d.* to 21*s.* each.
*CEDRUS AFRICANA, 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 30 ins., 5*s.*; 36 ins., 7*s.* 6*d.*; 48 ins., 10*s.* 6*d.* each.
* ,, DEODARA, 2 to 5 ft., 2*s.* 6*d.* to 10*s.* 6*d.* each.
*CRYPTOMERIA JAPONICA, seedlings, very robust plants, will require no support from stakes. Plants 4 to 5 ft. high have stems as many inches in circumference. 6 ins., 63*s.* per 100. 24 ins., 2*s.* 6*d.*; 36 ins., 3*s.* 6*d.*; 48 ins., 5*s.*; 60 ins., 7*s.* 6*d.* each.
,, JAPONICA NANA, seedlings 9 to 12 inches through, 10*s.* 6*d.* to 21*s.* each.
*CUPRESSUS FUNEBRIS, seedlings, very robust plants, from the open border, nearly as wide as high, very handsome plants, 12 ins., 5*s.*; 18 ins., 7*s.* 6*d.*; 24 ins., 15*s.*; 30 ins., 21*s.*; 36 ins., 31*s.* 6*d.* each. Cuttings, 6 to 8 ins., 2*s.* 6*d.* each.
* ,, ELEGANS, a rapid grower, and a most graceful tree, 12 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.*; 36 ins., 5*s.*; 48 ins., 7*s.* 6*d.* each.
* ,, GOVENIANA.—This is one of the most beautiful plants of its class. It has the merit of preserving its beautiful green colour during the most severe weather. 9 ins., 2*s.* 6*d.*; 12 ins., 3*s.* 6*d.*; 18 ins., 5*s.*; 24 ins., 7*s.* 6*d.*; 30 ins., 10*s.* 6*d.*; 36 ins., 15*s.*; 48 ins., 21*s.* each.
* ,, LAMBERTIANA, forms a noble tree, rivalling even the Cedar of Lebanon, and succeeds well in very exposed situations. 9 to 12 ins., 1*s.* 6*d.*; 18 ins., 2*s.* 6*d.*; 24 ins., 3*s.* 6*d.* each.
Grafted beneath the surface of the soil, 30 ins, 2*s.*; 36 ins., 2*s.* 6*d.*; 42 ins., 3*s.* 6*d.*; 48 ins., 5*s.* each.
CEPHALOTAXUS FORTUNII, male var., long leaves, seedlings, 21*s.* each.
,, ,, female var., short leaves, seedlings, 21*s.* each.
CHAMÆROPS, sp., a hardy Palm from the north of China, a decided acquisition to our hardy ornamental evergreens, 21*s.* to 31*s.* 6*d.* each.
*CLERODENDRON FŒTIDUM.*—The only species of this beautiful genus which can be successfully cultivated in a cool greenhouse, a situation in which this succeeds admirably. It forms its large heads of rosy lilac flowers in great profusion. Strong plants, 21*s.* each.
CERASUS ILLICIFOLIA, 7*s.* 6*d.* each.
DAPHNE JAPONICA, 12 ins., 2*s.* 6*d.* each.
,, HYBRIDUM, 12 ins., 1*s.* 6*d.* each.
FORSYTHIA VIRIDISSIMA.—This plant is not sufficiently known. It is an early spring-flowering plant, producing its yellow blossoms in great profusion. But it rarely flowers, or but scantily when young. The plants offered are well set with flower-buds. It forces well. Bushy plants, 24 ins., 1*s.* 6*d.*; 36 ins., 2*s.* 6*d.*; 48 ins., 3*s.* 6*d.*; Standards, 10*s.* 6*d.* each.
ILEX DIPYRENA, 9 to 12 inches, 3*s.* 6*d.* each.
,, MICROCARPA, 21*s.* each.
,, LATIFOLIA, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.*; 24 ins., 5*s.* each.
,, FURCATA, 21*s.* each.
JUNIPERUS ARGENTEA, new and very beautiful, 12 inches, 5*s.* each.
,, PHŒNICEA, 12 ins., 1*s.* 6*d.* each.
,, CHINENSIS, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d.*; 24 ins., 2*s.*; 30 ins., 2*s.* 6*d.* each.
,, TAMARISCIFOLIA, 12 ins., 1*s.* each.
,, FLACCIDA, 12 ins., 1*s* 6*d.*; 24 ins., 3*s.* 6*d.* each.
,, EXCELSA, 12 ins., 2*s.* 6*d.*; 18 ins., 3*s.* 6*d.* each.
,, SQUAMATA, 12 ins., 1*s.*; 24 ins., 2*s.* 6*d.* each.
,, CRACOVIA, 12 ins., 1*s.* each.
,, MACROCARPA, 12 ins., 2*s.* 6*d.* each.
,, REPANDENS, 12 ins., 9*d.*; 24 ins., 1*s.* 6*d.* each.
,, OBLONGA PENDULA, 6 to 9 ins., 2*s.* 6*d.* each.
,, BEDFORDIANA, 12 ins., 1*s.*; 18 ins., 1*s.* 6*d.*; 24 ins., 2*s.* each.
JASMINUM NUDIFLORUM, strong blooming plants, 2*s.* 6*d.* each.
LIGUSTRUM JAPONICUM, 9 ins., 1*s.*; 24 ins., 2*s* each.
*LYCOPODIUM WILDENOVII*, 5*s.* each.
LIBOCEDRUS CHILIENSIS, 7*s.* 6*d.* each.
MITRARIA COCCINEA, 2*s.* 6*d.* each.
*PICEA PINSAPO, very handsome specimens, 30 ins., 21*s.* each.
,, NORDMANNIANA, 10*s.* to 15*s.* each.
,, OVATA, 1*s.* 6*d.* each.
*PINUS INSIGNIS, 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 30 ins., 7*s.* 6*d.*; 36 to 42 ins., 10*s.* 6*d.* each.
,, MURICATA, 9 ins., 10*s.* 6*d.*; 18 ins., 21*s.*; 24 ins., 31*s.* 6*d.* each.
,, MONTEZUMÆ, 12 to 15 ins., 10*s.* 6*d.* each.
QUERCUS SCLEROPHYLLA, 21*s.* to 42*s.* each.
,, INVERSA, 21*s.* to 42*s.* each.
ROSE, "FORTUNE'S YELLOW," dwarfs, 2*s.* 6*d.* to 5*s.* each.
,, ,, ,, standards, 5*s.* to 7*s.* 6*d.* each.
RHODODENDRONS.—Hardy late flowering Hybrids, varying in colour from white to deep crimson. Dwarfs, 31*s.* 6*d.* to 6 guineas per dozen; standards, 21*s.* to 5 guineas each.
,, COMMON PONTICUM, for covers, thrice transplanted, 12 to 18 ins high, very bushy, 15*s.* to 21*s.* per 100.
SIKKIM RHODODENDRONS.—We believe we may state, without fear of contradiction, that we possess the largest plants of these beautiful Rhododendrons in the trade. The heights of those we are offering vary from 2 to 9 ins. From the altitude from whence many of them were obtained, there is great probability of their proving hardy in this country. Collections of 24 distinct kinds at 3, 5, or 9 guineas.
SPIRÆA CALLOSA.—An abundant and continued bloomer. It has large corymbs of rosy purple blossoms, and is a handsome addition to our shrubbery plants; 10*s.* 6*d.* each.
SALISBURIA ADIANTIFOLIA (seedlings), 12 ins., 2*s.* 6*d.* each.
*TAXODIUM SEMPERVIRENS. This and Cryptomeria japonica are amongst the most rapid-growing Conifers. In situations where such are required they cannot be surpassed. 18 ins. to 5 feet, 1*s.* 6*d.* to 10*s.* 6*d.* each.
TAXUS DOVASTONII, standards, 3 to 4 ft., 7*s.* 6*d.* to 10*s.* 6*d.* each.
,, ADPRESSA, 12 ins., 2*s.*; 24 ins., 5*s.*; 36 ins., 10*s.* 6*d.* each.
,, BACCATA (yellow-berried var.), 12 ins., 2*s.* 6*d.*; 24 ins., 5*s.*; 36 ins., 7*s.* 6*d.* each.
,, ,, (golden-leaved var.) 12 ins., 1*s.* 6*d.*; 18 ins., 2*s.* 6*d.* each.
VIBURNUM PLICATUM, 10*s.* 6*d.* to 21*s.* each.
*WEIGELA ROSEA.—This beautiful flowering shrub should be grown by every one. It forms a handsome object in the open borders in May. It also forces well. The plants here offered are as wide as high, and will flower abundantly in the spring. 18 ins., 2*s.*; 24 ins., 2*s.* 6*d.*; 30 ins., 3*s.* 6*d.*; 36 ins., 5*s.* each.

**A Descriptive Catalogue of Hardy Ornamental Trees and Shrubs; to which is prefixed a Treatise on the Cultivation of American Plants, may be had free, by enclosing six stamps for postage.**

---

PINE PLANTS.—For Sale, a quantity of PINE-APPLE PLANTS, of all the approved varieties, to insure a succession of fruit; they are fine, clean, and healthy.—For particulars, apply by letter to W. HARDIE, at the Gardens, Castle Ashby, Northampton.

---

MITCHELL'S MATCHLESS WINTER PARSLEY.—J. M. having saved a much larger quantity of Seed this season than last, can offer it to the public at a much reduced price. Wholesale, to seedsmen, 1*s.* 3*d.* per lb.; any quantity under 10 lbs. will be charged 2*s.* per lb. Can be sent to any part of the World, on receipt of a Post-office order, made payable to JOHN MITCHELL, Ponder's-end, Enfield, Middlesex.

---

SUPERB NAMED AND MIXED ASSORTMENTS OF ANEMONES, RANUNCULI, GLADIOLI, TULIPS, IRIS, CROCUS, LILIUM, IMPORTED DUTCH HYACINTHS, &c., with a large Collection of other Roots.—For BASS AND BROWN'S Priced Advertisement of the above, see *Gardeners' Chronicle* of Nov. 8th and 22d, or Catalogues sent free on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

---

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7*s.* 6*d.*
Extra ditto, with flowering buds ... ... 10 6
Usual discount to the Trade.
Clapton Nursery, London, Dec. 6.

---

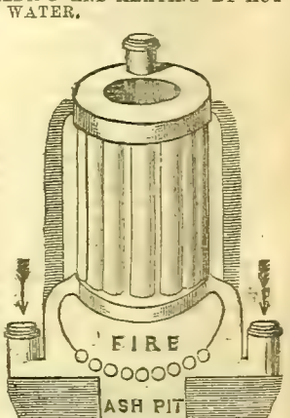
GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.
Nailsea Glass Works, near Bristol.

---

GLASS FOR CONSERVATORIES,
GREENHOUSES, PIT FRAMES, &c.

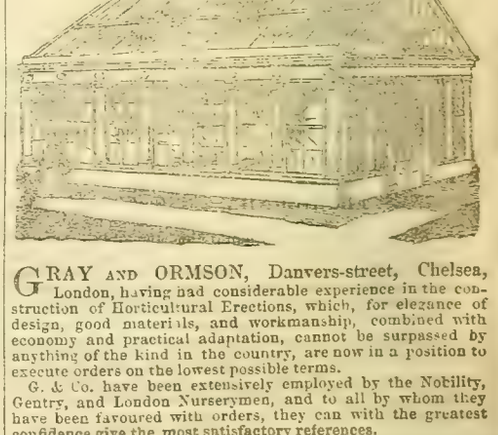


HETLEY AND CO. are supplying 16-oz. Sheet Glass, of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

| Sizes.—Inches. | | Inches. | | Per foot. | Per 100 feet. |
|---|---|---|---|---|---|
| | | Under 6 by 4 | at | 1½*d.* is | £0 12 6 |
| From 6 by 4 | ,, | 7 ,, 5 | ,, | 2*d.* ,, | 0 16 8 |
| 7 ,, 5 | ,, | 8 ,, 6 | ,, | 2½*d.* ,, | 0 18 9 |
| 8 ,, 6 | ,, | 10 ,, 8 | ,, | 2½*d.* ,, | 1 0 10 |
| 10 ,, 8 | ,, | 12 ,, 9 | ,, | 2¾*d.* ,, | 1 2 11 |

Larger sizes, not exceeding 40 inches long.
16 oz. from 3*d.* to 3½*d.* per square foot, according to size.
21 oz. ,, 3½*d.* to 5*d.* ,, ,, ,,
26 oz. ,, 3½*d.* to 7½*d.* ,, ,, ,,
PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.
GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.
Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.
PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.
GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

---



HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.
J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.
Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.
G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.
Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

---

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 12 in. greenhouse lights, 2½*d.*; 15 in. ditto, 3*d.*; 2 in. ditto, 3½*d* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.
J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

PLANTING SEASON.

W. H. ROGERS, Nurseryman and Landscape Gardener, 130, High-street, Southampton, begs to offer any quantity and description of finely grown and well-rooted NURSERY STOCK, including Forest and Ornamental Trees, Evergreen and Flowering Shrubs, American Plants, Fruit Trees, Roses, Herbaceous Plants, &c., &c., at a very reduced price. Planting contracted for to any extent, engaging to replace failures. Gardens and Pleasure Grounds laid out and planted in the best taste.—All communications addressed to W. H. Rogers, as above, will meet with immediate attention.

IMPORTANT TO ALL WHO HAVE A GARDEN.

CHALLENGE COMPARISON AND COMPETITION. Carriage Paid.

All orders above 5*l.* carriage paid to London, Liverpool, Birmingham, and Edinburgh, and all the intermediate Stations within 150 miles of the Nurseries, upon any line of Railway whatsoever. To those ornamenting their Gardens or Grounds, this is an advantage seldom offered.

SELECT HARDY HERBACEOUS PLANTS AND ALPINES.
100, own selection, two of each kind, 30*s.*; or our selection, in 100 varieties, 42*s.*
100, purchaser's selection, one of each kind, 42*s.*
100 Alpine or Rock Plants, 42*s.*

The above extends over 1000 species and varieties, selected from the choicest collections in the country, warranted second to none for beauty and display. Having an immense stock, they can be furnished at these low prices.

AMERICAN PLANTS, FLOWERING SHRUBS, ORNAMENTAL TREES, AND EVERGREENS.
Purchaser's, or our selection, from list, per 100, 2*l.* 10*s.*, one of each.
Own do. do. per 100, 1*l.* 10*s.*, two of each.

This Nursery has long held high celebrity for possessing a splendid stock of Flowering Shrubs and Ornamental Trees, extending over 800 species and varieties of the finest selection; and for quality, correctness in naming, and health, not equalled by any. To Gentlemen forming Arboretums, or adding desiderata, this is an opportunity never before offered.

HOLLYHOCKS.—No. 1, fine double kinds, all shades of colour, for exhibition, 9*s.* per dozen; 50*s.* per 100. No. 2, for border display, 6*s.* per dozen; or 30*s.* per 100. These are selected from the finest collection in the country.

COMMON LAURELS, 1½ to 2 feet, per 1000, 4*l.*; or 10*s.* per 100, fine. 2 to 3 feet, bushy, extra fine, per 1000, 5*l.*; or 12*s.* 6*d.* per 100.

PORTUGAL LAURELS, 1½ to 2 feet, 20*s.* per 100; fine, 3*s.* per dozen. 2 to 3 feet, extra fine and bushy, 30*s.* per 100; 6*s.* per dozen.

EVERGREEN PRIVET, fine, 2 to 3 feet, per 1000, 40*s.*; per 100, 5*s.* 3 to 5 feet, strong, 45*s.* per 1000; or, per 100, 6*s.*, healthy and fine grown.

LIMES, per 100, 4 to 5 feet, 30*s.*; 5 to 6 feet, fine, 40*s.* per 100, fine avenue trees.

HORSE CHESTNUT, 5 to 6 feet, 30*s.* per 100; 10 to 12 feet, 50*s.* per 100, splendid.

ROSES, 50 splendid sorts, Standards, fine healthy stuff, per 100, 5*l.*; or 18*s.* per dozen, own selection. 100 superb sorts of Dwarf Roses, in 100 fine varieties, 50*s.*; or 9*s.* per dozen, own selection; mixed, 30*s.* per 100, or 6*s.* per dozen.

MISCELLANEOUS GREENHOUSE AND STOVE PLANTS.
50 first-rate sorts, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
50 do. purchaser's selection, 3*l.*; or 18*s.* per dozen.
ERICAS, 50 of the finest sorts grown, own selection, 2*l.* 10*s.*; or 15*s.* per dozen.
" " purchaser's choice from list, 3*l.*; or 18*s.* per dozen.
CHINESE AZALEAS, 20 excellent show sorts, blooming plants, 21*s.*; or 15*s.* per dozen.
" " purchaser's choice, 1*l.* 5*s.*; or 18*s.* per dozen.

The above will be found to contain all the most beautiful and leading favourites. The plants are free grown, fine, and healthy. A splendid opportunity for specimen growers.

SEEDS.

HERBACEOUS PLANT Seeds, 100 fine varieties, comprising the choicest sorts from our unrivalled collection, 25*s.*; 50 fine for 15*s.*; 25 for 8*s.*, post free. A season will be gained by sowing them now in pots, and protecting under glass through the winter, and transplanting in early spring.
CINERARIA, from the choicest sorts, per packet, 2*s.* 6*d.*
PANSY, do. do. do. 1*s.* 6*d.*
HOLLYHOCK, warranted to produce 75 to 80 double in the 100, 1*s.* 6*d.*

FRUIT TREES.

GOOSEBERRIES, the finest Lancashire, and other sorts, per 1000, 4*l.*, in 100 varieties; or 10*s.* per 100, in 50 varieties.
A selection of the choicest description for show, 4*s.* per doz.
The stock extends over 50,000, and is fine and free grown.
CURRANTS.—May's Victoria or Raby Castle, red, has the finest flavoured, most abundant bearing, and largest sized bunches and berries of any Red Currant known; it is the best sort grown, and ought to be in every garden. Per 100, 25*s.*; or per doz., 4*s.*
Black Naples, the finest black (no other sort grown), 12*s.* per 100. 2*s.* 6*d.* per doz.
Red Grape and Champagne, fine, 10*s.* per 100.
White Dutch, large and fine, 12*s.* per 100, 2*s.* per doz.
APPLES.—Fine clean Standards, 10*s.* per doz., 70*s.* per 100.
" " Dwarfs, 8*s.* per doz., 50*s.* per 100.
" Dwarf trained superior kinds, 2*s.* 6*d.* each, or 24*s.* p. doz.
The collection is very choice, from the Horticultural Society.
PEARS.—The same price as Apples, well meriting the attention of planters, containing the choicest French, Flemish, and other sorts.
PLUMS and CHERRIES.—All the leading sorts, standards, 18*s.* per doz.
" " Dwarfs, fine, 9*s.* per doz.
" " Dwarf trained, 3*s.* 6*d.* each, or 36*s.* per doz.
APRICOTS, PEACHES, and NECTARINES.—Fine three years trained, 5*s.* each, 50*s.* per doz.
RASPBERRIES.—Fastolff, 3*s.* per doz., 16*s.* per 100.
" Antwerp Red, 2*s.* per doz., 12*s.* per 100.
" Monthly, or Double-bearing, 12*s.* per 100, 2*s.* per doz.
STRAWBERRIES.—Early and late kinds, 25 fine sorts, including some American novelties new to England, and all others of approved merit, 3*s.* 6*d.* per 100.

An extensive Descriptive List is in course of publication, in three parts, due notice of which will be given. Part I. will contain Greenhouse and Stove Plants, and all such as are tender. Part II. Hardy Herbaceous Plants and Alpines, with Ornamental Trees, Shrubs, Evergreens, and Roses. Part III. Fruits of various kinds. A short description will be given, as far as practicable, of everything contained. The want of such a list has long been felt by ourselves and correspondents, as a guide in making selections. To be had gratis on application.

In cases where our friends leave to us the discretion of selection, it will always be our anxious desire to supply fine plants of merit, and may be confidently relied on. To that end it is requested that we may be favoured with a list of such plants, &c., as are already in their possession, that duplicates may not be sent. All communications addressed to John May, the Hope Nurseries, Leeming-lane, Bedale, Yorkshire, will meet with immediate attention.

N.B. A fine stock of Larch, Spruce, Oak, &c.; sizes and price on application.

Ornamental grounds designed, executed, and furnished on liberal terms. Forest Planting by estimate.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, and CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s.* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. American Native, 10*s.* 6*d.* do. Early Manley, 10*s.* 6*d.* do. Early Ash-leaf Kidney, 10*s.* 6*d.* do.

For Testimonials, see *Gardeners' Chronicle*, Nov. 8, p. 705.

Post-office orders to be made payable at the Borough Post-office to Hay, Sangster, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

G. JACKMAN, Nurseryman, Woking, Surrey, (1½ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Dec. 6.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON and Co. have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21*s.* each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orleans Plum; when fully ripe are of a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

The Gardeners' Chronicle.

Models of the Glass Walls mentioned in our last were exhibited on Tuesday to the Horticultural Society, and beautiful looking contrivances they were. Should they realise in any considerable degree what there is great reason to believe they will fully realise—a new era in gardening is about to commence. For dead ugly cross-walls we shall have beautiful glass partitions, for "blocks" of Vineries we may expect great lengths of treillage; for conservative walls we shall get upright cases filled with exotic leaves and flowers; and even in the kitchen garden "the foot of a south wall" may cease to be an intelligible expression, when men shall have once begun to grow their early vegetables, or to ripen their forced Strawberries at the bottom of a glass box.

Conceive a line of flat iron uprights, nine feet high, firmly secured to the ground, so that no displacement is possible. Let the edges of these uprights be pierced with holes, through which wires may be horizontally stretched, whereon to train branches. At the distance of a foot from both faces of the uprights, erect a perpendicular sash of glass. House in the sashes with a glass coping, so constructed as to throw water off into gutters prepared for its removal. Finally, give the upright sashes a free motion to the right or left, that every part of the trellis-work can readily be uncovered and made accessible. The reader will then have an idea of Mr. Ewing's glass wall, which, in fact, is an erect glass case, 9 or 10 feet high and about 2 feet thick, perfectly transparent, within which all manner of plants may be trained in the espalier form, in a double line, one line facing the south, the other the north, or otherwise, according to the direction of the wall.

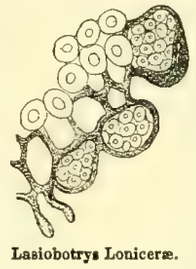
Some of the points which are gained by this plan are of great importance in gardening, wholly irrespective of that gain which consists in substituting an object of great beauty for one pre-eminently ugly. The first of these is shelter, an advantage which a brick wall does not possess. Enclosed at night in such a case, spring frosts and hail or snow-storms, while fruit trees are in blossom, can produce no injury. By closing the sashes to windward and leaving them open to leeward, a perfect screen is secured against unfavourable winds, without any material loss of ventilation. In bad weather rain need have no access; in damp weather comparative dryness is secured. In winter snow and ice cannot hang about the branches, and the worst effects of frost must be thus prevented.

But shelter is not secured by the sacrifice of light, as happens in greenhouses. On the contrary, the transparency of the structures is as perfect as is attainable if any medium whatever is to be interposed between plants and the source of light. In fine weather, when light is most wanted, and the sashes all open, there can be little difference, and certainly none of the least importance, between what reaches the interior and that in the free air. And, if it were otherwise, the full command of air which this invention secures, more than compensates for the loss of an element, the importance of which is often over-estimated. Experience tells us, that in looking at the action of light upon plants, physiologists have formed their views too much upon theory only partially exact; ascribing to the mere effect of light what is probably owing to the joint action of air in rapid motion, light, and heat.

Walls have this serious fault in addition to all others, that they present great difficulties in the way of fumigation or sulphuration, the necessity of which latter operation is becoming so much greater every day. In fact there is no way in which those operations can be applied to walls unless with the aid of canvas screens or travelling covers. In the glass walls, on the contrary, tobacco-smoke or sulphur can be applied even more easily than in a greenhouse.

As compared with Vineries these walls occupy very little space, not much more indeed than the superficial area of a Vinery roof; so that instead of a hollow block of glass containing some thousand cubic feet, a hollow plate of glass consisting of a few hundred will answer the same purpose.

These are what strike us as the advantages to be expected from glass walls, constructed upon Mr. Ewing's plan. Are any disadvantages to be expected? That is a question which can only be answered by experience. It may be that they will not be warm enough in summer to ripen certain kinds of fruits, from the want of the power of absorbing and reflecting heat. Mr. Ewing has, in fact, anticipated this objection, by providing his upright iron standards with grooves, into which slate, or wood, or metal panels may slide. This would, however, destroy the transparency of the walls, and is not likely to be required, unless for the most tender of fruits. It has been observed, too, that the space provided between the glass and trellis is insufficient; an opinion in which we concur in the case of slovenly gardeners who leave a forest of breastwood or Pear-spurs 18 inches long on their trees; but we believe that the space is sufficient with good cultivation. At all events, if the space should not suffice, the fault would be one of detail, and not of principle.



Concerning the main question, price, we are unable at present to make any positive statement. The patentees will lose no time in communicating that to the public through our advertising columns. We believe that the glass walls will be found at least as cheap as brick ones; and if it were otherwise their beauty, and obvious applicability to numerous purposes, now only attainable in a greenhouse, really reduces the cost to a secondary consideration. We believe, too, that they would be regarded as tenant's and not as landlord's fixtures, a most serious consideration, concerning which, if we are wrong, perhaps some legal friend will set us right.

In the course of the season a trial of these walls will be made in the garden of the Horticultural Society, when full opportunity will be found of investigating both the merits and demerits of the invention.

It was a favourite notion of the French botanist, Turpin, that every organism is but the development of a single primitive cell. This is, in fact, the one idea which pervades all his memoirs, and the germ of almost every true or false theory which he propounded. Of the notion itself, properly understood and limited, there can be little doubt, though it may be practically impossible to insulate, as Turpin proposed, a single cell of some phænogam, and by proper treatment to induce such an evolution as shall give rise to a plant similar to that from which it was taken. For, though while the cells are in connection, some privileged vesicle, as in the embryo-sac, or in any other part of the plant, may be the origin of the new individual, that cell, when insulated, might be wholly unfitted for such an end. Phenomena, similar to that of the occurrence of two kinds of flowers in the same shoot, in a variety of Laburnum in common cultivation, have been ingeniously explained by the supposition that a

single cell of two varieties had been divided in the process of preparing the stock and its scion, that the two half-cells had become completely united so nicely as to form a whole possessed of different character in its constituent parts, and that, from this cell so constituted, a bud had been produced, which was capable of exhibiting, according to the predominance of these parts, the peculiar attributes of each variety. This of course is but theory, but it is very specious and possible.

Some of Turpin's speculations, as that of the development of the sporidium of a Truffle into a new individual, without any direct germination, have been proved on further examination to be incorrect; it is now well ascertained that Truffles, like other Fungi, are developed from a mycelium springing from the sporidia. A fact, however, has lately come within our cognisance scarcely less wonderful than the development of the Truffle from the "Truffinelles," supposing that to be correct. The curious *Lasiobotrys*, which is not uncommon on the leaves of various species of Honeysuckle, has perplexed many botanists, because the apparent perithecia never fructify, but produce a number of minute perithecia from their base, which contain asci. The larger bodies in fact consist of a cellular mass of which the outer cells are dark, while those of the centre are hyaline, with thick walls. This is exactly the structure of the perithecia of *Sphæria* when immature, a portion of the central cells in age being absorbed, and those nearer the circumference either being transformed into asci, or giving rise to them; and such is in fact the structure of the smaller cysts in *Lasiobotrys*, in which alone at present asci have been observed. The curious point is the mode in which these minor perithecia originate from the large original mass. A happy section has exhibited very clearly the transformation of certain of the external cells into these organs of reproduction. The dark external cells at first contain a turbid slightly granular mass. This, however, in certain privileged individuals, at length becomes organised, exhibiting at first a few hyaline thick-walled cells. As these increase in size and number, the wall of the cell itself also become cellular, just after the fashion of the development of the simple walled cells into cellular sporangia in *Antennaria*, and finally separates entirely, or retains merely a slight connection by a portion of its surface with the parent mass. For some time there is no apparent difference between the two, except as regards size; but ultimately, a sheaf of utricles is formed towards the base, which soon assume the usual structure of asci. We have represented in our figure, which is highly magnified, the origin of these bodies, which we think highly important in a physiological piont of view. *M. J. B.*

Lasiobotrys Loniceræ.

## MUSHROOMS.

After reading the paragraph at page 675 relative to the late case of poisoning by Mushrooms, I was induced to examine some remarks which I had made, from time to time, on the changes of a fairy ring near where I am now writing. In the summer of 1849, I was requested to inspect a fairy circle, and was informed that in the previous year it had produced a great crop of fine looking Mushrooms, which were gathered and placed in the larder to await the time for cooking them, but in the meanwhile suspicion arose as to their being the true Mushroom, and they were destroyed without knowing whether they were really poisonous or not. When I visited the ring in 1849, I found a fine crop of Agaricus pratensis, which was looked upon with wonder by many, seeing that such fine Mushrooms had changed to those insignificant Champignons; and for me to say that they were of the same family, and eatable, was considered remarkable. They were, however, very fine, and made a delicious dish. In 1850 the same ring produced a crop of Agaricus arvensis (by the description given, I considered those in 1848 to have been the same), many of which I ate, and others I made into ketchup; but this year they have changed into a poisonous kind—Agaricus cristatus.

Where such annual changes as those just mentioned take place, great caution is required in gathering by persons not well acquainted with the edible kinds of fungi, although the common Mushroom can hardly be mistaken by the most casual observer, for when of medium size its beautiful pink or flesh-coloured gills, with its very fragrant odour, are good distinctions. When it becomes older, and the colour changes, it may, however, then be taken for some other kind. The quantity of different kinds of fungi is greater here than in any other part where I have been, and many bear close resemblance to the common Mushroom: they are, however, deficient in that very fine odour which is so abundant in Agaricus campestris. I have seen Agaricus virosus very plentiful in fairy rings, a species which is extremely poisonous, and may, at a certain age, be taken for A. pratensis by people unacquainted with their difference. In order to be on the safe side every doubtful species should be rejected.

I must not forget to mention that Withering remarks that only one species of Mushroom is ever concerned in making any one fairy ring. In the case just alluded to I did not find more than one species of Agaricus at one time, although I discovered Boletus luridus intermixed as well as within the ring. *William Culverwell, Thorp Perrow.*

[The preceding observations are well worth the attention of all who are experimentalists in esculent Mushrooms. It may be doubted whether the true *Agaricus pratensis* be meant, as it could scarcely be compared with *Agaricus virosus*, the former having a turbinate pileus, with thick, distant, buff-coloured decurrent gills, while those of the latter are of a totally different character. *Agaricus pratensis* is beautifully figured in Greville's "Scottish Cryptogamic Flora," and is indeed an excellent fungus. It is a well known fact, that many species frequently occur in the same ring, but not at the same time; and there is, therefore, some plausibility in the notion that the same mycelium may produce more than one kind. It will be found, however, on close examination, that the mycelium frequently affords excellent characters for the distinction of species, and there is no more reason to infer the identity of Agaricus growing successively on the same spot, than there is for asserting the identity of early and late Grasses in the same plot of ground. The mycelium, though frequently small and insignificant, is really the plant; and the pileus, with its stem and gills, the fruit. In some cases, however, the mycelium acquires an enormous development, as in the Amboyna species, figured by Rumphius, and in the well known Pietra funghaja of Italy. Every person who has studied these plants in their native ground is almost as well assured of finding a particular species in its own locality at the proper time of year, frequently confined to a few square feet, as in any other branch of botany, provided the weather and local circumstances are similar. Even in phænogamous plants it is well known that species are more abundant in particular years, and some appear only periodically. *Epipactis purpurata* was most abundant in a wood whose undergrowth is *Tilia parviflora*, a few years since, just after the brushwood was cut, though it had not been seen in the locality before during an acquaintance of 15 years, and it has in vain been sought for since. Under similar circumstances a neighbouring wood was absolutely blue with the common Columbine, though at other times only a few scattered plants could be found on the most diligent search. Numerous examples of a like nature might be adduced, and much more, in plants so completely dependent on atmospheric conditions as fungi, may we expect a little irregularity as regards the constancy of their appearance. If, however, the species mentioned in the foregoing remarks—substituting probably *Ag. oreades* for *Ag. pratensis*—be submitted to microscopic inspection, no doubt can be entertained about their complete difference. We may add to the list as frequent tenants of the same rings as *A. oreades* and *A. arvensis*, *A. personatus*. *A. procerus* also occasionally grows in them, one of the best of esculent fungi. This could scarcely be confounded with *A. cristatus*, though a fairy ring is a curious station for that species. *M. J. B.*]

## BRITISH SONG BIRDS.

(Cage Birds, No. 41.)

No. LVII.—It will readily be believed, that on a subject like the one we are now treating of, there must exist some differences of opinion; indeed, we have already hinted that the "Philosophers of the new school" are severe upon us for our short-sightedness, and 'narrow views.' Be it so. We try to reason logically and as Christians; and hope to show, by our evenness of temper, that we have no wish to quarrel with any person, however widely we may differ in our thoughts and perceptions of Nature's works.

The human mind, when once it ventures out of its depth, and dares to soar higher than it has a warrant for—and there surely is a limit to Man's inquiries into the more subtle and intricate works of God in connection with ourselves; establishes a code of laws, and introduces a new train of visionary ideas, as ridiculous and dangerous as they are untenable and unsound. Let us listen to the modestly-urged expostulations and sensible remarks of the good St. Pierre on this subject. "Nature," says he, "is herself the source of all that is ingenious, amiable, and beautiful. By applying to her the violence of our imaginary laws, or by extending to all her operations those with which we are already acquainted, we conceal others worthy of the highest imitation with which we are totally unacquainted. We add to the cloud with which she veils her divinity, that of our own errors. They get into credit by time, by professorships, and by books. We carry with us, into researches so independent and so sublime, the passions of the college and of the world. Those who enter first on the career oblige those who come after them to walk in their footsteps, or to give it up; as if Nature were their patrimony; or as if the study of Nature were an exclusive trade which did not admit of every one's participation! * * It is the study of some men's whole lives, to raise men towards the Deity by their sublime discoveries,—they little suspecting, that the laws *they* are endeavouring to establish in physics *may one day subvert those of morality*. In order to form a right judgment of the magnificent spectacle of Nature, *we must suffer every object to remain in its place*, and remain ourselves in that which she has assigned to us."—We offer no apology for the above admirable quotation, as it subserves a great moral purpose. There are many who dissent from these dogmas *toto cælo*; and we are anxious to declare ourselves of the 'old school.' But let us now resume our subject.

It has been objected to our general remarks, that the rook, crow, and other members of that family, are most assuredly possessed of reason, and that we cannot prove to the contrary. Now we do not admit this at all. The rook and crow, it must be borne in mind, are very different from most other birds. Their size and colour render them palpable to the sight of every passer by; consequently they require more foresight than those animals whose colour assimilates with that of the ground, or the particular situation which they are in the habit of frequenting. Plovers, partridges, larks, and some other birds, easily escape observation by lying close and motionless when danger is apprehended. You may pass within a foot of them, and never see them. I once found, quite accidentally, on a sloping bank, the nest of a yellow-hammer; and I marked the spot. On revisiting it a day or two afterwards, I was really puzzled to recognise it again. The old bird was on the nest, covering her young; and though my eye must several times have been fixed on her, yet, from her stillness and from her being surrounded by objects corresponding in colour and effect, I was for the time deceived.

The rook and crow are generally found upon ploughed fields; and are therefore naturally aware that, from their contrasting colour, they become objects for observation. Nature, foreseeing this, teaches them by a "universal law" to employ a scout or sentinel, whose duty it is to apprise the general body when anything looks at all suspicious, or there is reason for becoming alarmed. They then at once rise on the wing and decamp. If this were not universally the case, or formed a solitary instance of sagacity, we might, as we have before observed, be induced to alter our opinion,—*not* otherwise. They communicate the "signal" by a language peculiar to themselves. Often have we subjected them to a "proof" of this natural law, by raising a stick, shouting, or waving our hat; and we have *on every occasion* found our belief confirmed. The sentinel has "smoked" us, and has "reported progress."

The vulture, the eagle, and birds of that tribe know, by an unerring instinct, when and where they can obtain their prey, safe from pursuit; and they build their nests in situations for the most part inaccessible. As for the raven, which it is said can see and smell food at an incredible distance,—I believe sight and smell have very little to do with it. This creature is "gifted" by Nature with an instinct far superior to these common perceptions. No sight, no smell, could teach them what we have known them to exhibit in the matter of foresight. Let us, therefore, exalt Nature in her most bountiful gifts to certain of her family. They are, undeniably, 'extraordinary' endowments bestowed for "special" purposes.

We are again appealed to on the subject of certain birds, in foreign countries; and are defied to prove that *they* are not gifted with 'reason.' Our opponents are not very clear sighted, but we readily listen to them; for, as we have before said, to elicit truth is our *only* object. In the matter of some foreign birds, which build their nests at the extreme ends of branches, and in other equally safe positions, to escape the attacks of serpents, and such-like noxious animals peculiar to India and the East—what do we see but (as I have from the very first laboured to prove) the never-failing, never-ending beneficence of Nature, in providing for the wants, requirements, and necessities of *all* her children, *wherever situated*. Were she to forsake them, or neglect to endow them with instinct *because they resided abroad*, then should we have a most imperfect creation indeed! But the question cannot, must not, be *so* argued. Everything is better ordered than we could order it, how "wise" soever we may consider ourselves to be. To show how willing we are to give those who doubt, the benefit of every reasonable argument, we subjoin for their consideration the following, recorded by Dr. Buchanan. If nature's voice be not audible *here*, we leave the sceptics to explain the matter in their own way. "The birds," says Dr. Buchanan, "that build hanging nests, are very numerous at Cape Comorin. At night, each of their little habitations is lighted up, as if to receive company. The sagacious little bird fastens a bit of clay to the top of the nest, and then picks up a fire-fly; sticking it on the clay to illuminate the dwelling, which consists of *two rooms*. Sometimes there are three or four fire-flies; *the object of this is*,—that the blaze of light in the little cell should *dazzle the eyes of the bats*, WHICH WOULD OTHERWISE KILL THE YOUNG OF THESE BIRDS." As this is an "universal law," and not regulated by the brain, or organisation of any one bird's head in particular; what becomes of the modern philosopher's argument? We might multiply instances *ad infinitum*; but after all, it is labour thrown away to argue with an unbeliever.

Rather than wait for the natural evolution of the doctrines and views that would suffice to explain the mysterious powers of life and organisation in the animal creation, our impatient speculators seize upon some plausible supposition, and intrude it by main force into the appearances—thereby attempting to get rid of difficulties, and to misrepresent facts, for the sake of maintaining their own (untenable) position, and getting credit for their (misplaced) ingenuity. Day after day, we observe that this error is becoming widely circulated; and we feel quite sure that it must occasion painful regret to all who love their Creator, and are impressed

with His unerring goodness towards everything that He has made. *William Kidd.*

## FOREIGN GARDEN GLEANINGS.

Royal Gardens at Charlottenbourg.—A wide and beautiful avenue leads from Berlin to Charlottenbourg. In a corner of the park at the latter place, upon a small mound, may be seen the tomb of K. William, surrounded by a magnificent platform, on which the most rare and splendid flowers are to be found throughout the summer. At the end of this park, and before the palace, there is another platform, shaped like a horse-shoe, and designed by the King himself with exquisite taste. Although it is not ornamented with a single shrub, the annual and biennial herbaceous plants are so arranged according to their height, colour, size, and duration, that the effect produced is grand in the extreme.

Behind the palace are gardens laid out in different styles; there is a charming artificial Swiss valley, surrounded by beautiful trees, and on one side bounded by a stream of water, shaded by fine specimens o Cupressus disticha, and crossed by rustic bridges. At the end of this valley there are some tropical trees, and especially an Araucaria excelsa from Chili, worth 200 dollars; this magnificent tree suffered a little in its passage to Europe, but has now quite recovered and is in full health and vigour.

We need not describe the great clumps of trees, &c., scattered here and there, and which serve as a sort of frame to this splendid picture. Further on there are Palms in the open air, trees from cold climates, and groups of Agave of an uncommon size, crowning a small hill. In the damper places there are Cannas, Maranta grandis, Arundo Donax with ribbon leaves, Fuchsia corymbosa, Mexican Maize, Persicaria from the Levant, and Ricinus. We should very much like to see such masses of vegetation introduced into our own country.

The Orange house, decorated with statues of gods and goddesses, was built in the time of Frederick the Great, is 58 yards in length, and contains 500 Orange trees.

The kitchen garden, though its soil is hot and dry, nevertheless furnishes an abundance of excellent vegetables. The fruit trees, and the Apricots more particularly, bear very plentifully. Vines are trained with great care, and in various shapes. We were very much struck with a small spot in front of the temple of Princess Lignitz; the flowers which decorate it are tastefully shaded by the Vines, which form over them a species of canopy. The park is too much like that at Versailles to deserve any special remarks. *Masson's Report.*

## Home Correspondence.

*Late Roses.*—The following are now in full flower at Moore Abbey, County Kildare: Baronne Prevost, Duchess of Sutherland, Bouquet de Flore, Geant des Batailles, La Reine, Madame Laffay, Mrs. Elliot, Madame Desprez, Souvenir de la Malmaison, Fellenberg (very fine), Abricote, Devoniensis, White China, Aimée Vibert, Jaune Desprez, Rose de Roi, Bourbon Queen, Gloire de Rosaméne (very fine), Grand Capitaine, Pierre de St. Cyr, Celimene, and Acidalie. Since the above was written, there have been two nights' hard frost, which will, no doubt, put an end to Rose flowering this season. *Alexander Matthew, Dec.* 1.

*Hints to Persons making a Garden.*—Rock, wood, and water being the principal constituents of natural scenery; sand, clay, and lime the most obvious characteristics of natural soils, it becomes an object with the gardener to adapt—not his soil to his plants, as is the common but mistaken practice—but rather his plants to his soil, at the same time that he makes the most of his situation for picturesque beauty and horticultural enjoyment. An erroneous idea prevails, that it is necessary to have a very good—that is, a very rich soil, natural or artificial, for a flower-garden: a notion to which the requirements of the kitchen and fruit-garden have, in all probability, contributed. But most persons who have travelled with botanical pursuits in temperate climates (for with tropical botany, our out-door gardening has nothing to do), must have observed that the districts most productive of variety are those of a wild and sterile character; and that while in regard to luxuriance and vigour in the development of individual species, fertile plains and rich alluvial valleys are pre-eminent, they are accompanied by great monotony in the prevailing features of their vegetation. The modern taste in gardening in England is gradually leading to a something of higher aim and wider scope than the mere landscape pleasure-ground of the last century, or the more formal floriculture which preceded it: neither will be abandoned, because each has its merits, but they will, it may be foreseen, be united with views of a more scientific character. Geography and physiology may each contribute to give interest to collections in which mere horticulture plays but a subordinate part, though capable of combining and illustrating these two branches of science in a very high degree. The introduction of new plants, and the trial by experiment how far certain species, genera, or families—or the plants in general of certain regions, can be adopted to one climate without care, or cultivated to any useful purpose with care, form also legitimate objects of an enlightened system of horticulture. A few years ago the notion of acclimatising or naturalising plants of warmer lands than our own, was beginning to prevail, but was checked by some severe winters, as well as by juster views of what it was reasonable to expect in modifying the laws of nature. Except by a long succession of seedlings, and then only when some seedling shows a marked variation from the type, the expectation of acclimatising tender plants may be pronounced nearly hopeless, and is not intended to be included in the recommendations of the present notice. With regard to naturalising even the hardiest species, everyone must have observed the strong and unaccountable repugnance of the vast majority of plants, however easy their culture within the garden walls, to sow themselves to any extent, or to reproduce themselves for any length of time even when self-sown, outside of them. It is sufficient to have mentioned these few preliminary points before proceeding to some more practical observations hereafter. *S.*

*Rough Plate* v. *Sheet Glass.*—If "An Old Gardener's" sheet glass is not better than 21 ozs. to the foot, I expect that if his houses are exposed to the sun, he will have a scorching, except the aspect be a north one. I happen to have from 4000 to 5000 feet of Vineries, glazed with 21 oz. sheet, which was procured from a first-rate firm; but I have never been able to get over a season without the foliage of my Vines being dreadfully burned. This, however, has not occurred through want of robust health, for with all the disadvantages which this glass possesses, my Vines are the very acme of perfection in that respect. Your correspondent speaks of the old fashioned common glass, no doubt meaning the old green glass. Ah! give me that now in preference to sheet. It is twenty to one better for good cultivation; indeed, my sheet glass, looking obliquely at it, appears as if it had been hammered upon an anvil. I have had Camellias burnt under it, 7 feet from the roof. What glass manufacturer in England will not tell you that he knew it would cause burning; but he was obliged to meet a foreign market! I trust that its sun is setting, however, never again to rise, as far as horticulture is concerned. Now a word as to the merits of rough plate. At the present time I have nearly 3000 feet of it in use in the shape of pits and conservatory, and I am so far satisfied of its superiority, not only over sheet glass, but also over all other kinds of glass for horticultural purposes, that for whatever is to reglaze or erect new here, I will adopt it without hesitation. I use it for plant culture, Melons, Cucumbers, propagating, &c., and perhaps no one regrets more than I do that I cannot replace the sheet in my Vineries with it. It is a mistake to suppose that it obstructs light; on the contrary, it collects and diffuses it better than the clearest sheet or crown glass. Another advantage which it possesses is, that there is no scorching and no shading. I have recommended it to all my friends, and I have had the pleasure of seeing it adopted for the growth of the Vine. My friend is an amateur, but he has produced a pattern of Vine growing under rough plate, that would not be a disgrace to me or even "An Old Gardener." As to this kind of glass becoming dirty, that has not happened here. There are, however, many samples of glass in the market, called rough plate, which I would not use. The glass I have employed was purchased of Mr. James Hartley, of the Wear Glass Works, Sunderland, sole patentee of the true rough plate. A large conservatory erected at this place, glazed by him, is open for inspection as to its appearance, utility, &c. This glass is perfectly efficient for all purposes of horticulture; it effects a saving of fuel, and is proof against the severest storms. *James Roberts, Gardener to the Duke of Cleveland, Raby Castle, Nov.* 28.——It may interest some of your readers to know, that last winter I re-glazed with "Hartley's rough plate" a Vinery, which had previously been glazed with sheet glass; and which gave occasion to the complaints I formerly made against that article. The Vinery is a large house, with a flat roof, requiring nearly 1000 feet of glass, and during the late summer, it has answered every expectation I was led to hope from its use; and I have much pleasure in adding my testimony to its good properties, and adaptation to most garden purposes. *John Spencer, gardener to the Marquis of Lansdowne, Bowood, Dec.* 2.——I have for the last three years had a large quantity of Pines and a variety of stove plants growing under Hartley's patent rough plate glass. During the hottest sunshine, I have never required shade, and the plants have grown, especially the Pines, with a health and vigour that I have never seen surpassed. No instances of scorching have occurred, nor has the glass become dirty. I never would use any other glass for Horticultural purposes. *Tirydail.*——The south side of the roof of the plant-stove here was glazed with Hartley's patent rough plate, in panes 30 inches by 7 inches, three years ago; and from my experience of it I consider it superior to sheet glass in several respects. First it contains a tinge of green that I have not seen in any other kind of glass, which plants are peculiarly fond of, and it does not burn or scorch like sheet-glass, consequently there is no necessity for shading on that account; but when shade is necessary for other reasons, it is as much required with rough plate as with any other glass. All the plants that I have grown under rough plate possess a richer hue than the same kinds grown under sheet glass; they are also as sturdy in their habit, and blossom and fruit as freely under the former as under the latter. The light transmitted through rough plate is as powerful as that through sheet or crown glass; and it is of a better quality than sheet glass gives, which can easily be proved by means of some of the delicate vegetable colours, such as those of the Red Poppy, or newly expanded flowers of the Franciscea uniflora, placed on paper at a distance of 6 or 8 inches from the glass in strong sunlight, or some metallic compounds may be used which are equally sensitive to the effect of light, and *cæteris paribus*. It will soon be seen by the effect of the light upon the colour used under each kind of glass, that the rays are as powerful under one as the other; but the extraction or change of colour will be much more even under the rough plate than under the sheet-glass, showing that the light through the rough plate is of the best quality; and I consider that this description of glass is a boon to the horticulturist, as the obligation to shade, to save plants from the scorching propensity of sheet-glass, at a time when you require the sun-light upon them, is a very serious disadvantage. *Henry Bundy, gardener to Lord Dynevor, Dynevor Castle, Llandilo.* [We here close our correspondence concerning Hartley's rough plate. We have more letters to the same effect; and our own experience is conclusively in favour of it.]

*Phillips's Fire Annihilator.*—I desiderate practical information: 1, as to cost; 2, as to bulk, weight, and moveableness; 3, as to quantity of charcoal and nitre requisite to use, and therefore to keep; 4, as to time required in getting it ready; and 5, as to competency of farm-servants, house-servants, and others, not practical chemists, to get it ready for use, and use it. It points to most important results: 1, a law compulsory on all parishes, at least in towns and villages, to keep them; 2, to covenants in farm leases to do the like; 3, to the depreciation of fire-insurance-office shares; and 4, to Mr. Phillips purchasing Stow, and not insuring it. *A. H.* [For prices and such information you should write to the company's shop, at 150, Leadenhall-street. Each time the machine is fired, a fresh charge is required; and persons in the country should keep such charges by them; they are sold with the machines. The action is as instantaneous as the discharge of a fire-lock, and no more skill is required in its use than pulling a trigger. It is always ready for use, just as a loaded gun is always ready.]——The satisfactory notices of this very ingenious, and, as I have myself witnessed, very effective invention for the immediate extinction of fire, which have from time to time appeared in your paper, lead me to suppose that the subjoined extract from a newspaper cutting, relating to a similar invention in the former part of the last century, will not be uninteresting. I found the cutting pasted into an old copy of "A Century of Inventions by the Marquis of Worcester." I shall not be mistaken by you or by Mr. Phillips, if this should meet his eye, to wish to detract from the merit of that gentleman's invention, but rather to aim at overcoming any prejudice which from mere novelty alone may attach to his very important discovery. The cutting is dated in M.S. June 1760. The extract is as follows:—"The famous machine for immediately extinguishing fires, invented by that eminent chemist, the late Mr. Ambrose Godfrey, will, we hear, be submitted to the judgment of the present age; and, if found to answer the original intention, it is hoped will not be suffered again to drop into neglect. This machine is of a convenient portable size, proposed to be hung up in houses to be ready upon all occasions; and by being thrown into the window of a room on fire, by a sudden explosion suffocates and extinguishes the flames. In the year 1723 an edifice was erected at Belslize, near Hampstead, on purpose to try the experiment, which was set on fire and extinguished by the machine, to the satisfaction of some of the first nobility and persons of condition of that time. But from what fatality so great a design was then laid aside and never since taken up again, is at this time extremely difficult to be accounted for." *H.*

*Winter Covering for Hothouses.*—In a paper contributed by Mr. Buchan, at page 756, he very justly observes, "the inhabitants of plant and fruit houses require for their healthy development heat, air, light, and moisture," by light I presume he means sun-light, "the greater light that rules the day only," for by his system of covering at night, he entirely excludes the important and peculiar influences of "the lesser light that rules the night"—and the stars also. *Inquisitor, Lee-place, Lewisham, Dec.* 1. [Which lesser light is not of the slightest importance to plants that we know of.]

*Ice Stacks.*—"E. J." has no great reason to complain of the failure of his attempt to preserve ice, as detailed at p. 758. He appears to have adopted the general idea of the system I described at p. 812 of your volume for 1848; but to have departed from its essential principle. For his information I will, as succinctly as possible, recapitulate the substance of the article above alluded to. The position chosen for the ice stack at Hatfield is the north side of an abruptly sloping undrained bank. The ice is thoroughly pulverised, and the stack is compactly built up in a conical form from a base of 18 feet by 16 feet; when completed it is covered with 18 inches of dry Fern, and then thatched with straw. The thatch must rest exclusively on the ice stack, and no impediment should be allowed to exist to prevent its subsidence with the ice. As the ice wastes it is necessary occasionally to visit the stack, to see that the thatch closely clasps it. A wall, composed of decayed Fern and straw, stands at the bottom of the bank, and serves as a slight protection to the body of ice when first built, but it is not otherwise of great importance. It will be seen from the above, that in the application of the protecting materials, every endeavour is made to exclude air and moisture. "E. J." fell into error in placing roots and straw beneath the body of ice, the moist air existing amongst the roots would inevitably conduce to its destruction. The fixed roof was also, in my opinion, objectionable; as the bulk of ice decreased, a space between the roof and stack would be left, allowing a current of air to act on the top

as the air amongst the roots would at the bottom of the stack. Dependence on the wall of straw was perhaps another cause of failure. If "E. J." wishes for success, he must throw aside the roots, knock down his posts, and make the thatch moveable. *W. Ingram, Hatfield, Herts.*

*The Cuckoo.*—Notwithstanding the difference which "Ruricola" says exists between the formation of the throat of the male and female cuckoo, I am as sure as I am of my own existence that Mr. Kidd is right in stating that the female does utter the well-known cry, and also that the cuckoo does sometimes feed its own young. As proofs of these assertions I offer the following. I have stood within 3 feet of a cuckoo while depositing its egg in the nest of a robin, and I have heard that cuckoo when she left the nest, after depositing her egg, utter the pleasing sound "cuckoo" twice, as distinctly as ever I heard it in my life. I am certain that it was the female. I stood in a cellar where there is a small grated window surrounded with Ivy. A robin had made its nest on the ledge of the window. Happening to be in the cellar one day, and hearing a rustling noise at the window, I went up to it, and saw a cuckoo; but in approaching I had disturbed her, for she flew away. I observed that all the eggs (four in number) of the robin had disappeared, and that the nest was empty (whether the cuckoo had cast them out or not I cannot tell, but I found the shells on the ground when I went out). Thinking that the cuckoo might return, I remained at the window as quietly as possible, and she did return; but she exhausted my patience, as I had to sit in a rather tiring position, in order to see her, and I went out. On going round to the window she flew away; and, as I have said, called "cuckoo" twice. I looked in the nest and there was her egg, which I know was not in the nest before she returned the second time. I may state that coming out of the cellar and going to the window did not occupy me 30 seconds. In watching the progress of the young cuckoo, which in due course, under the fostering care of the robin, made its appearance, I have seen, from the same window, a cuckoo more than once bring food to it. I well remember a cuckoo carrying food to a young one, some 10 years ago, at Kingsbury, in Middlesex. I recollect it well, as it was the first young cuckoo I had ever seen; and I discovered it by seeing the old one go to the nest with something in its mouth. I saw it go several times, but I afterwards found that a hedge-sparrow did the most of the feeding. I noticed it particularly, as I had read that the cuckoo never did feed its own young. *Opinionum commenta delet dies, naturæ judicia confirmat. John Middlemiss, Bentham Hill, Tonbridge Wells.*

*Musa Cavendishii.*—This valuable tropical fruit has being growing in great luxuriance in the hothouse of the Rev. Sir T. G. Cullum, Bart., Hardwick-house, Bury St. Edmunds, in a bed, without the aid of bottom-heat; but, in order to accelerate its ripening, the gardener cut off the stem and suspended it in the warmest part of the house. As the plant is readily increased by suckers, will some of your readers favour me with the best mode of cultivation? *N. S. H., Bury St. Edmunds.*

*Blocks for Orchids.*—After some years' experiments, I find that the best of all possible blocks on which to grow Orchids, are formed from the root of Elder. They must be allowed to dry, so that the bark strips off, and they should be sawn into suitable sizes. Their gnarled and rugged surfaces appear to be peculiarly agreeable to the roots of Orchids. I have long used Elder for this purpose, finding it by far the most durable of soft woods, and at the same time spongy, so as to absorb due moisture; bnt is difficult to obtain it of suitable size and form. The roots which I have only tried during the last year or so, seem perfect, and such plants as Cattleya Mossiæ, Dendrobium aggregatum and Jenkinsii, soon cover the blocks with their roots, which are thus preserved through winter without the slightest injury. If the bark be retained, minute insects (and I believe young woodlice) harbour and are troublesome; the naked wood is free from these objections. *J. R.*

*Names of Conifers.*—Why is the name Pinus austriaca preferred to that of Pinus nigricans? The tree is not known by that name in Austria, to a small part of which country it is restricted, and in which most of the European Conifers are found. Host calls it nigricans, and in the Vienna Botanic Garden it stands under that name as well as in the "Flora Austriaca." It is hardly more than a variety of Laricio, so common over the south-east of Europe. Nigricans is the proper translation of its German name, Schwartz Föhre (black Fir), in contrast to P. sylvestris, their white Fir; while austriaca is neither characteristic nor distinctive. What is the distinguishing character of the genus Chamæcyparis? There appear to be two plants going under the name of Mexican Cypress in your list—Chamæcyparis thurifera and Cupressus thurifera—are they alike in general appearance? Pinus Persica I see numbered among the three-leaved Pines; this is hardly correct. It certainly bears occasional quills of three leaves; but only interspersed among the normal two-leaved ones, as happens to the Pinaster, and may possibly also to its nearest congener, P. halepensis. *S.* [It appears that Höss's name of P. austriaca was published earlier than Host's P. nigricans; no doubt it is a variety of Laricio. In Chamæcyparis the scales of the cones are two-seeded, in Cupressus they are many-seeded. Cupressus thurifera and Chamæcyparis thurifera are the same plant.]

## Societies.

Horticultural, *Dec.* 2.—E. Brande, Esq., in the chair. The greatest novelties exhibited on this occasion, and those which excited by far the most interest, were the models of glass walls, some account of which will be found in a leading article in another part of to-day's paper. Flowers, except those contributed from the Society's Garden, were scarce. Mr. Salter, of Hammersmith, sent a collection of Pompone Chrysanthemums in a cut state, the produce of crosses between Mr. Fortune's Chusan Daisy and some of the larger flowered kinds. Many of the sorts were very handsome; but as they were not shown in the shape of plants, a circumstance to be regretted, little can be said with certainty respecting them.—Blooms of a very beautiful hybrid Epiphyllum were produced by Mr. Snow, gr. to the Earl de Grey. It was stated to have been raised between E. Russellianum and E. truncatum, but it was much deeper in colour, and better shaped, than either of its parents. A Certificate of Merit was awarded it. —Fruit was tolerably plentiful. Mr. Ingram, gr. to her Majesty, at Frogmore, sent a finely-formed and well ripened, smooth-leaved Cayenne Pine-apple, weighing 8 lbs. 4 oz., for which a Knightian Medal was awarded. The same variety, weighing 5 lbs. 13 oz., together with a new kind, called Charlotte Rothschild's Pine, which resembles the Cayenne, were furnished by Mr. Dodds, gr. to Col. Baker. A Banksian Medal was awarded for the Cayenne.—Black Jamaicas, weighing respectively 4 lbs. 9 oz. and 4 lbs. 5 oz., came from Mr. Povey, gr. to the Rev. John Thornycroft.—A Certificate was awarded.—A Jamaica, weighing 3 lbs. 9 oz., was also shown by Mr. Bundy, gr. to Lord Dynevor, at Dynevor Castle, Llandilo.— From Mr. Higgs, gr. to J. Barchard, Esq., came a very fine cluster of the fruit of Musa Cavendishii. The bunch consisted of upwards of 90 fruits, most of which were ripe, and, upon some of them being cut up and tasted, they proved to be very good. This was from the dwarf variety of this Musa, which is most suitable for small stoves; a Banksian medal was awarded. Black Cluster Grapes, attached to the branches, shrivelled, and in the condition of raisins, but showing that they had perfectly ripened, were exhibited by J. Hogg, Esq., of King's Bench-walk, Temple. These had been produced without any artificial assistance on an open wall, at Norton, which is two miles north of Stockton-on-Tees. The plant in question had been transferred to the open wall, from a glass-house in which it produced abundantly, a propensity which it appears still to retain.—Mr. Middlemiss, gr. to A. Pott, Esq., Bentham Hill, Tonbridge Wells, sent a fruit of the Dampsha Melon, a variety which, although by no means first-rate in flavour, has the property of keeping good for a long time after being cut. The fruit shown was stated to have been removed from the plant on the 8th of September, and it was still in fair condition. The fruit shown was oblong in shape, and had some resemblance to a green and yellow mottled Gourd.—Mr. Cameron, of Uckfield, furnished a dish of Mannington's Pearmain Apple, a good keeping sort, possessing a brisk flavour, and a great bearer. The specimens shown were stated to have grown on nursery trees, two years from the graft. Potatoes, the produce of New Zealand seed which was distributed by the Society in April, 1849, were communicated by J. Gaskell, Esq., of St. Nicholas. The result of three trials with them is, that they are not less liable to disease than sorts in usual cultivation. A sample of a nice-looking dessert Pear, called Triomphe de Jodoigne, was furnished by Mr. Rivers, of Sawbridgeworth, from one of his potted plants; it arrived too late to be critically examined.—From Mr. Lawrence, of Parliament-street, came common garden watering-pots, with globular roses, instead of those of the usual form. This is found to be an improvement, inasmuch as it disperses the water better and quicker than the old-fashioned rose. — From the Garden of the Society came Beaufortia decussata, Muraltia Heisteri, three varieties of Epacris, the beautiful Winter Heath (E. hiemalis), and plants of various Pompone and other Chrysanthemums. The Daisy-flowered kinds were mostly new and unnamed, having nothing by which to distinguish them, except the numbers under which they were received from M. Van Houtte, of Ghent. The following Pears were furnished in good condition, viz., Beurré Diel, Napoleon, Glout Morceaux, Passe Colmar, and Forelle. The latter were smaller specimens than those shown at the last; but they were still perfect. The Apples sent consisted of Beachamwell, Dutch Mignonne, Court Pendu Plat, Blenheim Pippin, Waltham Abbey, Seedling and Tower of Glammis, the two latter being kitchen Apples.—In consequence of a clerical error in the notice of the alteration of the by-laws read at the last meeting, the following was re-read on this occasion as for the first time:—It is proposed to repeal the following by-law of the Society, viz.: Chap. 4, Art. 3, "Every Fellow may at any time compound for all his future annual contributions by paying ten times the amount of his annual subscription;" and to substitute the following words: "Every Fellow may at any time compound for all his future annual contributions, by paying, when first elected, 42*l.*; at the end of 7 years, 31*l.* 10*s.*; at the end of 14 years, 26*l.* 5*s.*; at the end of 20 years, 21*l.*"

Linnean, *Dec.* 2.—W. Yarrell, Esq., in the chair. Mr. Moore, of the Botanic Garden, Chelsea, presented to the society specimens of the staminiferous cones of *Zamia furfuracea*. Mr. Adam White exhibited two collections of insects, one consisting of Hymenoptera, made by Mr. Frederic White, and the other of Lepidoptera, Hemiptera, and Coleoptera, made by Mr. W. H. Bates, in South America. Mr. White gave a sketch of Mr. Bates' very important travels in South America, in the district of Para, and up the river Amazon, from whence he had sent back collections of insects and plants. If Mr. Bates obtained the assistance he needed, he proposed to explore the natural history of a branch of the river Amazon, called Rio Tassajos, which penetrated the Brazils, some 1000 or 1200 miles. He is now at Para. The remaining part of Mr. Miers's paper on two new genera of South American plants was read. In a note, the author stated that his new genus *Tetraraphis*, resembled Nuttall's genus, Oxytheca, which also belonged to the Erigoneæ. The second genus belonged to the order Bignoniaceæ, and was a leafless, spiny shrub, about 8 feet in height, and found growing on the western declivity of the Cordilleras. The name given to the plant was *Oxycladus aphyllus*. It differed so much from the true Bignoniaceæ, that the author proposed for it a sub-tribe, *Oxycladeæ*, and placed the remaining plants under the heads of Bignoniaceæ and Crescentieæ.

## Notices of Books.

*Game Birds and Wild Fowl; their Friends and their Foes.* By A. E. Knox. Van Voorst. 12mo, pp. 264.

We formerly noticed, with commendation, Mr. Knox's "Ornithological Rambles in Sussex," and we must not withhold our tribute of praise to this his second and better production. He is a true lover of Nature, and looks at everything with the eye at once of a keen sportsman and a practised naturalist. As a narrator of the scenes which a field zoologist so heartily enjoys, he scarcely yields to any one in graphic skill.

A few extracts from the author's account of a wild-fowl expedition, in the winter, will, we think, more than justify this statement:—

"I had made preparations over night for a regular field-day. The distance from my residence to the mouth of the haven was little more than a mile along the shore, and I was thus enabled—though not without a certain degree of labour, which, however, the intense cold rendered less irksome—to carry my own guns and ammunition, and at the same time to dispense with the services of an attendant, who, as experience had taught me, proves rather an incumbrance than an advantage on an expedition of this kind. My long duck-gun was now unpacked, and a heavy double, weighing about 11 lbs., also put into requisition. A supply of Eley's cartridges suited to the calibre of each, with well dried powder and waterproof caps, were stowed away in the larger pockets of my shooting coat, while the smaller receptacles contained the minor sundries necessary to complete my equipment. But although I willingly dispensed with the services of a biped attendant, I had one companion whose assistance was all in all to me on such occasions. This was an Irish water spaniel, whose education I had myself superintended in his native bogs and on the shores of the Atlantic, and whose sagacity, courage, and docility far surpassed those of any dog that I have been able to procure in this country. He was rather larger than a setter, but his legs were shorter and stronger; his coat was curly, entirely of a liver colour, and of a fine silky texture; his ears long and pendulous; his feet were webbed like a duck's, to the very toes; his face was smooth; his forehead broad and open. But the most striking feature was his eyes. Nothing in canine physiognomy could surpass the intelligence of their expression. They were of a bright golden colour, like those of a sparrow-hawk; restless, and always on the move; indicating a joyous and adventurous spirit, and an ardour and perseverance, which indeed were prominent qualities in the character of their possessor."

"As I swept the shores of the estuary with the spy-glass, I had the satisfaction of observing that my sport was not likely to be anticipated by any wandering gunner, who might have perceived the birds already, and perhaps venture on a random shot before I could commence operations, or even decide on the best mode of carrying them into effect. There was not a human being within sight, nor could I discover a single boat on the surface of the water."

"It was evidently the gun-boat of a wild-fowl shooter, and of one who was no novice in the craft; but when the first feeling of disappointment had passed away, I easily succeeded in persuading myself that I should derive more pleasure from witnessing his operations than in spoiling his sport—which would have been the result of a premature movement on my part, for he was yet at least half a mile from the objects of his pursuit—but it occurred to me at the same moment that I might even manage to convert him into an unconscious but important ally in contributing to my—the jackal's—share of it. Taking, therefore, a hasty survey of the harbour and its shores, I saw that if I could contrive to conceal myself at a certain point on a long and narrow belt of shingle at some distance, over which the swans would probably fly when returning to the sea, I might perhaps have the good luck to intercept them. I lost no time in carrying out this plan; the coast-guard man ferried me across the mouth of the estuary, after which, by taking a wide circuit and availing myself of the nature of the ground where it was possible to mask my advance, I succeeded at last in reaching the desired point, and having scraped a hole in the loose shingle sufficiently large to conceal myself and my dog in a crouching attitude, I placed my guns on either side of me, and now directed all my attention to the exciting scene in the harbour. The hoopers were still there, surrounded by several flocks of wild ducks, some 500 yards from the position which I occupied, and about half that distance beyond

them was the gun-boat, as harmless a looking object as could well be imagined, lying low in the water, and never for a moment attracting the attention of any of the devoted birds, who appeared to be perfectly at their ease and in the full enjoyment of repose and plenty after their long and stormy voyage. The brent geese and the widgeons were preening their feathers, while the scaup and tufted ducks were continually diving, or flapping their wings on their return to the surface before they again plunged to the bottom. The swans were also feeding, but in a different manner; with their long necks they explored the surface of the mud beneath, where, to judge from their perseverance and the number of tails that appeared at the same moment directed upwards, they must have discovered something well suited to their palates. I could also distinguish some of the less common species of anatidæ, among which the males of the smew and the golden-eye were conspicuous in their pied plumage. The sooty coter too was there, but foraging by himself apart from the main body. All this time their concealed enemy was gradually lessening the distance between them and himself. Slowly and stealthily did he advance, nearer and nearer, until at last I expected every instant to hear the roar of the stanchion-gun, and fancied that he must be excessively dilatory or over-cautious, as minute after minute elapsed without the report reaching my ears. At last a bird rose from the crowd and flew directly towards me. I saw that it would pass tolerably near, and when in a few seconds afterwards I perceived that it was a male golden-eye within 30 yards of me, I almost forgot the important—though as yet passive—part I was enacting in the scene, and as I instinctively grasped my double-gun and raised the hammer, I felt tempted to pull the trigger. Prudence, however, prevailed, and I followed the example of my sagacious dog, who lay crouched at my side without moving a muscle of his limbs. He had seen the bird as well as myself, and his quick eye had detected my hasty movement, but his attention was again directed to the main body of water-fowl, several of which had at length taken alarm and were rising, one by one, from the water. It was an anxious moment. The swans were still there, but they had ceased to feed; their heads were turned towards me, and I soon perceived that the entire flotilla had gradually approached nearer to me. Now or never, thought I. I glanced rapidly at the advancing gun-boat—almost at the same instant a small puff of smoke issued from its further extremity, succeeded by a pigmy report, and up rose the entire host of water-fowl—swans and all—the snow-white plumage of the hoopers standing out in bold relief against the murky sky. Then a huge volume of smoke and a bright flame burst from the prow, followed by the thunder of the great gun itself—off at last!—and as it cleared a passage through the winged mass between us, several of the motley crowd fell to rise no more; almost at the same instant the head and shoulders of a man were protruded from a covering of sea-weed, under which he had hitherto been concealed, and the next moment he was vigorously plying his paddles in all the excitement of a regular cripple chase. My turn had at length arrived; restraining the ardour of my dog, who only waited for a word to take an active share in the pursuit, I turned my attention to a detachment of swans, about five in number, which had apparently escaped unhurt, and after wheeling once or twice over the bodies of their dead companions, uttering all the time their trumpet-like notes, were now gradually ascending and nearing my place of concealment. On they came, but suddenly their leader seemed to have discovered my position, and veered round in an opposite direction, followed by all except one, who, as he was passing overhead, fell a victim to my long gun. A brent goose almost at the same instant passed on the other side, and afforded an easy mark for the first barrel of my heavy double, while the second was discharged at a venture, but ineffectually, at a party of pochards—the last detachment of the fugitives, as they hurried back once more to the tempestuous but less treacherous waters of the channel."

## Garden Memoranda.

Mr. Young's Nursery, Milford.—The beauty of the better sorts of Conifers, both in summer and winter, has led to their liberal introduction into private establishments, not only in England, but also in Scotland and Ireland; and this has induced nurserymen to pay more than usual attention to their cultivation. Mr. Young, foreseeing the demand which was likely to arise for this interesting tribe of plants, was among the earliest to devote a portion of his nursery to this description of stock, and the result is, that in few places is to be found so fine or varied a collection as he has got at present at Milford. Situated rather high, in the pure air of the finely undulated country in the neighbourhood of Guildford, and with a light loamy soil lying on sand-stone, these plants grow with a vigour and beauty which is uncommon to them in less favoured localities. Here some of the more tender and beautiful of the Mexican Pines endure the rigour of the winter's frost unscathed; but this is to be attributed, in no small degree, to Mr. Young's judicious management, in carefully watching and checking luxuriant and late growths. Whenever he perceives that such are likely to occur he moves the plant early in autumn, which has the effect of stopping its luxuriance, and of giving the shoots a chance of ripening and hardening before unfavourable weather sets in. In addition to this advantage they can be moved and transplanted with facility, and without fear of loss at any time. Their roots being so near "at home," a nice ball of earth is secured, and the plants never experience the slightest harm from the shift. This periodical lifting and replanting is extended to all the Conifer tribe in Mr. Young's nursery, so that Spruce and other Firs 10 and 15 feet high can be transplanted with the greatest safety, a circumstance of much value in planting for immediate effect, in forming screens, and in shutting out unsightly objects. Under the treatment just described, Pinus patula, one of the very handsomest of the Mexican species, and tender in most places, is found to stand the winter well, unprotected in any way; indeed, Mr. Y. finds that such sorts, in moderately exposed situations, where winds sweep off all stagnant damp, succeed much more satisfactorily than in low ground, where moisture hangs long about their leaves. In proof of this, in tolerably elevated and open places, the Cryptomeria and Taxodium sempervirens maintain their green colour unimpaired throughout the winter. The former, artificially fertilised, ripens fruit in abundance here; and we believe that Mr. Young was the first to raise plants in this country from home-matured seeds. The same thing is, however, stated to have been effected at the late Lord Harrington's, at Elvaston, and perhaps at other places.

Among a host of Junipers, Cypresses, and other plants, we remarked nice examples of Pinus pyrenaica, whose bright yellow bark, seen occasionally through the green foliage, is not unornamental, and it is as hardy as a Scotch Fir. It is therefore a good kind for exposed situations. P. Sabiniana, Webbiana, Montezumæ, Hartwegii, Teocote, longifolia, Russelliana, monticola, nobilis, Nordmanniana, and all the finer kinds are cultivated here, and are generally good sized plants, beautifully furnished with branches on all sides. Deodars and Araucarias are abundant and of all sizes; some of the former are splendid specimens, and their grey aspect strikingly contrasts with the deep green of the majority of the Pines with which they are intermingled, more especially with that most interesting of all the tribe P. insignis, whose lively appearance is so charming in the depth of winter. Indeed, so various are the colours of Conifers, that by exercising a little skill in planting them, great variety and effect may be produced by this description of plant alone. Mr. Young has attempted to illustrate this as far as he can by planting them in wide borders by the sides of his walks in what he calls the ornamental department of his nursery. Of the Yew tribe he has an immense stock, both in the shape of single specimens and hedge plants, and, as we have stated, these together with every other kind of plant in his establishment, are all lifted and replanted every three years or so, in order that no deaths may occur when they are sold and sent to other places.

The stock in this nursery being all of a hardy kind, few glass houses are required; nevertheless, there are some, and one of these, a long span-roofed erection, is used for wintering young plants of the tenderer Conifers. In this house, which is furnished with a bed in the middle, and shelves up either side, was a large stock of the Funereal Cypress (Cupressus funebris). Plants of Libocedrus chilensis, a large tree from mountains in the south of Chili, was also here, together with the New Zealand L. Doniana, the former being the handsomer of the two.

But it is not Coniferous plants alone for which Mr. Young's nursery is famous. Occupying an extent of 20 acres, he grows all kinds of forest and fruit trees, Quick, and other hardy stock, all of which is especially cared for, and is in excellent condition. Among other trees of an ornamental character we remarked fine examples of what is called the new Lucombe or Oxford Oak, a sort that is perfectly evergreen, while the old Lucombe Oak is not. In addition to these there were several new evergreen Oaks, not trees, but spreading bushes raised from seeds given to Mr. Young by P. B. Webb, Esq. These may prove valuable for planting among rocks, and for skirting the margins of clumps, &c. A new broad-leaved Laurustinus, some remarkable Hollies, and the Ivy called Hedera Rægneriana, are also worthy of mention. The latter, from the large size of its heart-shaped leaves, will be found useful for many purposes, and very ornamental.

After what has been stated, we need hardly say that a visit to this nursery cannot fail to be productive both of pleasure and profit, more especially to those about to plant; for here good sized specimens afford some idea of the kind of effect large plants of the sorts likely to be wanted make. It is easily reached by the Southampton Railway to Woking, and thence by loop line to Godalming, which is within two miles of Milford.

## FLORICULTURE.

National Floricultural Society, *Dec.* 4.—Mr. Salter in the chair. As might be expected at so advanced a season, but few novelties were contributed: Cyclamen persicum rubrum, a well coloured and finely formed seedling, received a Label of Commendation. It was furnished by Mr. E. G. Henderson.—An Epiphyllum, between E. violaceum and E. truncatum, was forwarded by Mr. Gaines. It was evidently a free flowering sort, but it was damaged by travelling.—Collections of Pompone Chrysanthemums were sent by Mr. Salter and Mr. E. G. Henderson, and from the latter establishment came a plant of Erica Leeana, in good flower.

North London (Highgate) Chrysanthemum Exhibition, *Nov.* 26.—As the following report of the awards and flowers occupies much space, we shall confine our preliminary comment to the simple announcement that every success has attended the unceasing exertions of the committee of this rapidly extending society, whose exhibition on this occasion was all that could possibly have been desired.

Class I. Six varieties in 11-inch pots, private growers: 1st, to Mr. Holmes, with Madame Cameron, Queen of England, Annie Salter, Defiance, Pilot, and Vesta; 2d, to Mr. James, with Vesta, Madame Cameron, Defiance, Medusa, Cloth of Gold, and Pilot.

Class II. Six varieties in 8-inch pots: 1st, to Mr. Lewis, with Pilot, Madame Cameron, Annie Salter, Vesta, Minerva, and General Marceau; 2d, to Mr. Boram, with Cloth of Gold, Queen Victoria, Formosum, &c.

Class III. Twelve blooms: 1st, to Mr. James, with Queen of England, King, Goliah, Lysias, Clustered Yellow, Defiance, Christine, The Duke, Dupont de l'Eure, and Imperial; 2d, to Mr. Taylor, with Golden Clustered, King, Queen of England, Beauty, Phidias, Defiance, Ne plus ultra, The Warden, Sydenham, Plutus, Pio Nono, and Formosum; 3d, to Mr. Hutton, with Phidias, Queen of England, The Duke, Rabelais, Golden Clustered, The Warden, King, Defiance, Vesta, Formosum, Beauty, and Dupont de l'Eure; E. Sanderson, Esq., set up Queen of England, Beauty, Defiance, King, Golden Clustered, Goliath, Temple of Solomon, The Warden, Aristides, Vesta, Barbarossa, and Imperial.

Class IV. Six varieties in 11-inch pots. Nurserymen: 1st, to Mr. G. Smith, with Napoleon, the Duke, Nemesis, Pilot, Annie Salter, and Defiance; 2d, to Mr. Back, with Vesta, Campestroni, Formosum, Queen of England, Annie Salter, and Defiance; 3d, to Mr. Batten, with Madame Cameron, Pilot, Belle de Versailles, Christine, The Warden, and Mount Etna.

Class V. Six varieties in 8-inch pots: 1st, to Mr. G. Smith, with Nonpareil, Annie Salter, the Duke, Pilot, Defiance, and Belle de Versailles; 2d, to Mr. Back, with Clustered Yellow, Pilot, Defiance, Campestroni, Annie Salter, and Madame Poggi.

Class VI. Twelve blooms: 1st, to Mr. Merry, with Guillaume Tell, Queen of England, The Duke, King, Goliah, Phidias, Clustered Yellow, Gem, Formosum, Dupont de l'Eure, Defiance, and Pio Nono; 2d, to Mr. G. Smith, with The Warden, Madame Chauviere, Queen of England, Clustered Yellow, Annie Salter, Christine, Polyclète, Vesta, The Duke, Phidias, Defiance, and Peruvienne.

Class VIII. Open. Six distinct Anemone-flowered varieties: 1st, to Mr. Taylor, with Madame de Gordereau, Marguerite d'Anjou, Fleur de Marie, Nancy de Sermet, and Gluck; 2d, to Mr. G. Smith, with Fleur de Marie, Cleopatra, Gluck, Madame de Gordereau, Nancy de Sermet, and Marguerite d'Anjou.

Class X. (Extra Prizes.) To maiden exhibitors, by Mr. G. Smith: 1st, to Mr. R. Waters, with The Warden, Cloth of Gold, Jenny Lind, Sydenham, Rabelais, and Vesta.

Class XI. By Mr. Stein, for three white and three yellow Anemone flowers: 1st, to Mr. James, with three blooms of Fleur de Marie, and Gluck.

Class XII. By Mr. King, for six plants Pompons: 1st, to Mr. Taylor, with Piquillo, La Fiancie, Daphnis, Le Nain, Bébé, La Jougleur, and Elise. Mr. James and Mr. Batten also exhibited in this class.

Class XIII. By Mr. Back, for a single bloom: 1st, to Mr. James, with Queen of England.

Class XIV. By Mr. Atkins, for three blooms of yellow: 1st, to Mr. James, with Clustered Yellow. This prize was at first awarded to Mr. Taylor, for three nice blooms; but it was afterwards withdrawn, on account of his not having complied with the regulations.

Class XV. By Mr. Atkins, for three blooms of white: 1st, to Mr. Taylor, with Defiance.

Class XVI. By Mr. Bevan, for the best specimen plant: 1st, to Mr. James, with Pilot.

Class XVII. By Mr. J. Edwards, for class showing in four divisions, viz., yellow, white, light and dark: best yellow, to Mr. Taylor, with Plutus; 2d, to Mr. Lochner, with Clustered Yellow; 3d, to Mr. Lochner, with Annie Salter: best white, to Mr. Lochner, with Defiance; 2d, to Mr. James, ditto; 3d, to Mr. Lochner, ditto: best light, to Mr. Lochner, with Christine; 2d, to Mr. Taylor, with King; 3d, to Mr. James, with Queen of England: best dark, 1st, to Mr. James, with Lysias; 2d, to Mr. Lochner, with Pio Nono; 3d, ditto, with Campestroni.

Class XVIII. By Mr. Lochner, for class showing Anemone flowers in two divisions: best yellow, to Mr. G. Smith, with Gluck; 2d, ditto, ditto; 3d, to Mr. Lochner, ditto: best light, 1st, to Mr. G. Smith, with Fleur de Marie; 2d, ditto, ditto; 3d, ditto, Madame de Gordereau.

Class XIX. By Messrs. James and Bevan, for the 1st, 2d, and 3d best flowers, to be selected by the censors from the entire exhibition. The first award was made to E. Sanderson, Esq., for a bloom of Beauty, being the No. 2 flower as enumerated in the 12 blooms in Class III.; this was the pride of the exhibition; 2d, to Mr. James, with Lysias, the No. 4 flower in the first stand of Class III.; 3d, to Mr. Taylor, for a flower of Defiance shown in Class XV.

Collections of plants and cut flowers were largely contributed by Mr. Salter, Mr. E. G. Henderson, Mr. Stein, and Mr. McEwan; an extremely well grown and abundantly bloomed Epiphyllum truncatum was staged by Mr. Stein. During the evening the prizes were handed to the respective winners, and the Hon. Sec., C. P. Lochner, Esq., announced, after payment of all claims, that there would be a balance in hand. Some extra prizes were announced by Mr. Salter for next season. *J. E.*

Norwich, *Nov.* 26.—The usual Chrysanthemum Show was held on Wednesday, the 26th ult. Many of the plants, especially the collection of 12, exhibited by the Rev. R. G. Lucas, were very beautifully grown, but the blooms were not, we think, quite so large as usual. The following is the list of awards. 18 varieties: 1st, to Rev. S. Burroughes, with Gipsey Queen, Satyr, Madame Hardy, Jenny Lind, Hecuba, Defiance, Queen of England, Nonpareil, The Warden (very promising), Annie Salter, Phydias, Queen of Yellows, Cloth of Gold, Duchesse de Moutal, Vesta, Pilot, Clustered Yellow, and Louis Napoleon; 2d, to J. Gordon, Esq., with The Duke, Saturne, King of Crimsons, Jenny Lind, Nonpareil, Vesta, Madame Poggi, Christine, Defiance, Pharemond, Annie Salter, Columbus, Queen, Trillby, Clustered Yellow, Belle de Versailles, Pilot, and Madame Chauvière; 3d, to R. Chamberlin, Esq., with Ondine, Madame Poggi, Bride, Campestroni, General Marceau, Defiance, Pilot, The Duke, Nonpareil, Annie Salter, Vesta, Duchesse de Montabello, Nancy de Sermet, Clustered Yellow, Lucidum, Minerva, Lysias, and Fleur de Marie; 4th, to Charles Short, gr. to Sir W. B. Procter, Bart., with Minerva, Merit, Eclipse, Queen of Yellows, Beauty, Memnon, Madame Bijou, Miss Jane, Annie Salter, Vesta, Campestroni, Defiance, Duchesse de Montabello, Cleopatra, Pilot, Sultana, Nancy de Sermet, and Queen of England. 12 varieties: 1st, to Rev. R. G. Lucas, with Minerva, Comte Ratzan, Vesta, Queen of Gipsies, Annie Salter, Defiance, Madame Poggi, Empress, Madame Chauvière, Pilot, Superb Cluster, and The Duke; 2d, to J. Gordon, Esq., with (Unknown), Hecuba, Nonpareil, The Duke, Christine, Endymion, Defiance, Annie Salter, Lysias, Madame Chauvière, Clustered Yellow, and Belle de Versailles; 3d, to J. N. Waite, Esq., with Sultana, Princess Marie, Queen of Yellows, Madame Poggi, Queen of Gipsies, Temple de Solomon, Bride, Vesta, Nancy de Sermet, Pilot, Minerva, and King of Crimsons 6 varieties: 1st, to Rev. J. Burroughes, with Nonpareil, Defiance, Vesta, Hecuba, Pilot, and Clustered Yellow; 2d, to Rev. R. G. Lucas, with Madame Poggi, Hecuba, Annie Salter Vesta, The Duke, and Pilot; 3d, to J. Gordon, Esq., with Formosum, Vesta, Endymion, Madame Chauvière, Clustered Yellow, and Louis Napoleon. Cut blooms, 12 varieties: 1st, to G. B. L. Knight, Esq., with Clustered Yellow, Comte de Ratzan, Hecuba, Queen of Yellows, Vesta, Pilot, Madame Poggi, Madame Chauvière, Annie Salter, Queen, The Duke, and Temple of Solomon; 2d, to G. Morse, Esq., with Minerva, General Morceau, Abd-el-Kader, Campestroni, Queen of Yellows, Princesse Marie, Annie Salter, Ondine, Pilot, Lavinia, Clustered Yellow, and Fleur de Marie. *J. E.*

Catalogues. Received from Mr. Dobson, of Woodlands Nursery, Isleworth.—*W R B, Slough.* Pansies and Hollyhocks.

## Miscellaneous.

*Mr. Rucker's Orchids.*—Botanists and horticulturists are alike interested in the conservation of the rarest and finest collection of Orchideous plants that has ever been amassed by any one individual. The palm for such an assortment has been universally awarded to S. Rucker, Esq., of West Hill, Wandsworth, where the collection is in all its integrity. Circumstances have happened, as the public is but too well aware, which require that these splendid specimens should find another possessor; but we must be allowed to express a most earnest hope that they will not be dispersed, but that some one among the noblemen and private gentlemen of fortune, of whom many have been distinguished by their love of science and of horticultural pursuits in this country, will be inclined to purchase it, and preserve it entire. *Hooker's Journal of Botany*

*Luminous Mosses.*—About two years since, Dr. Milde observed in the Orchis-house, at the Breslau Gardens, that the infant fronds or prothallus of some Ferns, which happened to stand in a dark place, emitted an emerald green light exactly as the Cotyledonoids of Schistostega osmundacea in the cavities of rocks. The same appearance presented itself in a fissure constantly moistened with the spray of a waterfall in the course of last July. The light proceeded from globular bodies. The place on examination proved to be thickly clothed with Mnium punctatum, almost every leaf of which was covered with a large drop of water, which produced exactly the same effect as the spawn of Schistostega. Meyer says rightly, that this species must be erased from the list of luminous plants, for the peculiar refraction and reflection which is produced by the drops of water on the leaves of the Mnium is equally effected by the swollen cells of the Cotyledonoids of the Schistostega, and has nothing to do with a development of light from the substance of the plant itself. *Botanische Zeitung*, 1851, p. 630

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

As the season is approaching when every proprietor looks to home for enjoyment, let the gardener make it his particular business to contribute, as far as lies in his power, to the gratification and pleasure of his employers and their friends. The plant houses and their occupants will be of the first importance at this dull season; and, to be appreciated, they should be arranged in such a manner as to display themselves to the best advantage. Great care should be taken of plants now in flower, in order to preserve them in that state as long as possible; due attention should also be paid to bringing others forward, that a proper succession may be kept up. Let perfect order and neatness be evident in everything; for, if this point be attended to, it will compensate in a great measure for the absence of a more extensive floral display. Hybrid Rhododendrons, and Chinese Azaleas, will now be coming in, to assist with the Camellias, early Epacrises, Indian Daphnes, and numerous other good things, in producing a rich display of flowers. A few more of the above should now be put into a mild heat.

FORCING DEPARTMENT.

PINERIES—Care should be taken during the next few weeks to limit the application of exciting influences, or the plants will be induced to grow at a rate very disproportionate to the amount of light which they are at liberty to enjoy. The object to be aimed at in Pine-growing, is not the producing of a large plant with gross exuberant foliage, but rather the production of small, yet healthy plants, with short sturdy leaves, while the roots are revelling in the rich compost, which they will continue to do even through the winter months, if the bottom heat is kept at 80° to 85°. This end is not, however, to be obtained through starving the plants by an inadequate supply of water and soil, but by affording, along with a proportionate quantity of these requisites, a free circulation of air at all times. If this point, in connexion with a proper supply of water, be duly attended to, and if a healthy root-action be secured, the plants, though small, will be filled with highly-elaborated sap; and, as a natural consequence, will produce large, well-swelled and highly-flavoured fruit. VINERIES.—Let forcing be carried on with great caution at this dull season of the year; but take advantage of every fine day to allow the temperature to rise 15° or 20° higher than that which it is kept during the night. Where the buds are not yet broken, the rods may be syringed three times a day in fine clear weather, with water of which the temperature is about 70; and, after the buds break, it should be used 10° to 15° warmer. But when sharp frost is expected during the night, syringing in the afternoons should be avoided; as otherwise the water becomes congealed about the laps of the squares, sometimes breaking them, and the front gutter or spout for carrying away the water from the roof becomes choked up with ice. Too much steam from the vapour troughs has also a similar tendency. Admit air on every favourable opportunity; and proportion the amount of moisture in the atmosphere to the strength of daylight. Be careful that the fermenting material over the roots does not get too hot—a moderate warmth, not exceeding 75° or 80° in the dung, is sufficient; but, at the same time, it should be frequently examined, that it does not fall too low during cold weather, or the check will injure the roots. Where the Grapes are still hanging, remove the faded leaves, which are no longer of any service to the Vines, and prune in at once all spurs on which no fruit is hanging.

FLOWER GARDEN AND SHRUBBERIES.

Let perfect neatness prevail in this department also, to compensate for the absence of more brilliant attractions. Remove all the fallen leaves, and let the surface of the soil in the borders and clumps be forked over, or made clean with the rake. The walks should be put into perfect order, and, if necessary, receive a slight sprinkling of clean fine gravel. It is not, however, a good time during frosty weather to lay down gravel, unless it is very clean, and free from clay; and even then, it is only in extreme cases that we would recommend it. Let the drains and grids be examined and cleaned; and if in very rainy weather the water lies on any parts of the walks, let the defect be remedied by introducing a new drain, or by filling up the low places with new gravel; nothing interferes so much with the enjoyableness of any place, at this season, as damp dirty walls. If the turf is wet in any part of the pleasure ground, the winter season during mild weather is an excellent time for remedying it, by cutting drains wherever they are required. In doing this, keep the drains at the greatest possible distance from trees, to prevent them being choked up by the roots; but in parts where the proximity of trees is unavoidable, let the drains be filled with broken rubble to within 12 or 15 inches of the surface, that a passage may be secured for the water, even if the roots do enter the drains. In filling the drains up with soil, let it be well rammed in, to prevent any after sinking of the surface.

FLORISTS' FLOWERS.

After severe weather, beds containing Pinks and Pansies should be carefully examined, those which have been late planted particularly, as the frost will often raise them nearly out of the ground. The latter would be benefited by having hoops placed over them, on which mats should be stretched during frost. If this precaution is not observed, small boughs of Spruce Firs may be inserted round the bed, and small twigs placed on each side, to prevent the plants being broken off by rough winds. In exposed gardens rabbits or hares will oftentimes commit serious damage; we have found an occasional handful of soot scattered over the soil a preventive, as well as having a beneficial effect on the plants themselves. Air, air, air, as much as possible, to Auriculas, Polyanthuses, Carnations, and Pansies, kept in frames; they will require very little water now, but when absolutely necessary, let it be given in the morning. Take every opportunity during wet weather of repairing handglasses, painting flower-pegs, casting leaden layer-pegs, &c. Look at Dahlia roots, and remove any that may be decaying.

KITCHEN GARDEN.

To prevent any difficulty in digging up Celery or Cardoons, when the ground is frozen very hard, let a portion of each, about as much as will suffice for a couple of weeks, be always under protection, either by means of loose litter, Fern, or thatched hurdles, or some other convenient material which will exclude frost. These coverings should be put on while the ground is in an uncongealed state, as it would otherwise do harm rather than good, by preventing the sun and air from acting upon the soil in case of a change of weather. It must however be understood that the portion which is covered up is not to be left untouched till the arrival of frosty weather, but used in the regular rotation; and as the covering is taken off the part for present use, it is to be moved forward to a similar space beyond, so that a supply for the next ensuing fortnight shall always be under protection, excepting, of course, when the ground is in a frozen state. If, by means of spare frames or other contrivances, a portion of such crops as Parsley, Spinach, Sorrel, &c., can be protected, they will be found very convenient, when the ground is covered with snow. Some Horseradish, Jerusalem Artichokes, Parsnips, &c., should be got up and laid in moist soil for present use. It is a practice with many, on the approach of severe weather, to take up a quantity of Celery and Cardoons, and remove them in-doors; but we never take up more than two or three days' supply, as we have invariably observed great waste to result from the opposite practice; besides which, the quality of the vegetable is deteriorated.

State of the Weather near London, for the week ending as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BIRDS—THE BLACKBIRD: *Agnes.* We most readily accede to your proposition, and admire the good taste that suggests our devoting "the very *first* week in the coming year" to a consideration of the claims of this "herald of early spring." His mellow voice, and amiable disposition, deserve such honour. Be it his, to receive it at our hands!—TRICKS OF CANARIES: *W M.* The habit which some of this tribe have of picking out their feathers is not easily curable. We have, however, just received from a young lady in Berkshire a proposed remedy for this evil practice, which we annex. The case of the poor parrot, to which we adverted a fortnight since, has no doubt suggested the kind and timely advice. "I cured a canary of mine," remarks the young lady, "by suspending in his cage a piece of pack-thread, previously dipped in sugar and water. He immediately began pecking at it; and finding it palateable, he never afterwards resorted to his own feathers. I allowed the pack-thread to remain some weeks in his cage. I may add, that *every other attempt to effect a cure had proved ineffectual.*"—*Rosa.* It would be rather premature to publish the list now, inasmuch as it might not prove accurate. The precise order *must* depend greatly on circumstances. We will, however, bear your suggestion in mind, and furnish all particulars at the proper season.—*John C.* Your black-cap has been blinded by cold. If not kept in an equable temperature, these birds invariably go blind in the winter.—*Edwin J.* No; young birds, being imitative, soon lose their original note, unless kept in a quiet room.—*Emily.* Sponge-cake is preferable to bread. If two days old, all the better.—*James F.* Try one snail, daily. They will not eat garden worms, and meal-worms are expensive.—*Arabella.* Select six, nearly uniform in size, and with heads of the brightest red. Put them all in one cage, open at the front only. They will twitter merrily; and their whole cost will not exceed 2*s.* You can tame them very easily.—*Harry T.* Ample directions were given in the first 16 Nos.; but the whole subject is necessarily indivisible.—*Emma.* Many thanks for the kind interest you have shown in the matter of the sick bird, and for the valuable information you have supplied connected therewith. You will see that we have *already* had occasion to avail ourselves of your good offices. Sometimes the heat of a room, or an improper mode of feeding a canary, will induce to these bad habits. In the summer season a frequent change of scene—such as allowing them the range of a large room, &c., &c., will divert them from their malpractices; but at *this* season, your proposed plan is undeniably good.—*Arabella.* Almost immediately after Christmas. Your patience must tarry yet a little longer. If these birds *suddenly* cease singing in the autumn, they seldom resume song till after the new year has come in.—*Jane L.* Our advice is asked "too late." Cramp has paralysed your little friend, and by putting his head behind his wing he gives you timely notice that you must immediately part. At this season, all who really *love* their birds should show their good sense, and keep them from cold and draughts.—*Alpha.* Read carefully the "treatises" Nos. 17 to 28.—*R T.* Full particulars, inadmissible here, about feeding your robins, and teaching your birds to "draw water," will be forwarded you by post.—*Chatteris.* We fear our letter, sent last week, has miscarried. We wrote on Saturday.—*W J.* The *extent* of your "list of inquiries" renders it necessary for us to reply to you by post. We will do so.—*Sidmouth.* See *answer* given to "J. C. E.," in last week's Paper. *W. K.*

CHEAP SULPHURATOR: *W S C.* Any tinman can make the contrivance described at p. 643 out of an old pair of bellows.

FARM: *D C L.* Yes; a great many.

FLOWER GARDENS: *W P P.* We have not one word to say in favour of hearts, diamonds, &c. Perhaps you might get some hints from Loudon's "Villa and Suburban Gardener." But it would be better to obtain a plan. We meant Mr. Kemp, of Birkenhead.

FRUIT TREES: *J S C.* Manure should be applied with a sparing hand, and only when soil is quite worn out. Stone fruit should not have it at all. It is no doubt desirable that the roots of all fruit trees should be kept near the surface.—*S J S H, Perthshire.* Fruit trees for an east aspect wall: In a northern part of the country late Pears will not ripen well on this aspect. You may plant May Duke, Knight's Early Black and Elton Cherries; Jefferson and Orleans Plums; and the Jargonelle, Williams' Bon Chrétien, Suffolk Thorn, and Broom Park Pears.‖

GLASS: *R F.* If possible, the laps should be the depth of the thickness of the glass. At all events, the shallower the better, if the laps are to be open. If they are to be puttied, then ⅛-inch is about what will prevent the putty coming out readily.—*W N S H.* Hartley's patent rough plate.‡

GRAFTING: *R M.* Read the articles on this subject which were published in our columns last spring.‡

LIQUID MANURE: *Frutex.* The gardener who applies liquid manure during hard frost, must be insane. But, surely, you are joking. No man could do that. Liquid manure should be given when plants are growing, or about to grow, and, if possible, a little at a time, and often.

NAMES OF FRUITS: *J F.* 35, Black Achan; 36, Grey Doyenné.‖—*J B Warren.* The Pear is unquestionably the Chaumontel.‖—*C R P.* The Passe Colmar; you will find it to possess a still higher degree of excellence if grown against a south wall, or as an espalier.‖—*W E.* 8, Early Nonpareil; 28, King of the Pippins; 30, probably Beauty of Kent; 11, Blenheim Pippin; 14, Northern Greening.‖

NAMES OF PLANTS: *S T.* 1, Celsia arcturus; 2, Echeveria lurida; 3, Escallonia rubra.—*Erzeroum.* 446, Papaver orientale; 175, P. hybridum; 153, P. armeniacum; 456, Glaucium luteum; 143, Hypecoum pendulum; 837, Trifolium arvense.—*Erzeroum.* 28, Viola Kitaibeliana; 628, V. Pallasii, yellow; 645, V. Pallasii, purple.—*A B.* 1, Maxillaria fusca; 2, Scutellaria, perhaps coccinea; 3, ?? Detestable specimens detestably packed.

PHILLIPS'S FIRE ANNIHILATOR: *B D.* This has been repeatedly mentioned in our advertising columns, to which we must beg to refer you. (See p. 254 of our volume for the current year.)

RUSTIC VASES: *Amateur.* There is no book that treats specially on the subject. If you have access to any of Downing's or Loudon's works, you may find such things figured in them.‡

SEEDS: *P N.* Your plan is the very worst that it is possible to imagine, and is founded on erroneous views, now wholly exploded. The seeds you have sent are alive and well, but your mode of packing would soon finish them off. Dry all seeds as well as you can, in the sun or dry air. Put them loosely in canvas bags, and cause them to be hung up in a cabin or between decks, where the air may circulate freely about them during their voyage. If you cannot do this, with bulky seeds, then put them in earth (loam), rammed hard in a stout wooden chest, or in kegs, if you prefer it. Loam is much better than sand. Such part of the cargo generally must go below; but seeds should never be placed in the hold, if it can be avoided.

WALLS: *S J S H.* When a *south wall* is mentioned, gardeners understand it to be the south aspect of a wall running east and west. A *north wall* is understood to be the north side of a wall running in the same direction of east and west. When trees are said to be planted against an east wall, the meaning is that they are planted against a wall facing the east. A north border is understood to be one at the bottom of a wall facing the north; and so of others.‖

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Turnip Manure, per ton | ... | ... | £7 0 0 |
| Superphosphate of Lime | ... | ... | 7 0 0 |
| Sulphuric Acid and Coprolites | ... | ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE PEAT CHARCOAL impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

FOSSIL BONES AND PSEUDO-COPROLITES (FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD and Co., Artificial Manure Manufacturers, Ipswich, Suffolk.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron.—His Royal Highness PRINCE ALBERT.
President of Council.—Earl Bathurst.
Vice-President.—Earl Ducie.
Principal.—Rev. J. S. Haygarth, M.A.
PROFESSORS, &c.
Chemistry.—J. A. C. Voelcker, Ph. D., F.C.S.
Geology, Zoology and Botany.—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery.—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, & Mathematics.—W. Sowerby, C.E.
Manager of Farm.—R. Valentine.
Assistant to Chemical Professor.—A. Williams, M.R.C.S.

THE NEXT SESSION will begin early in FEBRUARY. Students are admitted either as Boarders, or as Out-Students. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40l. per annum. The College course of lectures and practical instruction is complete in one twelvemonth—though for younger students a longer time is recommended. There is a department for general as well as for agricultural education. Prospectuses and information can be had on application to the Principal.

THE BIRMINGHAM CATTLE and POULTRY SHOW.—The THIRD GREAT ANNUAL EXHIBITION of FAT CATTLE and the various kinds of DOMESTIC POULTRY, will be held in the BINGLEY EXHIBITION HALL, BIRMINGHAM, on the 9th, 10th, 11th, and 12th of December. Admission—To the Private View on TUESDAY NEXT, December 9th, 2s. 6d.; on Wednesday, Thursday, and Friday, 1s.

CATTLE SHOW.—A choice assortment of MALVERN DOG CARTS, Leicester, and Sporting Carts, will be on view at Messrs. TRUPP'S during the Cattle Show; also a new Whitechapel Cart, and some very light one-horse Sporting Phaetons.

269, Oxford-street, near Baker-street, London.

CATTLE SHOW.

COGAN'S GLASS CHURN.—This PATENT CHURN is the cleanest, easiest, and the best; its arrangement is simple, its appearance elegant, and in all respects superior to every other. Dairymen and others supplied with Glass Milk Pans, Glass Cream Pots, Glass Milk Pails, Syphons, Lactometers, and every other kind of Dairy Glass; Hartley's Rough Plate and every kind of Hothouse and Horticultural Glass. Besides the GLASS PEN so attractive at the Exhibition, Messrs. COGAN and Co. have produced several new articles in Glass for useful and ornamental purposes. Catalogues can be had in the Implement Gallery, at Baker-street Bazaar, during the Show of Prize Cattle; and at their Glass Warehouse, 48, Leicester-square, London. Visitors to London during the Holidays are invited to see this establishment; likewise their stalls in the Langham Bazaar, Regent-street; and at the Hungerford Hall, Strand, where competent persons are engaged to explain and give information.

ENGLISH TIMBER cut to any length and scantling at from 2s. 4d. to 3s. per foot for Oak or Ash, 1s. and upwards for Elm; Oak Sash Sills from 2½d. per foot; Foreign Timber, Dantzic, at 55s. per load; Yellow Deals from 3d. per foot; Floor Boards, ¾ in. and 1 in., yellow batten, at 12s. 6d. and 15s. All other descriptions equally low.—Apply to Mr. MAY, 90, Leadenhall-street, London.

TO HORTICULTURAL & FLORICULTURAL SOCIETIES.

BENJAMIN EDGINGTON, Manufacturer to the Horticultural Society, Chiswick, and the Royal Botanic Society, Regent's Park, solicits attention to his stock of Marquees and Tents of every variety, and suitable for all climates. Rick Cloths, with Poles, &c., complete. Marquees and Tents on hire. Netting and Bunting for Fruit Trees. Orders, per post, duly attended to.

Address BENJAMIN EDGINGTON, 2, Duke-street, Southwark.—A Warehouse, 208, Piccadilly.

SMITHFIELD CATTLE SHOW.

W. SKIRVING, Walton Nursery, Liverpool, begs to acquaint his friends and the public, that he will attend at the ensuing Smithfield Cattle Show, to exhibit Roots of his Improved Swede and other Turnips, and to take orders for the seed of them and all other approved kinds of agricultural seeds. W. S. will also exhibit specimens of these three new and highly interesting hardy trees, Araucaria imbricata, Cedrus Deodara, and Cryptomeria japonica, of which he holds an extensive stock, of various ages and sizes, all grown from seed in the open ground and transplanted into beds or pots in the Nursery.

CATTLE SHOW, 1851.—THE PRIZE CATTLE SHOW of the SMITHFIELD CLUB and Exhibition of Implements, Seeds, Roots, &c., commences TUESDAY MORNING, and closes FRIDAY EVENING, Dec. 9th, 10th, 11th, and 12th, BAZAAR, King-street, Portman-square. The space appropriated to the Show is nearly double that of former years, and the arrangements are marked by the usual attention to the comfort of visitors.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE GENERAL MEETING will be held, at the Society's house, Hanover-square, on SATURDAY, the 13th December, 1851, at 11 o'clock, in the forenoon.

By order of the Council,
JAMES HUDSON, Secretary.

London, December 6, 1851.

**The Agricultural Gazette.**

*SATURDAY, DECEMBER* 6, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | | |
|---|---|---|---|
| TUESDAY, | Dec. 9 | | Smithfield Club. Birmingham Cattle Show. |
| WEDNESDAY, | — | 10 | Agricultural Society of England. |
| THURSDAY, | — | 11 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, | — | 17 | Agricultural Society of England. |
| THURSDAY, | — | 18 | Agricultural Imp. Soc. of Ireland. |

AMONGST the various obligations which the Clay-soil farmer is under to the Draining-tile, there is none more important, none perhaps less appreciated than the new relation in which it places him with regard to THE SUBSOIL. Before the modern system of drainage was much known or practised, shallow cultivation was the general rule, certainly the general practice, upon the clays. To bring up fresh soil, or plough below 'the staple,' as it was called, was regarded as little less than a qualification for Bedlam. There were few neighbourhoods in which a quotable instance did not exist of some rash man, and some unhappy field, whose respective characters had suffered permanent deterioration by too bold a launch of the share-point into the unknown strata that lay beneath the ordinary 'pan,' that had been trodden rubbed and polished by hard iron, probably since the days when the wooden implement of the Saxon followed, with comparative harmlessness, the cloven hoofs of the Ox-team.

Nor was the wide-spread opinion and still wider practice which prevailed, as to the shallow ploughing of clays, without defensible grounds. To prepare a seed-bed upon a field of undrained clay without running the chance of being thrown out for the whole winter, by some unlucky dash of wet, it was necessary to be pretty cautious to preserve a high ridge and an open furrow, and above all to keep the thin layer of cultivated soil lying upon its hard foundation, in that self-drying form and condition not inaptly represented by the round-backed convexity of a Macadamised road.

To attempt to open any dealings or even acquaintance with the subsoil, under such circumstances, was simply quixotic. There it remained compacted in its hard bed in a state of permanent and annually increasing induration and barrenness, if indeed its qualities in this respect had any capability of addition left—penetrated by no shower, exposed to no frost, admitting nothing and transmitting nothing, a veritable *mortuum caput* if ever any portion of creation deserved the name. No wonder, if on some accidental or audacious upturning, the 'nasty stuff' took years to civilise into decent or profitable texture. It had been ill-used for centuries, and it resented it for years: that was all: the debt of evil, accumulated through a score of generations, lay upon it: woe to the man who woke up the long account upon his year-to-year-held soil, and the impervious undrained 'pan' that lay below,—for it to *thaw* upon at leisure. It was safer to hide from such a formidable creditor, or to keep *him* hidden from the daylight, and men's eyes: and hidden he was, accordingly, like a public enemy.

The Draining-tile came at last. Two, three, four feet deep into the furrow went the spade, the shovel, and the pickaxe; and slowly fighting its way to the lower depths, through ignorance and prejudice stiffer than the clay, harder than the rock, more impracticable and elusive than the quicksand, the 'Two-inch Pipe' at last laid the water-course at a depth where every drop that goes must *leave its treasure behind it*, in the soil or subsoil, and depart with clean hands, drawing after it into tributary action every concealed and capillary channel, crevice, crack or cleavage that existed *under* that hardened kneaded cake which lay next beneath the soil, throughout the sections of earth that now hung tapped and undermined betwixt drain and drain. Down went the 'water-table' like a loosed-out pond or tank: crack went the under-soil, forsaken by its pent-up winter-damp, and left for the first time to the inevitable and awakening influences of ascending and descending moisture. Gravitation in the winter, capillary attraction in the summer, now commenced their alternate and enlivening action, and the field began TO BREATHE: for, what is breathing but *inhalation* and *exhalation?* and when *the pipe* was thus added to the bellows, who could forbid the alternating action of Nature's lungs that must ensue, with Rain and Frost at one end of the year and Heat and Sunshine at the other, to put the valves in motion?

But Man, hard-minded conventionalist, still clings to the old rule, though the principle is swept away that gave it force or reason. 'Subsoil' is still 'subsoil' with him, and 'the nasty stuff' is still 'the nasty stuff.' If the battle of the draining-tile is nearly over, the battle of the subsoil is yet to begin. Perhaps of all the prejudices that now infect the clay soil agriculture of this country, the prejudice against the subsoil is the most inveterate and common. The occupier of an undrained farm, experienced in his own conditions of success, confesses to it, and heads the charge: he has seen some (undrained) field where the subsoil was exposed, or he has stocked away some hedgerow where the hard bare 'till' was left (*with no soil underneath it*) and he tells you that they bore nothing for several years—so *he* for one has no faith in the subsoil! In vain you point out to him that the ground you drained and double-dug last year for 'the new plantation,' is throwing up fat roystering weeds and thistles, that would hide a flock of sheep; he is not fond of weeds and thistles, and rejects the unsavoury illustration; he has never double-dug any ground himself—would think it madness to bring up 'that nasty stuff' to the top, 'burying the good soil' in that dreadful way; he has never tried it, so he is sure it would not do, [the old argument against the deep drain come to life again!]—and he never means to try it, for the same good reason.

So thought JETHRO TULL, who tells his followers never to plough below 'the staple;' and well he might say so, on his Berkshire clay, nearly a century before the drain-tile had been heard of. And the consequence was that his Wheat was mildewed year after year, and his system, though pregnant with *after-truth*, miscarried. He never could get quit of this besetting enemy, the mildew; perhaps had every other impediment and vexation been overcome, or spared him (and people can hardly conceive in these days the martyrdom which the spirit of improvement brought upon him in those), he would only have been driven to a more serious conflict with this intractable but *meaning* foe.

It is at this point that the plan adopted for the last six years with such success by Mr. SMITH, and noticed on a recent occasion, parts company with TULL altogether, and begins an independent and entirely original course. The field having been ploughed and prepared for Wheat in the ordinary way (for we will suppose the experiment at its commencement) the grain is sown in triple drill-lines a foot apart, with *intervals* three feet wide,—just as though a three-row drill gauged to a foot wide between the seeders had passed up and down the field, *missing* an interval of three feet at each return: thus sowing *two* feet (the width occupied, it will be remembered, by three rows a foot apart) and leaving three unsown. The sowing is done early; if possible during the second week in September; and as soon as the plant appears above ground, the *double digging* of these three-foot intervals commences. In point of fact they are to constitute *next year's fallow*.

And here we must take occasion to correct what appears to us an unfortunate error of description in the account given of his system by Mr. SMITH, in the last number of the Royal Agricultural Journal. New systems have generally enough to battle against, without the self-infliction of extra sources of misunderstanding, by the use of erroneous or ambiguous expression. "Wheat year after year upon the same field," is a phrase of startling incidence upon the ear agricultural; and not less so to the inner sense, when informed that one-half of the field is really fallow. In fact, it would be quite as legitimate a description to call it 'Fallow

year after year upon the same field,' as Wheat: the fact being that the 'field' is equally divided (in detail, though not in moiety) between the two. We say 'equally' with perfect accuracy, because in the double-digging, the approach of the spade to the side-rows is necessarily fended two or three inches from the growing plant on both sides, leaving the width actually worked 30 inches, and the width occupied by the crop the same. Peace therefore to the tender feelings bucolic, that have been shocked from their complacency by an announcement awful to the ears of landlords and agents! It is, indeed, "Wheat year after year upon the same field"—but *not* upon the same part of it—in the same *garden*, but not upon the same *beds*.

It might, in fact, be most accurately described as the 'spade-fallow system' of Wheat growing; nor do we know any name that would more wisely or appropriately distinguish it. The attempt to coax clay soils into a sort of dream-land of Turnip-husbandry—to treat them, metaphorically as it were, upon a nearly four-course system—as if the drain-tile had performed the miracle it never promised, of metamorphosing clay into sand, has been one of the hasty errors of a transition period, and which people are beginning to find out. Clay, though drained, is still clay, greatly improved indeed in texture, character, and capability; but its distinctive features must still be borne in view, and treated accordingly; and those whose ambition for the practice of a 'gentlemanly soil' persists in thus mistaking Orson for Valentine, will find that in snapping at the shadow of light-soil practice they are sacrificing the substance—the genius of the clay, which light soils possess not, nor (with improved mechanical treatment of the clays) anything which is fully its equivalent.

The chemical superiority of the aluminous over the silicious soils, the whole evidence of the Laboratory has incontestibly proved. The drawback to its attestation in the field is simply a mechanical one. The drain-tile has done much: that clever little red-jacketed brigade of "sappers and miners," working under ground, has opened the passage: but the main body of that force that shall complete the conquest of the clays is not yet come up, the campaign scarcely opened. That at present prices of Wheat—their staple produce—the plough does not pay upon the clays, is the common complaint of the time. Such is the figurative language used; is it not significant? Let us look at the proposition again. 'On clay soils, at low prices, *the plough* does not pay.' Admitted, that chemically they are by far the richest,—that their power to absorb and retain volatile organic manures, the ammonia of the atmosphere, for instance, is incomparably greater, and that they are by far the richest storehouse of the mineral elements of fertility; yet, in spite of all this, at low prices, the clay soils, *par excellence*, do not pay *under the plough*. What is the conclusion?

In farming light soils, it is of well known yet scarcely enough known importance, to keep the land as solid as possible. No implement does this better than the plough; by the very nature and necessity of its action, it presses down the under-soil with exactly the stress by which it lifts and turns the upper. The spade does just the reverse; it lightens everything it touches. Even in double-digging, it throws the subsoil so lightly over the soil, that the atmospheric influences of every season are freely admitted. The Autumn rains, the frosts and thaws of Winter binding and loosening alternately, the *powdering* winds of March, the melting showers of April, the genial warmth of Summer,—each in their turn attack 'the nasty stuff' in irresistibly persuasive succession, on the clays. With the aid of a few light scufflings in the spring, to shatter the caked surface, and re-open the thirsty pores of mother earth, to the ammonia that falls in every shower, and the more important *daily* portion of it brought with every evening's dew (strangely unnoticed by the learned Liebig!)—with such a *preparatory* fallowing as this, who that knows anything from actual and intelligent experience of the constitution of a clay subsoil, will refuse to trust it as a seed-bed for next year's Wheat crop, with the rich top soil lurking below it, and offering to the instinctively exploring roots an additional stratum of permeable and fertile mould to complete their growth, and give vigour to the plant, just when the heavy stem and the maturing ear are most in need of sustenance?

Who *that has thus made trial of* 'the nasty stuff,' enters his verdict against it? It *has been* systematically tried for six years with *unvarying success*, by one person, on a subsoil of ordinary character; the alternate 30-inch rows double-dug, as described, between the rows which bear the growing corn. (To call this System a repetition of Tull, who seldom dug and never double-dug, and shrunk from the subsoil more than any man, is mere ignorance and inattention.) These rows at harvest appear to cover the *whole* field, concealing and *shading* the fallow prepared for the next crop, and producing 34 bushels per acre, *without manure*. But *is it, indeed*, without manure? There was something said about 'ammonia,' and showers, and nightly dews: ample subject for a chapter to itself. *H.*

## "THE IRISH EXODUS."

I have read with some interest, considerable surprise, and deep regret, your various articles approving of, nay urging on emigration, as the principal if not the only panacea for Irish distress. With surprise that you should be so far in the dark, not only as regards the interests of Ireland, but the sovereignty of Great Britain; and with regret that you should persevere in promulgating such views, with so many facts negativing all your assertions—facts patent to all sensible men but yourself. As my friend Mr. Goodiff appears, according to your notice, to have failed to convince you of the erroneousness of your views in this respect, I shall not trench on his mode of handling the subject; but I will, with your permission, give you a few facts, as rather irreconcileable with your oft-repeated views on Irish emigration.

It is a fact that Ireland, from time immemorial, has been not only the nursery but the draw-farm of England, in filling the ranks of her armies and manning her fleets, without which she never could have become what she is said to be, the mistress of the world. Is she now independent of Ireland in these respects? I rather think not. It is a fact that Irishmen, and Irishwomen too, have, in all their poverty, added considerably to the revenue of England. Can the Chancellor of the Exchequer, with all his boastings, afford to dispense with such trifling aids? I fear not; and if he can, he can very well afford to lighten the burdens of which England now so loudly and so justly complains. It is a fact that Irishmen and Irishwomen have, in all their poverty, been pretty good customers to your English manufacturers. Are these manufacturers now so well supplied with markets and consumers elsewhere as to be regardless of their Irish customers? The commercial travellers will, I think, say no. And if such facts be admitted, and no sane man in Ireland, nor many in England doubt them; and that emigration continues so as that her lands may be all employed in the feeding of stock suited to them, but on which now there are, in many places, none.

Will the short-horns of Kildare, the long-horns of Limerick, the Leicester sheep of Roscommon, the cheviots on the various high pastures, the mountain cows in Kerry, the ponies in Cashindal or Connemara, or the goats in Donegal, fill the ranks in your army, man your fleets, and consume excisable and manufactured articles? If they do, by all means have them, and let Irishmen and Irishwomen go to the Americans, who want them, and who will, sooner or later, use them perhaps in the very overthrow of England, whose greatness you would uphold by Irish emigration.

You have been rather unfortunate—and you will, I hope, excuse my saying so—in introducing the name of Sir Robert Kane in furtherance of your emigration scheme, as his life and writings are, of all others, the most opposed to such systems, or the consolidation of farms. If you or any of your readers doubt this, please turn to chapter viii., pp. 309—11, in a word, read the whole work, second edition, "Industrial Resources of Ireland," and in it will be found the root of Irish misfortunes. At pp. 406 and 407 he says, "So far from the habits of the working class of this country being adverse to the introduction of industrial occupations, they have made, within the last few years, unparalleled strides in the habits which best conduce to industrial success;" and hence their wish now to emigrate, because the British Government will not enact such laws as will protect them, not against foreign competition, but against those idle vagabonds to whom you allude, but made so by bad laws, which you, Sir Robert Kane, and all honest men, exclaim against—the very graziers to which, inconsistently enough, you would assign the lands, by extirpating the legitimate occupants. But hear Sir Robert Kane a little further. "We were reckless, ignorant, improvident, drunken, idle. We were idle, for we had nothing to do; we were reckless, for we had no hope; we were ignorant, for learning was denied us; we were improvident, for we had no future; we were drunken, for we sought to forget our misery. That time has passed for ever." So it has, and Irishmen will pass away, too, if you write a line to urge the imperial but unwise policy of encouraging them to do so. They, with the instinct of rats quitting a leaky ship, are crawling away from this jolly boat attached to England's great bark, leaving the boat to sink and the bark in danger of following her. I think I hear you, whilst reading this, exclaim, "Oh, these unhappy Irish have now the fountains of education open to them, but they won't drink of the waters." True for you, if you say so; but bear in mind that the Irish have a conscientious conviction that these waters are polluted if not poisoned; and though parching with thirst, will not taste of them. But this is a subject a little too ticklish for either you or me to touch upon. All your readers must have been too often bored, by having placed before them the dark side of the picture of the West of Ireland, without ever getting as much as a true sketch of any bright spot. That there is such a spot, on which the sun of common sense, if not full justice, occasionally shines, I am now going to prove. This spot extends over a space of nearly 100,000 acres, the property of an Irish nobleman resident in England. For two years before I came down here, I had been employed on that property, valuing lands between landlord and tenants, and superintending improvements in the same; and I can now tell you that there is not in all Ireland, nor perhaps in many parts of England or Scotland either, better paid-up rents than on it. There is not on it over 12 farms that could average 50 acres each, and the only farms untenanted were some two or three of these, though the best lands on the property, and would be let at a fair rent, if suitable tenants could be got for them. There is not on the entire property 12 ploughs, 12 harrows, 12 carts; no nor 12 horses worthy of the name. Is it by the encouragement of emigration this comparatively happy state of things is made to exist? Not at all; it is by a course the very opposite to this. It is by keeping the people on the land, through a pretty fair instalment of justice, and by whom is this instalment of justice to landlord and tenant doled out? Directly by a young man, the principal agent, and indirectly by his deputy, both Englishmen, but long enough in Ireland to know it and its wants, with the means of supplying the same, to a great extent by its own people, through its own resources; and still better could they supply them but for the bad laws of which Mr. Goodiff so justly complains, and which you seem so much to admire.

Come back with me now from the miserable county of Mayo, where rents are so well paid by the people kept on the land, and on passing through the rich county of Roscommon, you will find the large farms from which the people were driven, or on which they were starved out, and what shall we find? Deserts on the finest land in Great Britain, the late haunts of the "Terry Alt," and the "Molly McGuire," with an odd English farmer to the east having got that encouragement so long denied poor Paddy, by having good homesteads prepared for them, as in duty bound, by their landlords, and their rents lowered to a tolerably fair standard, by good agents appointed also too late.

Will those Englishmen continue to pay their rents? I fear not, whilst the Poor-law bastilles of Castlerea and Roscommon are filled to over-flowing by idle, able-bodied paupers, who should, could, and would support themselves, as I have so often shown, and as Mr. Goodiff has shown too, if the Government of which he complains would only permit them to do so.

Come on into the county of Longford, where you will find Mr. Goodiff himself, not "one of those querulous Irishmen who carp at everything, and think a Government is fully equal to the task of warding off those evils which are the consequences of their own misdeeds, or negligence, or selfishness," but a mild, unassuming, persevering, industrious, upright Englishmen; showing by his example, as far as permitted, what all could do "if their rulers would let them." Come on again through the county of Westmeath, or King's county, where you will meet long-established and industrious Scotch farmers, and ask them is emigration the panacea of Ireland, which they would honestly advise? And I rather suspect they'll answer in the negative. Come on still through Kildare, now said to be "in a transition state," between out-going Irish, and in-coming Scotch tenants. Enquire if the latter, in the well-arranged homesteads, at the landlord's expense (a thing always denied Paddy) are paying as high rents as some Paddies are paying beside them. If I am not much mistaken, you'll find that some of them have, *Ipsis Hibernos Hiberniores*, gone "and left the key under the door." And now that I have got you so near me, may I ask you to come down and "take potluck" with me here, and I will show you, even in this "model county," where large farms are said to be well managed, where the small farmers are "got shut of" paying the owners from 2*s*. 6*d*. to 5*s*. 10*d*. an acre for land hitherto paying 15*s*. to 20*s*. an acre; and for a similar quality of land the small farmers still struggle, where permitted to stay, paying from 10*s*. to 15*s*. an acre. With these facts staring you in the face, and "a thousand and one" others which I can adduce, will you persevere in recommending that as a benefit which every other wise and impartial man must now cry down as a curse to the country generally, though it may seem a benefit to the individuals who may be fortunate enough to escape from a country so badly governed as all men of all parties and all creeds now proclaim this to be? If you do, then it will be said, and I would regret to hear it said, you will stand *solus* at the press and amongst those who value the stability of the throne of England. *Edward Carroll, Beg Erin, Castlebridge, Wexford.*

## EXPERIMENTS WITH VARIOUS MANURES IN THE CULTIVATION OF POTATOES.

Although I do not pretend to be a proficient in the art of farming, and understand but superficially the science of agricultural chemistry; yet taking a pleasure in testing, upon a small scale, the effects produced from the application of sundry of the various substances that have of late years been introduced to public notice for increasing the return of our usually cultivated crops, I trust that I may not be considered over-presumptuous in submitting, through your excellent and valuable journal, should you deem it sufficiently interesting to publish them therein, the results I have acquired in the raising of Potatoes with these during the course of my researches.

Having measured off an acre and a half in the centre of a six acre field, consisting of a light, sandy, surface soil, very much out of condition, with strata of ferruginous clay, soft red sandstone, and white and yellow sand, about 16 inches underneath, which was cropped

with Rye the preceding year, unmanured, I had, early in the month of April, the whole trenched two spits deep, and manured with 15 cart loads of thoroughly decomposed stable dung, being 10 loads per acre. It was then formed into drills 6 inches deep and 2 feet apart. I next divided the space into six equal lots, being a quarter of an acre each, and planted in those drills the Potato sets whole (Flourballs), a foot separate in the row.

| | s. d. | £ s. d. |
|---|---|---|
| Lot 1 had 2½ more cart loads of the dung spread over the sets along the drills, and was then covered with the soil, the cost of which, at 5s., came to ... ... ... ... | | 0 12 6 |
| Lot 2—84 lbs. of guano added, costing ... ... ... | | 0 7 2 |
| Lot 3—84 lbs. superphosphate of lime ... ... ... | | 0 5 3 |
| Lot 4—63 lbs. guano ... ... ... ... | 5 4 | |
| 21 lbs. sulphate of potash ... ... | 4 6 | |
| 14 lbs. sulphate of magnesia ... ... | 1 3 | |
| | | 0 11 1 |
| Lot 5—70 lbs. superphosphate of lime ... ... | 4 5 | |
| 21 lbs. sulphate of potash... ... ... | 4 6 | |
| 21 lbs. sulphate of ammonia .. ... | 3 0 | |
| | | 0 11 11 |
| Lot 6—28 lbs. nitrate of soda ... ... ... | 4 0 | |
| 21 lbs. nitrate of potash ... .. ... | 5 3 | |
| 14 lbs. sulphate of magnesia ... ... | 1 3 | |
| | | 0 10 6 |

Each lot being previously well mixed with three times its bulk of simple top soil from the same field.

The five last specified preparations were spread, the same as in lot 1, respectively over the sets along the drills left uncovered, and the whole six lots then raked smooth. The cost of the applications, including the dung first added, at 5s. per load, would thus come to, per acre, in lot 1, 5l. ; lot 2, 3l. 18s. 8d. ; lot 3, 3l. 11s. ; lot 4, 4l. 14s. 4d. ; lot 5, 4l. 17s. 8d. ; and in lot 6, 4l. 12s., making the average of the whole six lots 4l. 9s. per acre.

The plants throughout the whole came up very evenly, and much about the same time, but those in lot 1 displayed all along a lighter colour than the others, and did not attain to so great a length and luxuriance of haulm as those in lots, 2, 4, 5, and 6 ; nor were the leaves so large ; and lots 4, 5, and 6, moreover, kept growing longer than the rest—indeed, continued doing so at the time they were taken up, without any symptoms of blight being observable in the stems. Upon raising the crop in September,

| | Bush. | | Bush. | |
|---|---|---|---|---|
| Lot 1 produced | 82½, | being at the rate of, per acre | 330 | A good many of which were diseased. |
| Lot 2 ,, | 85½ | ditto ... | 341 | Ditto. |
| Lot 3 ,, | 55½ | ditto ... | 221 | Not so many diseased. |
| Lot 4 ,, | 98 | ditto ... | 392 | A few only were affected. |
| Lot 5 ,, | 91 | ditto ... | 364 | Ditto. |
| Lot 6 ,, | 84 | ditto ... | 336 | Ditto. |

Comparing the cost of the different applications with the realised results, it will be seen that lot 1, where stable dung alone was used, though the most expensive, did not prove so efficacious as most of the others in which only half the quantity thereof was applied along with artificial manures ; and the statement also shows that lots 4 and 5, in which a proportion of sulphate of potash was introduced, gave not only the most prolific, but likewise the healthiest crop, which, I presume, may be accounted for from the circumstance of the large quantity of potash and sulphuric acid that are found, on analysis, to exist in the composition of the tubers and haulm of the Potato plant. There is usually, it is well known, but a very small per centage in the soil of potash, soda, magnesia, and the sulphuric and phosphoric acids, and as all plants contain a considerable share of these, more or less, in their structure, a proportionate supply is, no doubt, calculated to do good in general. But, unless the organic matters which also constitute the food of plants be present at the same time in sufficient abundance, the others must of course fail to produce so decided an advantage, and hence the disappointments so frequently experienced by the application of these singly. Guano, though so richly stored with organic matter, phosphates, and ammonia, yet, being deficient in those alkaline substances, will be found to possess a considerably improved fertilising power when incorporated therewith. Nevertheless, even with their addition, consisting wholly as it does of the excrements of birds, it too, will, if used constantly, cease after a time to yield the same beneficial effect, without an adequate quantity of *humus* be also present in the soil.

In order that I might be enabled to obtain by practical evidence, the correctness of these affirmations, as well as to judge of the state of fertility existing in the soil itself, another acre alongside of the before-mentioned lots, was also trenched, planted, and divided into four equal portions, exactly in the same manner, without any manure being added, as in the first instance.

| | Bush. | | Cost. | Bush. |
|---|---|---|---|---|
| Lot 1 was then covered over with the simple soil, and produced... | 27 | or, per acre ... | | 108 |
| Lot 2 had 84 lbs. of guano, costing 7s. 2d., and produced ... ... | 54¾ | .... | £1 18 8 | 219 |
| Lot 3 had 42 lbs. nitrate of potash, costing 10s. 6d., and produced | 29¼ | ... | 2 2 0 | 117 |
| Lot 4 had 42 lbs. nitrate of soda, costing 6s., and produced ... | 28 | ... | 1 4 0 | 112 |

The plants in lot 1 grew slender and sickly, and did not reach above a foot to 14 inches in height. Those in lots 2, 3, and 4, were more luxuriant, but all the four became completely withered in August, and their tubers were mostly of very small size, though not so many of them in proportion appeared to be diseased as in lots 1 and 2, in the foregoing case.

I ought to mention, that in the above and the preceding experiments, the guano employed was the best Peruvian, obtained from Mr. Gibbs, warranted to contain about 16 per cent. of ammonia, and not less than 20 per cent. of phosphate of lime. The superphosphate was prepared entirely from bones, not coprolites; the potash, soda, and ammonia, were not chemically pure, but of the best merchantable quality, and the sulphate of magnesia such as is sold in the shops as Epsom salts.

My conclusions, therefore, with regard to artificial manuring, are these :—That alkalies applied simply, tend chiefly to promote luxuriance of foliage, without producing any very sensible benefit to the land ; that phosphate of lime conduces to fill the ear in grain, increase the number, size, and weight of tubers or bulbs, in root crops, and augment the yield of others generally ; that a certain proportionate quantity of suitable organic matter is necessary to be added, or present in the soil, to bring these into action, so as that the plants may be able to assimilate them according to their wants, as well as to impart a mechanical and permanent fertility to the soil ; I mean, to keep it in what farmers term "good heart," which is the real object to be obtained in administering manure at all, and that, therefore, on occasions where such is found to be deficient, in order to accomplish this desideratum, stable or yard dung ought invariably to be added, in a certain diminished extent, according to circumstances, along with the applications of all artificial manures, for the purpose of furnishing the requisite supply in bulk to the land, of decomposable animal and vegetable matter, which the substitutes of the chemist, guano (or any other substances, are incapable of affording. *W. D. S., Nov.* 1.

## Home Correspondence.

*Alternate Culture.*— Your correspondent "H." has brought the plan of cultivating land in alternate strips of Wheat and fallow so forcibly before the public, that probably many may now be induced to take up the subject who would otherwise have turned a deaf ear to the advice of theory, or even of practice, in such a case. May I direct attention to what will be found in De Candolle's "Physiologie," p. 1036, on this very subject, as likely to throw light upon one, at least, of the reasons which should recommend the practice, and at the same time induce caution against unduly raising expectations that manuring may in future be entirely dispensed with. After remarking that the greater number of phenomena which gardeners and agriculturists ascribe to the influence of the atmosphere, are really to be attributed to that of light, and stating some examples, he makes the following remarks, which I have freely translated : "It is principally to the same cause that we should ascribe the greater vigour exhibited by our crops on the borders of fields and of our trees on the outskirts of woods. The principle on which Tull's method is founded of dividing a field into very narrow strips, which are to be sown or left fallow, on alternate years, is that of enabling the entire field to be equally stimulated by the action of light. (In a note, he remarks—I say nothing of the pretext of dispensing with manure, a practice which Tull had combined with the fundamental principle here referred to ; and which, in fact, was the real reason of the little success of his scheme.) 'My field is all border,' said an intelligent cultivator to me, who had adopted this plan, and who had found the mean value of his corn, which had now become both larger and heavier, amply repaid him for the increased manual labour which the process requires." *J. S. Henslow, Hitcham, Nov.* 25.

*Clipping Horses.*—Mr. Mechi is perhaps not aware that a new machine has been invented for burning off the hair, instead of the tedious and expensive way of clipping by scissors ; and I have been told by at least a dozen of drivers connected with the great company of omnibuses belonging to the Waterloo and Atlas company, that it is by far a superior plan to the old one, and after the first burning of the horses they care little about it. I have not seen this simple thing, but it is a gutta percha tube fixed on a gas-pipe and at the end is the machine, consisting of an iron about 6 or 8 inches long, with holes bored in it horizontally, and above the burners, horizontally, is a comb to raise the hair. When everything is ready the gas is lighted, and a man can do a horse easily in three hours: the thing altogether costs 2l. I was told that a white horse looked rather queer after the operation, but for a darkish haired horse it was hardly noticed. And the beauty of this new plan is, that you can leave just as much or as little as the operator chooses, and it is certainly very extraordinary that something of this sort was not long ago found out. Sending horses to hard ploughing all day with such great coats on, must very soon put them in a stew, and do their work with very great fatigue, compared to when their great coats are off ; they cannot catch cold, for as soon as labour is over they are at once taken to the stables, and instead of having a wet great coat on all night, they at once get dry. "But," says the farmer, "I have no gas ;" but gas now is in every town, and it would suit the blacksmith to buy the machine, and then do the horses brought to him ; the expence of doing a horse is three hours' gas, a man (any man can do it), say 3s. altogether, not saying a word about the comfort of the horse, and the loss of strength, and food, by such terrible sweating when at hard work. *James Cuthill, Camberwell, London.*

*Fossil Remains.*— Your correspondent, Mr. J. R. Markby, states that in levelling a pit last winter at Middleton, Suffolk, he found an ammonite in the soil he was moving, which soil he states to be of a sandy nature with a slight admixture of clay. As I am one who have pleasure in assisting an enquiring mind, I beg to state that the ammonite was, in some convulsion of Nature, broken up from its original bed and finally deposited where it was found by Mr. Markby. In answer to Mr. Markby's three queries ; the fossil in question reached the spot where it was found by transport, having been borne there by the action of water. It does not belong to the period when the soil was deposited in which Mr. M. discovered it ; but it had been a fossil, ages prior to its being deposited there. The fossil known as an ammonite belongs to the secondary formation. *H. A.*

*Price of Wheat.*—It is interesting to observe that the average price of Wheat now is just the same as it was in the year 1202, or almost 650 years ago. It was then 12s. per quarter, which in the money of the present times would be equivalent to 36s., the average price now. *T. Bul.*

*Game.*—There cannot be, I should conceive, any dispute about the abstract question of the preservation of game ; it can only resolve itself into a question of degree ; the due balance between increase of population, improved cultivation, and the amount of game, with the method of preservation. When such balances are wholly within the control of the established laws of nature, we observe that a just and well preserved equilibrium is maintained ; but when coming under the disturbing influence of human will, they become liable, as all man's regulations are, to imperfections, yet are they never absolutely removed beyond the all-guiding power of the Creator. In this case, however, the right being granted (and if landed property has any fundamental and unalterable rights, this is one of them), the due regulation of it, keeping pace with the time and advancing requirements of society, must be left to the proper feelings of the game-preserver and the force of public opinion. I should however imagine that it will ever remain a fair question, whether, under any system of the most improved cultivation, birds and animals not wholly domesticated, might not obtain their food from sources not profitably available for any other kinds, which solely depend upon the care of man for their sustenance ? Will there not be always berries of all sorts, Acorns, &c., which may feed vast numbers of them, which otherwise rotting in the ground would return no food to man ? Will there not be always innumerable insects and caterpillars (even could we by our vaunted knowledge and mechanical appliances, turn the mountains and swamps of the United Kingdom into one vast market garden), to the destruction of which, winged game alone would be found adequate auxiliaries ? Plantations moreover (for hedge-row timber, however picturesque, and enhancing as it does the beauty of English scenery, is already condemned) will readily be allowed to offer the best and most approved plan of growing timber. How then are these to be kept entirely free from game unless some person has the power of killing it ? And who has so just a right as the owner ? And if the right be in any case tranferred to the tenant, will he not take the place of the other, and become a game preserver ? Besides the benefit conferred by the continual check of all kinds of vermin should not be entirely lost sight of, which if unmolested, would do very serious injury to the cultivator of the soil. Let any one make a rough calculation of all hawks and stoats, &c., which are on this account annually slaughtered, and their progeny, according to the natural law of increase in each, and then consider if gamekeepers do no public service. They might, again almost be looked upon as a rural police not chargeable to the country, for the idle vagabonds of a neighbourhood are always kept under their observation, and so receive many checks which deter them from further deeds of mischief. And this point receives further confirmation from the fact that in countries where the game laws were relaxed such vagabonds increased into dangerous bands, a terror to all honest folks who wished to pursue their industrial occupations in peace. I do not wish to advocate the cause of over-preserving, or defend the genteel line of butchery which has become the fashionable profession of many, under the refined name of battues, which I consider a greater degradation of sport with dog and gun, than the turning of fox-hunting into steeple-chases, and mostly carries with it the conviction of an unthinking or bad landlord. In this, then, as in all other things, a happy medium should be observed ; while the abuse, which constitutes the evil, should be carefully guarded against. *Moderator, Nov.* 4.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's house in Hanover-square, on Wednesday last, the 3d of December : present, the Earl of Ducie, President, in the Chair, Duke of Richmond, Mr. Raymond Barker, Mr. Barnett, Mr. Brandreth, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Lawes, Mr. Milward, Prof. Sewell, Mr. Shaw (London), Mr. Shelley, and Prof. Way.

The following new Members were elected :

Fischer, Ewald, Wietendorf, Mecklenburg-Schwerin.
Hall, Dr. Marshall, Grosvenor-street, London.
Pocock, Thos. William, Glenridge, Virginia-water, Surrey.
Weir, Edward, 351, Oxford-street, London.
Powell, William Styles, Castle-street, Hereford.
Groves, Thomas, Manor House, Nun-Monkton, York.
Mitchell, Wm. Rowland, Royal Agri. College, Cirencester.
Hartley, John, The Oaks, Wolverhampton.
Goodson, William, Hill Farm, Carshalton, Surrey.
Evans, David, Llaethlin, Aberayron, Cardiganshire.
Key, Kingsmill Grove, 103, Newgate-street, London.
Pollen, R. H., Rodbourne, Malmesbury, Wilts.
Townshend, Charles, Pulford, Chester.
Matthews, Francis Cook, Driffield, Yorkshire.
Bulkeley-Owen, B. H., Tedsmore Hall, Salop.
Whiting, Charles, Beaufort House, Strand, London.
Greener, Thomas, Etherley, Darlington, Durham.

Del Valle, The Conde, Vergana-in-Giupoiscos, Spain.
Hawkesworth, Thomas, Chesterfield-place, Weymouth.
Harris, His Exc. Lord, Governor of the Island of Trinidad.
Coryton, Augustus, Pentillie Castle, Cornwall.
Peacocke, Montague, Fylewell, Lymington, Hants.
Scott, Sir William, Bart., Ancrum House, Jedburgh, Roxburghshire.
Jackson, John S., Bank of Mona, Douglas, Isle of Man.
May, John, Bath-road, Reading, Berkshire.
Wright, George, Chapel Farm, Dorking, Surrey.
James, William, Maypowder, Blandford, Dorset.
MacClintock, H. Stanley, Randal's Town, County Antrim.
Bulley, Rev. Frederick, Fellow of Magd. College, Oxford.
Stonehewer, William Scott, 10, Brunswick-terrace, Brighton.
Pye, William, Oaklands, St. Alban's, Herts.

The names of 17 candidates for election at the next Monthly Council were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented the report on the accounts of the Society, to the end of the previous month; from which it appeared that the current cash-balance in the hands of the bankers at that date was 781*l.*

Fines.—The Duke of Richmond, Chairman of the non-exhibition Fines' Committee, read the following report to the Council:—

"The Committee have had laid before them a list of the parties who had become liable to fines for the non-exhibition of animals entered for the Windsor Meeting, agreeably with the 22d regulation of the Show, printed both in the prize-sheet, and on the several certificates on which the respective entries had been made. Of these parties, it appeared, 18 had duly paid the fines, and 10 had sent letters of excuse, while the remaining 19 had sent no reply whatever to the circular addressed to them by order of the Council.—The Committee are of opinion, that the payment of these fines should be enforced, with one exception only, namely—in favour of Mr. Sharp Spence, who states that his animal died on the railroad, and that his servants informed the officers in charge of the show-yard at Windsor, of the circumstance.—The Committee recommend that the regulation under which these fines are levied, should be amended, with a view of making it more stringent; and the Committee accordingly beg to submit to the consideration of the Council the following new rule for future adoption:—In order to check the non-exhibition of animals which have been entered for the show, thus causing the Society to make unnecessary preparations and incur unnecessary expenses; and also to prevent the show-yard from being disarranged, a fine of 10*s.* will be levied on each entry of stock which shall not be exhibited, unless a certificate, under the hand of the exhibitor or his authorised agent, be lodged with the Secretary of the Society, on or before the day of exhibition, proving to the satisfaction of the Council, that such non-exhibition is caused either by the death of the animal or animals, by contagious or infectious disease, or by unavoidable injury, sufficient to prevent such stock from being exhibited."

The Report was unanimously adopted by the Council, and directions were given for carrying out its recommendations.

Guano.—The Duke of Richmond took that opportunity of reporting the favourable progress of the communications into which, at the request of the Council, he had entered with Viscount Palmerston, H.M. Principal Secretary of State for the Foreign Department, for the purpose of effecting a reduction in the price of Guano imported into this country. On the motion of Mr. Shelley, seconded by Mr. Fisher Hobbs, the cordial thanks of the Council were expressed to his Grace for the anxious attention he had bestowed on this subject, and for the important facts he had communicated to the Council, in reference to the deep interest felt by H.M. Government on this national question, and the entire willingness of the noble Lord at the head of the Foreign Department to promote the wishes of the Society, and advocate the cause of the English farmer to the utmost of his power; the noble Duke being requested by the Council to continue these communications, and act on their behalf and that of the Society in such manner as he might from time to time find most desirable.

Foreign Elections.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Raymond Barker, the following resolution was passed, and the by-law of elections ordered to be amended accordingly, namely, "That, in future, every candidate proposed for election into the Society, whose residence is out of the United Kingdom, shall only be elected under the condition that he makes in one payment the composition for life in lieu of annual subscriptions."

Standing Committees.—The following standing Committees were appointed for the year 1852:

Finance Committee.—Colonel Austen, Mr. Raymond Barker, Mr. H. Blanshard, Mr. Brandreth, Colonel Challoner, Mr. Jonas, Mr. Wilson (Stowlangtoft.)

House Committee.—Past President, Chairman of Finance Committee, Mr. Raymond Barker, Mr. Brandreth, Colonel Challoner, Mr. Brandreth Gibbs, Mr. F. Hobbs, Mr. Kinder, Mr. Shelley.

Journal Committee.—Duke of Richmond, Lord Braybrooke, Lord Portman, Hon. R. H. Clive, M.P., Sir C. Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Mr. Burke, Mr. Childers, M.P., Mr. E. Denison, M.P., Mr. Hyett, Mr. Miles, M.P., Mr. Milward, Mr. Pusey, M.P., Mr. Shaw (London), Mr. Shelley, Mr. Thompson.

Chemical Committee.—Lord Portman, Sir John V. B. Johnstone, Bart., M.P., Mr. Dyke Acland, Dr. Daubeny, Mr. Hoskyns, Mr. Hudson (Castleacre), Rev. A. Huxtable, Mr. Hyett, Mr. Jonas, Mr. Lawes, Mr. Miles, M.P., Mr. J. M. Paine, Mr. Pusey, M.P., Mr. Shaw (London), Mr. Sheridan, M.P., Mr. Thompson.

Veterinary Committee.—Duke of Richmond, Sir John V. B. Johnstone, Bart., M.P., Mr. Raymond Barker, Mr. S. Bennett, Mr. Brandreth, Colonel Challoner, Mr. E. Denison, M.P., Mr. F. Hobbs, Mr. Pym, Prof. Sewell, Mr. Shelley, Prof. Simonds, Mr. Shaw (London), Prof. Spooner.

General Lewes Committee.—Duke of Richmond (Chairman), Mr. Shelley, (Vice-Chairman), Earl of Chichester, Lord Portman, Sir Edward C. Dering, Bart., Sir M. W. Ridley, Bart., Sir John V. B. Johnstone, Bart., M.P., Sir H. Shiffner, Bart., Colonel Austen, Mr. Raymond Barker, Mr. Braudreth, Colonel Challoner, Mr. G. Darby, Mr. Ellman, Mr. B. Gibbs, Mr. Grantham, Mr. Hamond, Mr. F. Hobbs, Mr. Law Hodges, M.P., Mr. Jonas, Mr. Milward, Mr. Pusey, M. P., Mr. Shaw, (London), Mr. W. Simpson.

Implement Committee.—Lord Portman, Sir M. W. Ridley, Bart., Mr. Brandreth, Colonel Challoner, Messrs. Easton and Amos, Mr. Garrett, Mr. B. Gibbs, Mr. Hamond, Mr. F. Hobbs, Mr. Hornsby, Mr. Miles, M.P., Mr. Shaw (London), Mr. Shelley, Mr. Thompson.

Lewes Meeting.—The Council decided that the country meeting of the Society at Lewes, in 1852, should be held in the week commencing Monday the 13th of July.

Miscellaneous Communications.—Prof. Nesbit's offer to exhibit before the Council, at their weekly meeting, on Wednesday, the 10th of December, a new and simple mode for detecting the adulteration of guano; and Prof. Way's offer to explain at the same time a mode of effecting the same desirable object, communicated to him by a young Belgian chemist, were accepted with thanks by the Council.—Mr. Parkes, C.E., transmitted for each member of the Council, a copy of a work he had just published, containing an exposition of what he considered to be fallacies in land drainage, especially as propounded by Lord Wharncliffe, in the last Journal of the Society.—Baron Mertens addressed to the President a communication containing suggestions for ascertaining the conditions of deep ploughing, and an offer to become in part subscriber to a prize for promoting competition in the practical trial of the same.—Chevalier Claussen invited attention to his operations at Stepney for the manufacture of Flax-cotton fabrics.—Mr. Lawrence addressed to the Council various suggestions connected with the subject of Implement Prizes.—The Council ordered their usual acknowledgements for these communications; and adjourned to their weekly meeting, at 12 o'clock on Wednesday, the 10th inst., at which all members of the Society had the privilege of being present.

---

Newcastle, *Sept.* 6.—Mr. B. Green read a paper on the "Ventilation of Stables." He said:—

Having made various plans of different arrangements of stables, with and without lofts (I have them with me for the inspection of the meeting), I prepared a model of a two-stalled stable, to illustrate the mode of ventilation I advocate, which was shown at the Northumberland Agricultural Society's meeting here, on the 7th August, and is now in the room. It may not be out of place here to say that the great object in view was to house each draught (team?) in distinct stables, with separate lofts. That their provender, trapping, &c., should be under the control of each farm-servant, as a means of making him alone responsible for the condition of his horses, cleanliness of his stable, and the regulation of the food in regard to quantity; and by providing the stable with almost a self-acting system of ventilation, to insure a supply of pure air. His Grace the Duke of Northumberland, with his usual promptness and consideration, has sanctioned the building of the stables on this principle. Having made calculations of the difference of cost between the stables with the hay houses on a level, and with lofts above, in the range for 10 horses, I find it is 35*l.* more for the former than for the latter. My opinion, therefore, is not only as a matter of economy, but by lessening the cubical contents of the stable, by putting a loft above, that the due amount of warmth, free from foulness, with the ventilation I have proposed to adopt, is secured by the loft; and the air will be sufficiently rarified with having only two horses in one stable; that foul vapours will not be allowid to generate, and if they do, I prevent them from penetrating the loft to injure the hay, and in a range of stables open to the roof, with hay houses on the floor, none of these disadvantages are so cheaply or so easily effected. When a stable is cold, the animal has a much greater amount of the heat of his body to expend in warming it, and taking, on an average, from 1000 to 1100 cubic feet to be the proper quantity provided for each horse (that his blood may not be unnaturally cooled), I find that a stable of the size indicated by the model, viz. 18 feet deep, and 12 feet 6 inches wide, and 9 feet 7 inches high up to the boarding of the loft, contains 2156 feet, which leaves 1078 cube feet for each horse; and a stable of the same dimensions, without a loft above, has in the roof 862 feet more for the horses to warm, being 431 feet in excess for each animal. Farm stables, however, I propose (merely as a matter of economy) to be 16 feet deep, 15 feet wide, and 9 feet 7 inches high, being 1840 cubic feet, making 920 cubic feet for each animal, which will make them amply warm, and I propose to ventilate them on the principle of the model. In consulting the authorities I have named, I found they agree, that the effect of several horses being shut up in the same stable is to vitiate the air and yet, even in the present day there are too many who carefully close every aperture by which a breath of fresh air can possibly gain admission. A very large stable has nothing to recommend it but some trifling less expense, by getting many stalls in one apartment, rather than in several small stables. If the desideratum be, therefore, a cheap, rather than a healthy stable, and the builder be the owner of the horses, the large one may ultimately be a great loss. No wonder why so many horses catch cold. But by watching the alterations of temperature, which occur during the 24 hours, the cause is easily discovered, as sometimes 12 horses will be in all together; then two are left to expend their heat and flesh in the large vacuum created, and these transitions are unavoidable, and, indeed, are constantly happening in large stables. Neither are they so easily ventilated, if wished. They require a loftier roof than is ever given. They are not so easily kept in order (seldom at all), as the men leave it to each other, in spite of remonstrance. Disease once ensuing from the litter usually seen around, contagion spreads rapidly and extensively. Then, again, the rest of a horse is disturbed by the entrance of other horses at intervals. A vicious horse often disturbs his fellows; a collar may be slipped, and the vicious horse enters another stall, kicks, bites, and violence ensues, sometimes fatally. These objections are, however, modified in a measure in large farm stables, where all the draughts are more out together than in other cases; and this is the reason they have answered better, and clearly the cause that they have been longer continued in use, as an established custom, in absence of anything else being suggested. Again, the return to a hot stable is as dangerous as the change from a heated atmosphere to a cold and biting air. Many a horse has travelled over a bleak country and on being put into a hot and foul stable has been seized with inflammation and fever. There is, however, a great difference between hot and foul air. Warmth is congenial to the horse, but it should be pure; cold is not so dangerous as foulness. The effect of pure air in all animals, as well as human beings, is to purify the blood, and to enable it duly to perform its innumerable functions in circulating through the body. According to Lavoisier, 100 measures of pure air contain 73 of nitrogen and 27 of oxygen. It has been proved that the breathing animal consumes the oxygen, and death ensues when the supply falls below the demand. Carbonic acid gas is given out from the lungs, and impregnates the air, rendering it poisonous. The impure air of a stable is deficient in oxygen, and mingled with carbonic acid gas. Acrid vapours, arising from the dung and urine, if left, lead to disease; and it is clear, therefore, that any mode of ventilation that will carry off these vapours will be a boon. The effects of hot stabling are, a fine short glossy coat, a strong disposition to accumulate flesh, extreme susceptibility of cold, and therefore extreme heat is objectionable; but such heat cannot exist if the air be kept tolerably pure. A warm stable is generally at 60 to 65 degrees; in a hot stable it is often 10, 15, or 20 degrees higher. The same quantity of food does more good in a warm than in a cold stable, and all kinds of horses thrive better in a comfortably warm stable than in one sensibly cold. An extra supply of nourishment is, therefore, necessary in a cold stable; or, in other words, the horse will eat more food. A certain quantity of blood is requisite to produce heat; if a horse be not warmly housed, the nutriment which should go to the formation of vigour must be expended in the production of heat. The heat which is constantly passing from the horse's body soon warms, but judicious ventilation will keep it sufficiently comfortable; but in no case should a high degree of heat be purchased by sacrificing ventilation so far as to produce a sensible contamination of the air. The warmth usually recommended is that in which the thermometer stands at 62°. The best place for admitting light is at the back of the horse, to light the gangway; and where the work of the stable is to be done. In the case of two-stalled stables like the model, there is light from each side wall, but still this is at the back of the horse. I object altogether to putting windows in front of the horse; it glares his eyes, and the ray of light does not reach that portion of the stable where it is most needed. I will now give you a quotation from Youatt:—"Agriculturists should bring to their stables the common sense which directs them in the usual concerns of life; and should begin, when their pleasures and their property are so much at stake, to assume that authority, and to enforce that obedience, to the lack of which is to be attributed the greater part of bad stable management, and horse disease." All authorities, and all parties whom I have heard speak, or believe themselves competent to give an opinion on the subject, have held different views in regard to ventilation. Some think the badness of the fittings of the doors and windows are sufficient to admit fresh air. Luffer boards on the roof seem to have gained influence on some. But for my own part, I deprecate both these systems; and, finally, I have never seen two stables ventilated alike, in all the stables that I have seen. I will now proceed to a description of the model. All the walls are intended to be of stone, and the timber foreign. The scale of this model is as near as may be two inches to a foot. I have stated before the general dimensions to be 18 feet deep, 12 feet 6 inches wide, and 9 feet 7 inches high; and these dimensions I recommend for all racing and riding stables: they should not be less. The stall partitions have iron heel posts rounded going up to the joists, and fixed thereto. This is preferable to stopping them off, and putting on ball finials or any other finishing. Iron bottom rails are also intended, and the top rails may be of tick wood, if preferred, but iron may be more advantageously used, curved higher up to the head, to prevent the horses touching or smelling each other. The deals are intended to be 2½ inches, beaded and half-lapped, to avoid the middle rail, which makes the partition smooth, and prevents the horse scraping his hocks. In the latter named stables this partition should be repeated against the wall. The stalls are intended to slope 1 inch to the yard, and to be well paved. A channel stone is provided behind the horse, with a descent to the grating at one end, and from thence, below it, glazed pipe-drains will be laid to carry the liquid manure away into a tank, or in cases of farm stables where the fold is on the side of the stable, into it, to mix with the solid manure. In farm stables the gangway may be paved also, but in other stables it should be flagged and grooved transversely, but in each case sloped to the channel. The mangers are intended to be only 36 inches long, 12 inches deep, and 12 inches wide, of iron altogether, or with tick-wood rolls, or they may be made of slate or English marble, like the urinals of railway stations. Iron racks are intended, but with the rungs much closer together, and scarcely to lean out at all, or project in front, and they are only to hold a stone, or a stone and a half of hay; the space for it being got by hollowing out in the thickness of the wall. The small rack prevents the possibility of a quantity of hay lying in it to spoil, and the horse is better with an empty rack at times, for he relishes his food more when it is due to him. The hay I propose to be put down from the loft into the stable, as required, in a box tube, brought down to near the floor, and the aperture closed with a slot at the bottom, and no foul air can pass up it. The small trap-door for the ladder, double rabbetted inside, would be, therefore, the only opening to the loft, but I would prefer the groom being sent up by a ladder from the outside. The man will then take the hay in the stable, assuming the guaging to be, as it ought, kept clean, and put it into the rack, thus preventing the hay-seeds falling on the horse's head if put down over the manger from the loft. The careful groom, by the directions of his master, should roll the hay up in the loft before putting it down the box tube to economise the hay seeds. In farm stables, however, by double mitring very small doors over the racks they would not be objectionable, as the ventilation is anticipated to be so complete as not to admit of vapours being engendered at all, and the flooring deals are intended to be grooved, and hoop iron inserted in the joists. No ceiling is required, but the underside of joists and flooring will be painted, or in farm stables done with pitch, which expedients would prevent any foul air that might arise from passing up. The height of the loft is 5 feet 6 inches up to the tie beam, and 10 feet 6 inches to the apex of roof. Rough plate-glass is introduced in the slating, to light it, and the roof, if lower, ought to have ventilators. A door with a weather-board at the bottom is provided into the loft to admit the hay, immediately above the stable-door, and the stone head of the latter forms the sill of the former. Another door is provided at one side for the farm stables, to put the manure into the fold. This is 4 feet 6 inches by 2 feet 6 inches, and the stable door is 7 feet by 3 feet 9 inches. The masonry of doors is all chamfered, to avoid chafing the horse, if he touch it. Boxes are provided below the racks to collect the hay seeds, with openings to remove them, by putting dealsin a sloping direction from underneath the manger, and this also prevents the horse from getting his head or fore legs under it, and admits of the fresh air, from the tube in front of him, passing up between his head and the wall, to the opening above for the emission of the impure air into the close tube, through the loft, to pass off out of the roof above, and the top is turned down to prevent down drafts. I provide openings at both sides of the stable, and the pipe passes through, as may be observed, in front of the horse. I intend it to be of cast-iron, with small holes perforated on three-fourths of its diameter only, so as to diffuse the air. Each end of the tube is bell-mouthed, and not perforated till the circular part commences. The openings on the outside have cast-iron perforated gratings, so that the air is also diffused before entering the tube; and the small doors provided may be closed when the wind is strong at either side, or they both can be closed together, which, however, is not at all desirable. Ample light is provided by the two windows over the two doors, and these are intended to be glazed with rough plate-glass; but additional light may be provided by another glazed window at the same height on each side of the stable, if for three or four horses. I have stated my opinions before in regard to the best position for bringing in the light, to be at the back of the horse; and, after the utmost consideration, I am satisfied that the best situation for bringing in the fresh air is in the position shown in the mode in front of the horse, immediately below the apertures for emission of foul

air. Suppose both doors are shut and the stable has become foul (as it would do) immediately the small outside doors, one or other, are opened to the fresh-air tube, a diffused current will move off the vapours from the whole area of the stable, up the close tube above, and when they are all dispelled thus, the pure atmospheric air will gradually and imperceptibly diffuse itself through the stable. In this position the fresh air does not pass over the horse in a current, as it would do, if brought from the back of the stable; and as the pure air must and will reach his nostrils, if admitted at all, it is clear that if it gets there at first, it will be of most service. But it can only enter by the perforations, and no current will be perceptible while the ventilation is going on. Finally, then, in confirmation of this system, I have, since 1845, had the repeated assurances of those who bring horses to the race meetings here, that the Stand Stables are cured of foulness and undue heat. It is capable of being adapted to all cases, and at the Grand Stand Stables the openings in the walls are directly in front of the horse, but protected outside with a grating, and inside with a slot, to open and shut at pleasure. The tubes are all of wood, like so many boxes, the full width of the stall, but only the side next the wall (a space being left), and the bottom of the box or tube, is perforated. If the current be violent when the slot is open, the wind blows against the back of the tube, and is reflected back through the perforations in the other two sides, avoiding all draft upon the horse. The same mode of provision is made in the model, with the air admitted in a different position from the Stand stables.—The Chairman, Sir M. W. Ridley, Bart., said, "The paper just read contained, no doubt, many correct and valuable remarks. At the same time, however desirable it might be to have a stable well ventilated, in the manner described by Mr. Green, much of the mischief which arose from the neglect of a system of perfect ventilation might be avoided, if the farmer would only see the litter removed every morning, and the stable thoroughly cleansed—a precaution which was too apt to be neglected. The presence of so much ammonia was most hurtful. A gentleman told him that he once had a groom who attached great importance to keeping the stable exceedingly hot; and he not only excluded the outer air, but kept in the foul litter, laying down layer upon layer of straw. So great an amount of ammonia was, therefore, generated that the lungs of the horses were affected, and they died in consequence; and, in the end, the groom himself died from an infection of the lungs. Every person must be aware, who went into a foul stable, how powerful were the fumes of ammonia, making the eyes smart. A veterinary surgeon, consulted by a friend of his, whose horses had got a "hacking cough," recommended him to give them Grass. The cough, however, remained. Another application was therefore made for advice; but, this time, his friend saw the other partner of the firm. "Oh," said he, when the facts were stated, "it's a Grass cough!" "Why," was the reply, your partner recommended Grass as a cure; and now you say it is a Grass cough! Which doctor am I to follow?" The matter ended in following neither, but in giving the horses more air—which had the desired effect; and the virtues of pure air having been discovered, the stable was permanently ventilated by means of admitting the fresh air and carrying off the foul.—Mr. G. H. Ramsay said, it must be very gratifying to the members of the club, that the architect of one of the largest proprietors in the country, (the Duke of Northumberland,) should have come forward to read a paper on the important subject of stable ventilation, and assisted them in preserving the health and prolonging the lives of their horses. They were deeply indebted to Mr. Green for the valuable facts which he had laid before them; but in one respect, perhaps, his plans were open to question. He proposed to build his stables with lofts; and the hay, so kept, would be deteriorated as food. He (Mr. R.) doubted very much if there should be any racks at all—whether it was not better to feed horses with cut hay, Clover, and chaff—giving them, occasionally crushed food—lofts and racks being thus needless.

## Miscellaneous.

*The American Reaping-Machine at the Exhibition of the East Cumberland Agricultural Society, at Carlisle.*—I shall briefly detail what I saw. The field had a moderate declivity; the crop, Wheat, an average of the neighbourhood, what we would consider light, but all standing up; the ground unfavourable, being in narrow ridges, with moderately deep furrows; the plot selected was nearly square, a portion on each side, with the end ridges, having been reaped and cleared off; the machine commenced at one side, and reaped full round, was drawn by two strong horses, which were on their mettle and distressed; up the hill, in the centre of the ridge, it cut well; across the hill and ridges badly, and down the hill far worse; in fact, in the latter case, it dragged off the heads leaving a great portion of the straw cut at various lengths; and as a gentleman, a looker-on, observed, "It was like a man half-shaved with a bad razor." I reckoned 22 persons attending it, men and women; all appeared to be very busy collecting and binding up the grain in bundles, not sheaves, the heads and roots being somewhat equal; this is its greatest fault, delivering the grain after being cut, strewing the heads all over the ground; the persons attending could have cut the grain, at least as quickly, immensely better, and without one-fourth the loss. After it had cut once round the field, it was obvious to the most casual observer, that it was from home—out of its element—a decided failure; all present agreed in this. On the next day, the 20th, we had another fair trial, under other circumstances, and in another part of the country. The Earl of Lonsdale, for his own information, and that of his tenants and neighbours, hired, and had it brought down to Westmoreland, where it appeared before a large party of the nobility, gentry, farmers, &c., on the farm of Mr. Beanstead, near Lowther, and commenced work about 11 o'clock. This field was laid out favourably, in broad, well-formed ridges, with very shallow furrows, and was much more favourable in that respect than the one at Carlisle, except being rather hilly, steep, and a much better crop, which, I could easily perceive, was against it. It cuts moderately light grain better than heavy; here it was a good, standing crop, such as a reaper would choose for a first-rate day's work; it was drawn by two very strong horses, but it would have required four. They were much distressed, and during the four hours it worked, were twice changed. As on the former day, it cut cleanly up the hill, but very badly across the ridges, particularly at the foot, where the grain was strong; and they did not attempt to cut down the slope at all; it would have been abortive. After two rounds of bad work, they gave up cutting across also, and confined the operation to cutting up hill, going down empty. The work was continued four hours, cutting in all 9760 square yards, or a little over two statute acres. As on former days, a great number of persons were attending, binding up, &c., in fact, a quantity that could have reaped more ground in the same time, and immensely cleaner and better. Its great fault is delivering the grain from the platform—on which it falls after being cut; this falls on the former cut ground in great disorder, strewing it over with loose heads. A trial was made to bind up some of the heaps into sheaves orderly, straightening the grain tops and butts, as after reapers, but this was found quite impracticable: a man could have reaped and tied a sheaf much sooner and better than he could have settled the heaps as they left the machine. A very important experiment was made in the field by some gentlemen, to ascertain the loss sustained by loose heads, gleanings, &c., left on the ground after the grain had been bound up. An average square yard was measured, the loose heads collected upon it, the grain and straw separated and weighed. Of grain there was three-quarters of an ounce, being at the rate of 226⅔ lbs. per acre; of straw, 1¾ oz., or 378 lbs. per ditto—a quantity the value of which would have reaped, bound, and carried it to the stack-yard. After witnessing these trials, the facts are incontrovertible, that this implement is not, at present, calculated to meet circumstances. All circumstances must suit it; the ground must be perfectly level, without ridge or furrow; the grain must be a moderately light crop, and all standing. Even taking these matters into consideration, the crop can be much cheaper and better reaped by the scythe or sickle. On this head there were not two opinions in the field that day, nor have I heard any other since; the implement was acknowledged on all hands to be a decided failure. I am not prepared to say that it may not be much improved; in this country I should think it will. But there are serious difficulties in the way, in making a machine to do the work correctly and cheaply, in various localities, under different circumstances, and with different crops. My own impression is, it will be a long time ere it can come in competition with the scythe or the sharping sickle. On this head I may mention, that a very important experiment was made in this neighbourhood a few days ago, by the members of the Penrith Agricultural Society, to test the merits of the scythe and sickle in reaping grain. An English mower and an Irish reaper contested for a prize, and our countryman won easily. From this we may infer that there are still hopes for Ireland. *Thomas Skilling, Lowther Castle, Sept.* 22, 1851; *in the Dublin Gazette.*

*Draining in Lancashire.*—On the Duke of Hamilton's estates, drains from 60 to 70 miles in length have been of late annually completed, with pipe tiles, from 3 to 5 feet, and on a great number of the drains where the subsoil is clay, turves have been placed over the tiles. The width at the bottom is governed by the size of the tile, which ought exactly to correspond, and fit firmly and truly. The cost of labour in draining on these estates is as follows: 33 inches deep is 6*d.* per rod of seven yards; 36 inches, 7½*d.*; 42 inches, 9½*d.*; 4 feet, 11½*d.*; and 5 feet, 1*s.* 6*d.*, exclusive of carting the turf and tiles. Turves of the above description are used alone without tiles in many parts of the country where the clay is firm, and answer well; having been dried, and consequently, reduced in size, they swell from moisture, after being trodden into the drain, and are exceedingly secure, so much so, that after being in the drain a short time, they are not removed without difficulty. These turves are much preferred to the Grass sod dug from the surface, having been taken up after 50 years, and found perfect: their cost is 2*s.* 6*d.* to 3*s.* per thousand. It is very desirable to place a tile or two at the outlet of these turf drains, which not only admits of more ready inspection, but preserves it from being trodden in by cattle. The cost of cutting and finishing this turf drain is, according to depth, say for 30 inches, from 3*d.* to 4*d.*; for 3 feet, 5*d.* to 6*d.* per 7 yards. The advantages of pipe tiles consist not only in economy of construction, but in efficiency of purpose. The water, by being confined to a narrow space, clears out any sediment that would collect in a wider drain. Within a moderate distance of manufactories, a very cheap drain is sometimes made with waste cinders or "clinkers," thrown in promiscuously: they are used principally in pasture or meadow land, the drain being cut 2 feet deep, and filled to the sod. *Notes on Lancashire Agriculture.*

*New Mode of Ventilating Public Buildings, Stables, &c.*—Mr. Charles Watson has addressed a letter on this subject to the *Halifax Guardian*, in which he says:—"About six years ago I was appointed to a large ill-ventilated school-room, and as my health was injuriously affected I devised a mode of ventilation that has proved effective—withdrawing the vitiated and supplying any quantity of pure air without perceptible sensation to persons in the room, and they are not exposed to currents of air. Every crevice in the room that admits air may be closed without affecting the operation of the ventilator. The apparatus is made of zinc and iron, is simple, self-acting, and durable, and regulates the supply of air according to the season of the year and the number of persons in a room. It has been also successfully applied to other schools and to public buildings, private dwellings, stables, large weaving sheds, an infirmary, an editor's study, and a chapel that seats above 1000 persons. In one of the stables were nightly lodged nine horses, and generally four of them suffered from disease, now they enjoy good health; on opening the door in the morning the stench was intolerable, and the horses, harness, walls, and door were very wet, at all times the floor was black with damp—now, the smell is scarcely perceptible, and all are quite dry. In another stable that had holes in the roof and walls, the horse next the window was so inconvenienced for want of fresh air that he pushed his head through the glass that some might be admitted; since one of my ventilators was put in, the holes have been closed, everything is dry, and the smell is pleasant. I feel thus induced to give publicity to my experience, because there is a great outcry throughout the United Kingdom about the injurious effects of ill or no ventilation, and a knowledge of efficient means for remedying the evil is so limited. I am not the discoverer of the principle, but I believe the first who has applied it. The invention is not patented. I have allowed it to become public property. It is the opinion of those who have used the ventilator that it has only to be known to be extensively applied. If those who suffer from bad ventilation and want a remedy, or if workers of zinc feel disposed to introduce and push the ventilator in their localities, I will feel it a source of gratification to be called upon to furnish them by letter with full explanations as to its construction, with advice as to its applicability to special buildings, and to inform them of the necessary apparatus to test the ventilator and convince the most sceptical. The larger the building the more suitable the ventilator; yet rooms about 14 feet square have derived equal advantages." *Bedford Mercury, August* 20.

METEOROLOGICAL REPORT.—NOVEMBER—DECEMBER.
(*Continued from p.* 766.)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| ‡ 27 | 7.50 a.m. | ... | 29.72 | N. Gentle, bright. |
| | 11.30 p.m. | 29.83 | ... | Sunny day; white frost; barometer rising steadily. |
| 28 | 8 a.m. | ... | 29.88 | N. Gentle, hard. |
| | 11 p.m. | 29.98 | ... | White frost, heavy bank in eastern horizon; bright and sunny; barometer rising steadily. |
| 29 | 7.50 a.m. | ... | 30.00 | A.M., calm, clear and frosty. P.M., easterly. Evening, ENE. Gentle. |
| | 6 p.m. | 30.03 | ... | Bright beautiful warm day; barometer steady. |
| | | | | Night, densely overcast. |
| Sun. 30 | 8 a.m. | ... | 30.00 | NNE. Gentle; overcast rainy. |
| • | 5.30 p.m. | ... | 30.03 | Cold, comfortless, dull day. |
| | 10 p.m. | 30.06 | ... | Night bright. |
| Dec. 1 | 8 a.m. | ... | 30.11 | N. Gentle; bright; hard frost. |
| | 11 a.m. | 30.15 | ... | Bright day; barometer steady from noon. |
| | 10.30 p.m. | 30.15 | ... | Night frosty. |
| 2 | 3.40 a.m. | ... | 30.16 | N. Almost calm; fine sunny day, thawing; barometer steady. |
| | 10.30 p.m. | 30.18 | ... | Night, barometer risen. |

‡ Continuation of the previous storm, which had come from the westward, and crossed England (or *possibly Scotland*), to the eastward. By laying a storm-card on a map of the British Isles, it will appear that as the centre of this storm lay to the northward, the wind in the rear quadrants of this cyclone, coming from a colder latitude, caused a succession of white frosts. I say *possibly Scotland*, as this must have been a cyclone of considerable area, and the centre of it must have lain a long way off to the northward.

The month of November has been unusually bright and fine, and white frosts have prevailed during it to an extent not commonly experienced. I believe I have already stated that fogs and *black frosts* are generally consequent on a storm passing over the *south* of England to the German Ocean, *eastward*, and coming from the south; whereas, *white frosts* appear to be caused by storms passing over Scotland to the northward. It will, perhaps, be a matter of interest to some of my readers to observe how far this hypothesis is susceptible of proof.

• "Three white frosts, and then rain," is a common saying in some parts of England: the continuation of white frosts has been explained above (‡); and the rain, which, after a white frost is almost always accompanied by a fall of the barometer, is the condensation of the dampness of the front quadrants of an approaching cyclone, travelling from the equator towards the Poles, *i.e.*, from a warmer to a colder latitude. The present storm came from the southward, passing over France and the German Ocean; if this hypothesis be correct, the depression of the barometer should have been greater in London on the 30th, than in Dorchester.

Dorchester, Dec. 4. *F. P. B. M.*

(*To be continued*).

## Notices to Correspondents.

BITTER YEAST: *Anon.* The bitterness of yeast may be removed by straining it through bran, or by dipping a red-hot charcoal in it. But the most effectual and easily-available remedy is, to put the yeast in a large pan and cover it with fresh spring water, changing it every three or four hours. This last is the plan we adopt, and it never fails. The bran seems to impair the strength, and the coal sometimes stains it, but the water purifies it both in colour and taste; thus maintaining its character as the best beautifier as well as purifier. *G. S.*

BOOKS: *A Subscriber.* Information in detail on the very different subjects named is only to be obtained in our Agricultural Cyclopedias—and we recommend Blackie's, in course of publication.

CATTLE INSURANCE COMPANIES: *L C F.* next week.

CONTRIBUTIONS TO THE GAZETTE: *Subscriber.* Both of your papers have been received—with thanks.

CREAM CHEESE: *Friday.* It is made by adding the cream of one meal's milk to the milk immediately taken from the cow. This, after being *made* and pressed gently two or three times, and carefully turned for a day or two, is fit for use.

DRAINING MATERIALS: *N.* A well burned 1½-inch pipe is as good and economical a material as any.

EARLY SPRING FOOD: *Anon.* If you cannot sow till March, you must not till April; when, if white Mustard be sown, it will give you a crop early in June.

FODDER: *M.* We do not know in what work you can see a list of the various plants that have been tried as green and dry food for cattle, with the various results. Fullarton's "Cyclo-

pædia of Agriculture," in the article "Food of Animals," refers to the subject.

Grass Land: *An Old Subscriber.* Apply compost of earth and farm manure in autumn, or some more soluble manure, as guano and superphosphate of lime, in early spring.

Gravelly Soil: *Urbs in Rure.* You should get up some of the clay below, and mix it in compost with your manure, and spread the compost over all. Artificial manures upon very light soils are very rapidly wasted; but after dressing with this clayey compost, you might more economically apply guano or bone-dust. Three cwt. of Peruvian guano per acre, in compost with vegetable mould or other organic manure, is as good an application as you can make; apply it broadcast in early spring.

Gypsum: *G M.* Sprinkle 3 or 4 lbs. of the powder among the litter of each horse or beast.

Milk: *J J.* asks if Rape-cake, given to cows, will affect the taste of butter? Most likely it will; but we have no experience. Will any one who has had experience give us it.

Oilcake: *J H.* It is probably cheaper than the Oatmeal—more economical.

Pinoceo: *T J* asks our correspondent on this subject where he can obtain this manure.

Poultry: *J J* must have overlooked the answer to his query, some weeks since; it immediately followed another, asking the same question. Cramp is caused by damp, or by stone or brick floors to poultry houses; if from the latter cause, it may be cured by removing the floors, and substituting good hard earth, such as will be made with gravel and a small mixture of clay to harden it; it should be rammed till it will bear sweeping without disturbing the surface. If from damp, the fowls should be removed to a drier spot; if that cannot be done, the food must be altered, to counteract the evil effects of the locality, and must be persevered in, so long as the bad weather lasts; nothing is better than bread soaked in ale, given once a day, a little meat at times, and oatmeal slaked and mixed with pounded peppercorns. In fast-growing, large young birds, weakness is often mistaken for cramp, because the birds rest on their knees; this will disappear as they get strength, and cease to grow, and the food mentioned above will help them. I know no one who breeds Malay fowls for sale, and gentlemen will not allow their stocks to be picked. So long as purchasers will put no faith in sellers, so long will diseased fowls be sold; it is impossible to keep them healthy in confinement, especially in London; and if gentlemen will not buy without seeing, then they buy at their own risk and on their own judgment, and dealers have no alternative but to keep stock on hand. If buyers would put a little more faith in sellers, and the latter would be more careful to sell none but good specimens, and thereby justify confidence, such complaints as those of "J. J." would be less frequent. *J. Baily.* 113, *Mount-street.*—*J R M.* See "Farming for Ladies." In our next volume we may perhaps give plates of poultry-houses, &c.

Erratum. There is an omission in one of the sentences in Professor Henslow's letter to Mr. Lawes, p. 764, which, as it materially affects the character of his suggestion, requires notice. The sentence stands thus: "If you had grown half the field with Barley and half without, at successive intervals," &c.; whereas he meant to suggest that "each half thus grown, *should be mown little by little* at successive intervals." This way of varying the experiment would show us whether these failures may be attributed to the too early mowing of the Barley; and *also* whether there is any difference in this respect between that which is grown with, and that without, Barley. Of course in both cases one patch should be left wholly unmown, by way of comparative experiment, so essential in all such cases, and which (as De Candolle long since complained) had been so frequently neglected as to have rendered the great mass of agricultural experiments utterly worthless as data for arriving at scientific conclusions.

# Markets.

## COVENT GARDEN, Dec. 6.

The supply of English Pine-apples is still well kept up, and Grapes, both foreign and English, are plentiful. Importations of Pears from the Continent are nearly at an end for this season. The best English kinds fetch from 2s. to 4s. a dozen, and 8s. to 12s. per half sieve. They consist of Glout Morceau, Crassane, Beurré Diel, and Chaumontelle. Oranges are plentiful. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are still dearer. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 3s to 6s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 2s to 5s | — sweet, per lb., 2s to 3s |
| — Lisbon, per lb., 9d to 1s | Oranges, per doz., 1s to 1s 6d |
| Apples, kitchen, per bushel, 1s to 2s 6d | — per 100, 6s to 10s |
| Pears, dessert, p. doz., 2s to 4s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Lemons, per doz., 1s to 2s | — Brazil, p, bsh., 12s to 14s |
| Walnuts, per bush., 12s to 24s | Filberts, per 100lbs., 70s to 90s |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 8d to 1s | Shallots, per lb., 6d to 8d |
| Cauliflowers, p. doz., 6d to 3s | Garlic, per lb., 6d to 8d |
| Broccoli, per bunch, 3d to 1s | Artichokes, Jerusalem, per hf. sieve, 9d to 1s |
| Potatoes, per ton, 45s to 80s | Lettuce, Cab., p. score, 4d to 1s |
| — per cwt., 2s to 5s | — Cos, per score, 3d to 1s |
| — per bush., 1s 6d to 2s 6d | Small Salads, p. punn., 2d to 3d |
| Turnips, p. bunch, 1d to 2d | HorseRadish, p. bundle, 1s to 4s |
| Cucumbers, each, 6d to 1s | Red Beet, per doz., 1s to 2s |
| Radishes, per doz., 9d to 1s | Mushrooms, p. pot., 1s to 2s 6d |
| — Turnip, p. doz., 9d to 1s | — per bushel, 7s to 10s |
| Celery, p. bundle, 6d to 1s 6d | Sorrel, per hf. sieve, 6d to 9d |
| Carrots, per bunch, 4d to 6d | Fennel, per bunch, 2d to 3d |
| Brussels Sprouts, p. half sieve, 1s 6d to 2s | Savory, per bunch, 2d to 3d |
| Spinach, per sieve, 1s to 1s 6d | Thyme, per bunch, 2d to 3d |
| Onions, p. bunch, 1d to 5d | Parsley, per doz. bun., 2s to 3s |
| — Spanish, p. doz., 1s6d to 3s | Mint, per bunch, 1d to 2d |
| Endive, per score, 9d to 1s | Basil, p. bunch, 3d to 4d |
| Beet, per doz., 6d to 1s | Marjoram, do., 3d to 4d |
| Parsnips, per doz., 6d to 1s | Watercress, p. 12bunch., 4d to 6d |
| Leeks, per bunch, 1d to 2d | |

## HAY.—Per Load of 36 Trusses.

### SMITHFIELD, Dec. 4.

| | | | |
|---|---|---|---|

## HOPS.—Friday, Dec. 5.

Messrs. Pattenden and Smith report that there is a much better demand than usual at this period. Middling and fine samples are very scarce, and realise rather more money. Currency:

| | | | |
|---|---|---|---|
| Mid & East Kents | 140s to 252s | Yearlings ... ... | 95s to 112s |
| Weald Kents ... | 120s to 147s | Old Hops ... ... | 20s to 50s |
| Sussex ... ... | 105s to 130s | | |

## COAL MARKET.—Friday, Dec. 5.

Holywell, 18s.; Carr's Hartley, 16s.; Eden Main, 18s. 9d.; Ravensworth West Hartley, 15s. 6d.; Wallsend Riddell, 18s. 3d.; Wallsend Harton, 18s. 6d.; Wallsend Russell's Hetton, 19s. 3d.; Wallsend Bell's, 19s.; Wallsend Stewarts, 19s. 3d.—Ships at market, 57.

## SMITHFIELD, Monday, Dec. 1.

The supply of Beasts is considerably shorter, which enables us to quote 4s. for the choicest Scots. The number of Sheep is small; trade, however, is not proportionably active, yet the shortness of supply causes an advance of fully 2d. per 8 lbs. on almost all kinds. Good Calves continue to be scarce, and are sold rather dearer. From Holland and Germany there are 656 Beasts, 3690 Sheep, and 161 Calves; from Scotland 220 Beasts; from Norfolk and Suffolk, 120; and 2750 from the northern and midland counties.

| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. ... | 3 | 8 | to 4 | 0 | Best Long-wools . | 3 | 6 | to 3 | 10 |
| Best Short-horns | 3 | 6 | — 3 | 8 | Ditto Shorn ... | | | ... | |
| 2d quality Beasts | 2 | 10 | — 3 | 2 | Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Best Downs and Half-breds ... | 4 | 2 | — 4 | 6 | Ditto Shorn ... | | | ... | |
| Ditto Shorn ... ... | | | | | Lambs ... ... | 0 | 0 | — 0 | 0 |
| | | | | | Calves ... ... | 2 | 8 | — 4 | 0 |
| | | | | | Pigs ... ... | 3 | 0 | — 4 | 4 |

Beasts, 4013; Sheep and Lambs, 23,630; Calves, 191; Pigs, 450.

## Friday, Dec. 5.

We have a heavy trade for Beasts to-day, owing to a larger supply of mild weather. A few of the choicest make 4s., but 3s. 10d. is the more general price for good qualities. Several inferior remain unsold. The supply of Sheep is considerable for the time of year; buyers are scarce, and Monday's prices are scarcely maintained. There are very few good Calves on offer, we are therefore enabled to retain late quotations for these, but generally trade is worse. From Germany and Holland we have 95 Beasts, 1790 Sheep, and 88 Calves; from France, 30 Sheep; from the northern and midland counties, 400 Beasts; and 110 Milch Cows from the home counties.

| Best Scots, Hereford, &c. ... | 3 | 8 | to 3 | 10 | Best Long-wools . | 3 | 6 | — 3 | 8 |
|---|---|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 6 | — 3 | 8 | Ditto Shorn ... | | | ... | |
| 2d quality Beasts | 2 | 8 | — 3 | 2 | Ewes & 2d quality | 2 | 10 | — 3 | 2 |

| | | | | | Calves ... ... | 2 | 8 | — 4 | 0 |
| | | | | | Pigs ... ... | 3 | 0 | — 4 | 4 |

Beasts, 897; Sheep and Lambs, 4349; Calves, 157; Pigs, 389.

## MARK LANE.

Monday, Dec. 1.—At the close of Friday's market several parcels of foreign Wheat were taken on speculation, and a considerable quantity purchased for exportation. The supply of English Wheat by land carriage samples to this morning's market was small, and generally disposed of at an advance of 1s. per qr.—Foreign met a retail inquiry at rather more money, and we raise our quotations 1s. per qr. Floating cargoes continue to be inquired after for the Continent.—We observe no alteration in the value of Barley, Beans, or Hog Peas. White are very scarce, and again 1s. per qr. dearer.—Oats meet a fair demand, at an advance of 6d. per qr.

Friday, Dec. 5.—The arrivals of grain and Flour (Barley excepted), have been small this week; to-day's market was thinly attended, and the sales of Wheat were very limited; nevertheless, prices are fully supported. Floating cargoes for the Continent continue in request, but scarcity of offers and the advanced prices asked prevent business.—Flour is a slow sale, although still wanted for export.—The supply of Barley since Monday has been rather more liberal than of late, and that day's prices are barely maintained.—The value of Beans and Peas remains as last quoted.—The Oat trade is dull, and prices to-day are scarcely as good as at the beginning of the week.

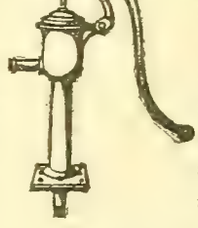
Liverpool, Tuesday, Dec. 2.—At our market this morning there was a good attendance of the trade, and a fair consumptive demand was experienced for Wheat, at an advance of 1d per 70 lbs. on all descriptions. American Flour also met with a good sale at fully 2d. per barrel more money, and French was held for extreme rates. Oats were in fair request, and fine mealers were fully 1d. per 45 lbs. dearer. Oatmeal brought full prices. Barley, Beans, and Peas sold in retail at late quotations. Indian Corn was held for more money, but few sales were made.—Friday, Nov. 28.—There was a moderately fair business transacted in Wheat and Flour for local consumption at our Corn Exchange this morning at fully Tuesday's prices. Several purchases of the superior qualities of both articles were made for shipment to Ireland, and to move into the interior. Indian Corn was considered a shade better in value than on Tuesday. Every other article of the corn trade fully sustained late rates, and there was more looking after feeding stuffs.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.



This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to James Lyne Hancock, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

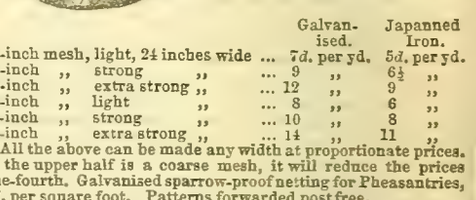
FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0

Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes if required.



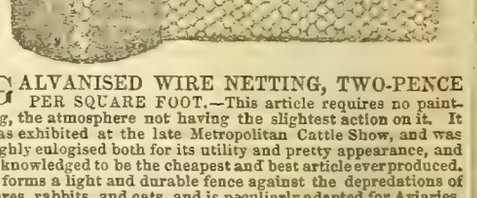
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

The usual allowance to the Trade

GALVANISED WIRE GAME NETTING.—*7d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | | *7d.* per yd. | *5d.* per yd. |
| 2-inch | strong | ... 9 | 6½ |
| 2-inch | extra strong | ... 12 | 9 |
| 1½-inch | light | ... 8 | 6 |
| 1½-inch | strong | ... 10 | 8 |
| 1½-inch | extra strong | ... 14 | 11 |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 " | 4½*d.* " | 36 " | 9*d.* " |
| 14 " | 6*d.* " | 48 " | 1*s.* " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames: Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

COPPER BOILERS, of various Shapes, for Heating Baths and Conservatories.

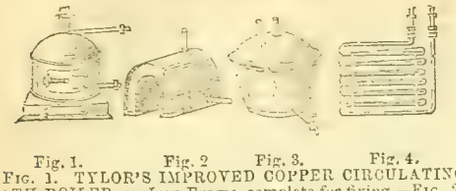


Fig. 1. Fig. 2 Fig. 3. Fig. 4.

FIG. 1. TYLOR'S IMPROVED COPPER CIRCULATING BATH BOILER, on Iron Frame complete for fixing.—FIG. 2. COPPER-RIVETTED ARCH-TOP BOILER for large Greenhouses or Public Buildings, from 4 to 40 gallons.—FIG. 3. DOME-TOP COPPERS, with draw-off Cocks, for Public Baths, from 15 to 150 gallons.—FIG. 4. TINNED COPPER COIL PIPES for heating Baths, by passing water through the kitchen range boiler.—Apply to Ironmongers or Plumbers, or to the manufacturers, J. TYLOR and SON, Warwick-lane, London.

THERMOMETERS.

HENRY BAKER'S (90, Hatton Garden, London), List of Prices. Every instrument made by him warranted accurate.—Vertical self-registering THERMOMETER, for heat and cold, of the best construction, and not liable to get out of order, 14 inches high, in copper case, 1*l.* 5*s.*; in japan case, 1*l.* 1*s.*, and 1*l.*; 10 inches high, in copper case, 1*l.* 2*s.*; in japan case, 18*s.* Horizontal Thermometers for registering the extreme of cold only, 4*s.* 6*d.*; Hot-bed Thermometers, in oak frames, 1*l.* 1*s.*; copper frames, 1*l.* 5*s.* Thermometers for Brewing, Baths, &c., in copper cases, 14 inches, 7*s.* 6*d.*; 10 inches, 5*s.* 6*d.*; 8 inches, 4*s.* 6*d.*; in japan cases, 14 inches, 5*s.*; 10 inches, 3*s.* 6*d.*; 8 inches, 2*s.* 6*d.* Dr. Mason's Hygrometer or wet bulb Thermometer, for showing the humidity of the air, with tables, ivory scale, 1*l.*; wood, 15*s.* An invaluable instrument in Hothouses, Sick Chambers, &c. Wheel Barometers from 1*l.* 1*s.* each, sent, securely packed, without fear of getting out of order.

A PRIZE MEDAL FOR SUPERIOR LOCKS WAS AWARDED TO J. H. BOOBBYER, AT THE GREAT EXHIBITION OF 1851

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6*s.* per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7*s.* 9*d.* a set. Sword-scrapers for Gardens, 1*s.* 2*d.* each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

TO LANDOWNERS AND AGRICULTURISTS.
EXTENSIVE DRAINAGE.

MESSRS. EASTON AND AMOS (Consulting Engineers to the Royal Agricultural Society of England), have just erected an
APPOLD PUMP, AT WHITTLESEA MERE,
which is 20½ times larger than the one exhibited by Mr. Appold at the Crystal Palace, and five times larger than any of the kind yet made. This powerful pump was publicly tried on the 12th of November, in the presence of the landed proprietors and farmers of the county, assisted by several scientific gentlemen, and at various lifts from 1 to 10 feet. At two to three feet, it raised 101 tons of water per minute (which would cover an acre of land one inch deep); and at five feet, it raised 75 tons per minute.—Grove, Southwark.

WARMING AND VENTILATING FOR CHURCHES, CONSERVATORIES, AND OTHER BUILDINGS.—The most efficient and economical Hot-water Apparatus, supplied and erected for the above purposes, fitted with improved boilers, requiring no brick-work, capable of working 14 hours without attention. Also the THERMANTERION, a cheaper and simpler apparatus, especially adapted for buildings only used occasionally.—Apply to SPILLER and TAYLER, Battersea, near London.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap and efficient Portable Cooking Apparatus or Cottagers' Stove.

250 STOVES, AND 325 FENDERS, all differing in pattern, forming the largest assortment ever collected together, are always on Sale at the Show Rooms of WILLIAM S. BURTON. They are marked in plain figures, and at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.* Bronzed Fenders, complete, with standards, from 7*s.* to 3*l.*; Steel Fenders, from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.* Fire-irons, from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other patent Stoves with radiating hearth plates; and Kitchen Ranges.

WILLIAM S. BURTON is enabled to sell at these very reduced charges from three simple causes, which he is most anxious the public should understand and appreciate.

First. From the frequency and extent of his purchases.

Second. From those purchases being made exclusively for cash.

And last, not least, from the non-allowance of the usual discount of 10 or 15 per cent. to architects, builders, &c., on the amount of goods sold through their recommendation, by which arrangement the price of such goods is of course enhanced to, at the very least, the extent of the discount.

WILLIAM S. BURTON has just completed some extensive alterations in his premises, by which he has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the Show of GENERAL FURNISHING IRONMONGERY, including cutlery, nickel silver, plated and japanned wares, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues with engravings sent (per post) free. The money returned for every article not approved of.

39, OXFORD-STREET (corner of Newman-street), Nos. 1 and 2, NEWMAN-STREET, and 4 and 5, PERRY'S-PLACE.
Established A.D. 1820.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The ORANG UTAN, presented by the Governor of Singapore, is exhibited daily, together with the ELEPHANT CALF, and the HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt. Admission, 1*s.* On MONDAYS, 6*d.*

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING
Houses, Farm Buildings, Sheddings, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by
HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,
And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are
F. M'NEILL AND CO.'S
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'Neill and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—CRINILENE has been pronounced by thousands to be the only preparation that can be relied upon for the restoration of the hair in baldness from any cause, preventing the hair falling off, strengthening weak hair, and checking greyness, and for the production of Whiskers, Moustachios, Eyebrows, &c., in a few weeks with certainty. It is elegantly scented, and sufficient for three months' use; will be sent, post free, on receipt of 24 postage stamps, by Miss DEAN, 48, Liverpool-street, King's Cross, London. Testimonial: Dr. Thompson says—"It is a beautiful preparation, and the only one I can recommend."

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.

DR. BARKER continues to supply the afflicted with his Celebrated Remedy for this alarming complaint, the great success of which for many years past renders any further comment unnecessary. It is easy and painless in use, causing no inconvenience or confinement, and is applicable to every variety of single and double Rupture, however bad or long standing, in male or female, of any age. The remedy, with full instructions for use, will be sent post free, to any part of the Kingdom, on receipt of 7*s* in postage stamps, or Post-office Order, by Dr. ALFRED BARKER, 45, Liverpool-street, King's Cross, London, where he may be Consulted Daily from 10 till 3 o'clock (Sundays excepted.)

DOMESTIC SANITARY MEASURES.—Places in Gardens rendered as comfortable as the best-constructed water-closets, by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Sold only at FIFE and Co's Scientific Repository, 26, Tavistock-street, Covent Garden, London, sole depôt for the Patent Hermetically-Sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also improved Portable Water Closets, with pump, cistern, and self-acting valve. Orders by post attended to.

CROSBY HALL VAULTS, No. 35, BISHOPSGATE-STREET-WITHIN.—CURRALL and SON beg to invite public notice to their STOCK of OLD BOTTLED WINES. They being desirous to secure that patronage which wines of the first quality, at fair and remunerating profits, will maintain, respectfully submit the annexed list of cash Prices:—

| | Per doz. | | Per doz. |
|---|---|---|---|
| Port, old bottled | 36*s.* and 42*s.* | White Port in pints, bottles and package inclusive | 30*s.* |
| Ditto, six years in bottle | 48*s.* | Sherry (excellent dinner wine) | 28*s.* |
| Sherries, pale and brown | 36*s.* | Port, superior draught | 28*s.* to 33*s.* |
| Ditto ditto | 42*s.* to 48*s.* | | |
| Marsala | 24*s.* | | |
| Champagne (1 doz. cases) | 54*s.* | | |

PALE BRANDY, 60*s.* per doz.; bottles, 2*s.* per doz.; hampers, 1*s.* per doz.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s, Sole Establishment, 130B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not regenerate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars London; and 36, Seel-street, Liverpool.

SACRED HARMONIC SOCIETY — EXETER HALL — CONDUCTOR, Mr. COSTA.—Next FRIDAY, Dec. 12, Handel's "MESSIAH." Vocalists, Miss Birch, Miss Dolby, Mr. Lockey, and Mr. H. Phillips.

The Orchestra, the most extensive in Exeter Hall, will consist of (including 16 double basses), nearly 700 Performers. Tickets, 3*s.*; Reserved, 5*s.*; Central Area, numbered seats, 10*s.* 6*d.* each; at the Society's Office, 6, in Exeter Hall.

BERDOE'S SUPERIOR OVERCOATS.—Quality the true test of cheapness.—A very large stock of first-class garments, adapted to every taste and purpose, and reduced to the lowest possible scale of charge; also of Overcoats for Boys, of all ages (at from 25*s.* to 35*s.*), kept for selection, or made to order. An extensive variety of SHOOTING JACKETS, RIDING AND DRIVING CAPES, &c., at same charge, at a day's notice. All guaranteed to resist any amount of rain, and possess every quality essential to a really respectable and permanently satisfactory article.

W. BERDOE, 96, New Bond-street, and 69, Cornhill (only).

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

FRIGI DOMO.—A perfect protector against frost, a non-conductor of heat or cold, and cheaper in price than bass matting. A canvas made of prepared hair and wool, adapted to many horticultural and floricultural purposes, for covering up, where a fixed temperature is required. It is 2¼ yards wide, and of any required length at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, Oxford-street, London.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

FORD'S EUREKA SHIRTS and FORD'S EUREKA SHIRT COLLARS are not sold by any hosiers or drapers. The Collars possess an improved method of fastening, which entirely dispenses with the use of strings, loops, or elastic contrivances. Adapted to any size, suitable for once or twice round cravats. They may be had in three different sizes, and either rounded or pointed. Price 11*s.* 6*d.* per dozen. Two, as samples, sent post free on receipt of twenty-eight postage stamps.—RICHARD FORD, 185, Strand, London.

HEAL AND SON'S EIDER DOWN QUILTS are made in three varieties—the BORDERED QUILT, the PLAIN QUILT, and the DUVET. The Bordered Quilt is in the usual form of bed quilts, and is a most elegant and luxurious article. The Plain Quilt is smaller, and is useful as an extra covering on the bed, or as a wrapper in the carriage, or on the couch. The Duvet is a loose case filled with Eider Down, as in general use on the continent.—List of Prices and Sizes sent free by post, on application to HEAL and SON'S Bedding Factory, 196 (opposite the Chapel), Tottenham Court-road, London.

ELEGANT TOILET REQUISITES.—Under the Patronage of the Queen, the Court, and the Royal Family of Great Britain, and the several Sovereigns and Courts of Europe, ROWLAND'S MACASSAR OIL. The unprecedented success of this discovery in restoring, improving, and beautifying the Human Hair, is too well known and appreciated to need comment. Price 3*s.* 6*d.*, 7*s.*, family bottles (equal to four small) 10*s.* 6*d.*, and double that size, 21*s.*—ROWLAND'S KALYDOR. An eastern botanical discovery of unfailing efficacy in eradicating all Cutaneous Eruptions, rendering the skin soft, clear, and fair, and bestowing a healthy roseate hue on the complexion.—Price 4*s.* 6*d.*, and 8*s.* 6*d.* per bottle.—ROWLAND'S ODONTO, or PEARL DENTIFRICE. A fragrant White Powder, prepared from oriental herbs, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Beware of spurious imitations. The only genuine of each bears the name of "ROWLANDS'" preceding that of the article on the wrapper or label.—Sold by A. ROWLAND and SONS, 20, HATTON-GARDEN, London, and by respectable chemists and perfumers.

FREEDOM FROM COUGH IN TEN MINUTES after use, is insured by DR. LOCOCK'S PULMONIC WAFERS. From the Rev. Cyril Curteis, Rectory House, Seven Oaks, Kent. "Dear Sir,—I have the greatest pleasure in recommending your Wafers. On Sunday last I was suffering from a cold, when I tried them with the most perfect success." Dr. Locock's Pulmonic Wafers give instant relief and a rapid cure of asthma, coughs, and all disorders of the breath and lungs. They have a pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all druggists. Also Dr. Locock's Female Wafers, the best medicine for females. Full directions with every box.

AN EXCELLENT FAMILY MEDICINE FOR INDIGESTION, BILIOUS AND LIVER COMPLAINTS, &c.—In every instance where a fair trial has been made, NORTON'S CAMOMILE PILLS have invariably given satisfaction, affording permanent relief in all cases of Indigestion, and a speedy cure for Headaches, Bilious and Liver Complaints, Heartburn, and Acidity of the Stomach, Depressed Spirits, Disturbed Sleep Violent Palpitations, Spasms, General Debility, Costiveness, &c. They are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use.—Sold in bottles, at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* each, in every town in the kingdom.—CAUTION. Be sure to ask for NORTON'S PILLS, and do not be persuaded to purchase an imitation.

## SEEDS, CARRIAGE FREE.

GREAT WESTERN, GREAT NORTHERN, SOUTH-WESTERN, AND SOUTH-EASTERN

SEED ESTABLISHMENT, READING, BERKS,

FOR SUPPLYING SUTTON'S HOME-GROWN SEEDS TO ALL PARTS OF THE UNITED KINGDOM.

THE GARDEN SEEDS grown in Berkshire and the Southern Counties having obtained great celebrity, and our low prices for Seeds of superior quality having gained us a very extensive connection in almost every county in the United Kingdom, we have made such arrangements with MESSRS. PICKFORD AND CO. (who have Offices on most of the great lines of Railways), as will enable us to DELIVER OUR GOODS FREE OF CARRIAGE, as under:—

Packages of not less than Two Pounds value are now sent carriage free as far as

*Bideford, Swansea, Birmingham, Chester, Liverpool, Manchester, Sheffield, Lynn, Norwich, and intermediate Stations;* also *to York, Leeds, Lincoln, Boston, Peterborough, and all other Stations of the* GREAT NORTHERN RAILWAY; *also by Steam Packets to Hull, Sunderland, Leith, and to the coasts of Wales and Ireland.*

*Packages of not less than Ten Shillings value are delivered free of carriage to*

Any Office in London, Bristol, Exeter, Southampton, Dorchester, Portsmouth, Dover, Canterbury, Guildford, Reigate, Oxford, Banbury, Cheltenham, Gloucester, Hungerford,

*And all Stations on the Great Western, South-Western and South-Eastern Railways.*

Being extensive *Growers* of Seeds (including the best of the New Sorts as soon as introduced), we can supply any sort required at THIRTY PER CENT. LESS THAN THE PRICES GENERALLY CHARGED in most parts of the kingdom; and as we grow *most largely* those sorts which we have proved to be most worthy of cultivation, *a still greater economy will be* EFFECTED BY ORDERING ONE OF THE UNDERMENTIONED COMPLETE COLLECTIONS FOR ONE YEAR'S SUPPLY.

### SUTTON'S COLLECTIONS OF GARDEN SEEDS.

| | £ | s. | d. |
|---|---|---|---|
| No. 1.—A COMPLETE COLLECTION OF GARDEN SEEDS, FOR ONE YEAR'S SUPPLY OF A LARGE GARDEN; including 20 quarts of Peas, in the best eight sorts for succession; the best eight sorts of Broccoli, together with the choicest Melons, Cucumbers, Lettuces, Cauliflowers, and every other sort of Vegetable required, and in full quantities ... ... ... ... ... ... ... ... ... ... ... | 2 | 10 | 0 |
| No. 2.—A COMPLETE COLLECTION, IN QUANTITIES PROPORTIONATELY REDUCED ... ... ... ... | 1 | 10 | 0 |

| No. 4.—A SMALL AND VERY CHOICE ASSORTMENT ... ... ... ... ... ... ... ... ... ... | 0 | 12 | 6 |

FLOWER SEEDS.

These may be had in Collections of "*Hardy sorts only,*" or assorted in "Hardy," "Half-hardy," and "Tender," as preferred.

| | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| No. 5.—The most showy 50 sorts known (post free) | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | ... | 0 | 10 | 6 |
| No. 6.—The most showy 36 | do. | do. | ... | ... | ... | ... | ... | ... | ... | ... | ... | 0 | 7 | 6 |
| No. 7.—The most showy 24 | do. | do. | ... | ... | ... | ... | ... | ... | ... | ... | ... | 0 | 5 | 0 |

*The advantages of purchasing* "SUTTON'S COLLECTIONS OF SEEDS" *are threefold,* viz, superiority *of sorts,* superior *germinating* quality, and great *economy in the cost;* besides the benefit generally derived by procuring Seeds from a distance, being in fact *a change of soil*

*If some kinds of Seeds are already possessed purchasers are requested to name them, that increased quantities of others may be sent in lieu of them.*

Having carried on business in Berkshire for upwards of 40 years, during which time we have introduced some of the finest sorts of Peas, Broccolies, Lettuces, &c., yet known, we in the year 1842 first offered to the public, in all parts of the kingdom, the advantages of our "*Complete Collections*" *consisting of the sorts we considered most worthy of cultivation,* which advantages have been so fully appreciated that we are annually receiving a large increase of orders, *entirely through the recommendations of our customers.* Trusting to a continuance of such recommendations, we are determined to *maintain* the superiority of *our* "*Collections*" not only in quantity, but also and *especially* in quality.

*Our New Seeds are now harvested, and arranged for delivery.* The samples are fine, but as some kinds are rather short in stock, EARLY ORDERS ARE PARTICULARLY REQUESTED, *and will have the preference of scarce sorts.*

Remittances *are not required* with the orders from clergymen, noblemen, and resident gentlemen, or their gardeners.

N.B.—We are also growers of Mangolds, Turnips, and other agricultural productions, which are likewise delivered carriage free.

ADDRESS, JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

Dedicated by Special Permission to Her Majesty the Queen.

## THE BOOK OF THE GARDEN.

A COMPLETE SYSTEM OF GARDENING IN ALL ITS BRANCHES, AS PRACTISED AT THE PRESENT TIME.

WITH UPWARDS OF ONE THOUSAND ILLUSTRATIONS.

By Charles M'Intosh,

F.R.P.S., F.R.S.S.A., CORRESPONDING MEMBER OF THE LONDON HORTICULTURAL SOCIETY, THE MASSACHUSSETTS HORTICULTURAL SOCIETY, AND ROYAL CALEDONIAN HORTICULTURAL SOCIETY, ETC., ETC.

Late Curator of the Royal Gardens of his Majesty the King of the Belgians at Claremont and Brussels; and now to his Grace the Duke of Buccleuch, at Dalkeith Palace.

PROSPECTUS.

THE object of the BOOK OF THE GARDEN is to exhibit, in a clear and orderly treatise, all that is known at the present day on the subject of Gardening; as well as to make public the result of the Author's long and extensive experience, and the original views which that experience has developed.

Never before were plans for Conservatories, Hothouses, and all kinds of horticultural buildings, in such demand as now. This is doubtless owing in part to the abolition of the duty on glass and bricks, and to the reduction in the cost of timber and other materials; but principally to the increasing taste for floral beauty, and the extended appreciation of those healthful pleasures derivable from elegant and well-ordered gardens. It is believed that the BOOK OF THE GARDEN will be found to be the first work which treats this interesting subject in a manner adequate to its importance.

The work will consist of Two DIVISIONS. The first, *Architectural* and *Ornamental,* in which Gardening will be treated as an Art of Design and Taste; the second, *Practical,* which will be devoted to the Theory and Practice of Gardening in relation to Culture and Management.

The FIRST DIVISION will include the following subjects:

INSTRUCTIONS for the FORMATION and ARRANGEMENT of GARDENS of every variety of extent, form, style, and circumstance of situation; in which various examples will be furnished of Gardens existing or in progress of formation, including those of Frogmore, Dalkeith Palace, Poltalloch, &c.

PLANS and DESIGNS for the Erection of CONSERVATORIES, GREENHOUSES, HOTHOUSES, VINERIES, FRUIT-HOUSES, PINERIES, FORCING-PITS, GARDENERS' RESIDENCES, and other descriptions of GARDEN BUILDINGS, on every scale from the most extensive to the most humble; with Details of Construction according to the most approved methods, embracing all modern improvements and scientific applications; and SPECIFICATIONS and ESTIMATES of COST.

The principles of HEATING and VENTILATION, as applied to Horticultural Structures, carefully described and illustrated, from the Author's own extensive experience, as well as by reference to the various other methods in use:—

The laying out of FLOWER GARDENS, GEOMETRICAL, PICTURESQUE, and GARDENESQUE, with their subdivisions; the objects of Art and Nature appropriate to each, such as FOUNTAINS, STATUARY, TEMPLES, TERRACES, BRIDGES, FENCES, ROCKWORK, RUSTIC WORK, HERMITAGES, RESTING-PLACES, RIVULETS, and CASCADES:—

The arrangement of PARTERRES with reference to the GROUPING OF COLOURS, their HARMONY and CONTRASTS.—&c. &c. &c.

This Division of the Work will be profusely Illustrated by UPWARDS OF A THOUSAND ENGRAVINGS ON STEEL AND ON WOOD, representing every description of Garden Structure, with Diagrams exhibiting the details of construction, Glazing, Roofing, Heating, Ventilating, &c.

In the Floricultural Department, Plans of Flower Gardens, on a variety of scales, will be given, with their proper ornaments and accessories; also, many BEAUTIFULLY COLOURED EXAMPLES of the Pictorial effects produced by the Harmony and Contrast of Colours in the arrangement of Plants in Gardens and Parterres, &c.

In the SECOND DIVISION, the THEORY AND PRACTICE OF HORTICULTURE will be treated on the somewhat novel plan of arrangement under the Four Seasons—namely, WINTER, SPRING, SUMMER, and AUTUMN; a method which, it is hoped, will present greater facilities to the inquiring reader, and be less liable to needless repetition, than any hitherto adopted. In each department the subject will be treated at length; and while the most approved methods will be carefully detailed, all obsolete and erroneous practices will be omitted or exposed; the object of the Author being to present a complete and comprehensive Treatise on the Art of Horticulture, according to the most perfect systems now in operation.

Descriptive Lists will be added of all the best varieties of Fruits and Vegetables.

The *Book of the Garden* may be said to be the work of a lifetime—its Author having been from his earliest years engaged in Horticulture, and having had the very best opportunities of acquiring a thorough and extended knowledge of his art. For the last 28 years he has been in charge of the Gardens, first of the KING OF THE BELGIANS, at Claremont and Brussels, and latterly of the DUKE OF BUCCLEUCH.

Her MAJESTY has graciously intimated her willingness that the *Book of the Garden* should be dedicated to herself. It is hoped that its own merits, as well as the style of its Printing and Illustration, will be worthy of the Royal patronage so graciously conferred upon it.

The Work will be beautifully printed with a new type, on superfine paper. The numerous Steel Plates and Engravings on Wood, which illustrate it, have been executed in the highest style of art; and no expense has been spared by the publishers to render this the most elegant, as well as the most comprehensive and valuable Work which has yet appeared on the Art of Gardening. It will be issued in FIVE-SHILLING Parts, monthly, commencing on the 1st of February, 1852; and will form, when complete, two large volumes in royal octavo.

WILLIAM BLACKWOOD AND SONS, EDINBURGH AND LONDON.

ABSOLUTE SALE.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mons. A. Van Geert, of Ghent, to submit to public competition by Auction, at the Mart, Bartholomew-lane, on THURSDAY, Dec. 18th, at 12 o'clock, 300 Double CAMELLIAS, 18 inches to 3 feet, beautifully set with bloom buds; 300 Standard Perpetual Roses, 200 Ghent Azaleas, 100 Azalea indica, 500 Gladiolus Gandavensis, 100 fine roots of Lilium lancifolium rubrum, 200 roots of Chilian Alstrœmeria, and 100 of the Hardy Asclepias tuberosa.—May be viewed the morning of sale. ROBERT M. STARK, Edgehill Nursery, Dean, Edinburgh, respectfully invites the attention of his friends and the public to his STOCK OF TREES, SHRUBS, &c., which comprises every article generally in demand, and is unusually healthy this season. Priced Catalogues of the following may be had on application:

Forest Trees, Shrubs, Hedging, and Underwood, new and showy Shrubs, Trees, and Roses, new or rare Plants, containing many interesting novelties; select Herbaceous Plants, with height and colour indicated; Alpine Plants, hardy Ferns and Aquatics.—Dec. 13.

VERY FINE SPRUCE FIRS, &c.

WOOD AND INGRAM beg to offer the above, 2 to 3 and 3 to 4 feet high, and well furnished, at from 25*s.* to 30*s.* per 1000; and if 10,000 are taken, 10 per cent. less will be charged.

BRITISH OAKS, transplanted, 6 to 8 feet high, and admirably adapted for planting in woods, &c., from 55*s.* to 60*s.* per 1000.

LIMES.—Splendid plants for avenues, &c., from 6 to 12 feet high, and feathered from the bottom, from 25*s.* to 80*s.* per 100.

HUNTINGDON ELMS, of all sizes, from 3 to 20 feet, at from 10*s.* to 100*s.* per 100.

PORTUGAL LAURELS, some fine standards, with 3 to 4 feet stems, 4*s.* to 5*s.* each.

W. and I.'s General Catalogue of Forest, Ornamental, and Fruit Trees, Evergreens, &c., may be had on pre-paid application. Amongst the Fruit Trees may be named some splendid plants of the Stanwick Nectarine—some established in pots, and well adapted for forcing purposes, at 21*s.* each.

Huntingdon Nurseries, Dec. 13.

HOME GROWN SEEDS, NEW AND TRUE, CARRIAGE FREE.—The great advantages of purchasing SEEDS OF THE GROWERS are the *superior germinating quality, trueness to the sorts, and economy of price.* These advantages have now been afforded by us to *retail* as well as wholesale purchasers for several years, and are fully appreciated by the public, as is shown by the numerous recommendations we are receiving from our customers in all parts of the Kingdom.

*We have now the pleasure of announcing that our New Seeds are all harvested and arranged for delivery, and respectfully solicit early orders, which will have the preference of scarce sorts.*

Particulars may be had on remitting two postage stamps.—Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

THE TRUE LANCASHIRE GOOSEBERRIES.—The best Lancashire Gooseberry Trees, strong, 4 and 5 year old plants, for culinary purposes, 3*s.* 6*d.* per dozen; best and heaviest show varieties, 6*s.* per dozen, package, &c., included, at JOHN HOLLAND'S, Bradshaw Gardens, Middleton, near Manchester. Post-office orders to be made payable at Middleton, Lancashire.

Catalogues on application (inclosing a postage stamp), containing Priced Lists of Auriculas, Alpines, Polyanthus, Primroses, Carnations, Picotees, Pinks, Pansies, &c.

EDWARD GEORGE HENDERSON, Wellington-road Nursery, St. John's Wood, London, offers the following plants; for Description see his new Autumn Catalogue, which will be forwarded, post free, on application.

Garden Seeds of all kinds supplied.

Albion Nursery, Stoke Newington, London, Dec. 13.

MAGNIFICENT SPECIMENS
OF
CONIFERÆ,
HARDY ORNAMENTAL TREES, SHRUBS, &c.

LUCOMBE, PINCE, AND Co. respectfully call attention to their fine, and, perhaps, unequalled stock of well grown specimens; capable not only of producing great immediate effects, but also quite safe to remove to any distance, consisting of—

Arbutus Andrachne hybrida.
Arbutus magnifica.
Arbutus, Scarlet-flowered, *the finest variety.*
Abies Douglasii, 3 to 12 feet high.
Abies Menziesii, 3 to 6 feet high.
Araucaria imbricata, 4 feet 6 ins. high, by 5 feet through. *Grand specimens.*
Æsteosmalus ferrugineus.
Biota glauca. *This is one of the handsomest of the hardy Coniferæ.*
Purple Beech, 8 to 12 feet. *These are truly grand plants.*
Cedars of Lebanon, 6 to 8 feet.
Cedrus Deodara, 6 to 12 feet.
Cupressus macrocarpa, 5 to 7 feet.
Cupressus Uhdeana, 5 feet.
Cupressus Goveniana, 3 to 4 feet.
Fagus Cunninghamii.
Fagus betuloides, 3 to 4 feet. *The Evergreen Antarctic Beech.*
Garrya elliptica.
Hedera Rægneriana. *The new Giant Ivy.*
Holly, Black Irish.
Irish Yew, 8 to 10 feet. *These are extraordinary plants, unrivalled in size and form.*
Juniperus excelsa, 6 to 7 feet. *Truly magnificent specimens.*
Lindleya mespeloides.
Magnolia grandiflora, Exmouth variety.
Myrica Californica.
Oaks, Lucombe, 8 to 12 feet, and 14 feet.
Oaks, Ford's, 6 to 8 feet.
Oaks, Ilex, 6 to 12 feet.
Oaks, Ilex macrophylla, 2 to 3 feet. *Lucombe, Pince and Co's new Ilex, the finest of all the hardy Evergreen Oaks.*
Oaks, Scarlet, 8 to 10 feet.
Pavia californica.
Pinus insignis, 3 to 15 feet. *The most ornamental, the most rapidly growing, indeed, the finest Pine ever introduced.*
Pinus austriaca (the Austrian Pine), 2 to 8 feet.
Pinus Cembra, 3 feet.
Pinus excelsa, 3 to 5 feet.
Pinus tuberculata, 1 to 1½ foot.
Pinus muricata, 1 to 1½ foot.
Pinus Sinclairii, 4 to 5 feet.
Picea Nordmanniana. *This noble Fir, from the Caucasus, is one of the finest and hardiest of the Silver Fir tribe, shooting late, and thereby avoiding injury from spring frost.*
Standard Rhododendrons, 5 to 6 feet.
Rhododendrons, *fine bushy compact plants, finely set with flower-buds; these are especially worthy of notice.*
Standard Thorns, 9 feet, *unusually fine, with large heads and straight stems.*
Standard Portugal Laurel, 6 feet, *with clean straight stems and shapely heads.*
Thuja japonica.
Taxus adpressa, 1½ to 2½ feet.
Taxus Dovastonii, 2 to 3½ feet.
Taxodium sempervirens, 7 to 10 feet.
Viburnum suspensum.
Yuccas of sorts.

A first-rate collection of Fruit Trees of all descriptions, including fine Trees of the Stanwick Nectarine, and many other things equally fine, but not within the limits of an advertisement; prices and further particulars of all of which may be had on application to them.

Exeter Nursery, near Exeter, December 13.

N.B. The Exeter Nursery was established in the year 1720, and is situated in the valley of the Exe, contiguous to the St. Thomas' Station of the South Devon Rail, and within 10 minutes' walk of the centre of "the Ancient City of Exeter:" and those who honour it with a visit may always depend upon seeing a collection of the newest, rarest, and most beautiful plants, such as for variety and quality cannot be excelled in any Nursery in the kingdom. And L., P., and Co. beg leave further to observe, that for the express purpose of facilitating the inspection of these, they have erected, upon an original plan, a spacious show house, close to the entrance of the Nursery, which will enable those whose time is limited to take a cursory glance of some of their productions.

SUPERB NAMED AND MIXED ASSORTMENTS OF ANEMONES, RANUNCULI, GLADIOLI, TULIPS, IRIS, CROCUS, LILIUM, IMPORTED DUTCH HYACINTHS, &c., with a large Collection of other Roots.—For BASS AND BROWN'S Priced Advertisement of the above, see *Gardeners' Chronicle* of Nov. 8th and 22d, or Catalogues sent free on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their Descriptive Catalogue, with the Treatise on the "Cultivation of American Plants," can still be had, by enclosing six stamps for postage.

Gentlemen requiring the services of a Landscape Gardener, can procure such by applying to the Advertisers.

Bagshot, Surrey, Dec. 13.

SEEDS DIRECT FROM THE GROWERS—CARRIAGE FREE TO ANY STATION ON THE GREAT NORTHERN, GREAT WESTERN, SOUTH-WESTERN, OR SOUTH-EASTERN RAILWAYS.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, can supply their choice sorts of KITCHEN GARDEN SEEDS, NEW AND TRUE, at THIRTY PER CENT. LESS than the prices usually charged in most parts of the Kingdom. Carriage free, as see their Advertisement in the last page of last week's *Gardeners' Chronicle*.—Further particulars may be had by post, on application (enclosing one postage stamp), addressed, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

OF GREAT IMPORTANCE.
TO EXHIBITORS OF CUCUMBERS AND OTHERS.

EDWARD TILEY has great pleasure in being enabled this season to offer his celebrated and unrivalled new Cucumber "CAPTIVATION," which has not been equalled or surpassed by any other Cucumber ever sent out. He has been many times asked for this superb variety by growers who have seen it, but he has been unable to supply it, in consequence of the small quantity of seed it produces. E. T. has no hesitation in saying that this will be found "the standard of perfection of a Cucumber," and he has never seen one so before till he raised this. It possesses the following unrivalled qualities: It is a splendid black spine, of a very dark-green colour, and entirely free from ribs or shrivels, with scarcely any or no handle, and carries its bloom well to the last. Length, from 24 to 28 inches. It is a very quick grower, sets well, prolific bearer, and second to none for exhibiting. To show its perfection, a brace of these Cucumbers, when cut last season, were found to measure exactly 10 of its diameter long, being 25 inches, and not more than half an inch handle. As a proof of the productiveness of the above, a bed was made for a two-light frame, and four plants placed therein; the first brace of fruit was cut on the 29th March, and the last brace on the 25th November last, during which time the unaccountable number of 102 brace was produced from the four plants; total length of the whole amounting to 56 yards 2 feet.—Sold in packets of three Seeds 5*s*., or five Seeds, 7*s*. 6*d*. Also,

TILEY'S CUCUMBER "PHENOMENA,"

which Cucumber gave universal satisfaction last season. This is also a splendid black spine, abundant bearer; in length, from 22 to 28 inches, and very easily grown, with little heat. Packets, of six Seeds, 2*s*. 6*d*., or a packet of this and one of "Captivation," 6*s*.

E. T. has also Seed of the undermentioned fine varieties:—

| | |
|---|---|
| Chamberlain's "Essex Hero," a fine black spine, per packet of four seeds | 3*s*. 6*d*. |
| Hunter's "Prolific," fine white spine, 2*s*. 6*d*. per packet of 3 seeds; or, per packet, of 7 seeds | 5 0 |
| "Lord Kenyon's Favourite," a fine winter Cucumber, per packet | 2 6 |

The above Cucumbers have been exhibited at the Botanic Gardens, Regent's Park, London, Colchester, Ipswich, Chelmsford, Bath, and other places, where they were successful in carrying off first prizes. Also—

| | Per packet.—*s*. *d*. |
|---|---|
| Victory of Bath Cucumber, extra fine black spine | 1 0 |
| Gordon's White Spine | 1 0 |
| Hamilton's Black Spine | 1 0 |
| Conqueror of the West, a good frame Cucumber | 0 6 |
| Butcher's Stratford-upon-Avon Cucumber, do. do. | 0 6 |

And numerous other older varieties at 6*d*. per packet.

A remittance must accompany the order from unknown correspondents, either by Post-office Order or Penny Postage Stamps, when the whole or any quantity of the above varieties, as the case may be, will immediately be forwarded to any part.

*Numerous Cucumber growers, on visiting the Cucumber grounds last season, expressed their astonishment at the quantity and perfection in which they were then growing.*

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

NEW ARAUCARIA, "ARAUCARIA COOKII."—This extremely rare species, just introduced for the first time from New Caledonia, is described in the last Number of the "Journal of the Horticultural Society," by Dr. Lindley. The Stock consists of only a very few plants from seed, 6 to 9 inches high, and quite healthy. Ten guineas each.

NEW HARDY SHRUB—NEILLIA THYRSIFLORA, a native of Nepal; grows about 6 feet high, producing beautiful white flowers. 10*s* 6*d* each,

AMYGDALUS PERSICA, *sanguinea plena*, double crimson Peach, from China, quite hardy. Dr. Lindley, in describing it, says, "It is a very fine and handsome plant." Three guineas each.

AMYGDALUS PERSICA, *alba plena*, double white Peach, from China. This and the above are exceedingly ornamental plants, either in the open ground or in pots, constituting handsome objects for winter and spring decoration in the conservatory. Three guineas each.

R. GLENDINNING, Chiswick Nursery, near London.

LANDSCAPE GARDENING.
EXCLUSIVELY PROFESSIONAL.

MR. THOROLD, of Norwich, offers his services to the Nobility and Gentry as a LANDSCAPE AND ORNAMENTAL GARDENER, in the highest style of the Art, including Decorations around a House, forming Water, Approaches, Picturesque Scenery, &c.

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d*.; 3-16*ths*, 9*d*.; ¼ *inch*, 1*s*. *per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs*.

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

Milk Pans, 2*s*. to 6*s*. each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d*.; 1⅝ in. ditto, 3*d*.; 2 in. ditto, 3½*d*. per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d*. per foot extra

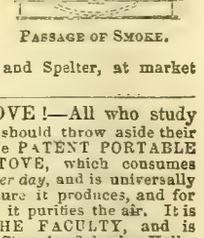
J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

TO BE SOLD, A PORTABLE SPAN-ROOF GREENHOUSE, 13 feet by 11 feet.—For particulars, apply personally to Mr. J. LEWIS, Stamford-hill, near London.

GALVANISED WIRE GAME NETTING.—7*d*. per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7*d*. per yd. | 5*d*. per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| 1⅝-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1⅝-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1⅝-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

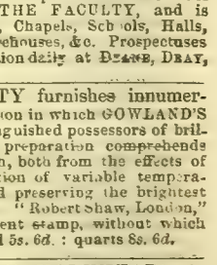
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d*. per square foot. Patterns forwarded post free.



Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

MECHI'S PREPARATIONS FOR CHRISTMAS AND NEW YEAR'S PRESENTS.—Sensible that the season is approaching when love and friendship give their tangible testimonials, Mechi has taken care to provide an abundance of objects for tasteful selection. None need deny themselves the luxury of giving, for the most inexpensive as well as the most costly articles are to be found at his repository of utilities and elegancies, 4, Leadenhall-street, near the India House. England has always been renowned for its hearty Christmas liberality, while "Le jour de l'an" of our lively neighbours (the French) is equally consecrated to the gifts of affection. Mechi invites a visit from the natives of all countries to his emporium, where they may be sure of putting their kind intentions into an acceptable shape. A new feature has been added to his elegant show rooms by the removal from the Great Exhibition of the unique glass cases which excited so much admiration. Within them are displayed to the greatest advantage a superb stock of ladies' and gentlemen's dressing cases, work boxes, tea trays, work tables, chess tables, tea caddies, card cases, &c. Those who desire to make really useful presents will find in the general department the best table cutlery, scissors, thimbles, penknives, writing desks, ivory and other hair brushes and combs, and a variety of goods adapted to every exigency; also bagatelle tables, affording a charming amusement on a wintry or wet day.

4, Leadenhall-street, London.



FUMI-PORTE.

FUMI-PORTE WITH CAP.

LAWRENCE AND CO., No. 55, Parliament-street, Westminster; and No. 10, York-place, Lambeth, ZINC DEALERS and MANUFACTURERS.

Chimney Shafts, 9*d*. per foot; various Cowls and Tops for Chimneys; Perforated Zinc, 3½*d*. per foot; Drawn Bell Tube, &c., 3½*d*. per lb.; Rain Pipe, 3 inches, 4*d*. per foot; 2 inches, 3*d*. per foot; Skylights and Windows. Drawn Bay, Cottage, and Church Lights, made to order and plan; Brass and Zinc Plates engraved and fixed on Glass; Sheet Zinc, Nails, and Spelter, at market prices.

PASSAGE OF SMOKE.

THE ONLY PERFECT STOVE!—All who study Health, Comfort, and Economy, should throw aside their old Stoves, and replace them with the PATENT PORTABLE VENTILATING SUSPENSION STOVE, which consumes only *Three Farthings worth of fuel per day*, and is universally admired for the delightful temperature it produces, and for the extraordinary manner in which it purifies the air. It is strongly RECOMMENDED BY THE FACULTY, and is adapted for Bed-rooms, Churches, Chapels, Schools, Halls, Libraries, Greenhouses, Shops, Warehouses, &c. Prospectuses to be had free by post. In operation daily at DEANE, DRAY, and Co.'s, London-bridge.

THE TOILET OF BEAUTY furnishes innumerable proofs of the high estimation in which GOWLAND'S LOTION is held by the most distinguished possessors of brilliant complexions. This elegant preparation comprehends the preservation of the complexion, both from the effects of cutaneous malady and the operation of variable temperature, by refreshing its delicacy and preserving the brightest tints with which beauty is adorned. "Robert Shaw, London," is in white letters on the Government stamp, without which none is genuine. Prices, 2*s*. 9*d*. and 5*s*. 6*d*.: quarts 8*s*. 6*d*.

LONDON TO DUBLIN (*viâ* HOLYHEAD) in THIRTEEN HOURS and a HALF.

Three communications daily on week days; two on Sundays. Sea passage Four Hours and a Half. First class, 3*l*.; second, 2*l*. Return tickets (available for a fortnight), first class, 4*l*. 10*s*.; second, 3*l*. Children under twelve, half-price.

For full particulars of the booking-through system between England and Ireland, see "Bradshaw's Guide," page 122; "Walsh's Irish Guide," page 20; "Fisher's Irish Guide," page 2.

FOOD FOR INFANTS, LADIES NURSING, AND INVALIDS.—BULLOCK'S SEMOLA is agreeable to the taste, easy of digestion, and the most nutritious substance ever introduced. This food is sanctioned by the leading members of the profession.—Sold in packets at 1*s*, 2*s* 6*d*., and 7*s*. 6*d*. each, by LLOYD BULLOCK, 22, Conduit-street, Hanover-square, and may be ordered of chemists and druggists.

THE ROYAL EXHIBITION.—A valuable, newly-invented, very small, powerful Waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of 4 to 5 miles, which is found to be invaluable for YACHTING, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring, and the double stars. They supersede every other kind, and are of all sizes—for the Waistcoat pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses with wonderful powers; a minute object can be clearly seen from 10 to 12 miles distant.—Invaluable newly invented preserving Spectacles; invisible and all kinds of acoustic instruments for relief of extreme deafness.—Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, opposite the York Hotel, London.

HOLLYHOCKS AND ROSES.

JOHN CHATER AND SON can still supply most of the leading varieties of Hollyhocks in cultivation on reasonable terms. Also 12 fine Show Roses, 2 feet Standards, for 12*s.* (six summer and six Perpetuals). Strong Climbing Roses, 4*s.* 6*d.* per dozen; double major white Rockets, 2*s.* 6*d.* per dozen; superb named Hollyhock Seed, in packets of 200 seeds, 1*s.* 6*d.* Catalogues of the above may be had, on application, by enclosing a postage stamp. 12 fine Show Pansies, 10*s.*

Nursery, Haverhill, Suffolk.

PRINCE ALBERT PEAS, AND EARLY ASH-LEAVED KIDNEY POTATOES, at 6*s* per bushel, delivered free of expense at the Bredon station, on the Birmingham and Gloucester Railway. Four-bushel bags, 2*s.* each.—Address to Mr. ARTHUR STOW, Bredon, near Tewkesbury.

YEWS FOR HEDGING, &c.

EDWARD SANG AND SONS have for SALE a large quantity of YEWS of a size suitable for making hedges. The plants are of fine quality, three years transplanted, and from 9 to 21 inches in height. Prices moderate.

Kirkaldy, Dec. 13.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, CONIFERÆ, ROSES, ORNAMENTAL SHRUBS, FRUIT AND FOREST TREES, &c., may be had on application, by enclosing two postage stamps.—Windlesham Nursery, Bagshot, Surrey.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2*s* 6*d.* per quart.

York Regent Potatoes, from prepared cuttings, 6*s.* per bush. Cambridge Radical do. (a first-rate second early) 6*s.* do. American Native, 10*s.* 6*d.* do. Early Manley, 10*s.* 6*d.* do. Early Ash-leaf Kidney, 10*s.* 6*d.* do.

For Testimonials, see *Gardeners' Chronicle*, Nov. 8, p. 705.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1*s.* 6*d.*; two-bushel, 2*s.* 6*d.* Sacks, 2*s.* 6*d.* each.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1¼ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Dec. 13.

BEST LANCASHIRE GOOSEBERRIES, named, at 15*s.* per 100.

Also, APPLES, PEARS, CURRANTS, RHUBARB, &c, in all the best varieties, and at equally moderate prices.

Carefully packed, to carry any distance, or for exportation.

H. BIGLAND and Co., Manchester.

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7*s.* 6*d.*
Extra ditto, with flowering buds ... ... 10 6
Usual discount to the Trade.

Clapton Nursery, London, Dec 13.

HUNTER'S PROLIFIC CUCUMBER. — This handsome and delicious variety obtained, in June last year, with fruit upwards of 30 inches in length, the Silver Medal at the Botanic Gardens, Regent's-park; and a Certificate of Merit at the Exhibition in July. It has also been awarded Four Prizes at the Highbury Exhibitions. It is white spined and an extraordinary bearer. To be had in packets of seven seeds, at 5*s.*; or three seeds at 2*s.* 6*d.*, of Mr. HUNTER, 5, King-street, Islington; and at J. G. RENWICK'S Seed Warehouse, 107, St. John-street, Smithfield, London.

MITCHELL'S MATCHLESS WINTER PARSLEY.—J. M having saved a much larger quantity of Seed this season than last, can offer it to the public at a much reduced price. Wholesale, to seedsmen, 1*s.* 3*d.* per lb.; any quantity under 10 lbs. will be charged 2*s.* per lb. Can be sent to any part of the World, on receipt of a Post-office order, made payable to JOHN MITCHELL, Ponder's-end, Enfield, Middlesex.

WILLMORE'S SURPRISE GERANIUM.

JOHN AND CHARLES LEE beg to announce that they have purchased the entire stock of this extraordinary novelty of Mrs. Willmore, of Edgbaston, near Birmingham, and they intend offering it to the public in the autumn of 1852, when they will have proved its qualities as a bedding plant, which they believe to be first-rate; and opportunities will have been afforded at the various Flower Shows of witnessing what may be regarded as a floral wonder.

Mrs. Willmore has stated her belief that its parentage lies between Geranium erubescens and a Hollyhock. Our great Horticultural authority, Dr. Lindley, repudiates the idea, but acknowledges it to be an extraordinary production. Messrs. LEE hope to produce such proof as may possibly stagger the learned Doctor's opinion, if it fails to convince him. For the present, suffice it to say that the structure of the plant is different to anything to be found in the Geranium; the roots are quite unlike any of the class, and the seed pods are formed more like a Hollyhock than a Geranium. The flowers are semi-double, and the whole truss of a monstrous form. Allowing it to be no more than a mere sport from the Geranium, its merits far exceed anything hitherto introduced as a gay border or bedding flower.—Nursery, Hammersmith.

NEW GARDEN SEEDS, SAVED THIS SEASON.

WILLIAM E. RENDLE AND Co., SEED MERCHANTS, Plymouth, beg respectfully to state that they are now receiving from some of the most careful growers a choice assortment of

NEW AND GENUINE SEEDS,

Of first-rate quality; and as the season is fast approaching when a fresh supply of seeds will be required for the Kitchen Garden, they take the liberty of recommending the proprietors of every garden whether extensive or small, to procure without delay a copy of

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY, *Which cost more than One Hundred Pounds in its production, and has been most favourably noticed by some of the most eminent Horticulturists of the day, as well as by the Editors of the leading Garden Publications.*

*It contains 24 folio pages, and is the same size as the* GARDENERS' CHRONICLE.

It contains a Descriptive Catalogue of the best Culinary Vegetables in cultivation, with the time of sowing, height, and other useful particulars, as well as the quantities furnished by WILLIAM E. RENDLE and Co. for their Collections; also a Descriptive Catalogue of all the choicest and best varieties of Agricultural Seeds; and an excellent Descriptive List of all the newest and choicest Flower Seeds.

It likewise contains a COMPLETE CALENDAR OF OPERATIONS in the Kitchen Garden for every month in the year, in a concise and useful form.

*Copies can be obtained from any Bookseller in town or country, price Fivepence, through Messrs.* BRADBURY *and* EVANS, *the London publishers.*

*Copies will also be sent gratuitously on receipt of Six penny postage Stamps (to pay the postage), on application to* WILLIAM E. RENDLE & Co., *Seed Merchants, Plymouth.*

*Our Stocks, Early Peas, Beans, Radish, and Carrots are already in, and can be supplied at once.*

W. E. RENDLE and Co. have made arrangements to supply all the new descriptions of SEEDS that may be advertised in this Paper during the ensuing season.

NEW DAHLIAS.

E. SPARY begs to announce to his Floricultural Friends, both English and Foreign, that he intends sending out, the first week in May, 1852, the below named DAHLIAS, which E. S. can confidently recommend as constant and desirable show flowers.

ABSOLAM (SPARY'S).—Clear amber, first-rate form, and petals very constant (an acquisition in its colour). Height, 4 feet; Plants, 10*s.* 6*d.*

VICTORIA (COOK'S).—Pale primrose, tipped with lilac; exquisite form, and good centre. To exhibitors will prove a desirable light flower. Height, 4 feet; 10*s.* 6*d.*

JOHN DAVIES (COOK'S).—Crimson, occasionally shaded with puce; symmetrical fine form; petals high in centre. Always to be depended on. Height, 4 feet; 7*s.* 6*d.*

A Descriptive Catalogue of select new and old varieties of Dahlias will be ready in January; Camellias, Geraniums, Fuchsias, Cinerarias, Verbenas, and a variety of other plants; Hamburgh Vines, and other sorts (in pots), from E. S.'s celebrated stock; Bouquets, Seeds, &c.

Queen's Graperies and Nursery Ground, Park-street, Brighton.

The Gardeners' Chronicle.

*SATURDAY, DECEMBER* 13, 1851.

THE third and last part of Dr. HOOKER'S "RHODODENDRONS OF THE SIKKIM-HIMALAYA" has just appeared. Although, perhaps, it contains figures of plants scarcely so grand as *R. Dalhousieanum* and some others, it yields in nothing to its predecessors in point of beautiful execution. Whether we shall ever see the species in our gardens in their native beauty, it is premature to say; we can only express an ardent hope that gardeners will overcome the great difficulty that attends their management. Some persons, indeed, in their desire to soften the vexation of those who have lost their "miffy" plants by the hundred, pretend that, after all, the species are not so fine as is alleged, and that their death is no great matter. But we can assure our readers that, after having in many cases compared Dr. HOOKER'S dried specimens with the published plates, we find nothing to complain of, except, perhaps, a tendency to diminish rather than exaggerate. Some of the flowers and leaves which we have seen are finer than anything which is to be found in the pictorial representations themselves.

Having already in our volume for 1849, p. 228, given such an idea of the Sikkim climate as could then be gathered from published materials, we have little to add on the present occasion, beyond the following extract from Dr. THOMAS THOMSON'S valuable sketch of the climate of the Himalaya, republished in the last Number of the Horticultural Society's Journal.

"The source of humidity in the Himalaya," says this most intelligent traveller, "is almost entirely the Bay of Bengal, which is situated about 5° to the south of the eastern extremity of the chain; and the wind which carries the humid atmosphere along the chain is that which is known to nautical meteorologists as the south-west monsoon, a wind which begins to blow in the open sea about the month of April, but whose effects are not felt in the far interior before the month of June. This wind, though constant in its direction at sea, is not so in its inland course; at the head of the Bay of Bengal it is almost a south wind. It blows from the sea nearly due north towards the Himalaya, striking in its course upon the low chain of the Khasya hills, whose maximum elevation is scarcely 7000 feet.

"Upon this range the first force of the monsoon is expended, and the annual fall of rain at Churra Poonjee, elevated 4000 feet on its southern slope, amounts to about 500 inches. This range, which has its origin among the mountain ranges of the south of China and north of Burmah, lies to the south of the Burrampooter, and, following the course of that river, terminates in the concavity of its great bend, where it turns down towards the sea. The Khasya mountains do not therefore entirely run across the Bay of Bengal, so as to intercept the force of the monsoon from the whole of the Himalaya, a part of which wind, laden to saturation with moisture at a temperature of nearly 90° F., blows due north from the Bay of Bengal upon the district of Sikkim, which is on that account the most rainy part of the whole range of the Himalaya, for, on the one hand, the more eastern parts of the chain are protected by the Khasya range, and on the other, the more westerly parts are more distant from the source of moisture, and therefore receive a less share of it. The interception of the moisture from the province of Bootan and the independent states north of Assam, by the Khasya range, has this curious effect, that the lower ranges of this portion of the Himalaya are dry and arid, while above 7000 feet, to which elevation only the hills to the south attain, the climate is very much more humid.

"The diminution in the amount of moisture in proceeding to the Westward along the Himalaya from Sikkim is extremely gradual, but also, so far as our present rather limited number of observations go, very regular. The effects of the south-west or rainy monsoon diminish step by step, as we advance westward, till on arriving at the valley of the Indus at the western extremity of the Himalaya, it ceases to be observed at all. In these most western portions of the chain, very little rain falls at any season of the year, and the little which does occur falls in the spring months, and is therefore quite independent of the regular monsoon.

"It is also worthy of note, that in the more western parts of the chain the climate is extremely dry at all periods of the year, except during the monsoon or rainy season, as it is called in India, while to the eastward the climate of the mountains shares to a considerable extent the more equable and always moist climate of Bengal.

"The most important point of all, however, regarding the climate in respect of its effects on vegetation, which requires to be borne in mind, is that a very great portion of the rain which falls is deposited on the first range of mountains upon which the rain wind strikes. I have already pointed out that this is the case with the Khasya range, and it is there highly strikingly illustrated by the fact, that it is only on the very south side of the hills that the rainfall is so enormous, the fall 20 miles north of Churra being probably less than half what it is there.

"This tendency of the rain-fall to exhaust itself very considerably on the first range of mountains to which it has access, is peculiarly important in a mountain chain 150 miles in width, its effect being that the upper part of all the large valleys, and especially the interior valleys and their ramifications, are much more dry than those adjacent to the plains of India. Even in the most humid part of the Himalaya, in Sikkim, this difference is extremely marked, and in the more dry parts to the west (the extreme east interior is not known), the inner valleys are so dry that rain is scarcely ever known to fall."

To this excessive moisture it is, we presume, that attention should be directed; but the grand difficulty will be to combine it with a suitable temperature. Upon this, and many similar points, the public trusts that Dr. HOOKER will favour them with his suggestions. There can be no doubt that the species of Rhododendron require very different treatment: for instance, the *R. Edgworthii*, now figured, a species with large pale lemon-coloured flowers, hardly inferior to *R. Dalhousieanum*, comes from the valleys of the inner ranges of Sikkim, at an elevation of 7000—8000 feet, hanging from trees in an atmosphere saturated with moisture; on the other hand, *R. æruginosum* and *fulgens*, two species with the habit of *R. campanulatum*, are found at twice the elevation, where the climate must be totally different; and as an extreme case, the *R. nivale*, "from the loftiest elevation on the surface of the globe,"—is a representative "of the most excessive climate—of the joint influences of a scorching sun by day, and the keenest frost by night—of the greatest drought, followed in a few hours by a saturated atmosphere—of the balmiest calm alternating with the whirlwind of the Alps. For eight months of the year it is buried under many feet of

snow; for the remaining four, it is frequently snowed and sunned in the same hour. During genial weather, when the sun heats the soil to 150°, its perfumed foliage scents the air; whilst to snow storm and frost it is insensible, blooming through all, expanding its little purple flowers to the day, and only closing them to wither, after fertilisation has taken place." Such is Sikkim!

We understand that the late Mr. Feilding, of Lancaster, has bequeathed his Herbarium to the University of Oxford, upon certain conditions. This collection, formed at a very large expense, is understood to consist of 70,000 species, forming one of the most complete herbaria in the world.

## WEEDS.—No. II.

On Lawns.—The beauty of a Grass plot or lawn is so much dependent upon its being free from weeds, that I think my commentary would be incomplete if a few observations were not made on this branch of my theme.

I have sometimes seen operations upon a large scale in order to eradicate Moss, but I think that unless excessive in quantity it forms a luxurious carpet, and in extensive grounds is useful to cover the surface where little else can grow. In the more distant and sequestered portion of pleasure grounds, I prefer the mossy bank, overhung with umbrageous foliage; but in the formal quadrangles of mansions or colleges, neither moss nor weeds should grow. Such plots, with the margins of walks in terraces, their slopes, and the formal patches of Grass, which frequently form part of a design, should be free from Moss, Daisies, and all broad-leaved plants, including the coarser Grasses, such as the Couch-grass (Triticum repens), and the Cocksfoot (Dactylis glomerata). There is no plant which detracts so much from the beauty of our English lawns as the common Daisy (Bellis perennis). Sorry am I to lay such a charge upon this "modest crimson-tipped flower," associated as it is with our happy recollections of childhood, when all that was gay and pleasing seemed made for us alone, and we dreamed not that the same field which yielded us Daisies and Buttercups produced also Nettles and Thistles. But while I would do it ample justice as a wild flower, which

> "Opens with perennial grace,
> And blossoms everywhere,"

I confess to have found it my greatest plague, particularly in the earlier spring and summer months; after the lawns have been neatly mown, "swept, and garnished," a few hours of sun have studded them with these flowers, producing a frittered effect, and destroying that agreeable contrast which a well-kept lawn always gives to masses of flowers, particularly those of a scarlet colour. In gardens where there are many large trees, the better Grasses will not thrive, but even if annually renewed, as annually perish; in such places the Daisy and Moss alone will thrive, and therefore in all such spots I would not disturb them, but take their verdure as the best instalment we can have for the effect of turf. On the contrary, wherever level open spaces prevail, more particularly in scenes which are highly artistic, the Daisy has no place. The quadrangles of the colleges at Oxford have long been celebrated for the beauty of their Grass-plots; and I remember that at All Soul's College I have seen the most perfect specimen of a well-kept lawn I ever beheld: not a Daisy, or broad-leaved plant of any kind, but one uniform, dark-green, velvety surface, such an one as perfectly accorded with the artificial expression of the venerable buildings, and was evident of the design and influence of highly civilized and erudite man.

Beautiful as were the Daisies and golden Dandelions of our childhood, and much as we regard their beautiful forms and wise adaptation as a link in the great charm of nature, we hail their absence from such classic regions as a boon.

One of our poets has immortalised the Daisy in these lines—

> "The Rose has but a summer's reign,
> The Daisy never dies."

Now it is precisely for these ever-blooming and "never" dying qualities that we gardeners banish them from our lawns. They may be ranked in the first class of our "forget-me-nots," and every gardener may truly say of them what the poet said of the Rosemary, "that's for remembrance."

Next in order, as weeds on lawns, come the Dandelion and Rib Grass, or Plantain; these are the only ones which become troublesome when Grass is moderately well kept. But what is deficient in quantity is compensated for by the facility with which great quantities are produced from seeds. The practice of neglecting the mowing of Grass as a point of economy is not to be commended, because it gives these pests an opportunity of propagating themselves to an almost incredible extent, not only stocking the Grass with their frequency, but also the walks.

The task of cleaning a foul lawn is indeed a serious one, but one which will amply repay, where high keeping is necessary; and like all other undertakings, it may be accomplished by a little perseverance. When once got under, they may, by a little regular appliance, be easily kept in subjection.

The best workman for the purpose is a boy from 12 to 14 years of age, who need only be thus occupied in dry and suitable weather. The best instrument is the Daisy-digger; it has a handle like that of a large chisel, into which is fixed a piece of iron, which is bent upwards at the end and forked thus ⋋. It is necessary to take out the entire roots of these ⋋ plants, and therefore advantage should be taken to do it after rain, the operator placing the forks under the leaves of the plant, and pressing the handle gently down, the plant is drawn out of the earth, the point of fulcrum being that where it begins to curve.

I fear that my remarks may be thought tedious upon this simple subject, but as "trifles make the sum of human things," it is evident that to do great things well we must not despise little ones. My maxim through life has been—that what is not worth doing well, is not worth the attempt. Often have I seen persons on Grass delving and pottering with a short weeding knife to extract weeds, when the use of the Daisy-digger would have done double the work in a more efficient manner.

According to Professor Burnet, the Plantain "has a peculiar tendency to follow the migrations of man, as if domesticated or sympathetically attached to the human race. It has by the natives of some of our settlements been emphatically called 'the Englishman's feet,' for with a strange degree of certainty, wherever it is found, there our countrymen have trod." *Henry Bailey, Nuneham, Oxford.*

## BRITISH SONG BIRDS.

(Cage Birds, No 42.)

No. LVIII.—It can hardly be matter for surprise that, whilst reasoning logically on the ways of Providence, and whilst directing attention to an undeviating "universal law" by which all things (animals included) are wisely governed,—it can hardly be matter for surprise, we repeat, that we should raise up some few opponents; and that by such we should be esteemed 'ignorant,' and behind the times in which we live. Be it so. These "wise men" will have it that 'reason,' properly so called, *must* reign wherever there is brain,—and they defy all proof to the contrary. Whilst 'doctors so disagree,' who shall decide the point? However, even the renegade Pilate could ask "What is truth?" and surely it is worthy of careful inquiry to come at it.

Our modern philosophers are by no means the only persons who have made the brain of animals a matter of constant study. But the point in which they fall short is, the inability they possess to 'comprehend,'—that is the word, the difference between matter and mind,—'ponderables' and 'imponderables.' The philosophers of the old school, amongst whom materialism seems to have found comparatively little place,—filled as they were with admiration at the wonderful works of God, settled this question at once, and discarded all 'speculation' the moment they found they were on 'sacred ground.' Far be it from us to imagine that the Creator of heaven and earth should make man "in his own image," and share such honour indiscriminately with the brute creation! To everything has been given "its own body"—beautiful in the extreme in all its interior machinery, and admirably adapted for its purpose; but as Equality never was designed to reign on earth, everything in Nature is assigned its proper, its fitting place.

Buffon, a true experimental philosopher, tells us, that on dissecting the uran-utan,* there were found "*many* essential distinctions in its internal formation from that of a man; though in some parts," he adds, "*the affinity is so great that their inferiority can only be attributed to the want of reason, or a deficiency in those intellectual powers that lift the human race above all other creatures.* The tongue, and the organs of the voice, are exactly similar; yet is the animal DUMB. *In the appearance and arrangement of the* BRAIN, *no difference can be perceived;* YET is the uran-utan IRRATIONAL." Hence, Buffon wisely concludes that mind does not depend upon any conformation of matter, but is of a nature superior and independent. Derham, too, the reverend author of the 'Physico-Theology,' made this particular question a matter of intense study; and gives us "proofs" undeniable of the soundness of the argument on which we insist. Many other equally corroborative facts—*quæ nunc perscribere longum est*, might be adduced; but we feel they are not required. We may just observe, that all our wisest philosophers are agreed upon the genus *Simia* having its organisation as nearly as possible framed like that of man. Admitting this—even to the full extent of the organs of speech being identical in both,—WHY, let us ask, do they NOT speak? If the "vital principle" be really the same in brutes as in ourselves, how can it fail to act, *cæteris paribus*, as well in the one machine as in the other? The philosophers shirk this altogether. Lucretius took the proper view of "mind and matter" when he remarked,—

> "——*Nil ideo natum est in corpore ut uti*
> *Possemus; sed quod natum est id procreat usum.*"

And after giving many proofs of the correctness of his arguments, he adds,—

> "——*Omnia denique membra*
> Ante *fuere, ut opinor,* eorum quam fuit usus."

By this sound doctrine, atheistical cavillers are worsted in their dictum,—that "Things make Uses." We maintain that the converse is the case; and that "Uses make Things."

Nature, unassisted, could not constitute bodies, whose structure is against the law of specific gravity; and we hold with Ray, that spontaneous production is against the catholic laws of motion, against matter of fact, a thing without example—not only in Man, and the nobler animals, but in the smallest of insects, and the vilest of weeds; though the fertility of the earth cannot be said to have been impaired since the beginning of the world. "Read the 'Vestiges of the Natural History of Creation'," said one of our modern philosophers to me a few weeks since; "you will *then* agree with me, that we mortals were most probably, or, for what we can tell to the contrary, *originally* in the tadpole state, rejoicing in plump round bodies, with cork-screw tails, at the bottom of a pond!" I *have* long ago read the book in question; yet do I *not* agree with my philosophic friend of the tadpoles. Nor need I enumerate here, how very many other similar works I have read; all of which, so far from "convincing me of my error," serve rather to confirm my fixed, my unchangeable principles. It is not my intention to pursue this branch of our inquiry any further; it would be quite out of place. Indeed, I stated at the outset, that a metaphysical disquisition on such subjects was, in the columns of a newspaper, impracticable, and would readily fill a large volume,—I might have added, *six* large volumes. However, I consider that what has been advanced has not been *de trop*, and that it will not be without its useful purpose. It will lead people to "think," if it does nothing more; and it will, moreover, fortify them against giving too great credence to *all* the hypotheses of Modern Science.

I purpose devoting two more chapters to this series of Papers—one, of course, to the instinct observable in the "higher order" of animals, with pleasing examples; and the last to the noble consideration of Reason, and its gradual advance upwards, from the cradle to the grave. Instinct we have shown to be stationary; reason, it will be proved, is always progressive.

The termination of this inquiry which has formed so interesting a subject for the last eight weeks, will bring us, should we live so long, to the end of the present year, a year long to be remembered by us all; for such fine successive seasons as we have had, are beyond the recollection of any of us. No time has been lost, so far as our winged friends are concerned. Passing through a state of probation, the last three months of the year are with them a *tempus non;* but so soon as the new year commences, they all in turn give signs of new life, and return to the performance of their allotted duties in the choir with due energy. We do indeed long once more to commence heralding their sayings and doings; and we shall be found ready to sing their praises at the first dawn of 1852.

The voices of the blackbird and the thrush, at present small and irregular, will then be heard merrily pealing; and many lesser feathered pensioners, even now benumbed with cold, and occasional parlour visitors, will in January present themselves at our windows to share our Christmas cheer. Truly welcome shall they be to the rites of our hospitality; and we shall look for our reward in the harmony of their sweet voices at an early day of dawning spring.

No person, if he be honest, can say that the gratitude of a bird does not far exceed that of any of the human race. By the former, a favour conferred is *never* forgotten; whilst, by the latter, it is seldom, if ever, remembered. We speak truly, experimentally, advisedly. *William Kidd.**

* There is, at the present time, in the Zoological Gardens, Regent's-park, one of these extraordinary animals, which are said so closely to resemble Man in their organisation; and it is "strange" to observe how constantly and sedulously its society is courted by the fair visitors to the gardens. We only hope that our weapons may not hereafter be turned against ourselves; and the "reason" of the animal not said to be "proved" by the "natural affinity" evidently existing between it and the fair sex! Hamlet was in the right, when he said—"There are more things in heaven and earth, than are dreamt of in our philosophy," for we really have seen Men looking *very like monkeys.*

## JOTTINGS ON FOREST PRUNING.

I have alluded to the philosophical bearing of forest pruning, as distinct from the mechanical, and demanding as such a separate course of inquiry. The effects of the latter are generally visible to the eye; for the full appreciation of the former, a certain amount of faith is demanded—faith in the existence and operation of the powerful but invisible agents which enter so largely into the material world, and which in their combinations perform such wonderful phenomena in the great laboratory of Nature. We do not see the action of the leaf in the economy of the plant; but from scientific data, or negative evidence, we can infer how important an organ it is. We cannot follow with the eye the fixation of carbon, building up the solid tissues of the Oak, the elaboration of absorbed fluids, or the deposition of secreted products; yet we know that every moment in the growth of a plant, some one, or all of these processes are going on. We know, beyond the possibility of doubt, that fluids are pumped up from the soil, and absorbed from the air; mixed, concentrated, and a portion again exhaled; that any material obstruction to the circle of phenomena, which are the visible evidences of the life of a vegetable, must act detrimentally to its constitutional vigour, and it is to this point that I wish to make allusion in relation to trees grown for timber.

We know that all exogens consist of a series of layers of wood overlying each other—the layer of this season completely enveloping that of the preceding, the last formed layer of course being in immediate contact with the leaves, by whose agency it has been formed; and it will be found that such a connection is maintained with every layer after its formation till it assumes the character of heart wood, such connection decreasing as we approach the centre of the tree. From this must be inferred that for several years after the formation of a

* *Erratum.*—In last week's article the word "imitation" (see second paragraph, line 14), *should have been* "admiration." Although the mistake is palpable to the eye of a careful reader, yet the correction is important, as the sense is materially

layer of alburnum, certain changes take place, a number of secretions are deposited, and doubtless various fluids and gases are thrown off, which, if retained in the tissues of the wood, would act detrimentally to its durability.

Organically speaking, the heart-wood of a tree is of little importance. If wholly removed no injury would be sustained to the surrounding parts. It aids nothing in the vital economy. Its formation and consolidation is complete. But if during its changes from the season of its formation to that of the inert condition of duramen, any material interruption to the processes by which such changes were effected had been given, there can be no doubt but that it would have reached that state in a morbid condition, and its durability would of course be affected. Such injury could not, however, be appreciable to the eye.

No such injury can be effected by pruning; every branch is connected with a given number of living layers of wood. When a branch is removed, every such layer is cut off from an amount of leaf surface by which its important changes are effected. The result is, that the wood does not attain its natural conditions. Deleterious matters are retained in its tissues, and its organisation is incomplete.

There is a disease to which the human subject is liable, arising from an imperfect formation of the *septum* of the heart, which allows a portion of the blood, at each pulsation, to escape into the arteries, without having performed the pulmonary circulation. The result is that the whole mass of blood is impure, from the non-removal of the deleterious matters acquired in its circulation through the body. Persons labouring under such a disease may be known by the leaden hue of countenance and their want of vivacity. They are seldom long livers. An imperfect aëration of the blood in animals, and that of the sap in plants, produces analogous disastrous results. The difference in the two cases is, that the one is apparent, the other not. In both cases the system becomes loaded with impurities, which a healthy action of all the organs would have thrown off, and in plants a plethoric condition is induced by an indiscreet removal of the branches. On a future occasion I shall endeavour, by a few diagrams, to render visible the conditions I have here described. *G. L.*

## Home Correspondence.

*Hints to Persons Making a Garden.*—Rock, wood, and water. To begin with the rock. No garden that pretends to represent the variety of Nature in her vegetable kingdom can dispense with something in the form of rock—be it natural or artificial; not merely by way of a feature in the pleasure-ground, but as a situation or condition almost indispensable for certain plants; and those plants, it may be observed, are some of the most interesting and elegant species that we have in cultivation. Great mistakes are frequently made in the selection of a site for rockwork, as well as in that of the plants supposed to be adapted to it. Of course, where the gardener is fortunate enough to have natural rock to deal with, he must take it as he finds it; but that is not often the case. With regard to the proper site for rockwork, a garden, to be complete in that particular, ought to possess two entirely distinct piles of rock, unless the situation and the scale of operations be so extensive as to allow of one pile of rock considerable enough to afford a sunny and a shady face, each large enough for the requisitions of that department. For the plants that like sunny rocks are chiefly those of warm or dry climates, sea-shore plants, or those of the Mediterranean rocky coasts, or of the arid parts of the east. Those, on the other hand, that prefer moist or shady rocks, are those of the Alps, or of northern moors and mountains, Ferns, &c. The two, it will be evident, are hardly compatible. Primula minima and Asplenium fontanum would hardly assort with Crassula jasminiflora, and Convolvulus Cneorum. The Alpine and the Mediterranean, or maritime rocks, should be considered as quite distinct. On no rocks, unless natural and on a very large scale, should those plagues, the creeping plants, be allowed. They are suited only to banks, generally to the shade. Every gardener will understand that the plants alluded to are such as Moneywort, St. John's Wort, Periwinkles, Lyciums, or Honeysuckles. Trees ought not to be permitted near rocks destined for maritime plants, and but partially near those appropriated to mountain plants, though they will not injure Ferns or Orchidaceæ. A rocky soil is not necessarily poor; a good natural soil, unmanured, but well drained, suits maritime or Mediterranean rocks, and a damp, peaty gravel, perhaps with a slight trickling of water, will agree with Alpine rocks. No plants should be grown on rocks but such as are naturally rock plants. *S.*

*Bad Seeds.*—There is so much difficulty in procuring true and good seeds, even from established houses, that amateurs are fairly disgusted with the frequent disappointments they are subjected to, either through carelessness or wilful neglect. Can you suggest any plan to mitigate the evil? To find your Walcheren Broccoli, which you have tenderly nursed all the winter, turn out, in spring, useless rubbish, is enough to provoke the mildest temper, more particularly as it cannot be replaced, and you must patiently wait many months to witness another failure, although you procure your seed from another house. To have your field of Carrot seed unproductive, and your Cabbages run to flower, are among the many miseries we amateurs are liable to, and we shall never be well treated till the parties who fancy they may send us any trash are exposed in the *Chronicle*. *Falcon.* [We have some thoughts of publishing the result of trials of seeds made by known persons of judgment. We fully admit that some seeds are disgraceful to the houses that sell them.]

*Bee Houses.*—The instructions for the construction of an apiary given in a Leading Article (at p. 755), are, on the whole, excellent; it may, however, perhaps be questioned whether the slanting of the roof from back to front is advisable. It has, indeed, its advantages as well as its disadvantages, as ordinarily made. The advantage is that the house, being higher behind, where the apiarian's operations ought to be performed (and not in front), he has more head room for working. The disadvantage is that rain dropping on the roof is liable to fall or be blown on the bee-boards, even if the roof be extended 12 inches in front, as "Y." suggests. This may be prevented either by having the front entirely closed, with holes only for the entrance of the bees, or by the adoption of a very simple little contrivance which I have observed in the hot-houses of my friend W. W. Saunders, Esq, for preventing the dropping of the steam collected on the underside of the frames of the lights. This consists simply in fastening along the under side of each of the frames dividing the panes of glass, strips of thin zinc plate, about an inch wide, bent up at each side, so as to form a little gutter, which is to be tacked to the frame, and made at the bottom to communicate with a little transverse gutter, having an exit outside the house. Thus, for a few shillings, the annoyance from drip may be prevented. With reference to the size of the bee-house, that given by "Y." may be advisable for amateurs and experimentalists; but for those who keep bees for profit, I apprehend a much larger house would be more convenient. If hives are not kept entirely apart, I know no reason, so far as the natural habits of the bees are concerned, why a hundred instead of four hives should not be kept in one apiary. Will "Y." be so good as to state his reasons why he restricts the number to four. *J. O. W.*

*The Weather.*—Instead of the damp and stormy weather which usually characterises November in the south of England, the past month has been remarkable for its low temperature, comparatively clear skies, and drought. The mean temperature has been six degrees below the average of the last nine years; and upon reference to the valuable tables compiled by Mr. Glaisher, of the Royal Observatory, Greenwich, and published in the Phil. Trans., Part 2, 1850, it appears that so low a temperature has not been recorded in November since the year 1786. During the present century, the following are the only instances of much continued frost at this period, and which I here insert, together with their respective mean temperature.

| Years. | Mean Temperature of November. |
|---|---|
| 1807 | 38.7° |
| 1809 | 39.5 |
| 1815 | 38.9 |
| 1826 | 39.9 |
| 1829 | 39.3 |
| But the mean temperature of November, 1851 has been only | 37.78 |

It is worthy of remark that much severe weather prevailed during the subsequent winter months in every instance. A general idea is prevalent in this neighbourhood that it is many years since there was such continued drought and scarcity of water during the autumnal months. I shall therefore state the fall of rain during the past five months, ending November 30th, together with the quantity which fell in the corresponding months of 1847, and the average for the same period during the last eight years:

Fall of Rain in Inches.

| | 1851. | 1847. | Average of 8 Years. |
|---|---|---|---|
| July | 3·50 | ·22 | 1·95 |
| August | 1·56 | 1·08 | 2·69 |
| September | ·21 | 1·80 | 1·99 |
| October | 4·11 | 1·57 | 3.99 |
| November | ·81 | 2·12 | 2·63 |
| Total | 10·19 | 6·79 | 13·25 |

From this table it is manifest, that although the fall of rain in the present instance is rather more than three inches below the average, yet it is nearly three and a half inches more than fell in 1847, proving, therefore, that it is not safe to trust to "the memory of man" in these matters. *C. Leeson Prince, M.R.C.S., Uckfield.*

*New Strawberries.*—Mr. Bailey has stated, at p. 740, that the Black Prince is not worth cultivating. Now this variety is very early, an abundant bearer, and fine in flavour; and it is most useful, inasmuch as it ripens sooner than any of the large-fruited kinds. I imagine therefore, that Mr. Cuthill has not much "victimised" the public in sending it out. In like manner Mr. B. says the Goliath is acid, insipid, coarse, and a shy bearer. (Can a thing be acid and insipid at the same time?) Now, according to this account, I am one of those who, Mr. B. insinuates, has victimised the public. Mr. B. must have grown this variety under very unfavourable circumstances, or he could not have formed such an opinion of it. But without offering a word myself as to its merits, I will refer Mr. B. to what has been said in favour of it, in 1849, 1850, and 1851, by the best authorities on fruits in the different weekly periodicals of the day; and in addition to such opinions, I have numerous testimonials in writing from those who have tested it. The Bicton White, Mr. B. says, is only valuable for its colour; can a white fruit be valuable on that account? Myatt's Eleanor he mentions to be disagreeably acid. Now Mr. B must not tell the gardeners about Bath that this is a bad Strawberry; they find it too useful a variety to listen to such statements. Nevertheless the raiser of this, as well as of the celebrated British Queen must, in Mr. B.'s opinion, be a "victimiser" of the public. Myatt's Globe I am not acquainted with, but I have heard it highly spoken of. The Mammoth is the only variety that deserves Mr. B.'s condemnation, and even this, being the largest of all Strawberries, deserves a further trial. Willmot's Prince Arthur Mr. B. describes as being as hard as a cricket-ball; consequently Mr. Willmot must be classed amongst "victimisers." I have, however, heard from good authority that this is a good Strawberry, and I intend to have a hundred or two of the plants. The British Queen is the only fruit Mr. B. seems to care for, as all the other large varieties are like eating wool or drinking vinegar. Is Mr. Bailey quite sure that all these large, woolly, acid, ill-flavoured, worthless sorts were raised from crosses from the Chili Pine, and so become worthless? I can assure him that the Goliath was not crossed in that way; it was raised (without crossing) from the British Queen. I should like to give Mr. Bailey an opportunity of testing the merits of the Goliath with the British Queen next season; and in order to do that effectually, I cannot, perhaps, do better than offer to show a bed of Goliath against a bed of Mr. B.'s British Queen, for a *5l.* note. This can very well be done, as both varieties are ripe at the same time. Mr. B. may choose any number of plants for this purpose, varying from 12 to 100; and I will "take him" upon the number he may stake; he shall have liberty to appoint a censor, and I will appoint mine; and provided these two do not agree, they shall call a third as a referee. The respective merits of the fruits shall be taken on these five points, viz., flavour, colour, size, productiveness, and hardiness of plant; the one that gains the most points to be declared the winner. This plan will decide the merits or demerits of the Goliath much better than anything I can say regarding it; and I will give Mr. B. until the 1st of next June to say whether he will accept my challenge or not. *James Kitley, Lyncombe Vale Nursery, Bath.*

*Effects of Severe Frost upon more or less sheltered Plants.*—The great injury sustained by Evergreens from low temperature in sheltered positions, has been ascribed to their want of habitual exposure to cold. I find that builders are generally of opinion that it is more dangerous to use cements during winter in low protected situations, than in loftier and colder places. If this opinion be well founded, there may be, in the case of the plants, something beyond the effect of mere habit. *A.*

*The Ostrich.*—I am sure that your amusing correspondent Mr. Kidd, will not willingly libel any of his feathered friends; and, therefore, I am certain that he will not be angry with me, for correcting an error which he has made at p. 740, respecting the ostrich. He accuses that bird of a want of parental feeling, but I think, after what I say, he will fully acquit one parent of that offence. I have had an opportunity of watching the South American ostrich on its native plains; the hens all lay to one nest (like guinea hens), but one hen sits them, and after the young leave their eggs, the cock bird takes charge of the family. When he meets with another cock similarly employed, he attacks him, and in case of victory, takes charge of the other's family: so that in a short time a strong bird may be seen with three or four united families together, 50 or more in number, and they will follow him in a long string, as orderly as a charity school, led by a parish beadle. *Observator.*

*Vacca Vinery* (see p. 744).—In reply to your correspondent's inquiries, I beg to say that the cows are now in the Vinery again for the winter. The Vines have grown remarkably well, and I believe I must let them bear a few bunches next summer; at present, Strawberries, scarlet Geraniums, Calceolarias, &c., are thickly stowed away, on boards placed across the beams above the cattle, for the winter; and the front walk is (or rather was) looking very pretty with a fine scarlet Geranium, planted in the border, in full blossom; and a large quantity of Chrysanthemums and two Orange trees were trained along the wall. I say *were*, for, alas! the fat pigs have just made their way in and destroyed root and branch. I think the warmth of the cattle will keep out frost; if not, I shall add a small Polmaise stove at one end. For three nights we have had the thermometer, outside, down to 18° of Fahr.; in the cow Vinery it did not go below 37°. *Tirydail.*

*Bats and Fireflies.*—It were to be wished that our scientific writer on "Song Birds" would erase from his last paper the anecdote of the bats and fireflies. The gentleman who first gave the strange story to the public must have been under a delusion. Zoologically speaking, it is a blot from the clever pen which has lately transcribed it, and a stain upon the instructive page which has received it. It will not do. It is a nursery tale from distant eastern regions. Delenda est. *Charles Waterton, Walton-hall, near Wakefield, Dec. 8.*

*How to Crop a Small Kitchen Garden.*—I would not advise any one to grow Early Peas and Beans on a south border, where there are trees against the wall, unless the border is at least 12 feet wide, when it should be laid out in the following manner. Leave a space next the wall, 2 feet wide (which will be found very useful); then form a path, 2 feet wide; the space between the latter and the walk may be trenched and cropped with Early Peas, or any other crop, without at all injuring the trees. But whether Peas are grown on a border, or on a more open part, the mode of cropping should be the same. Let the ground be well manured with well rotted dung, and ridge trenched; let the trenches be 2 feet wide, and run north and south.

It is the best practice to sow on sods laid Grass downwards, as recommended in this Paper, or else in small pots placed in a frame, as a more regular crop is thereby insured. Sow about the beginning of January. When up 1 or 2 inches, plant a row on the west side of the first ridge half-way down, the next on the fourth ridge, which will be 6 feet between the rows; so proceed till all is finished. If sown where they are to remain, sow about half-way down the ridges, allowing the same distances. In the beginning of March fork down the ridges, which will earth the Peas; then strew some soot along the rows (which I consider one of the best manures that can be applied to Peas), and stick them. Plant one row of Lettuces up the centres; about the beginning of June draw two drills, at 3 feet apart, and plant a row of Cauliflowers in each drill, at 30 inches apart. As soon as the Peas are all gathered clear away the sticks, and fork the ground, earthing up the Cauliflower. Beans should be grown adjoining the above. The best practice is to sow thickly in a frame, or else close under a wall, and to cover with a handglass; or in lieu of that, arch the bed over, and cover at night with a mat and straw. Sow about the middle of December. When up 2 or 3 inches, fork down the ridges; then draw two drills, at 1 foot apart, plant one row in each drill, at 3 inches apart; plant with a dibber, retaining the Bean to the roots, if possible; go 3 feet, then plant two rows more in the same way (measuring from inner row to inner row), and so proceed till all is finished. Plant a row of Lettuces, at 2 feet apart, up each middle. In June, plant Cauliflowers between the Lettuces, provided they are not off. When the Beans are all gathered, clear away the stalks, and fork the ground, earthing up the Cauliflowers: then plant a row of Lettuces between. The Cauliflowers for the above plantation should be sown about the middle of April. *J. Steel, Clitheroe.*

*Singing Hens.*—Allow me to add my little anecdote to Mr. Kidd's testimony of singing hens, and somewhat, too, in contradistinction to the old saw, "A singing hen," &c. I may say I have met with a very worthy dame who sang often and loud. In the year 1843 I had a favourite cock canary, and, possessing a good breeding cage, I thought I would get him a mate, and obtained a green hen, which from the habit of singing, after her fashion, was gladly disposed of as being good for nothing. However, having a predilection to oppose or rather fathom old notions, I thought I would give her the same chance as I should have done a mute and higher priced bird. I accordingly put them up the beginning of February; and, not to be too tedious, I had the pleasure by the end of the season of an increase of 25 young; the produce of five nests, without an addled or unfecundated egg, or the least casualty after hatching. By this time (end of August) I did not wish for more; however she built again and laid four eggs, which I did not allow her to incubate, and took the male away, thinking that would prevent her laying more, and therefore any casualties to such a matron by exhaustion. In that I was mistaken, as, although I took nest-box, &c., away, she laid two more eggs in the bottom of the cage, making in all 31 eggs in one season, and bringing the first 25 birds up. I remarked they generally left the nest at from 8 to 10 days old, and fed themselves at 12 or 13. One of the first nests I have still in my possession, eight years old next March. She was full of her song during the breeding, but not when sitting, and so tame that she allowed me to be very inquisitive as to her progress. I attribute a great part of the success to good management. *Walter Stone, Commercial Academy, Hammersmith.*

*Glass Walls.*—In reading your account of the proposed glass walls, I am inclined to think that it would be a more useful, as well as on the whole a cheaper mode, to dispose the sashes on a slope, instead of perpendicularly, thus A: like the ridge of a house. Take for instance the length of the proposed wall to be 50 feet, the height 10, and the distance between the walls 2 feet with a glass coping over. If you compare this with walls set on the slant, so as to meet in a ridge, and to extend 3 feet on each side, there is hardly any difference in the glass required from that in the upright walls; and consider the convenience of having such a place to stow away half hardy plants in the winter, or early Strawberries, &c., in the spring. *T.*——On examining Mr. Ewing's models of glass walls, I could see at once that their application would not end in the growing of fruit trees alone. An erection of the sort made wider, and 40 feet long, heated with hot water pipes, would produce more Cucumbers, Melons, Strawberries, French Beans, &c., than four 12-light pits could do. Nothing would be more easy than to shelve it for pots; and as I learn that the Horticultural Society is about to test the merits of the invention, I trust that the patentees will take this hint, and make it adapted for forcing the things I have just mentioned. If my acre was held by lease, instead of by yearly tenancy, I should be amongst the first to try the walls for Cucumbers and Melons. Glass and iron, as I stated in your columns last spring, will by and bye effect wonders, not only for the horticultural world, but it will be largely employed for a thousand other purposes not at present thought of. Like gutta percha, there will be no end to its uses and benefits, at least to all northern Europe. *James Cuthill, Camberwell.*

## Societies.

Entomological, *Dec.* 1.—J. O. Westwood, Esq., F.L.S., President, in the chair. Amongst the donations to the Society announced as received since the last meeting, were various publications from the Royal Society, the American Association for the Advancement of Science, the Smithsonian Institute of America, the Lyceum of Natural History of New York, the Boston Natural History Society, Messrs. Guérin Méneville and Macquart, &c., and a large box of beautiful British Lepidoptera from Mr. H. Doubleday. A new part of the Transactions was announced as ready for delivery. Mr. S. Stevens exhibited a specimen of Argynnis Lathonia, taken near Hastings, by Mr. Cooke, of Brighton; also specimens of Diphthera Orion, and Adela cuprella (two very rare moths), the latter taken on Sallows, in April. Mr. A. White read a note from Mr. George, of Kensington, relative to the supposed luminosity of the well known Staphylinus, commonly called the devil's coach-horse (Goerius olens.) Having observed a number of moveable shining points in a lane near Kensington, at night, Mr. George swept up the whole into a handkerchief, which, on being examined, was found to contain a specimen of the insect in question. Mr. Stephens suggested that the Goerius, when captured, was in the act of devouring a Scolopendra electrica, the writhing motions of which would present the appearance noticed. Mr. F. Smith also said, that on one occasion he had observed the allied Staphylinus maxillosus, luminous from having devoured decaying crabs which emitted light during their decomposition. Mr. Curtis stated that the ordinary food of Goerius olens was earwigs, and that it was consequently a friend to the gardener, and Mr. Westwood stated that he had seen it attack a common worm three times its own length. Mr. A. White also exhibited several species of spiders and Tipulidæ from the arctic regions, brought home by Messrs. Ede and Ommaney; several species of spiders had been confounded under the name of Lycosa saccata, including one of those exhibited, which he proposed to call L. Baffini. He also noticed the powers which the eggs of the Tipulidæ must possess of repelling the frost in the arctic regions, where they must lay so long in the frozen ground previous to hatching in the short summer; and Mr. Curtis stated that Capt. Ross had repeatedly frozen caterpillars, and that they as often revived again on being thawed. A letter was read from Mr. Bates, giving some account of his travels in Brazil, and stating his intention of remaining there several years longer and of ascending one of the tributary streams of the Amazon River. A letter was also read from Mr. Newman of Stroud, on the habits of the species of the genus Bombus, in reply to Mr. Smith. An abstract of Mr. Le Conte's memoir on the Pselaphidæ of North America was read by Mr. Douglas, and Mr. Westwood read the commencement of a report upon the insects and insect products exhibited in the Great Exhibition of the Industry of all Nations during the past summer.

Royal Horticultural of Ireland, *Nov.* 26.—The Duke of Leinster, President, in the chair. At this, the annual general meeting, the secretary read a report from the Council, from which we extract the following: "Your Council have the satisfaction of informing your Society that scarcely in any previous year has there been more encouraging and gratifying results, as it relates to its general working, than has been presented in its several operations throughout the season. The several exhibitions that have taken place have redounded much to the credit of your exhibitors, and speak not less for the spirit of the employer than they have done for the perseverance and skill of the cultivator. As to attendance (notwithstanding the all-absorbing attraction arising from the great London Exhibition), your several shows have, on the whole, been well and liberally patronised, as will appear by reference to the balance-sheet. With respect to expenditure, besides the current expenses of the year now closing, a considerable amount of arrears, chiefly arising from the general depression that has unfortunately recently attached, more or less, to almost every interest in Great Britain, but especially in Ireland, your Council are happy to inform you, have been entirely cleared off, and your Society now stands with a fair and encouraging balance to its credit, to begin active and energetic operations for the approaching year. In no corresponding period have the subscriptions to its funds been more regularly and punctually paid. The arrears of subscriptions for the present year do not in all exceed 12*l*." The High Sheriff, Alderman Kinahan, moved the adoption of the Report, and Dr. Plant seconded the motion, which passed unanimously. Mr. Niven then read the rules of the Society, to which a new one was added, that practical gardeners should be admitted members on payment of a subscription. A resolution appointing the Council and officers for the ensuing year was next passed. *Dublin Advocate, Dec.* 3.

## FLORICULTURE.

Chrysanthemum Exhibitions.—With these has closed the floral year of 1851. It is not our intention here to review the entire doings throughout this particularly lengthy season—one, we may say, of unexampled prosperity; for Floriculture has not only fully maintained its position, but evidence has been given of a vigorous determination to march with the onward movement. The Great Exhibition of all Nations had, no doubt, its influence in making the now almost past year one to be ever held memorable; floriculture has been no laggard, and although we may not boast our Exhibition of all Nations, we may proudly refer to our exhibitions of all flowers; gorgeous displays have been made in localities hitherto anti-floral; old institutions have maintained their positions, and, in truth, universal prosperity seems paramount wherever Flora reigns. Exhibitions are the key-stones of all floral greatness; it is to the practical demonstrations made at these gatherings, from which success takes its rise, and it is to the results derivable from these *réunions* on which the whole science hinges; every improvement emanates from exhibitions—form, substance, colour, novelty, habit, and general display, each in its turn shares the critical observations of the connoisseur, comparisons are instituted year by year, anticipations are rife for the future, hints abound for sundry improvements where weakness is apparent—in truth, our best energies are strengthened in the cause we love and advocate. What will not the Chrysanthemum owe to the exhibitions we have just recorded? We append a simple statistical enumeration of the more popular varieties, a duty we owe our readers, but in this much caution is needed; for instance, Golden Clustered Yellow is shown to have been produced in no less than 42 blooms; whereas Plutus, a new variety, figures but thrice; in this it is that searching enquiry must be made, reliable information alone used, otherwise injury may arise to a new sort, not in general cultivation; old sorts which make no way had better be at once discarded; they are either deficient in quality, or they are inconstant: and however fine a variety may be when caught, "there is nothing like constancy" in the constitution of a flower for exhibition. On the other hand, if the magic word new be given, argument should run, "On what variety is it an improvement?" These and sundry other tests prove, however, of little real value, unless applied by comparison at public exhibitions. The following is a classified statistical list compiled from our reports of the three Chrysanthemum Exhibitions at pages 759 and 775:—

| Times shown. | Name. | Class. | Times shown. | Name. | Class. |
|---|---|---|---|---|---|
| 46 | Defiance | W | 12 | Sydenham | D |
| 42 | Golden Clustered | Y | 11 | Campestroni | D |
| 35 | Queen of England | L | 10 | Madame Chauviere | L |
| 33 | Pilot | D | 10 | Christine | L |
| 33 | Annie Salter | Y | 10 | Madame Poggi | D |
| 32 | The Duke | L | 10 | Cloth of Gold | Y |
| 30 | Beauty | L | 9 | Madame Camerson | D |
| 29 | Vesta | W | 8 | Nonpareil | L |
| 24 | King | L | 7 | Pio Nono | D |
| 21 | Phidias | L | 6 | Minerva | L |
| 18 | Formosum | L | 6 | Orlando | D |
| 15 | Goliath | W | 6 | Princess Marie | L |
| 15 | The Warden | D | 5 | Temple of Solomon | Y |
| 13 | Dupont de l'Eure | D | 5 | Queen of Yellows | Y |
| 13 | Lysias | D | 5 | Hecuba | D |

W, white. L, light. Y, yellow. D, dark.

Here we have 30 sorts, which have been shown in the aggregate no less than 520 times, including pot plants; the classes have been represented thus: Class 1, white, 3 varieties, shown 90 times; 2, light, 11 ditto, shown 201 times; 3, yellow, 5 ditto, shown 95 times; 4, dark, 11 ditto, shown 134 times. Total, 30 sorts shown 520 times.

In addition to the above we find that about 40 sorts have been produced, varying from one to four times each; but we think enough has been given in the foregoing whereon to form an estimate of the relative value of the sorts shown. *J. E.*

Newcastle-upon-Tyne Chrysanthemum Exhibition, *Dec.* 3.—The 1st prize for 18 pots was awarded to Mr. Stocksley for Madame Chauviere, Queen of England, Etoile de Versailles, Rose et Blanch, Annie Salter, Temple of Solomon, Queen, Etna, Lucidum, General Marceau, Surprise, Comte de Nantyar, Cyclops, Fleur de Marie, Jenny, Madame Poggi, &c. 12 in pots: 1st, to Mr. Deans, with Annie Salter, Nonpareil, Temple of Solomon, Queen, Queen of the Gipsies, Minerva, Solar, Lucidum, Marquis, Fleur de Marie, Minerva, and Gipsy Queen; 2d, to Mr. Stockley, with Queen of England, Marquis, Catalini, Lucidum, Queen, Jenny, Henrietta, Madame Poggi, Etoile de Versailles, La Reine d'Or, Fleur de Marie, and Queen of England; 3d, to Mr. Holmes. Three pots; 1st, to Mr. Deans, with Queen of the Gipsies, Annie Salter, and Minerva; 2d, to Mr. Stocksley, with Etoile de Versailles, Madame Chauviere, and Queen of England; 3d, to Mr. Holmes. Best cultivated specimen: 1st, to Mr. Deans, with Annie Salter; 2d, to Mr. Stocksley, with Etoile de Versailles. Best light: Mr. Deans, with Lucidum. Best dark: Mr. Deans, with Madame Poggi. Best yellow: Mr. Deans, with Annie Salter. Best 24 cut blooms: 1st, to Mr. Stocksley, with Lady Hunlock, Pius the 9th, Fleur de Marie, Marquis, Pilot, Madame Chauviere, King of the Crimsons, Princess Maria, Queen of England, Madame Poggi, Temple of Solomon, Annie Salter, General Marceau, Lucidum, Marquis, Fleur de Marie, and La Reine d'Or, &c.; 2d, to Mr. Deans, with Temple of Solomon, Pius the 9th, Annie Salter, Princess Maria, Marquis, Queen, Minerva, Queen of Gipsies, Queen of England, Lucidum, Elvira, Jenny, Etoile de Versailles, Foulatowski, Nonpareil, Madame Poggi, Fleur de Marie, and Solar, &c. Best 18 cut blooms: 1st, to Mr. Deans; 2d, to Mr. Stocksley. Best 12 cut blooms: 1st, to Mr. Stephenson, with Queen, Annie Salter, Princess Royal, Madame Poggi, Nancy de Sermet, and Temple of Solomon, &c.; 2d, 12 cut blooms, to Mr. Johnston, with Nancy de Sermet, Princess Maria, Solar, Annie Salter, Rigolette, Lucidum, Gluck, Queen of England, Pilot, Lady Talfourd, Etoile Palaise, and Fleur de Marie. Three Pompons in pots: 1st, to Mr. Stocksley, with Cuce, Madame Miellez, and d'Or.

Books. Our notices of periodicals are omitted this week, for want of space. *J. E.*

Scarlet Geraniums next week. *J. E.*

Misc: *J E and Co., Dublin.* Attended to. *J. E.—J S., Hammersmith.* Immediately. *J. E.*

## Miscellaneous.

*Ornamental Trees of Panama.*—The most famous of all the ornamental plants is the Couroupita odoratissima, Seem., combining a most delicious fragrance with a splendid flower. In the Morro, a forest near the village of Rio Jesus, are four of these trees, which are considered by the inhabitants as the only ones that exist in the country, and the greatest curiosities Veraguas can boast; and, indeed, I myself have never observed them in any other locality. They form a group, and are vernacularly termed Palos de Paraiso (*i. e.*, Paradise trees), or Granadillos, deriving the former name from their beauty,

and the latter from the close resemblance which their flowers bear in shape and size to those of the Granadilla (Passiflora quadrangularis, Linn.). The trees are from 60 to 80 feet high, and up to an elevation of 20 feet, where the branches diverge, their stems are thickly covered with little sprouts, bearing, from February until May, blossoms, the odour of which is of so delightful and penetrating a nature, that in a favourable breeze it may be perceived at nearly a mile's distance. The flowers are 1½ to 2 inches in diameter, and their petals are of a beautiful flesh-colour with yellow stripes, contrasting charmingly with the golden stamens of the centre. The people of Veraguas, whose apathy is not easily roused by the beauties of Nature, often repair to these trees during their flowering season, in order to behold the bright tints of the blossoms, and enjoy the delicious perfume which they exhale. *Hooker's Journal of Botany.*

*Acer circinatum.*—This is a most beautiful hardy deciduous tree from Oregon, with purple and white flowers, and leaves rich crimson in the autumn. It was introduced by the Horticultural Society. (See Fig. 210.) There is probably no hardy tree in this country more eminently beautiful than this, if tree it can be called, for it seems rather a bush. In the spring, when its leaves unfold, they are preceded by long crimson leaf-scales, from two to four to each twig; the leaves when they first come are thin, semi-transparent, and a clear light green; at the same time peep out little tufts of purple flowers, with white petals; and in the autumn the plant seems on fire with the rich red of the foliage, more rose-coloured, and not less intense, than that of the most scarlet of Oaks. Sir William Hooker tells us that the species is found wild on the Great Rapids of the Columbia River, and is common along the north west coast of North America, between lat. 43° and 49°. Mr. Douglas observes that it is exclusively confined to the woody mountainous country that skirts the shores, and there, among the Pine forests, it forms almost impenetrable thickets. The branches are pendulous and crooked, often taking root, as is the case with many species of the genus Ficus. Bark smooth, green when young, white when fully grown. The wood is fine, white, and close-grained, very tough, and susceptible of a good polish. From the slender branches of this tree the native tribes make the hoops of their *scoop-nets*, which are employed for taking salmon at the Rapids, and in the contracted parts of the river. It is said to form a tree 20 to 40 feet high. *Paxton's Flower Garden for December.*

Fig. 210.

Fig. 211.

*Remuneration for Professional Services.* — The value of ordinary commodities finds its level by the reciprocal influence of supply and demand. The producer calculates the cost of production by a simple process of arithmetic, adding a per-centage for profit, the amount of which is regulated by the balance of pressure between demand and competition. The value of mental labour or professional skill is not deducible by any such method of calculation. The benefit conferred on the employer bears no definite relation to the expense incurred, or the labour bestowed, in each particular case; and although all these items may be considered as elements in the calculation, there is no formula by which to arrive at an uniform result. Consequently, disputes not unfrequently arise, and in the absence of a better tribunal, cases are argued in courts of law, and decided by juries, who, with every disposition to do justice, are in possession of imperfect data on which to form an opinion. As a general rule, professional men are underpaid for their services, because the nature of these services is not understood by those who have to form an estimate of their value; and however low this estimate may be, those parties who are called upon to pay the amount, are seldom satisfied. In the case of Taylor *v.* Vickers, there are some peculiarities which seem to deserve attention. The public have very little idea of the labour and research involved in chemical analysis. Patients frequently take a pill or a mixture to a chemist's, requesting that the same may be analysed, and a supply prepared, with a copy of the prescription, supposing that the price of the medicine will include the analysis. The following case occurred lately:—A patient having derived much benefit from a prescription, lent it to many of his friends, and acquired some celebrity as the possessor of a certain cure. One of his friends lost the prescription, but another happened to have a bottle of the medicine, which he obtained, and took it to a chemist for analysis. Being informed that the expense would be two guineas, he said he could get a new prescription for half the money, which he accordingly did, by calling on the doctor. *Abridged from the Pharmaceutical Journal.*

*Esculent Plants.*—Evelyn, moreover, is valuable by helping us to mark the introduction of several of our cultivated vegetables. Of "Artichaux," he tells us (Acetaria): "'Tis not very long since this noble Thistle came first into Italy, improved to this magnitude by culture, and so rare in England that they were commonly sold for crowns a piece; but what Carthage yearly spent in them—as Pliny computes the sum—amounted to *sestertia sena millium*—30,000*l.* sterling. Note that of the Spanish Cardon—a wild and smaller Artichoak, with sharp pointed leaves and lesser head—the stalks, being blanched and tender, are served up *à la poiverade* (that is, with oyl, pepper, &c.), as the French term is." Of "Pompey's beloved dish, so highly celebrated by old Cato" he says: "'Tis scarce an hundred years since we first had Cabbages out of Holland; Sir Anthony Ashley, of Wiburg St. Giles, in Dorsetshire the seat of the Earls of Shaftesbury), being—as I am told—the first who planted them in England." Of the Melon he bids us "Note, that this fruit was very rarely cultivated in England, so as to bring it to maturity, till Sir George Gardner came out of Spain; I myself remembering when an ordinary Melon would have been sold for five or six shillings." Spinach was "by original a Spaniard." Tarragon also "of Spanish extraction;" and "the Caulyflower (anciently unknown) from Aleppo." Some of our garden esculents are of high antiquity; Asparagus was a favourite vegetable with Cato, and Onions are inscrutable. Others are quite modern upstarts. Sea-kale is one of these—by the present mode of producing it. And a truly British dish it is. On many parts of the south coast the inhabitants, from time immemorial, have been in the habit of searching for it in the spring where it grows spontaneously, and cutting off the young and tender leaves and stalks, as yet unexpanded and in a blanched state, close to the crown of the root. Evelyn confounding it with "the Broccoli from Naples, perhaps the *halmerida* of Pliny"—[or Athenæus rather]—"*capitata marina et florida*," mentions that "our sea-keele, the ancient crambe, and growing on our coast, are very delicate." But its cultivation is a recent practice. *Quarterly Review.*

*Acer villosum.*—A noble tree, from the Himalayas, with the aspect of a Sycamore. It was introduced by Messrs. Osborne and Co., of the Fulham Nursery, (See Fig. 211.) Dr. Wallich tells us that this is a very large tree, inhabiting the high Alps of India, approaching towards those of perpetual snow in Sirmore and Kamaon, ripening its fruits in November, at which time "the very fragrant flowers also begin to appear." Dr. Royle says it is only "seen with Pines and Birches on the loftiest mountains, which are for many months covered with snow." In its general appearance this may be compared to the common Sycamore, but is a much finer looking tree, its leaves being thicker, greener, and larger; besides which, they are covered with a close fur on the underside, although smooth above; in the autumn they assume a peculiar nankeen tint. The plants in the possession of Messrs. Osborne and Co. have not yet blossomed; but our Herbarium tells us that the "fragrant" flowers come out in close panicles, covered with long yellowish hairs. Undoubtedly this is one of the finest hardy deciduous trees yet introduced. It is to be hoped that India will soon yield us her other alpine Sycamores, of which there are three, viz., 1. *A. sterculiaceum* Wallich, found near the summit of Mount Sheopore, and very like *A. villosum*, except that it is nearly destitute of hairs. The trunk of this is said to be 3 feet in diameter, and the flowers white.—2. *A. caudatum* Wallich, so called because the palmate leaves have the lobes extended into tails. In this the leaves are scarcely more than three-lobed, and are sharply and doubly serrated. Dr. Wallich says it is a native of the highest regions of Nepal, towards Gossain Than, as also of Sirmore and Kamaon. Dr. Royle found it growing in company with *A. villosum*. It is a remarkable and handsome species.— 3. *A. cultratum* Wallich, the leaves of which are heart-shaped, and deeply divided into seven much acuminate *undivided* lobes, besides being much smaller and thinner than in the two preceding species. It is "a larger tree, native of the regions towards the Himalaya, in Kamaon and Srinaghur." Dr. Royle, who also found it, says that its wood "is white, light, and fine-grained." Dr. Wallich suggests its being allied to the *Acer pictum*, of Japan, to which we must add that it is little different from Bunge's *Acer truncatum*, from Northern China. *Paxton's Flower Garden for December.*

*The Cedron Tree of Panama.*—A tree, which has attained great celebrity, is that called Cedron (Simaba

Cedron, Planch.). The most ancient record of it which I can find is in the "History of the Buccaneers," an old work published in London, in the year 1699. Its use, as an antidote for snakes, and place of growth, are there distinctly stated; but whether on the authority of the natives, or accidentally discovered by the pirates, does not appear. If the former was the case, they must have learned it while on some of their cruizes on the Magdalena, for in the Isthmus the very existence of the tree was unsuspected until about 1845, when Don Juan de Ansoatigui ascertained, by comparison, that the Cedron of Panama and Darien was identical with that of Carthagena. The virtues of its seeds, however, were known, years ago, from those fruits imported from the Magdalena, where, according to Mr. William Purdie, the plant grows in profusion about the village of San Pablo. In the Isthmus it is generally found on the outskirts of forests in almost every part of the country, but in greater abundance in Darien and Veraguas, than in Panama. The natives hold it in high esteem, and always carry a piece of the seed about with them. When a person is bitten, a little, mixed with water, is applied to the wound, and about two grains scraped into brandy, or, in the absence of it, into water, is administered internally. By following this treatment the bites of the most venomous snakes, scorpions, centipedes, and other noxious animals, have been unattended by dangerous consequences. Doses of it have also proved highly beneficial in cases of intermittent fever. The Cedron is a tree, from 12 to 16 feet high; its simple trunk is about 6 inches in diameter, and clothed on the top with long pinnated leaves, which give it the appearance of a Palm. Its flowers are greenish, and the fruit resembles very much an unripe Peach. Each seed, or cotyledon I should rather say, is sold in the chemists' shops of Panama for two or three reals (about 1*s.* or 1*s.* 6*d.* English), and sometimes a much larger price is given for them. *Hooker's Journal of Botany.*

*Sale of Orchids.*—A few plants of Vanda cærulea, just imported, were sold the other day by Mr. Stevens, at from 1*l.* 1*s.* to 5*l.* 5*s.* per lot. Some miscellaneous Dendrobes realised from 1*l.* to 1*l.* 12*s.* per lot. At a former sale Odontoglossum hastilabium fetched from 1*l.* 10*s.* to 3*l.* 3*s.*, the famous Uropedium Lindenii from 1*l.* 18*s.* to 3*l.* 5*s.*, Oncidium candelabrum from 1*l.* 10*s.* to 4*l.*, and Odontoglossum nævium from 1*l.* 10*s.* to 4*l.* 5*s.* Others fetched from 1*l.* to 2*l.* 10*s.* per lot.

*Out Shooting near Vienna.*—When we had quite reached the hunting-ground, I found myself almost alone. Our companions had been dropped by the way singly, like Hop-o'-my-Thumb's crumbs, and formed a line of sporting posts some 20 or 30 yards apart from one another. We then stood at ease for an hour, with a keen wind in our teeth; while a section of our party took a circuit for the establishment of a circle, within which the game was to be hemmed. My friend at this time had an opportunity of introducing me to a few stationary brethren. A fat little Sancho, in dress boots, with a coat much too small for his broad back, stood nearest to us. He was armed with a small Swedish rifle, which was loaded with ball. When my friend presented me to him as "Sir Smith," he answered "Mr. Sir, your most obedient servant." The rest were a motley group of officers in uniform, and men in every costume but what we should suppose to be the right one; fine picturesque fellows with sweeping moustaches, good beards, and gorgeously coloured clothes. A painter might have been glad of them—though certainly an English painter never would have grouped them in a sketch of partridge shooting. At length a hum along the line informed us that the sport was shortly to begin; and a student from Bonn who had included English in his studies turned to me with some excitement, saying, "Sor, if you please now we cotch them will." Assuredly, there galloped hares in plenty down upon us, with their heads up, and the partridges were darting upward like rockets in all directions. "Lie quiet," said I to the student, "for here comes a hare!"—"I fear me not," was the reply. The student, shutting both his eyes, let off at the same time both his barrels, and a horrid howl from my friend's bull-dog told us the result, which was precisely the reverse of that which was either intended or desired. A sharp fire now ran along our line, and the hare fell. When we took him up, it appeared that our stout little friend with the rifle had the credit of one among the lucky shots; for besides being riddled like a sieve, our victim had his head almost blown off. In some alarm at these proceedings, I refrained from firing, in order that I might keep a wary and an anxious eye upon the gentleman who had just shot the dog. My relief was inexpressible, when one of the keepers told me he could do no further harm, precaution having been taken to load his gun with powder only, and not to put in very much of that.—*Dickens's "Household Words."*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

The season of the year is fast approaching when everything in the shape of flowers are always most scarce, and consequently most appreciated, when they can be had. In the early part of the season, we advised that cuttings of that charming little plant, the Otaheite Orange, should be struck, and forwarded, that they might come in usefully at this time, as neat flowering plants suitable for the tables of the drawing-room or sitting-room; and by placing them now, in a slight warmth, their buds will expand freely, and be ready for Christmas. Older plants will be in fruit and flower at the same time, in which state they are doubly interesting; their fragrance, too, is delightful. A collection of neatly trained pot plants in fruit, such as many kinds of dwarf Oranges, Ardisias, Habrothamnus, &c., are objects of much interest at all times; and a very good effect may be produced by bringing such prominently into view, at a time when flowers are scarce. Plants, with handsome foliage, may be made to play their part also. What is finer than the Ferns, when well grown? And the Calathea zebrina and Dracæna terminalis are also valuable, on account of their beautiful and highly coloured leaves. Some of the early potted Hyacinths, Tulips, and Narcissus, may now be removed from the bed in which they have been plunged since October, to a gentle heat. We always find them to come strongest when plunged in some well worked horse-litter and leaves. These plants will bloom well with with a bottom heat of 70° to 75°, and 55° to 60° top heat, with a little air at all times.

### FORCING DEPARTMENT.

Pineries.—It will be a trying task just now to manage these structures with no other heating material than fermenting litter. Every favourable opportunity should be taken to turn the linings, and if necessary to add to them. Let them at least be protected by some kind of covering from the rain and snow; and if possible, let them be entirely enclosed, that they may of themselves supply a sufficient amount of heat to do away with the necessity of covering the pits during any portion of these very short days. Young Pines are frequently much drawn during winter, and the mischief is not noticed until they are taken out in the spring to be repotted or planted; and then it is that the gardener repents not having given more air, and more light, by keeping the glass clean. We have felt this ourselves, and no doubt others have done the same. If the bottom-heat is 80°, the top may be as low as 55° without the plants suffering; and particular care should be taken that no injury occurs from excessive dampness at the root from any cause. We seldom see plants suffering from being too dry during winter, unless the roots are too near a flue.

### FLOWER GARDEN AND SHRUBBERIES.

The sooner that all tender plants, such as Tea Roses, are protected with some light warm material, the better. Half decayed leaves answer very well, as they do not become frozen, and the wind does not disturb them. Besides this protection, we stick in among them some short Yew branches, to check the cold cutting winds, which do more harm in the early spring, than even very severe frosts. The pruning and tying of creepers upon walls and trellises should now be proceeded with. Take advantage of frosty weather, when the walks are hard, to convey fresh soil to the flower beds; or for doing any kind of work in the flower garden and shrubbery which would damage the walks when not in a frozen state. In extensive gardens there is generally much heavy wheeling to do every winter, and no time is more favourable than during sharp frost. All plants of which any doubts are entertained as to their perfect hardiness, should have some kind of protection afforded them; but in doing this, care should be taken not to go into the opposite extreme.

### HARDY FRUIT GARDEN.

The dressing of fruit trees against walls, with a mixture of a little lime, soot, and tobacco water (or water in which tobacco has been boiled), with a small quantity of glue to fix the mixture to the trees, should now be proceeded with. No scale or the larvæ of any troublesome pests can withstand this simple recipe; and as fruit trees are so liable to the attacks of insects it is well worth the trouble of applying it, even if there are at present no signs of our enemies; for in this, as in all other cases, prevention is better than cure. Some Pear and Cherry trees, which were omitted when this operation was in progress last year, were completely denuded in August by the grub of the saw-fly; while the trees to which the mixture had been applied were quite uninjured. After the trees are dressed over, proceed actively with the retraining; and as soon as Peaches, Nectarines, or Apricots are trained, let the coverings be applied. These should be let down when there is rain or sleet, to keep the branches dry, and thus preserve them from canker and gumming; and also during bright sunshine to prevent the buds from being prematurely excited, which is as necessary at this season as it is to protect the blossoms in spring. The fault of Peaches and Apricots in our climate is their early blossoming; and shading during sunshine in winter is found to keep them back considerably. Take grafts of any good kinds of Pear and Apple which it may be desirable to increase, and lay them well into the ground on the north side of a wall. The wood for this purpose should be the well ripened shoots of last year; and care must be taken to provide only such as are healthy, and perfectly free from all kinds of insects. Cuttings of choice Gooseberries and Currants should be put in; and the Bur Apple, which is a good stock for dessert Apples, should also be struck from cuttings, removing all buds except three or four at the top, so as to get rid of suckers. Handsome standard Currant trees may be quickly obtained, by splitting up old bushes that have many stems. Take them up wholly with plenty of roots, divide them into single stems, trim the roots, and spur the shoots up the stem, as it will bear all the way up; and shorten in the shoots which are to form the future head to within 5 or 6 inches. Plant in good rich soil, and tie them to a stout straight stake, and you have a standard at once. We have some very fine standard Currants made in this way, which are much admired, and they produce the finest fruit.

State of the Weather near London, for the week ending Dec. 11, 1851, as observed at the Horticultural Garden, Chiswick.

| Average.... | | 30.235 | 30.122 | 51.3 | 37.1 | 44.2 | 42.3 | 41.3 | | .02 |

Dec. 5—Hazy; cloudy; uniformly overcast.
— 6—Overcast; densely overcast; cloudy.
— 7—Fine; cloudy; slightly clouded at night.
— 8—Cloudy; clear and remarkably fine; slight frost.
— 9—Foggy; hazy; densely overcast; mild at night.
— 10—Cloudy and mild throughout.
— 11—Clear and very fine; foggy at night.
Mean temperature of the week, 3½ deg. above the average.

State of the Weather at Chiswick, during the last 25 years, for the ensuing week, ending Dec. 20, 1851.

| Dec. | Average Highest Temp. | Average Lowest Temp. | Mean Temp. | No. of Years in which it Rained. | Greatest Quantity of Rain. | Prevailing Winds. N. | N.E. | E. | S.E. | S. | S.W. | W. | N.W. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Sunday 14 | 45.8 | 33.6 | 39.7 | 13 | 0.32 in. | 2 | 2 | 1 | 2 | 3 | 6 | 4 | 1 |

The highest temperature during the above period occurred on the 16th, 1849—therm. 58 deg.; and the lowest on the 14th and 15th, 1846—therm. 13 deg.

## Notices to Correspondents.

Back Numbers: Full price will be given for No. 25, 1846; and Nos. 38, 42, and 48, 1850.

Birds—Canaries Living in the Open Air: *S.* This little episode appeared in the *Gardeners' Chronicle* of May 17, forming No. XXX. of the treatises on "British Song Birds." We shall, as we have already said, pay marked attention to this subject at the proper season; the more readily, as the experiment has already been made by our Most Gracious Majesty and Prince Albert, at Osborne, and with success. Of this, more by and bye.—*Olney.* You may, indeed, anticipate a treat; for however interesting the matters hitherto discussed, those which have to follow, as each bird renews his song in the coming year, will be even more so. We have, as yet, scarcely made a beginning.—*J C E.* The paper arrived safely. Many thanks for it, and also for the accompanying letter.—*Chatteris.* We feel obliged by your kind researches, and are glad to have such a watchful eye placed at our disposal.—*E C.* Your birds have gone into a *second* moult. It is as bad to keep them in an over-heated room, as it is to leave them exposed to cold. Reduce the heat gradually, and do not expect any "song" from your little prisoners till next spring.—*Novice.* The most lively companion we can recommend you, is a canary. Hear him sing before purchasing him. Kindness will soon render him familiar.—*Jane F.* It can only be acquired by long practice. The eye, certainly, *has* much to do with it.—*Canterbury.* On the 3d of January, next ensuing; we shall then go on regularly.—*Maidstone.* The feet are diseased solely from dirt. If you wish to keep your birds well, you must keep them clean.—*E A H.* Your bird has the cramp. Give him a little Maw seed, and keep him warm.—*Eliza N.* The tail-feathers will reappear in the spring, and your little friend's plumage will be bright and attractive as ever in a few weeks afterwards.—*Keswick.* In about a month, which will be just the thing for your proposed trial.—*P N.* They are very showy birds, and very amusing in their habits, but of little intrinsic value.—*Fanny.* They are hardy enough to endure any amount of cold; but, in confinement, should be kept out of the reach of draughts.—*J F W.* A "divorce," under the circumstances stated, is sound law; and let it be, from the peculiar atrocity on the part of the husband,—"*a mensa et thoro.*" Your bullfinches are "unequally yoked;" and the necessary consequences are but too obvious. Fortunately for them, the case need not, as with us, be carried into 'Doctors' Commons? Nature has kindly given them 'cheap law?' *W K.*

Glass Pipes: *Rev W F C.* We cannot answer letters privately; you will find them advertised at page 770 of last week's paper.

Gooseberries; *H D.* The following varieties will afford a good succession:—Early Sulphur, Early Green Hairy, Rob Roy, Early White, Keens' Seedling Warrington, Early Black, Small Dark Rough Red, Red Champagne, Woodward's Whitesmith, Melling's Crown Bob, White Fig, Pitmaston Greengage, Red Turkey, Rumbullion, Leigh's Rifleman, Red Warrington, Massey's Heart of Oak, Edwards's Jolly Tar, Cleworth's White Lion, Collier's Jolly Angler. The Elton Strawberry is later than the British Queen.‖

Names of Fruits: *W H S.* 1, Northern Greening; 2, Old Nonpareil; 3, Hawthornden; 4, New Rock Pippin.‖—*E S.* 1, Court Pendu Plat; 3, Golden Noble; 6, Dutch Mignonne; 10, Minchall Crab; 30, Beurré Diel.‖

Names of Plants: *A Constant Subscriber.* Quercus infectoria for the cup, and Ceratonia siliqua, the Locust tree, or Carob tree, for the seed. There is no good book on the subject; Loudon's "Encyclopædia," and "Cottage and Villa Architecture," contain some information.—*B K C.* 1, Hibiscus acerifolius; 2, Nicandra physaloides; 3, Pharbitis diversifolia.—*W C C.* Pistacea lentiscus, the Mastich tree.

Seeds: *P N.* The pulp is useless to them, and is much better away, if they are packed as we have advised. Mix the seeds in dry loam, and then ram the mass down hard into the kegs.

Sugar: *C R D.* We do not believe that lead is used anywhere at present in purifying sugar in the manner to which you refer. It is true that common treacle sometimes contains a minute trace of lead, derived from the use of leaden vessels, white paint, &c., but the quantity is very small indeed, and you need not be afraid of its injurious effects.

Superphosphate: *C E W.* Cabbages, Cauliflowers, and all sorts of root crops like it, if dissolved in water, and applied to the soil while they are growing. If you give it to others, you must dilute it largely, and apply it every now and then, like other liquid manure. Made as yours is, there is danger of its burning the roots.

Vine Borders: *W F.* Chalk makes a very good bottom. Mr. Mitchell, the celebrated Grape grower, at Brighton, has his borders on nothing else. The main bulk of the compost should be rich turf, to which may be added bone-dust, or broken bones and cow-dung. Drain well, and after your border is made, cover the surface in winter with some material that will throw off heavy wet. ‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Turnip Manure, per ton | ... ... | £7 | 0 0 |
| Superphosphate of Lime | ... ... | 7 | 0 0 |
| Sulphuric Acid and Coprolites | ... ... | 5 | 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

FOSSIL BONES AND PSEUDO-COPROLITES (FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD and Co., Artificial Manure Manufacturers, Ipswich, Suffolk.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

TO LANDOWNERS AND AGRICULTURISTS. EXTENSIVE DRAINAGE.

MESSRS. EASTON AND AMOS (Consulting Engineers to the Royal Agricultural Society of England), have just erected an

APPOLD PUMP, AT WHITTLESEA MERE,

which is 20½ times larger than the one exhibited by Mr. Appold at the Crystal Palace, and five times larger than any of the kind yet made. This powerful pump was publicly tried on the 12th of November, in the presence of the landed proprietors and farmers of the county, assisted by several scientific gentlemen, and at various lifts from 1 to 10 feet. At two to three feet, it raised 101 tons of water per minute (which would cover an acre of land one inch deep); and at five feet, it raised 75 tons per minute.—Grove, Southwark.

A PRIZE MEDAL FOR SUPERIOR LOCKS WAS AWARDED TO J. H. BOOBBYER, AT THE GREAT EXHIBITION OF 1851.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STUBCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars, London; and 36, Seel-street, Liverpool.

ADULTERATION OF FOOD.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, begs to call attention to his ACHROMATIC MICROSCOPES (warranted good) which will be exchanged if not approved of. These Instruments will define the Circulation of the Blood in the Frog's Foot, the Saw in the Sting of the Wasp, the Comb in the Spider's Foot, the beautiful form and varieties of Pollen in Flowers and their Structure, the Scales of the Butterfly's Wing, and also in many instances Adulteration of Food. It is a very interesting companion, and will pass away usefully many a leisure hour, the fund for observation being inexhaustible. Price for No. 1, 3l. 12s.; No. 2, 5l. 15s; No. 3, 9l. 10s. A descriptive Book, sent post free, on receipt of three postage stamps. Prepared objects, 12s.; injected do., 30s. per dozen.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE, PEAT CHARCOAL, impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

SMITHFIELD CLUB CATTLE SHOW. STAND. No. 164.

READ'S PATENT FIRE AND GARDEN ENGINES, upon his new patent principle, which, for power, portability, and simplicity of action, surpass anything of the kind hitherto invented.

PATENT SUBSOIL PULVERISER, PATENT VETERINARY INJECTING INSTRUMENTS, IMPROVED HOLLOW PROBANGS, for relieving Hoven or Choked Bullocks, Sheep, Calves, &c.

GARDEN MACHINES and SYRINGES of every description, manufactured only by

RICHARD READ, 35, REGENT-CIRCUS, PICCADILLY, LONDON.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron.—His Royal Highness PRINCE ALBERT.
President of Council.—Earl Bathurst.
Vice-President.—Earl Ducie.
Principal.—Rev. J. S. Haygarth, M.A.
PROFESSORS, &c.
Chemistry.—J. A. C. Voelcker, Ph. D., F.C.S.
Geology, Zoology and Botany.—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery.—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics.—W. Sowerby, A.I.C.E.
Manager of Farm.—R. Valentine.
Assistant to Chemical Professor.—A. Williams, M.R.C.S.

THE NEXT SESSION will begin early in FEBRUARY. Students are admitted either as Boarders or as Out-Students. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40l. per annum. The College course of lectures and practical instruction is complete in one twelvemonth—though for younger students a longer time is recommended. There is a department for general as well as for agricultural education. Prospectuses and information can be had on application to the Principal.

**The Agricultural Gazette.**

*SATURDAY, DECEMBER* 13, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Dec. 17—Agricultural Society of England.
THURSDAY, — 18—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 24—Agricultural Society of England.

BEFORE we attempt to apply the meteorological figures which we gave in a former Number, in explaining some of the causes of our varied systems of agriculture, we must first be convinced that these systems are actually required. For this end we shall take a general view of the subject in its broadest features; and we think it will appear patent to every one that our chemistry of vegetation must have a little more elasticity in it, if it is to assist us in solving the numerous problems of a practical nature by which we are beset. Mr. PUSEY, in the last Number of the Royal Agricultural Journal, is still confident that at present Rothamstead must be considered "as the principal source of trustworthy scientific information on agricultural chemistry." Now we would say to Mr. PUSEY, what we would say to any one else, "If you think you can account for the varied systems of British agriculture by the light of Mr. LAWES' chemistry, just try it." If our best practical authority is still going to encourage our hard-working and most useful chemists to contentment, with a mere Pisgah-view of the promised land of scientific agriculture, and is not to direct them when they wander, he may depend upon it that others will go in and possess the territory.

We have already given our opinion of Mr. LAWES' experiments, and we by no means under-rate his labours—he has done much to consolidate our opinions on many special points. The elaborate experiments of Mr. HANNAM and Mr. GARDNER, in the Transactions of the Highland Society, are, however, as valuable for practical purposes, seeing that these were made under less artificial conditions. For on this account Mr. LAWES' figures will by no means bear that rigid application which many imagine. We do not think that Mr. LAWES' generalisations on the chemistry of vegetation are an improvement on the broad and deep views of LIEBIG, nor do we think that LIEBIG has been quite fairly dealt with on the ammonia question. We say deliberately that Mr. LAWES has actually shown his own experiments to be "entirely devoid of value *as the foundation for general conclusions*." But for special purposes they are exceedingly valuable. His last contribution to the Journal of Agriculture is but an iteration of his former opinions; but as he draws particular attention to a subject which happens to lie across our path, we make his propositions the basis for better developing the principles which we are endeavouring to trace. And to show that some of the difficulties with which he is struggling are of his own creation, we appeal from the narrow and limited horizon of Rothamstead to that of a much wider experimental field. Mr. LAWES writes:

"There is another point in connection with the great demand made by the Wheat plant upon nitrogen supplied to the soil, to which we draw particular attention. De SAUSSURE, DAUBENY, and DRAPER, have found that nitrogen was really given off during the growth of certain plants; but, in a practical point of view, the question still arises whether this is uniform with all the different plants which enter into a rotation. It would appear that there is evidence of a superior power in the leguminous, as compared with the Graminaceous plants, of obtaining their nitrogen from the atmosphere rather than from the soil; or it may be supposed that the expenditure of it during the growth of the plant is greater in the one case than in the other. In support of the view that leguminous plants do possess a superior power of reliance upon the atmosphere for their nitrogen, and, indeed, that it is to this property that they materially owe their efficacy in rotation with grain, we may refer to the admirable investigations into the chemistry of agriculture of M. BOUSSINGAULT. The rotation usually adopted at Bechelbronn, and throughout the greater part of Alsace, is as follows: Beet-root, Wheat (17 bushels), Clover, Wheat (24 bushels)."

The chemists and agriculturists of this country must know a little more of the philosophy of rotations nearer home before they can expect to derive much practical benefit from the agricultural practices of one of France's fairest and richest provinces. But why does Mr. LAWES not give the results of his own experiments on leguminous plants, rather than refer to the rotation of Alsace? He expends much care in dividing plants into classes which he imagines have less or greater powers of relying on the atmosphere for their nitrogen. Now this *is* the case, to a certain extent, when they are grown under the same conditions, but this difference applies as much to species as to classes. In this respect the Wheat-plant will no more admit of being taken as a type of the Graminaceous order, or even of the cereals, than the wild Mustard can be taken as a type of the nitrogen-collecting powers of the Turnip. But on the other hand, there seems to be no inherent difference between plants by which one class relies more upon the atmosphere for nitrogen than another. It is to the conditions in which they are or can be grown that we must look, when we would account for their opposite qualities and requirements taken in connection with their known habits and functional resources. This at once leads us into the discussion of the circumstances of vegetable growth, and the consideration of the specific effects of the excess or deficiency of any of the multifarious elements of growth.

We shall first consider the widely opposite characters of some of the members of the Graminaceous plants and the analogy which some of them bear under certain conditions to the leguminous plants—embracing Clover, Beans, Peas &c.

So far as we can judge from the results of two very opposite systems, there is reason to believe that the plain of Alsace is as fertile as the "golden vale" of Limerick in Ireland. In the latter, however, there may be a continual succession of Graminaceous plants—some ameliorating and restoring fertility to the soil, while others are scourging, and exhaust it. The simple and primitive rotation of Grass! Grass! Grass! Oats (50 bushels); Wheat (30 bushels); Oats (50 bushels), is much more productive in nitrogenous seeds, than the highly artificial one of Alsace. There is, surely, no evidence here that all the members of the Graminaceous order have less nitrogen in the produce than is supplied in the manure. For "the annual expenditure of nitrogen is completely replaced by means of the pastures." (LIEBIG.) The Grasses under the skies of Limerick fulfil the office of restoring the nitrogen to the soil which has been spent by their congeners, the cereals, as effectively as the Clovers of Alsace, the Lucerne of Provence, or the Turnips of Norfolk. The granitic soils of Aberdeenshire are comparatively barren, when contrasted with the calcareous loams of Alsace; but if the mineral condition of soils is favourable in the former (Aberdeenshire), they rapidly enrich themselves under pasturage. But such a system as this never would succeed on a similar class of soils in Bourbonnois, where they would probably be abandoned to Broom for some years, to recruit the exhaustion brought about by bearing several miserable crops of Rye or Oats. In the drier portions of France, it is only in the irrigated meadow that the Grasses are such powerful agents in extracting from the atmosphere those elements which sustain animal existence.

In many parts both of the New and Old World, Wheat is watered like the Grasses with the best results. But while this operation can be successfully carried out even under our cold humid skies, for the Grasses, it can only be practised on the Wheat plant where the temperature is high combined with a clear dry atmosphere. Experience has hitherto been against the practice of watering the cereals in France, except in extreme cases of drought. In the arid climate of Spain, the productive powers of the country are almost entirely centered in its well watered valleys, and three crops of Wheat are sometimes grown in one year in the Vegas of Granada. (INGLIS.) There is little doubt that the Wheat plant in these cir-

cumstances can rely to a much greater extent on the atmosphere for its nitrogen, than when it is grown in the cold dry springs of Northern Europe. The Wheat plant is not necessarily one that requires much nitrogen in the soil, any more than its congeners, the Grasses; it is entirely a matter of circumstances. In the moist and warm atmosphere of Xalapa in New Spain, Humboldt found Wheat was raised solely for fodder, for there it had no tendency to produce seed. In that region, it would be no greater test of the fertility of land than the growth of the common Grasses in Britain. But Wheat is a most exhausting plant—taking a large quantity of manure to grow it—in the higher latitudes of North America and Europe.

It may be stated as a general law that those plants which can be grown both in spring and in autumn, require more highly nitrogenised manures in the former than in the latter season; or, in practical language, they are very truly said to exhaust more when raised in spring than in autumn. Thus, those crops which are often grown by the farmer with manures that are deficient in nitrogen, demand an enormous supply of that valuable element in the hands of the market-gardener, when they are grown out of their agricultural season. This principle can be traced through a great number of our cultivated plants, and it holds out a means of solving points of much practical importance, that we may in vain look for in any other direction. It is also in the nicer shades of this and similar modifying principles, and in the analogy which one plant bears to another, under given conditions, that we can expect to arrive at a rational explanation of the cause of the different exhausting powers of the cereals. But we must always keep in view that there are many points of differences in plants which we can never fathom, any more than why one species of plant is externally different from another.

Just look at the requirements of Wheat and Rye. The habits of the Wheat plant require that it should be sown in autumn over the continent of Europe. It is very sensitive of solar heat, and on the return of spring it is amongst the first of the Graminaceous plants to push forward its leaves to the extreme cold and dry atmosphere of European springs—even while the Grasses in the pastures are yet dormant, like the Oak, and will not unfold their tender shoots until the air becomes more genial and adapted for fulfilling the functions which Nature has assigned them. The large quantity of manure required by the Wheat in Europe and North America is probably a consequence of the ungenial conditions of the first stages of its growth. It is a fact which has been long recognised on the continent of Europe, that Wheat is more exhausting than Rye; or in other words, the former requires much more manure or a richer soil to grow it than the latter. Rye is even grown as a forage plant in Europe, after the land would not carry a crop of Wheat. Wheat might be as easily grown, and as productive as Rye in some parts of Mexico, but it is not so in Europe. It would therefore appear that, owing to certain atmospheric conditions peculiar to Europe, Rye gets rid of less nitrogen in the manure than Wheat does; this is plainly revealed in the history and necessities of the agricultural systems.

Some of our finest qualities of Wheat are grown in the countries adjoining the Baltic; but, although Wheat brings a much higher price than Rye, the extent of land in Wheat bears a small proportion to the extent in Rye, because the latter can be grown with much less expenditure for manure. This is the simple reason why the lower classes in the greater part of Europe subsist on the black, instead of the white bread. Two crops of Wheat are generally believed to exhaust the land as much as three of Rye; this is particularly seen when the soil is poor or out of condition; in these circumstances, Rye will often be grown with advantage when it would be out of the question to grow Wheat. The productive powers of the climate of the continent of Europe for Wheat are very much exaggerated; but what can we expect to learn on this subject when every one is impressed with the false idea, that the amount of summer temperature is the ruling element which determines the whole matter. We are satisfied that many of the fine soils of France would be more productive, for Wheat and all the other cereals, if they had been placed in the same atmospheric conditions of many parts of England, and even of Scotland. But the opposite opinion is so firmly seated in the popular mind, that it is almost useless to write against it. One is very apt to look upon the agriculture of much of the continent in a very unfavourable light, from not being aware of the comparative productiveness of Wheat and Rye. It was from a cursory view of this matter which led Arthur Young—the soundest practical philosopher modern farming has had—to exclaim, "the quantity of Rye in every part of France, even in the richest provinces, is probably one of the grossest absurdities in the agriculture of Europe." Certainly it does look very absurd to see such an extent of fine land under Rye, where the climate is generally supposed to be so very superior for the growth of Wheat; but it is the want of manure that is the great drawback to the extension of its cultivation, whether in Italy or in Ireland. Even in the rich soils of Flanders, with their overrated system of farming, the Wheat crops have a shabby appearance in sight of the luxuriant crops of Rye; there Wheat encroaches on the breadth of land sown with Rye, as the manure increases on a farm in much the same way as it has done over the spring crops in Scotland with the increased production of meat on a given space. The prime difficulty in Scotland also is to get a sufficient supply of manure to grow a large breadth of Wheat—to proscribe and limit its cultivation on the farm is only on a par with the policy of the fox in the fable, who despised the luscious produce of the Vine, as it was beyond his reach. In many parts of Britain, however, the conditions of soil for growing Wheat are separated from those which influence the produce of the spring crops by a much wider boundary than that of the Wheat and Rye on the continent of Europe; and there is no country where there are greater facilities for studying the causes which modify the exhausting qualities of the cereals and other plants, if we do not tie up ourselves to inflexible and unnatural theories. *R.*

## ON LAND DRAINAGE.

Under the term drainage is included the regulation of the water-level in loughs—the changing, improvement, and new forming of river channels, and the sewerage, draining, water supply, &c., of towns. But for our purpose, the most important office of drainage is to provide for the escape of water from the soil which supports and nourishes plants, whose existence and growth are modified or prevented by the action and influence of water, or by want of it. The method of effecting this desirable object is what is called thorough drainage, and though cases of any of the other provinces of drainage, which we have mentioned, may demand the attention of the agriculturist, it is principally with this and its various applications that he shall have to deal. In all these cases it is very necessary to be able to calculate the quantity of water which will be discharged by given relations, or under given circumstances of inclination, size, and shape of conduits, &c. To give a rule applicable to all cases, would be to embody in a formula almost the whole subject of hydraulics or hydrodynamics; and though it is done, and to the mathematical scholar appears simple, yet to purely practical men it presents apparent complexity and difficulty. Leaving it therefore to what we have in previous lectures said, and to what we shall say when treating it as a separate and distinct department, applicable to this as well as to numerous other cases, we shall rest satisfied with introducing the following practical rule, which will furnish the velocity with sufficient accuracy for ordinary purposes.

Multiply the hydraulic mean depth (in feet) by the declivity per mile (in feet), extract the square root and subtract one sixteenth of itself from it, the remainder will be the mean effective velocity in miles per hour; from which the amount of discharge may be calculated. The quantity discharged equals the velocity multiplied by the area of the section of conduit, $Q = v.s.$ It should be here explained that the hydraulic mean depth is the depth of the rectangle, whose area is equal to the sectional area of the stream, and whose base is equal to the line of contact between the water and the channel, or what the French call the *périmètre mouillé*. Hence in a circular conduit, such as a pipe, it is one half of the radius, or one fourth of the diameter.

Example:—Find the discharge of a pipe or stream (rectangular) 6 feet broad and 2 deep, with a fall of 5 feet per mile.

Here the hydraulic mean depth = 1-2 feet, wherefore the velocity is 2-3 miles per hour nearly. Therefore a mass of water, 2-3 miles long, 6 feet broad, and 2 deep (= 5388 cube yards, or 145,464 cube feet), would be delivered every hour, which is equal to 2424 cube feet, or nearly 15,000 gallons per minute. Such is the quantity of water which can be conveyed away, and such is the method of determining it for given circumstances.

The next preliminary consideration is, the determination of the quantity of water which *must* actually be conveyed away. It is principally surface or rain-water which we have to guard against. The quantity of rain varies in different places, and each must determine it by his own or his neighbour's rain gauge. It is found by careful observation here that the greatest quantity is ·75 inch, or $\frac{3}{4}$ of an inch in depth all over the surface in 24 hours. This is the maximum, when *it* is provided for the rest is sufficiently safe; for we need not allude to the learned gentleman who cut a small hole for a kitten, though he had already provided a door for its mother.

Now it has also been found by careful observation that of the water which falls on the surface of the ground only *one-half* passes off through the best constructed and most efficient drains. We have therefore only a ·375 inch deep sheet of water to be delivered in 24 hours. This on an acre equals 13,590 cubic feet, or &c. gallons, &c. From these two principles the smallest pipes that may be used can be determined in all situations, and here it may be observed that the joints of the smallest pipes can be shown to be sufficient for the entrance of all this water, or even more.

As an illustration of this method and its applicability, take the case of a 50 acre field. It will be found that more than 47 cubic feet of water must be discharged per minute in the extreme case to be provided against. Now, would one-half inch pipe be sufficient? Let us see. The area of section of this pipe is ·19,635 square inch, and supposing a fall of 20 feet per mile, which is a great one, the velocity would be found to be nearly 52 feet per minute, and $Q = 52 \times ·00,136$ (= the section of pipe in area in square feet) = ·6727 &c. cube feet of water delivered per minute. Showing that this pipe would not be at all adequate to discharge 47 cubic feet under the circumstances supposed.

By taking the instance of a 2 or 3 inch pipe, and determining its delivery under assumed circumstances, the reader may become familiar with this method of estimating the effects of pipes, drains, rivers, &c., compared to any quantity of water which it is necessary to convey from one place to another.

A five-inch pipe would give a velocity of six miles an hour, and is therefore admissible in this case. Such a velocity would not wear hard materials nor cause any great mechanical mischief. When a river meanders through a flat country, its course might be straightened, its channel systematically, suitably, and properly formed, and simultaneously the ground may be drained and improved, the whole being done with a very moderate outlay; but of this case we shall speak more in detail when considering the conditions of proper and possible irrigation.

It is frequently necessary to execute some cuttings and embankments in drainage and irrigation, but we cannot detail the methods of making these, at least in this place. They have been already pointed out. Rivers are often modified for the purpose of navigation, &c. Engineering is then called in, to exercise a very extensive influence; but we cannot for the present dwell on these cases. We must now proceed to discuss the methods of thoroughly draining land for agriculture. It is surprising to see what a quantity of the country still requires the skill and energy of the drainer, though every one admits the advantages of this system of improvement.

It was early observed that in valleys and hollows lined with stiff retentive clay, the water which fell on their own surface, or on that of the surrounding eminences, collected in reservoirs under the surface, which broke out in springs in the sides or bottoms, and kept their vicinities continually in a state of wetness, destructive of healthy vegetation. Though this evil would necessarily impress itself on the attention of the farmer, yet in many cases it appeared impossible to take the water away, owing to the obstruction of high ground all round it, as well as to the retentive character of the land itself. Many cases, however, admit of easy and effectual treatment.

If it be found by boring that the retentive soil lies on a porous bed, which often happens, a complete remedy will be afforded by cutting a well through to this bed, and conveying the water into the well by small drains from the various springs or points at which the water collects. In some cases tapping with a geological auger will be quite sufficient to let the water escape through such a porous substratum. When no such porous substrata are found, a drain of suitable size must be cut from the spring, or through them all, if many exist, and conveyed to a lower level to discharge itself. This drain may in some cases even be partly composed of a syphon bringing the water over some eminence when the wet soil is *land locked*, so to speak. All these cases require the exercise of some skill in their treatment. Their occurrence is only exceptional, though it is striking, and calls loudly for relief when it does exist; and no doubt many places may be much improved by it at a very small outlay of capital. It was to this subject and on these principles that Elkington founded his system of drainage. His chief error seems to have been—ascribing all necessity for drainage to the same circumstances, and treating all on the same principles. No doubt the method has merit, and finds many instances where it may be advantageously applied. But it is certain that all land may be improved by drainage, and that a much more extensive, nay universal system is needed. This is supplied in thorough drainage, which has a variety of other names, such as parallel drainage, &c., and which we now consider.

Thorough drainage consists in forming a main drain, commencing it at a low level to which it is intended to conduct the water to be there discharged, and carrying it up through a low part of the ground to be drained, submains leading from this main at various points and in different directions, along other hollow parts of the ground, where any such exist, and minor drains, which are laid at suitable distances apart, parallel, or as nearly so as may be to each other, and also nearly as possible at right angles to the main or submain to which they flow.

The materials, expense, distance apart and depth of these drains, are still much canvassed, and much that appears ridiculous is said on the subject. We shall consider these subjects successively, and we trust that we shall settle them very considerably.

Regarding the depth, on which we shall find the other questions considerably dependant, it must be evident to every one that when a soil is stiff and retentive the water cannot make its way through it, but must flow

along the top of this stiff clay in finding its way to the drains. In other words, it gets very little lower than the vegetable mould, which must be rendered porous to some extent by roots of plants, even if it were not moved by the plough. But the water will not be able to find its way far, having so many obstructions, or if it must get away to a distance by the force of its own weight, it will remain a ruinously long time in doing so, and will stagnate and injure vegetation. Deep draining would have no adequate advantage in this case, as the water must flow to the edges and down the sides of the drain, not making its way through the soil directly to the bottom. The drains cannot draw from great distances, whatever may be their depth.

From these two considerations, namely, of the obstruction to water flowing far, on a nearly horizontal surface (that of the clay), and of the inutility of deep drains (since they cannot draw to a distance which is very great), we infer that in stiff retentive cold soils, drains should approach the minimum depth and distance.

On the contrary, in gravelly and porous soils the water makes its way down from the surface and filtrates through the subsoil to almost any distance and depth. Hence in this case deep drains will draw from distances proportioned to their depth. These two cases would best be illustrated by the use of a diagram.

Deep drains at considerable distances therefore seem most suitable for porous, gravelly, and loose subsoils. They may in this case reach the maximum depth and distance. It thus appears that both deep and shallow drainage have their respective advantages, that both are required and applicable; where then can be the use of so much discussion and altercation on the subject, as appears in all the journals of the day which notice agricultural interests and improvements?

We have now to point out what are the *minimum* and *maximum* of depths and distances to which we have referred.

The water entering the pipes, stones, conduits, or whatever else conveys the water along the drains, must be previously filtered, so that no deposit may be made which would obstruct the passage. Hence some layer (clay for instance) must remain unmoved between these pipes and stones, &c., and the tillage or surface mould. Supposing the plough to move the soils to a depth of 12 inches, and allowing 6 inches for this immovable layer, and 9 inches for the stones, &c.; we obtain a minimum of 2 feet 3 inches, for a general rule we shall say 2½ feet for the minimum depth of a drain in arable land. In pasture land or water meadows they need not be so deep. The distance between such drains may be from 20 to 30 feet. The maximum again depends on the facility of forming the drain, as we have seen that it does not depend on the soil. But as a deep drain should be wide at top, to allow men to work at great depths, we question whether it would be economical to make any drains deeper than 5 feet. This we shall state as the maximum, to be filled with materials so near the surface as the abundance of such materials allows; but not of course nearer than the 20 inches for tillage and filtering stuff. With this depth the drains may be placed at a distance apart of 60 feet. Between these limits the nature of the soil must suggest to the skilful drainer what dimensions he will choose. Practice suggests the following relations:—3 feet deep, 33 feet apart; 4 feet deep, 48 feet apart, &c. &c.

It is also a result of practical observation that by doubling the depth you may drain one half more surface, and three times as much soil. This is only true in the case of porous subsoils. One other circumstance remains to be adverted to, namely, that when the fall is slight an increase may be required to be made by varying the depth of the drain. Mains and submains must always be from 4 to 8 inches deeper than those drains which flow into them, in order to increase their draught of the water from these minor conduits. Regarding the dimensions of each drain in cross sections, it needs only to be mentioned that it must be such that a man can conveniently stand and work in it. It may be 15 inches at top and taper down to 3 or 4 at bottom, according to the nature of the filling materials. If pipes be used the bottom of the drain should just be capable of receiving them.

The drainer having decided on the distances of his drains, and marked them on his plan, proceeds to stake them out on the field, and should make models and gauges of wood, to ascertain that the labourer has cut them to the form required by the specifications, and also a level (such as the A level) to try the rates of inclination, which should be made sufficient to cause the water to flow, yet must not be too great, so that the soil would be worn away.

We have said that all land may be improved by drainage, but many cases of wet land which demand immediate attention occur. Delay in drainage is positive waste of the legitimate produce of the soil.

The usual symptoms by which these cases may be detected, and by which, in general, wet land may be known to require drainage, are,—1st, that it produces coarse Grass, much weeds, rushes, or in general vegetation which possesses the characteristics, in some degree, of aquatic plants; and 2d, that when tilled, it appears dark and cold after rain, while the surrounding dry ground looks comparatively light in colour, and hearty; and 3dly, that in every case wet ground feels hard and inelastic to the tread. From these symptoms the practical man soon decides when drains are needed, and simultaneously the method of forming them to advantage.

The result of draining immediately appears to be beneficial, and shows itself in increased and healthier crops, more luxuriant and matured at the season of ripening. The explanation of these changes is, no doubt, supplied by the facts, that by the combined and alternate action of air and water, much matter is made available to the plants by chemical changes and mechanical action, such as solution and transportation, which was not before suitable to their nourishment, or within their reach. If the water lies in the subsoil, the air cannot act upon it below that water, and it is known that the roots of plants do not penetrate lower down than they find air. Many other equally rational causes might be assigned were any argument needed to prove the importance of this treatment of wet soil. It is wet soil which in seasons of drought are most likely to lack healthy moisture. It becomes hardened, cracked, and caked, so that the dew only falls on its surface to escape again in the first hour of the succeeding sunny day, which otherwise would cause the rejoicing plants to grow in vigour, refreshed by the cooling draught of evening. It never is spongy. In pasture land open drains may serve very well, but they fill up and are so liable to be obstructed by matter falling that they will be found as expensive in the end as thorough drainage. In all cases of drainage the subsoil must be examined by opening into them a short drain to see it. This preliminary reconnoissance must precede all conclusions of form and position of drains. It is therefore the first operation to be performed.

*Materials.*—Where stones can be easily obtained they are perhaps the most economical materials for drainage, and will serve very well, if carefully put in. The mains and submains should be formed by placing the stones so that a duct of triangular section is formed throughout:—Thus ▲ the triangle should be as nearly equilateral as possible, and should rest on its base that it may not sink into the clay and get choked up. Small stones should then be put in on it. The stones for all drains should be broken, but not too small. A little straw or brushwood placed on them to prevent the mould getting down among them is an indispensable requisite. The mould may then be pushed in; but the turf, when carefully removed in the opening of the drain and placed on the stones in filling in, serves admirably for this purpose. Where stones are not in abundance without great expense for quarrying, carriage, &c., tiles may be used. The circular tile now seems to have established its character as the best and most economical. Certain it is that it suits most the purposes of drainage, completely supplying all the requisites to a good draining conduit.

A drain should never be placed close to a fence, else the roots of trees, &c., get in and stop it up; besides vermin are more likely to lodge in it if it is near hedges, &c. It is difficult to say what the expense of drainage ought to be, so much depends on the price of labour, the nature of the soil, size, &c.; but 3*d.* per pole may be taken as a fair average, which will enable anyone to compute the expense of a given quantity of work approximately. Bricks, peat, and Larch tubes, have in many localities been found cheap and efficient materials for forming drains, when stones and pipe tiles could not be conveniently obtained. The price of tiles is very uncertain, varying with their size, &c., from 10*s.* to 25*s.* We need not here advert to the many excellent drainage tools which are now so commonly sold, and used everywhere throughout the country.

In conclusion, we have only to express our astonishment that so much discussion should exist about the depth of drains—since their useful depth in any situation can be settled to a mathematical demonstration, and therefore admits of no doubt. Yet we find silly people still raising the question, and short-sighted individuals who only see as far as the boundary of their own respective premises, setting up a favourite depth and distance, which *they* would apply in all cases. True, it would only involve a little additional and unnecessary expense, and therefore they are quite at liberty to indulge their foolish fancies on their own territories; but we regret that this will not satisfy them. They must be out in print and try to instruct, while they only mislead, as often as they find innocent or ignorant readers and practitioners.

We have also to regret that very much land still remains in its primeval state of neglect and humidity. How often one sees a farm cultivated almost beyond its capabilities, money expended on artificial stimulants to vegetation, and lazy men going idle for want of work, or crying out against the introduction of improved machinery for performing useful labour lest *they* should be disengaged; and in another tenement, a few perches distant, wet, unreclaimed native land, requiring only labour to double its produce. Much agitation is kept up about the best manures, while not one-fourth of the land is prepared for the beneficial application of any, to the full extent which skill alone directing labour would effect. Yet every man must not be his own drainer, unless he first studies the principles; or he is likely to incur much more useless cost than would remunerate the professional practitioner in this department. It is almost painful to see what waste is caused by inattention to drainage and irrigation.

Frequently a river may be seen lazily wending its way to be drunk up by the ocean in dry weather, when it might be made to play a most important part as the farmer's friend, and the same stream in times of rain comes with resistless force and carries off his grain and half the food of all his crops, as if in wicked retaliation for his carelessness and neglect of it. This is a subject, however, which we purpose to resume at no very distant day, and we shall therefore now conclude with humble wishes that some people may have been improved in their notions of drainage by our earnest efforts. *Lecture by J. G. B. Marshall, B.A., C.E., Professor of Engineering, at Royal Ag. College, Cirencester.*

## Home Correspondence.

*Game.*—What! has the old poacher trapped his reverend opponent along with all the hares and rabbits round Manningtree and Wix — 3000 acres of first-rate land, all highly cultivated, and not a hare or rabbit to be seen. Is it in the middle of these 3000 acres is to be found the challenge farm which the reverend gentleman spoke of some time ago? No doubt of it. No game farm could for a moment challenge one that is free of those destructive animals. A gentleman living here, who holds a high office in Somerset House, told me that upon his farm, near Farnham, he is surrounded with game estates; he told me that he has repeatedly sent to them to say that if they do not take means to keep hares, rabbits, and pheasants off his farm that he must destroy them himself, as the land belongs to him. He also told me that he would follow a very different course of culture (and *now* he is a second Mechi) in good farming; he knows there are great virtues in Cabbages, Brussels Sprouts, Savoys, Carrots, &c., but these vermin are continually devouring them, and would take one man doing nothing else to watch his ground, besides living in hot water with his neighbours. At an estate, some miles below Croydon, two years ago, the farmers were so eaten up with game that they threatened, to a man, that they would all leave if the game were not reduced. The landlord very wisely granted it; he allowed not only the farmers but all their friends to kill as well. How many was the number, thinks my opponent? one of the men who helped to kill told me that there were close upon 15,000 head of all sorts. My reverend opponent knows nothing of a game estate. For what has a noble Earl done away with all the game upon his immense estates, as mentioned just now in the papers, and many more besides him? I do hope that no one for one moment will think that I have anything but a national good in view. Those nightly bandits would soon turn into decent workmen if there were no game. As game stealing is the first crime of these people, all others would alike cease; the now oppressed farmer would no longer have to keep *their* families. Game preserved estates produce just the very lowest rent, a continued animosity and bitter feeling between landlord and tenant, too often carried on in an under current; it is also the producer of every sort of destructive insect; the very nursery beds of millions of seeds along the uncultivated headlands and broad hedges and ditches. And many of those beautifully ripened seeds can and do travel for miles. Some game estates that I know are not one bit better than when the Saxons first landed upon our shores. But on the other hand, where no game is, leases are granted; the farm has a neat and garden-like appearance, the wild animals are all gone, no rats and mice by the thousand coming in from their summer quarters to winter upon the corn of the farmer. No gamekeeper's houses covered with cats, polecats, stoats, weasels, &c., the farmers look after them; but where game is, they are not allowed even to shoot at a rat, or the keeper would soon be after him. I am quite prepared to state, that when the Game-laws are done away with, the land will rise in price in every acre. Is it not cruel to think that we have the best of land within 30 miles of the great metropolis, let at 5*s.* and 7*s.* 6*d.* per acre (all through game). The days are now gone, a gentleman will no longer be able to resist the just demands of his tenants, even if he should be rich enough to still make his estate into a game preserve. My reverend opponent, in one of his letters, has stated that it is a great benefit to the poor to have such a quantity of game sent to London; I can answer for them all, that the poor of London do not even know the taste of either a hare, pheasant, nor partridge; half-a-crown for a hare, half-a-crown for a pheasant, and three shillings for a brace of partridges! One wild thing they do buy, and that is rabbits; those are bought at 8*d.* and 10*d.* a-piece, and a cat would answer the same purpose. My reverend opponent seems to lay some stress upon woods breeding insects. No doubt of it. I must here state that a properly managed wood ought to be kept quite clear of all brushwood and rubbish. A plantation likes good management, like a plantation of Liquorice or anything else. I am truly sorry that the Rev. George Wilkins has spoken so lightly of the celebrated Mr. Smith of Deanston's shallow draining. I have a case here that Mr. Smith was quite right with drains 2 feet 6 inches in a strong retentive clay. When the rage came up for deep drains, the Bishop of Winchester ordered a ten-acre field to be drained 5 feet deep at some five-and-thirty feet apart; the drains never run. The bailiff took upon himself after two years to put in drains upon Smith's plan 2 feet 6 inches deep between the others; those drains carried off every drop of surface water. The Bishop was so surprised that he had no more deep drains upon such soil. This I was told in Sir Robert Peel's house some four years ago or more; and by the Bishop's steward and bailiff. Had my reverend opponent known Mr. Smith, of Deanston, for five-and-thirty years, as I have done, he would have arrived at a very different opinion of this great man, whose name will not soon be forgotten. I return my most grateful thanks to my reverend opponent for his temperate and kind consideration during this discussion, and his good wishes for so humble an individual as myself. *James Cuthill, Camberwell, London.*

*Game.*—I should not have troubled you again on this subject, had it not been for Mr. Wilkins' last communication. I must, however, in self-defence, beg to assure that gentleman that I am not "like one of the seven sleepers," for I have carefully read every word he has published in the *Agricultural Gazette*, on the subject of game; and it was because I considered, and still do consider, that he left untouched that particular point to which I wished to draw the attention of your readers, that I troubled you with the few lines he has found fault with, though at the same time thanking me for my letter in general. He may, in his own mind, have intended to include among his arguments the point I adverted to, but he certainly never brought it forward with the clearness I thought it deserved; at any rate I cannot understand his considering it "disheartening and provoking" to have a fellow-labourer in the same cause. He surely cannot be jealous of my humble article! If so, I am afraid I shall again incur his displeasure; as, before I conclude, I wish to say a few words in answer to Mr. Cuthill's last communication on the subject under discussion. That gentleman seems to me to be labouring under a great mistake, in so perseveringly connecting the preservation of game with small fields and wide hedgerows. He surely cannot pretend to say that is the character of farms in Norfolk, which is the most celebrated partridge county in England. Why it is only a few days ago that I read an account of a farm in that county of 1000 acres, which was divided into no more than four fields. In Cambridgeshire, too, where I am in the habit of shooting, the fields are very large. Indeed the whole county, as everybody knows, is very open, and nowhere have I seen more game. And in Suffolk, on my own property, I have many fields of 50 acres and upwards; and when I used to preserve had plenty of game. My only reason for giving up preserving there was the great distance of that estate from my place of residence; and I may safely assert that I never had any complaints, except occasionally on the subject of rabbits, which I always endeavoured to keep under as much as possible, and which I would willingly have got rid of altogether, had it been possible. In conclusion I will merely add that I should be sorry to see the day arrive when the moderate preservation of game is forbidden. The present outcry against it is, I am convinced, founded on a most unfortunate and much to be lamented prejudice, originating among the candidates for mob popularity, and encouraged by a very large class of people who will not take the trouble to think for themselves, but imbibe, involuntarily perhaps, the stereotyped mistakes of the many, and are therefore well prepared to be influenced by those mob orators or ignorant enthusiasts who, either to gain their own ends, or from an honest though mistaken conviction, that if it were not for game there would be little or no crime in the country, are labouring to bring about an alteration in the laws, which the farmers themselves, who are supposed to be the most aggrieved, would be the very first to lament. *W. F. G. F.*

*Clover Failure.*—Seeing, from your Paper of the 29th ult., that the above subject is again revived, I take the liberty of submitting to your notice the following facts, which, if new, may probably be worth publishing. In the spring of 1847, my attention was called to a large break of Spruce Fir plants, growing in a nursery in this neighbourhood, and which presented an unusual appearance, there being large patches over the whole break in which the young plants were yellow, sickly, and apparently in a dying state. Upon examining the roots, I found in every instance that they were almost wholly denuded of their outer coat or bark. The Spruce were planted out the previous autumn, being then two and three years seedlings. I need hardly add that all that were affected as described, died. I am given to understand that the disease referred to is well known to nurserymen, and is attributed to the ravages of a small beetle. In the same spring, I visited one or two farms —heavy clay soil—where the Clover failure was very bad, and seeing that the fields had very much the appearance as the break of Spruce referred to, only in the diseased patches the Clover leaf was either wholly gone, or what remained was quite dry and withered, I carefully lifted a great many of the roots, and without a single exception, they were peeled or barked exactly as the Spruce. On the same farms, the red Clover has, for the last two years, been as entire and luxuriant a crop as ever it was in the best days of that useful plant. With regard to the duration of red Clover—about six years ago I was anxious to ascertain if there was any difference in the produce of seed from various countries. I therefore procured genuine samples of seed, of English, French, American, and Dutch growth, and in the month of April I sowed a drill of each on a medium dry soil, and the whole were cut in August or September, that same season, and the whole kept the ground fresh and vigorous for the three following years, cutting them twice each year, and, I suppose, they would have stood till now, but I dug them up. No manure was applied after the first year. I could see no difference in luxuriance or otherwise, in the four samples. I make no comments on the above, but I shall be well repaid for the trouble in noticing the facts, if they should, in the least degree, throw any light on the cause of the Clover failure. *H. D., Stirling, N. B.*

*Keeping Cows in the Yard.*—As many inquiries are made as to the best mode of keeping cows, I venture to suggest a plan which I am about to adopt. I have one field of 16 acres under plough and this I shall divide into four courses—1, Vetches sown in February, followed by transplanted Cabbages in June and July; 2, Mangold Wurzel; 3, Vetches in March, followed by Italian Rye-grass sown in August; 4, the Italian Rye-grass sown the year previous. These are the courses I propose for artificial Grasses and winter food. I have some Grass land besides, and shall purchase straw for litter, being certain of getting any quantity I desire, and at a cheaper cost than I can grow it. The cows will be kept in stalls in a yard, and all the dung will stand for the 16 acres of plough land. The produce will be consumed as follows—April and May, Italian Rye-grass; May to July, Vetches; July to September, Italian Rye-grass; October to January, Cabbages; January to March, Mangold Wurzel. *A. B. C.*

*Tank* v. *Box.*—I asked a friend of mine, last summer, by what means he invariably obtained such exuberant crops of first-rate Grass? This was his enthusiastic answer—"By means of the tank, spring, summer, autumn, and winter, I work at the tank—the tank is my sheet anchor, and it must be yours. My good sir, stick to the tank." But in the *Agricultural Gazette*, Nov. 29, 1851, are these remarkable words, in answer to a query as to the proper size of a tank for a certain number of acres, "No tank at all, is the right method. This, with the adoption of box-feeding in stables, as well as in the feeding stalls, is the most economical mode of manure management." Here, then, are two large and influential parties of the agricultural world at issue on a vital point. On the one hand, the numerous and intelligent party, of which my friend is but the type, have long been, and still are, loud in praise of the tank; and capable, moreover, of practically demonstrating its highly fertilising effects. On the other hand, you, sir, yourself a host, with a crowd of experienced and clear-sighted men at your elbow, denounce the tank, and stick to the box. I presume that the advocates of the tank, as well as those of the box, agree that this is by no means a question of mere fertility, however great, but of fertility in combination with the largest net profit. Let account books and balance sheets decide which party is entitled to the prize. *A. Z.*

*Fork Husbandry.*—I have waited for the announcement of a handsome Christmas-box to the most diligent peruser of your Journal, that I might prove my right to the prize, and claim it at one and the same time. You have not determined what the prize shall be, and your correspondent, H. Copland, may be in despair, so, in charity to him, I write to let him know that the book he inquires for is a "New Practical System of Fork and Spade Husbandry," by John Sillett: Simpkin, Marshall, and Co. Now, if I were not the most diligent reader of your Paper, how could it have happened that so many of your other subscribers could have left the query unanswered which appears in No. 46, Nov. 15? And a very useful book H. Copland will find John Sillett's little tract. His system is that of the Rev. Mr. Smith, with divers improvements of his own—chief amongst which improvements in the making and using a large quantity of manure. When the doctors have settled the great question of organic or inorganic, such men as John Sillett will cease to manure. Which of the S's is the capital I don't know. I should say Sillett had priority, but Sillett is not a clerkly man. His system, nevertheless, appears to extort from the breast of our common mother by much the larger quantity of milk. His practice has clearly anticipated the recommendations in your very able leader, in a late number, on the subject of Rev. Mr. Smith's system. That was a very smart paper, and very sarcastic. I doubt, however, if it will be useful to those chiefly interested—the agriculturists.

Wit may be so subtle, so keen, as to be neither felt nor seen. *W. R. Carter, Eel Moor Farm, Cove, Bagshot, Dec. 2.*

## SMITHFIELD CATTLE SHOW.

We have a detailed report of the cattle, sheep, and pigs exhibited at Baker-street during the past week; but, owing to its length, must postpone it until our next publication, when we shall ask our readers to walk round both the London and Birmingham Exhibitions with us, and give us an opportunity of pointing out to them the character and history of many of the specimens therein. Having obtained the dimensions of almost all the animals exhibited at both places, we shall then be able to draw a strict comparison between the two. Meanwhile, we have merely to state, in general terms, that the Baker-street Exhibition was as good as usual in point of numbers, and better than usual as regards quality. The Hereford breed has appeared in great force, and carried off an unusual number of prizes. The system which sets animals of different breeds in competition with one another, however desirable it may be as the only remaining test of relative merit, which we have among our public cattle shows, is one which renders modern judgment extremely difficult and rarely satisfactory to competitors, and it is not improbable that this cause may act to the prejudice of the Smithfield Club and to the advantage of the Birmingham Exhibition, where the more easy and satisfactory method of classification according to breed is obtained. The former, however, with the exception of the class Pigs, is, of course, still much inferior to the latter in point both of quality and extent. As regards the pigs shown, there was more equality between the metropolitan and provincial meetings. But on this, as on other points, we shall be able to speak more particularly next week. The Baker-street exhibition included as usual a large collection of agricultural implements; among which the rival reaping machines excited much curiosity—and the collections of vegetable specimens were numerous and creditable.

The following is the award of prizes:

### OXEN OR STEERS.

Class I.—Oxen or Steers, of any breed, above 4 and not exceeding 5 years old.

1st prize, of 30*l.*, to Mr. William Heath, of Ludham-hall, Norwich, and Silver Medal to the breeder, Mr. John Oakes, of Afcott, Church Stretton.—2d, 15*l.*, Mr. William Henry Brickwell, of Leckhampstead, Bucks.—3d, 5*l.*, His Royal Highness Prince Albert.

Class II.—Oxen or Steers, of any breed, above 3 and not exceeding 4 years.

1st prize, of 30*l.*, to Mr. Edward Longmore, Adforton, near Ludlow, and Silver Medal to the breeder, Mr. Edward Longmore.—2d, 15*l.*, Mr. William Heath, of Ludham-hall, Norwich.—3d, 5*l.*, His Royal Highness Prince Albert.

Class III.—Oxen or Steers, of any breed, above 2 and not exceeding 3 years old.

1st prize, of 25*l.*, to Mr. Joseph Phillips, of Ardington, near Wantage, Berkshire, and Silver Medal to the breeder, Mr. Thomas Carter, of Dodmore, near Ludlow, Salop.—2d, 15*l.*, His Royal Highness Prince Albert.—3d, 5*l.*, Mr. Isaac Niblett, of Conygre Farm, Filton, near Bristol.

Class IV.—Oxen or Steers, of any breed and age, not exceeding 80 stone weight.

1st prize, of 20*l.*, to the Right Hon. Earl of Leicester, of Holkham-hall, Norfolk, and Silver Medal to the breeder, Mr. William Baker, of Bishop's Nympton.—2d, 10*l.*, Mr. Daniel Maydwell, of Ashstead, Surrey.

Class V.—Oxen or Steers, of any breed and age, not exceeding 80 stone weight.

1st prize, of 15*l.*, to the Right Hon. the Earl of Leicester, of Holkham-hall, Norfolk, and Silver Medal to the breeder, Mr. George Turner, of Barton, near Exeter.—2d, 5*l.*, Mr. Thomas Bond, of Bishop's Lydeard, near Taunton.

Class VI.—Oxen or Steers of the Scoteh, Welsh, or Irish (Kerry) breed, of any age.

The prize of 10*l.*, to Mr. G. H. Kinderley, of Kilpalson, Pembroke.

### COWS AND HEIFERS.

Class VII.—Fattened Cows or Heifers under 5 years old.

1st prize of 20*l.*, to Mr. Samuel Druce, of Eynsham, near Oxford, and Silver Medal to the breeder, Mr. Samuel Druce.—2d, 10*l.*, Mr. Richard Stratton, of Broad Hinton, near Swindon, Wilts.—3d, 5*l.*, Mr. John Philips, of Ardington, near Wantage, Berkshire.

Class VIII.—Fattened Cows of 5 years old and upwards.

1st prize of 20*l.*, to the Right Hon. Lord Feversham, of Duncombe-park, Helmsley, York, and Silver Medal to the breeder, the Right Hon. Lord Feversham.—2d, 10*l.*, Mr. Joseph Gillett, of Little Haseley, near Wheatley, Oxon.

Class IX.—Fattened Cows, of 5 years old and upwards, that shall have had at least two live Calves at separate births.

1st prize of 20*l.*, to Mr. William Holland, of Lightcliffe, near Halifax, and Silver Medal to the breeder, Mr. William Holland.—2d, 10*l.*, Mr. Robert Beman, of Moreton-in-the-Marsh, Gloucester.

### LONG-WOOLLED SHEEP.

Class X.—Fat Wether Sheep, of any long-woolled breed 1 year old.

1st prize of 20*l.*, to Mr. R. L. Bradshaw, of Burley-on-the-Hill, Oakham, and Silver Medal to the breeder, Mr. R. L. Bradshaw.—2d, 10*l.*, Mr. R. F. Hall, of Hesley, near Bantry.—3d, 5*l.*, Mr. George Walmsley, of Rudston, near Bridlington.

Class XI.—Fat Wether Sheep, of any long-woolled breed, 1 year old.

1st prize of 20*l.*, to Mr. Lawrence Willmore, of Whetstone, near Leicester, and Silver Medal to the breeder, Mr. Lawrence Willmore.—2d, 10*l.*, Mr. Thomas Pulver, of Broughton, near Kettering.—3d, 5*l.*, the Marquis of Exeter, of Burghley-house, Stamford.

### LONG WOOLLED (NOT BEING LEICESTERS).

Class XII.—Fat Wether Sheep, of any long-woolled breed, (not Leicesters), 1 year old.

1st prize of 10*l.*, to Mr. Robert Beman, of Moreton-in-the-Marsh, Gloucester, and Silver Medal to the breeder, Mr. Robert Beman.

### CROSS-BRED SHEEP.

Class XIII.—Long and Short-woolled Cross-bred fat Wether Sheep, 1 year old.

1st prize of 10*l.*, to Mr. J. R. Overman, of Burnham Sutton, near Burnham Market, and Silver Medal to the breeder, Mr. J. R. Overman.—2d, 5*l.*, Mr. Samuel Druce, of Eynsham, near Oxford.

Class XIV.—Long and Short-Woolled Cross-bred fat Wether Sheep, 1 year old, under 220 lbs. live weight.

1st prize of 10*l.*, to Mr. J. R. Overman, of Burnham Sutton, near Burnham Market, Norfolk, and Silver Medal to the breeder, Mr. J. R. Overman.

### SHORT-WOOLLED SHEEP.

Class XV.—Fat Wether Sheep, of any short-woolled breed, 1 year old.

1st prize of 20*l.*, to his Grace the Duke of Richmond, of Goodwood, Chichester, and Silver Medal to the breeder, his Grace the Duke of Richmond.—2d, 10*l.*, Mr. William Sainsbury, of West Lavington, Devizes.

Class XVI.—Fat Wether Sheep, of any short-woolled breed, 1 year old, under 200 lbs. live weight.

1st prize of 10*l.*, to Mr. William Sainsbury, of West Lavington, Devizes, and a Silver Medal to the breeder, Mr. William Sainsbury.

Class XVII.—Fat Wether Sheep, of any short-woolled breed, 2 years old.

1st prize of 20*l.*, to his Grace the Duke of Richmond, of Goodwood, Chichester, and a Silver Medal to the breeder, his Grace the Duke of Richmond.—2d, 10*l.*, Mr. J. V. Shelley, of Maresfield Park, Maresfield.

### SHORT-WOOLLED (NOT BEING SOUTHDOWNS.)

Class XVIII.—Fat Wether Sheep, of any short-woolled breed (not Southdowns), 1 year old.

Prize withheld.

### PIGS.

Class XIX.—Pigs of any breed, above 13 and not exceeding 26 weeks old.

1st prize of 10*l.*, to Mr. John Coate, of Hammoon, near Blandford, Dorset, and a Silver Medal to the breeder, Mr. John Coate.—2d, 5*l.*, Mr. William Mills Barker, of Langley Broom, Slough, Bucks.

Class XX.—Pigs of any breed, above 26 and not exceeding 52 weeks old.

1st prize of 10*l.*, to Mr. John Coate, of Hammoon, near Blandford, Dorset, and a Silver Medal to the breeder, Mr. John Coate—2d, 5*l.*, to his Royal Highness Prince Albert.

Class XXI.—Pigs, of any breed, above 12 and under 18 months old.

1st prize of 10*l.*, to Mr. John Coate, of Hammoon, near Blandford, and a Silver Medal to the breeder, Mr. John Coate.—2d, 5*l.*, the Earl of Radnor, Coleshill, near Farringdon.

The Gold Medal for the best ox or steer in Classes 1, 2, 3, 4, 5, or 6, to Mr. Edward Longmore, of Adforton, near Ludlow, Salop.

The Gold Medal for the best cow or heifer in Classes, 7, 8, or 9, to Mr. Samuel Druce, of Eynsham, near Oxford.

The Gold Medal for the best pen of long-woolled sheep in Classes 10, 11, or 12, to Mr. R. L. Bradshaw, of Burley-on-the-Hill, Oakham.

The Gold Medal for the best pen of short-woolled sheep in Classes 15, 16, or 18, to his Grace the Duke of Richmond, of Goodwood.

21. The Gold Medal for the best pen of Pigs in Classes 19, 20, or 21, to Mr. John Coate, of Hammoon, near Blandford.

EXTRA STOCK.

A Silver Medal for the best beast in extra stock, to Mr. William Heath, of Ludham-hall, Norwich (this animal was too heavy for Class 4).

A Silver Medal for the best long-woolled sheep, to Mr. Lawrence Willmore, of Whetstone, near Leicester.

A Silver Medal for the best short-woolled sheep, to Mr. William Sainsbury, West Lavington, near Devizes.

A Silver Medal for the best cross-bred sheep, to Mr. John Hitchman, of Little Milton, Wheatly.

A Silver Medal for the best pig, to No. 263, viz., to Mr. William Culliford, of Hayling Island, Havant, Hants.

COMMENDATIONS.

Class 2.—The judges commend Mr. Richard Stratton's ox; Sir C. E. Isham's ox. They highly commend Mr. A. Beisley's ox.

Class 7.—The judges commend Mr. R. Healy's heifer; Mr. Joseph Phillips' heifer; Mr. Isaac Niblet's heifer. They highly commend Mr. W. M. Gibbs' heifer.

Class 15.—Highly commended: Mr. John Williams' pen of Southdown wethers; Messrs. W. and T. Arkcoll's pen of Southdown wethers. Commended: Lord Walsingham's pen of Southdown wethers; Mr. J. R. Overman's pen of Southdown wethers.

Class 16.—Commended: the Duke of Richmond's pen of Southdown wethers.

Class 19.—Commended: Mr. William Goodson's pen of pigs; Sir John Conroy's pen of pigs; Mr. S. Marjoribank's pen of pigs.

Class 20.—The judges highly commend Sir John Conroy's pen of pigs; Mr. Stewart Marjoribank's pen of pigs; Mr. Thomas King's pen of pigs.

Judges of cattle and long-woolled sheep—Messrs. James Quartley, Henry Chamberlain, Thomas Greetham.

Judges of cross-bred sheep (short-wools) and pigs—Messrs. Edward Pope, John Ford, jun., John Farncombe.

Stewards of cattle and long-wool sheep—Messrs. George Turner, John Buckley, William Loft.

Stewards of cross-bred sheep (short-wools) and pigs—Messrs. Jonas Webb, James Burgess, J. Saxby.

## BIRMINGHAM AND MIDLAND COUNTIES EXHIBITION OF FAT CATTLE, &c.

We shall make a further reference to the character of this exhibition next week. Meanwhile, we may say that it was this year a great improvement upon last. The cattle shown were generally superior, some of the classes excellent; the pigs were, as last year, very good, the sheep were a more numerous and better show than last year, and the exhibition of poultry was, there can be no doubt, unparalleled. Four thousand head of poultry never before entered the lists on one occasion, and never before did birds of such excellent quality compete with one another. Many thousand persons, no doubt, availed themselves upon the Tuesday, of what was called the "private" view!—for both on that and the following days, the great hall was crowded. We shall hereafter be able to make a detailed comparison of the two shows of this week—at Birmingham and Smithfield respectively. Meanwhile, we have only room to add the prize list of the former.

PRIZE LIST.—FAT CATTLE.

Judges.—Mr. John Booth, Killerby, near Catterick, Yorkshire; Mr. Edward Price, Court House, Pembridge, Leominster; and Mr. Valentine Barford, Foxcote, near Towcester.

Class I.—Herefords: Oxen or Steers.

1st prize, 10*l.*, and the Gold Medal, and Extra Prize of 15*l.*, for the best ox or steer of any breed, His Royal Highness Prince Albert. Medal to Mr. Stedman, as breeder.—2d, 5*l.* The Executors of the late Sir Francis Lawley, Bart., Middleton Hall.

Highly commended.—Mr. Henry Chamberlain, Desford, near Leicester.

Commended.—The Right Hon. Lord Hatherton, Teddesley Park.

Class II.—Herefords: Steers.

1st prize, 5*l.*, and Silver Medal, as Breeder. The Right Hon. Lord Hatherton, Teddesley Park.

Class III.—Herefords: Cows.

1st prize, 10*l.*, and the Gold Medal, and Extra Prize of 15*l.*, for the best cow or heifer of any breed. Mr. William Vaughan, Cholstrey, near Leominster. Silver Medal to the Rev. Henry Blissett, as Breeder.—2d, 5*l.* Mr. Edmund Herbert, Powick, near Worcester.

Highly commended.—Mr. William Rogers, Martley Court, near Worcester. The class generally commended.

Class IV.—Herefords: Heifers.

1st prize, 10*l.* Mr. John Walker, Holmer, near Hereford. Silver Medal to Mr. Thomas Morris, as breeder.—2d, 5*l.* Mr. Henry Hill, Stableford, near Bridgnorth.

Highly commended.—Mr. John Walker, Knightwick, near Worcester.

Class V.—Short-Horns: Oxen or Steers.

1st prize, 10*l.* Mr. Richard Spraggett, Southam, near Warwick. Silver Medal to Mr. James Richards, as breeder.—2d, 5*l.* W. de Capel Brooke, Esq., Geddington Grange, Northamptonshire.

Highly commended.—Mr. Samuel Wallis, Barton Seagrave, near Kettering; Mr. John Worsey, jun., Lower Clopton, near Stratford-upon-Avon.

Commended.—Mr. William Cox, Brailsford, near Derby.

Class VI.—Short-Horns: Steers.

1st prize, 5*l.*—Mr. Thomas Pulver, Broughton, Northamptonshire.

Commended.—Mr. John Henry Lees, Bacon's End, Coleshill.

Class VII.—Short-Horns: Cows.

1st, prize, 10*l.*,—Mr. Robert Beman, Moreton-in-the-Marsh.—2d, 5*l.* Mr. Samuel Wiley, Bransby, near York.

Highly commended.—Charles Towneley, Esq., Towneley Park, near Burnley, Lancashire.

Commended.—Captain Dilke, Maxstoke Castle, Coleshill.—Mr. James Dormer, Ashow, near Kenilworth. Age, 4 years and 4 months.—Mr. W. T. Cox, Spondon, near Derby.

Class VIII.—Short-Horns: Heifers.

1st prize, 10*l.*, and Silver Medal, as breeder. The Right Honourable Viscount Hill, Hawkstone, near Shrewsbury.—2d, 5*l.* Mr. William Woodward, Breedon's Norton, near Tewkesbury.

Highly commended.—Mr. William Fletcher, Radmanthwaite, near Mansfield.

Commended.—The Right Honourable the Earl Howe, Gopsall, Leicestershire; Mr. Joseph L. Hassall, Packington, near Ashby-de-la-Zouch.

Class IX.—Devon Oxen or Steers.

First prize, 10*l.*, and Silver Medal, as breeder, the Right Honourable the Earl of Leicester, Holkham Hall, Norfolk.—2d, 5*l.*, The Right Honourable the Earl of Leicester, Holkham Hall, Norfolk.

Highly commended.—The Right Honourable the Earl of Aylesford, Packington, near Coventry.

Class X.—Devon Steers.

Prize of 5*l.* The Right Hon. the Earl of Aylesford, Packington, near Coventry.

Class XI.—Devon Cows.

1st prize, 10*l.* The Right Hon. the Earl of Aylesford.—2d, 5*l.* Mr. Abraham Umbers, Weston Hall, Leamington Spa.

Class XII.—Devon Heifers.

1st prize, 10*l.* Mr. Thomas Newbold, Baginton, near Coventry.—2d, 5*l.* The Right Hon. the Earl of Leicester, Holkham Hall, Norfolk.

Class XIII.—Long-horn Cows or Heifers.

10*l.* and Silver Medal, as breeder. Mr. Richard Gibbs, Blackford Mill, Henley-in-Arden. Age, 11 years and 9 months.—2d, 5*l.* Capt. Inge, Thorpe Constantine, near Tamworth.

EXTRA CLASSES.

Class XIV.—Oxen or Steers.

1st prize, 10*l.* The Right Honourable Lord Leigh, Stoneleigh Abbey, Kenilworth.—2d, 5*l.* Mr. Richard Spraggett, Southam, near Warwick.

Commended.—Mr. William Thomas Cox, Spondon, near Derby.

Class XV.—Cows.

1st prize, 10*l.* Mr. William Timms, Grandborough, near Southam, Warwickshire. Silver Medal to Mr. Cartwright, as breeder.—2d, 5*l.* Mr. Matthew Ingle, Wigginton, near Tamworth.

Highly commended.—Mr. Henry Brown, Derby.

Commended.—The Right Honourable Lord Hatherton, Teddesley Park.

Class XVI.—Heifers.

1st prize, 10*l.*, and Silver Medal as breeder. Mr. A. Umbers, Weston Hall, Leamington Spa.—2d, 5*l.* The Right Hon. the Earl of Leicester, Holkham Hall, Norfolk.—3d, 5*l.* Mr. Thomas Yeld, the Broome, near Leominster.

Highly commended.—Mr. Abraham Hopkins, Yardley. Breeder unknown.

Class XVII.—Scotch or Welsh Oxen or Steers.

1st prize, 10*l.* Capt. Musgrove, Milverton Hill, near Leamington, Silver Medal to Mr. Campbell as breeder.—2d, 5*l.* Mr. Joseph D. Rob, Catton, near Thirsk. The whole class commended.

Class XVIII.—Scotch or Welch Heifers.

Prize, 5*l.* Mr. John Pickthall, Mint House, near Kendal, Westmoreland.

SHEEP.

Class XIX.—Leicesters.—(Fat Wethers, not exceeding 22 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder. The Most Noble the Marquis of Exeter, K.G., Burghley-house, near Stamford.—2d, 5*l.* Mr. George Walmsley, Rudston, near Bridlington.

Class XX.—Leicesters.—(Fat Wethers, not exceeding 34 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder, and Silver Medal, as exhibitor of the best pen of Long-woolled Sheep in Classes 19, 20, 21, and 22. Mr. John Henry Lees, Bacon's-end, Coleshill.—2d, 5*l.*, to the same.

Commended.—Mr. Robert Holloway, Yardley.

Class XXI.—Long-Woolled Sheep, not being Leicesters.—(Fat Wethers, not exceeding 22 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder. Mr. William Coldicott, Over Norton, Oxfordshire.—2d, 5*l.*, to the same.

Class XXII.—Long-Woolled Sheep, not being Leicesters.—(Fat Wethers, not exceeding 34 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder. Exhibitor and breeder: Mr. Robert Beman, Moreton-in-the-Marsh, Gloucestershire.—2d, 5*l.*, Mr. Richard Spraggett, Southam, near Warwick.

Class XXIII.—Pure-Bred Southdowns.—(Fat Wethers, not exceeding 22 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder, and Silver Medal, as exhibitor of the best pen of Short-woolled Sheep in Classes 23, 24, 25, and 26. Mr. John Williams, Buckland, Farringdon, Berks.—2d 5*l.*, to the same. The class generally commended.

Class XXIV.—Pure Bred Southdowns.—(Fat Wethers, not exceeding 34 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder. Darwin Galton, Esq., Edstone Hall, near Stratford upon-Avon.

Class XXV.—"Shropshire," and other short-woolled Sheep, not being Southdowns.—(Fat Wethers, not exceeding 22 months old.)

1st prize, 8*l.*, and Silver Medal, as breeder. Mr. John Benjamin Twitchell, Welby, near Northampton.—2d, 5*l.*, Mr. James Williams, Culmington, near Ludlow.

Commended.—Mr. James Williams; the Right Honourable the Earl of Aylesford; James Foster, Esq., Kinver Hill Farm, near Stourbridge.

Class XXVI.—"Shropshire," and other short-woolled Sheep, not being Southdowns.—(Fat Wethers, not exceeding 34 months old).

1st prize, 8*l.*, and Silver Medal as breeder. The Right Hon. the Earl of Aylesford.—2d, 5*l.*, Mr. Michael Goodall, Evelith Manor, Shiffnall, Salop.

Class XXVII.—Cross bred Sheep.—(Fat Wethers, not exceeding 22 months old.)

1st prize, 8*l.*, and Silver Medal as breeder, and Silver Medal as Exhibitor of the best pen of cross-bred Sheep in Classes 27 and 28. Mr. John Benjamin Twitchell, Welby, near Northampton.—2d, 5*l.*, Mr. William Gillett, Southleigh.

Highly commended.—Mr. Charles Randell, Chadbury, near Evesham.

Commended.—The Right Hon. the Earl of Leicester; Mr. Benjamin Twitchell, Welby, near Northampton.

Class XXVIII.—Cross-bred Sheep.—(Fat Wethers, not exceeding 34 months old.)

1st prize, 8*l.*, and Silver Medal as breeder. The Right Hon. the Earl Howe, Gopsall, Leicestershire.—2d, 5*l.*, Mr. Abraham Nurse, Ashby Parva, near Lutterworth.

An excellent collection of Roots, grown by Lord Hatherton, the Earl of Aylesford, Mr. Bretherton, Mr. Wiggan, Mr. E. Southall, and Mr. G. Peters, and exhibited by Mr. T. Burbidge, were inspected by the Judges of Cattle and Sheep, and highly commended by them. The collection included very fine specimens of Mangold Wurzel, Swedes, Cabbages, Kohl Rabi, green-topped Turnips, &c.

PIGS.

Judges.—Mr. William Wethrell, Kirk Bridge, near Darlington; Mr. B. Swaffield, Chatsworth, Derbyshire; Mr. William Heseltine, Warlaby House, near Brigg, Yorkshire. Mr. William Hollingsworth accompanied the Judges in the capacity of referee as to the ages of the Pigs.

Class XXIX.—Fat Pigs.—(Not exceeding 10 months old).

1st prize, 10*l.*, and Silver Medal, as Breeder. James Taylor, Esq., Moseley Hall, near Birmingham.—2d, 5*l.* Exhibitor: Mrs. Martha Emuss, Handsworth.

Commended—Mr. Edward Lowe, Comberford Mill, Tamworth. Mr. William Burbidge, Bromsgrove-street, Birmingham. Mr. Henry Oldham, Leamington.

Class XXX.—Fat Pigs.—(Not exceeding 15 months old.)

First prize, 10*l.*, and a Silver Medal, as breeder. Mr. Thomas Studholme Wilkins, Peddemoor Hall, near Sutton Coldfield.—2d, 5*l.* Mr. W. D. Hollister, Hampstead Mill, near Birmingham,

Class XXXI.—Fat Pigs.—(Exceeding 15 months old.)

First prize, 5*l.*, and Silver Medal, as breeder. Exhibitor and breeder, Mr. Arthur Perks, Kingsbury, Warwickshire.—2d, 3*l.* Mr. Thomas Beaumont Shilock, Hose, Leicestershire.

Highly commended.—Mr. Edward Lowe, Comberford Mill, near Tamworth; Mr. William Hopkins, Nelson Inn, Deritend, Birmingham.

Commended.—Mr. James Baldwin, King's Norton.

Class XXXII.—Breeding Pigs, of a Large Breed. (Not exceeding seven months old.)

1st prize, 10*l.*, and Silver Medal, as breeder. Mr. Arthur Perks, Kingsbury, Warwickshire.—2d, 5*l.* Mr. George Graham, Yardley, Worcestershire.

Silver Medal.—Mr. Moses Cartwright, Stanton Hill, near Burton-upon-Trent.

Class XXXIII.—Breeding Pigs of a Small Breed. (Not exceeding seven months old.)

1st prize, and Silver Medal, as breeder. Mr. William Ludlam, Bradford, Yorkshire.—2d, 5*l.* To the same.

Silver Medals.—Mr. Matthew Pemberton, Gibraltar Soap Works, Leeds.—Mr. William Eaton, Copley Wood, Halifax, Yorkshire.

## Miscellaneous.

*A Digging Machine.*—George Guthrie, of Appleby, Chamberlain to the Earl of Stair, for improvements in machinery for digging, tilling, or working land.—Patent dated March 24, 1851. [Reported in the *Mechanics' Magazine*]. The machinery which forms the subject of this patent is intended to facilitate the operations of digging and working land, by the application thereto of steam power. The machine is composed of a strong rectangular wooden framework mounted on four wheels, which are made wide in the tyre to prevent their sinking into the ground, and to facilitate the travelling of the machine. The motive power for working the grape movement or digging action, is derived from a pair of steam cylinders, supported by the framing, which serve also to supply the power for propelling the machine. The diggers are formed with three prongs each, and they may be of such a number, arranged side by side, as to extend across the whole width of the machine. In addition to the downward motion imparted to the grapes by a crank, for the purpose of causing them to enter the ground, they are also acted upon, after they have passed through the first half of the down stroke, by a second crank, by which they are raised to a horizontal position, carrying with them the portion of the earth immediately in front and within the scope of their action. As soon as the grapes have arrived in this horizontal position, the shaft on which they are mounted is caused, by means of a slide working on a spiral or screw of coarse pitch cut on that shaft, to make a semi-revolution on its axis, so as to throw off the earth which had been supported on the grapes, which are then returned to their original position, and carried back ready for operating on a fresh piece of ground, over which the machine will by this time have been moved. The patentee does not confine himself to the employment of cranks for effecting the movements of the grapes, as other means, capable of producing a similar motion approximating closely to that of the spade in hand-digging, may be adopted for the purpose; instead, also, of the above-mentioned arrangement of the grapes, they may be fixed to a revolving shaft, and the earth may be removed from them, by causing them in their revolution to come in contact with suitable stops. It may be necessary in some cases, in order to facilitate the action of the grapes, to make a series of cuts in the land previous to the grapes coming into operation; and this may be effected by attaching to the front of the machine a series of circular cutters fixed on a revolving shaft, and brought into action as the machine is propelled forward. *Claims.*—1. The general arrangement of the grapes, forks, or spades, for digging and working land. 2. The system or mode of turning the grapes or digging apparatus by a screw and traversing slide. 3. The application and use of guides for giving direction to the grapes. 4. The system or mode of digging or working land by causing the grape or digging apparatus to turn, or partially revolve, when loaded with earth. *From the Architect, Oct.* 11.

*Cultivation and Cutting of Straw for Plaiting.*—The best straw for plaiting is grown on the rich soils of Bedfordshire, and in the neighbourhood of St. Alban's. The straw grown on the richest soil in Ireland should be selected for plaiting. The straw must be cut a little before it is quite ripe, and the greatest care must be taken not to crush or break the straw while it is being cut and bound. When cut it is bound into small sheaves, and left standing up on the field for two or three days, or until it is thoroughly dry. The best straw for bonnets is the white wheaten straw. The head of the straw containing the grain is then cut off or slashed. In England the grain is boiled in milk and given to the reapers and girls, or else stored for feeding poultry. The straw is then housed for cutting, for the straw is more valuable than the grain. This process requires care and experience, in order not to break the straw, and also to cut it the lengths without waste. Four or five hands are generally employed in cutting, and are placed before a bench with drawers in it, which receive the straw as it is cut. On each straw there are three knots or joints, the top knot being in all cases the finest and consequently the most valuable. The first hand at the bench cuts off the top close above the first knot, and drops it into the drawer, while she is passing the remainder of the straw to the second hand, who cuts off the next pipe at the second joint, and so on until the whole straw is cut into fine lengths, and each length deposited in a separate drawer. By adopting this course, a great deal of time, trouble, and waste will be saved. When cut the straw is called "pipe straw," and is tied up in bundles of 50, 100, and 200, and bound with different sized gads of straw to denote the various sizes and quality. The top or first cut is used for "rice straw" and fine "Dunstable plait," and is worth from 3*d.* to 4*d.* a bundle, of 200 straws. The second and third cuts are used for "whole straw," "cord edge," and "split straw," and are worth from 3*d.* to 5*d.* per bundle. The lower or bottom cuts are the coarsest and are generally dyed various colours and used in "mixed plait." These when dyed realize from 2*d.* to 4*d.* per bundle of 200 straws. In this process of preparing the straw, the small farmers

of Ireland might find ample and remunerative employment of the lightest description for their wives and daughters. Markets would be found in London, Luton, Dunstable, St. Alban's, Bedford, Walford, Hitchin, Market-street, Woburn, Berkhampstead, Hemel Hempstead, and in nearly all the principal towns in the Southern and Midland counties of England, for the largest quantity of pipe straw that this country can produce. And, totally irrespective of the profit arising from the manufacture of straw into plait, many of the farmers of Ireland would, if properly directed, be able to pay much of their rent and taxes from this source alone. *Belfast Paper.*

METEOROLOGICAL REPORT.—December.

* This storm came from the westward and passed over England to the eastward.

† The change of the wind and the pause in the rise of the barometer are consistent with the supposition that this was a storm's-eye passing over England from west to east.

‡ I never saw any instance of a storm's-eye more clearly developed than on the morning of the 18th, clear above, and horizon a dense bank all round; at 8 a.m. the barometer began to rise, and at noon the wind drew to north of west. This storm came from the south-west and crossed England to the east.

Dorchester, Dec. 9. *F. P. B. M.*

*(To be continued.)*

## Notices to Correspondents.

Cow: *Pocklington.* The occurrence is certainly unusual, and may be considered as one of those anomalies sometimes met with. It is quite as likely that the first might have been successful as the second; but, surely it can now be readily ascertained whether the animal is in calf or not. *W. C. S.*

Food of Cows: *Pocklington.* Your feeding appears so successful, that we should advise you to let well alone; although there can be no objection to the food suggested. *W. C. S.*

# Markets.

COVENT GARDEN, Dec. 13.

The supply of English Pine-apples is well kept up for the season, and Grapes continue to be plentiful. Pears are still furnished from Guernsey. The best English kinds fetch from 2s. to 4s. a dozen, and 8s. to 12s. per half sieve. They consist of Glout Morceau, Winter Nelis, and Chaumontelle. Oranges are plentiful and good. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are still dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 8s to 6s | Almonds, per peck, 6s |
| Grapes, hothouse, p. lb., 2s to 5s | — sweet, per lb., 2s to 3s |

| Beet, per doz., 6d to 1s | Watercress, per doz. bunches, 4d to 6d |
| Parsnips, per doz., 6d to 1s | |
| Leeks, per bunch, 1d to 2d | |

POTATOES.—Southwark, Monday, Dec. 8.

The committee report that the supply coastwise has been very limited for the season of the year; notwithstanding the trade has been extremely dull, and prices a shade lower for some sorts than last week, owing to a larger supply by rail and from the neighbourhood of London. The following were the quotations:—York Regents, 70s. to 80s.; Scotch do., 60s. to 75s.; Kent and Essex do., 75s. to 80s.; ditto Shaws, 65s. to 70s.; Lincolnshire and Wisbeach, 60s. to 75s.; French, 55s. to 70s.

SMITHFIELD, Monday, Dec. 8.

There was a few more Beasts at market, and trade certainly slower, although the choicest kinds, being scarce, were not much lower. A clearance could not be effected of inferior qualities. The number of Sheep a full average; trade very slow, and it was with difficulty that late quotations were realised. Calves not much in demand; prices on the average lower. From Holland and Germany there were 658 Beasts, 3090 Sheep, and 197 Calves; from France, 90 Sheep and 6 Calves; from Scotland 230 Beasts; from Norfolk and Suffolk, 120; 2850 from the northern, and 200 from the western counties.

| Per st. of 8 lbs.—s d | s d | Per st. of 8 lbs.—s d | s d |
|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 8 to 4 0 | Best Long-wools . | 3 8 to 3 10 |
| Best Short-horns | 3 6 — 3 8 | Ditto Shorn ... | ... |

| Ditto Shorn ... ... | | Lambs ... .. | 0 0 — 0 0 |
| | | Calves ... ... | 2 8 — 4 0 |
| | | Pigs ... ... | 3 0 — 4 6 |

Beasts, 4289; Sheep and Lambs 23,900; Calves, 243; Pigs, 410.

Friday, Dec 12.

We have a large supply of Beasts, and several of very good quality; trade is exceedingly dull, and they cannot all be sold, although there is a disposition to take lower rates. We have but few Sheep and buyers are equally scarce; our quotations are with difficulty realised. Calves are plentiful; choice ones are making about as much as of late, and inferior are unsaleable. From Germany and Holland we have 190 Beasts, 350 Sheep, and 194 Calves; from Spain, 52 Beasts; from Scotland, 200; from Norfolk and Suffolk, 100; from the northern and midland counties, 700; from the western, 230; and 110 Milch Cows from the home counties.

| Best Scots, Herefords, &c. ... | 3 8 to 3 10 | Best Long-wools . | 3 6 — 3 10 |

| | | Pigs ... ... | 3 0 — 4 4 |

Beasts, 1713; Sheep and Lambs, 2920; Calves, 245; Pigs, 280.

MARK LANE.

Monday, Dec. 8.—The continuance of mild weather appears to have a depressing influence on the corn trade. The supply of English Wheat by land carriage samples this morning was small, but the condition being generally bad, such qualities could only be realised 1s. to 2s. per qr. below the prices of this day se'nnight. For foreign there was scarcely any demand, but holders were not disposed to make any reduction from our quotations.—Barley, Beans, and Hog Peas are a slow trade at 1s. per qr. reduction; the value of White Peas remains unaltered.—The Oat trade is very dull, and rices must be written 6d. per qr. cheaper.

Friday, Dec. 12.—The arrivals of all grain continue small, particularly of Wheat from abroad. To-day's market was attended by a few country millers visiting the cattle show; holders evince great firmness, but the amount of sales continues unusually limited; prices of Wheat must be considered nominally unaltered.—The value of Barley, Beans, Peas, and Oats remains as on Monday, there being scarcely any business doing.—Flour continues in moderate request.—A cargo of Sandomirka Wheat afloat realised 38s. per qr. f. o. b., including freight and insurance.

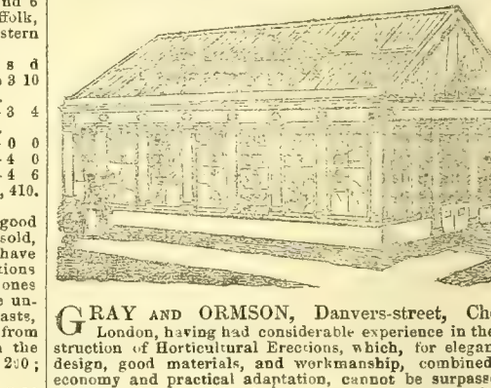
HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. Weeks and Co., King's Road, Chelsea, Horticultural Architects, Engineers, and Builders. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. Weeks and Co., King's Road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their Victoria regia Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY and ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to James Lyne Hancock, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

WARMING AND VENTILATING.

D. and E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

CROSBY HALL VAULTS, No. 35, BISHOPSGATE-STREET-WITHIN.—CURRALL and SON beg to invite public notice to their STOCK of OLD BOTTLED WINES. They being desirous to secure that patronage which wines of the first quality, at fair and remunerating profits, will maintain, respectfully submit the annexed list of cash Prices:—

| | Per doz | | Per doz. |
|---|---|---|---|
| Port, old bottled | 36s. and 42s. | White Port in pints, bottles and package inclusive | 30s. |
| Ditto, six years in bottle | 48s. | Sherry (excellent dinner wine) | 28s. |
| Sherries, pale and brown | 36s. | Port, superior draught | 28s. to 33s. |
| Ditto ditto | 42s. to 48s. | | |
| Marsala | 24s. | | |
| Champagne (1 doz. cases) | 54s. | | |

PALE BRANDY, 60s. per doz.; bottles, 2s. per doz.; hampers, 1s. per doz.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s, Sole Establishment, 130B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

PRIZE TURKEYS AT BIRMINGHAM.—Three Couple of young wild American Turkeys, hatched on the 24th of May last, from these fine birds (which were awarded an extra Medal, as well as the first Prize, at Birmingham), may be had on application to E. W. WILMOT, Hulme Wa field, Congleton, Cheshire.—Price 4l. a couple

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. The fact speaks too strongly for itself to require comment."—*Bell's Week'y Messenger.*

ROWLANDS' MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the human hair, is too well known and appreciated to need comment. For Children it is especially recommended, as forming the basis of a beautiful head of hair, and rendering the use of the fine comb unnecessary.—Price 3s 6d., 7s.; family bottles, (equal to 4 small), 10s. 6d., and double that size, 21s. per bottle.

N B. Each bottle of the genuine article has the words—ROWLANDS' MACASSAR OIL, engraved in two lines on the wrapper; and on the back of the wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Druggists.

CHRISTMAS HOLIDAYS.—THE GARDENS of the ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY, except Sunday, from Christmas Eve to January 6, inclusive. The HIPPOPOTAMUS and the URAN UTAN are exhibited from 11 to 4 o'clock. The collection includes 1750 living animals, having recently been increased by the addition of 60 species from the collection at Knowsley.

FORD'S EUREKA SHIRTS.—"The Great Exhibition has produced a multitude of novelties which have alternately delighted and astonished the world. How many of these will survive for any practical purpose is a question. It is another question if any one of them will bring half the practical comfort of a good shirt. Mr. FORD, of the Strand, has an invention of this kind, which is a material improvement upon the old plans, and for positive enjoyment is worth nineteen-twentieths of the marvels of the huge building in Hyde-park."—*Atlas.*

FORD'S EUREKA SHIRTS are not sold by any Hosiers or Drapers, and can, therefore, be obtained only at 185, Strand. They are made in two qualities, the first of which is 40s the half dozen, and the second quality 30s the half dozen. List of Prices, containing an illustration, with directions for self-measurement, sent per post free.—RICHARD FORD, 185, Strand.

DINING-ROOM FURNITURE, Sideboards, Chairs, extending Dining Tables, &c., in oak and mahogany, warranted of first-rate materials and workmanship.—The public are invited to select from a choice of 40 sideboards, in various styles, 100 dozen of chairs in morocco, and 30 sets of extending dining tables. Also, several sets Utrecht velvet and silk damask window curtains, ready made, Turkey and Brussels carpets, &c., at prices one-third less than elsewhere; also a large quantity of second-hand furniture constantly on sale.—DRUCE and Co., 68, 69, and 58, Baker-street, Portman-square, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

ERIGI DOMO.—A perfect protector against frost, a non-conductor of heat or cold, and cheaper in price than bass matting. A canvas made of prepared hair and wool, adapted to many horticultural and agricultural purposes, for covering up, where a fixed tempera ure is required. It is 2¼ yards wide, and of any required length at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, Oxford-street, London.

DOMESTIC SANITARY MEASURES.—Places in Gardens rendered as comfortable as the best-constructed water-closets, by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Sold only at FIFE and Co.'s Scientific Repository, 26, Tavistock-street, Covent Garden, London, sole depôt for the Patent Hermetically-Sealed Inodorous Chamber Commodes, 1l. 1s., 2l. 6s., and 3l.; also improved Portable Water Closets, with pump, cistern, and self-acting valve. Orders by post attended to.

THE BRITISH HEATING AND VENTILATING COMPANY, Offices, 14, Lincoln's-inn-fields, London, Under Hazerd's Patent.—The Company has now been successfully employed in all parts of the Kingdom, in PUBLIC and PRIVATE BUILDINGS, CHURCHES, CONSERVATORIES, FACTORIES, DRYING-HOUSES, &c., where a genial and healthy atmosphere is required.—Particulars and testimonials can be obtained by applying at the Company's Office.

Parties about to build, or those who suffer inconvenience from present arrangements, will save expense by consulting the Patentee, Mr. Hazerd, who has made ventilation and warming a peculiar study for years.

WATER BASINS.

J. SEELEY begs to inform Gardeners engaged in large grounds that he is prepared to supply ORNAMENTAL COPING FOR WATER BASINS, of various patterns, and to suit any circumference.

In a handsome volume, strongly half-bound in Morocco, with gilt leaves, price 2l. 16s.,

BLACK'S GENERAL ATLAS OF THE WORLD. New edition, revised and corrected throughout, with numerous additional Maps, and an Index of 60,000 names.

The work is in every respect accommodated to the present advanced state of geographical research; and, whether on the ground of accuracy, beauty of execution, or cheapness, the publishers invite a comparison with any work of its class.

"We are now in possession of an 'Atlas' which comprehends every discovery of which the present century can boast. It ought at once to supersede all other works of the kind, and no one, either in pursuit of truth on his own account, or attempting to direct the inquiries of others, will hereafter have any excuse for going astray."—*United Service Gazette, Feb.* 22, 1851.

A. and C. Black, Edinburgh; and sold by all Booksellers.

In a handsome volume, post 8vo, price 6s., with an engraving of the "Sic Sedebat" Statue of Sir Walter Scott,

THE POETRY AND POETS OF BRITAIN, FROM CHAUCER TO TENNYSON.

With Biographical Sketches, and a rapid view of the characteristic attributes of each. By Daniel Scrimgeour. Preceded by an Introductory Essay on the Origin and Progress of English Poetical Literature.

"His acquaintance with literature is exact and extensive, and he has shown a fine taste and a sound judgment in criticism."—*Prof. John Wilson.*

"The best and compactest view of the subject we have seen."—*Spectator.*

A. and C. Black, Edinburgh; and sold by all Booksellers.

A New Edition of

THE POETICAL WORKS of Sir WALTER SCOTT, including "The Lord of the Isles," and a variety of other Copyright Poetry, contained in no other pocket edition. READINGS FOR THE YOUNG, selected from the Works of Sir Walter Scott, containing

1. Tales of Chivalry and the Olden Time.
2. Historical and Romantic Narratives.
3. Scottish Scenes and Characters.

"We should think that a selection of these (Sir Walter Scott's Writings), with some of the prints representing realities, from the Abbotsford Edition of his Novels, would be the most popular child's book in the world; and the drawing-room set would last a good while longer."—*Quarterly Review*, No. 147.

A. and C. Black, Edinburgh; Houlston and Stoneman, London.

In crown 8vo, with 2 engravings after Turner, cloth, gilt edges, 5s., or, handsomely bound in extra cloth, gilt edges, 6s.,

BEAUTIES OF SIR WALTER SCOTT,—a Selection from his Writings and Life, comprising Historical, Descriptive, and Moral Pieces, and Lyrical and Miscellaneous Poetry.

A. and C. Black Edinburgh; Houlston and Stoneman, London.

BRADBURY AND EVANS 11, BOUVERIE STREET.

PUNCH'S ALMANACK FOR 1852, Price 3d., or stamped 4d., will be published in the course of the month.

Punch Office, 85, Fleet-street; and sold by all Booksellers and Newsmen.

In small 8vo, with a Map, and upwards of 200 engravings on wood and steel, price 6s., handsomely bound in cloth; or 6s. 6d., with gilt leaves,

THE HISTORY OF PALESTINE, by Dr. Kitto, from the Patriarchal Age to the present time, with Introductory Chapters on the Geography and Natural History of the Country, and on the Customs and Institutions of the Hebrews.

Adam and Charles Black, Edinburgh; Longman and Co., London.

A BIBLE-DICTIONARY FOR THE PEOPLE.

By John Kitto, D.D., F.S.A., &c., Editor of the "Pictorial Bible."

In a beautifully printed volume, 8vo, price 10s. 6d., illustrated by 336 engravings on wood,

A CYCLOPÆDIA OF BIBLICAL LITERATURE FOR THE PEOPLE. By John Kitto, D.D., F.S.A.. &c., &c.. &c.

This work is studiously accommodated to the wants of the great body of the religious public. To parents, to Sunday school teachers, to missionaries, and to all engaged, either statedly or occasionally, in the important business of Biblical education, the volume is confidently recommended as at once the most valuable and the cheapest compendium of Bible knowledge for the people which has ever appeared in this country.

Adam and Charles Black, Edinburgh; and sold by all Booksellers.

In Two Volumes, price 3l., illustrated by 554 engravings on wood, besides Maps and Views on steel.

A CYCLOPÆDIA OF BIBLICAL LITERATURE. By John Kitto, D.D., F.S.A., &c., &c., Assisted by Forty able Scholars and Divines, British, Continental, and American, whose initials are affixed to their respective Contributions.

"Among the contributors are to be recognised the names of many of the most distinguished Biblical scholars, both British and Foreign. It is not, therefore, too much to say, that this Cyclopædia surpasses every Biblical Dictionary which has preceded it, and that it leaves nothing to be desired in such a work which can throw light on the criticism, interpretation history, geography, archæology, and physical science of the Bible."—*Horne's Introduction to the Critical Study of the Scriptures.*

Adam and Charles Black, Edinburgh; and sold by all Booksellers.

In One thick Volume 8vo, double columns, price 12s.,

The Tenth Edition of

A DICTIONARY OF MEDICINE; Designed for Popular Use. Containing an account of DISEASES and their TREATMENT, including those most frequent in Warm Climates; with DIRECTIONS for administering MEDICINES; the REGULATION of DIET and REGIMEN; and the Management of the DISEASES of WOMEN and CHILDREN. By Alexander Macaulay, M.D., Fellow of the Royal College of Surgeons of Edinburgh, and Physician Accoucheur to the New Town Dispensary.

"Just such a work as every head of a family ought to have on his book-shelf."—*Brighton Herald.*

"If sterling merit be the passport to success, this work will obtain the most extensive celebrity."—*Bath Herald.*

"Calculated to accomplish all that could be wished in a Popular System of Medicine."—*Edinburgh Medical and Surgical Journal.*

"We have seen nothing of the kind better adapted for consultation."—*Literary Gazette.*

"Decidedly the most useful book of the kind that has yet been offered to the public."—*Caledonian Mercury.*

Adam and Charles Black, Edinburgh; and sold by all Booksellers.

PRICE ONE SHILLING.

London: Chapman and Hall, 193, Piccadilly and sold by all Booksellers.

PUNCH'S POCKET-BOOK FOR 1852 with a Coloured Plate (PROGRESS OF BLOOMERISM) by JOHN LEECH, and numerous Wood Engravings by JOHN LEECH and JOHN TENNIEL, is now ready, price 2s. 6d.

Punch Office, 85, Fleet-street, and sold by all Booksellers.

*SALES BY AUCTION.*

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, December 17, at 12 o'clock, a first class collection of DUTCH BULBS, comprising Double and Single Hyacinths, Narcissus, Crocus, Jonquils, Gladiolus, Tulips, &c.; also Standard and Dwarf Roses, consisting of Hybrid Perpetuals, Bourbons, Chinas, Noisettes, &c.; together with a fine assortment of American Plants.—May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

ABSOLUTE SALE.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mons. A. Van Geert, of Ghent, to submit to public competition by Auction, at the Mart, Bartholomew-lane, on THURSDAY, Dec. 18th, at 12 o'clock, 300 Double CAMELLIAS, 18 inches to 3 feet, beautifully set with bloom buds; 300 Standard Perpetual Roses, 200 Ghent Azaleas, 100 Azalea indica, 500 Gladiolus Gandavensis, 100 fine roots of Lilium lancifolium rubrum, 200 roots of Chilian Alstrœmeria, and 100 of the Hardy Asclepias tuberosa.—May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

VANDA CÆRULEA.—THE FINEST CONSIGNMENT YET RECEIVED.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent-garden, on Tuesday, 16th December, at 12 for 1 o'clock, 70 Plants of the charming VANDA CÆRULEA, including some of the finest and most healthy specimens that have yet arrived in this country.—May be viewed the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King-street, Covent-garden, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market, and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

FARM TO BE LET IN WESTMORELAND.

TO BE LET, and entered upon, the usual times the coming season, a FARM, well situated, 4 to 5 miles from a good market town, with railway communication, consisting of 275 statute acres of Arable, Meadow, and Pasture Land, and 111 statute acres of valuable Allotment for Sheep. The buildings are extensive, and ample for any mode of farming, and well supplied with water inside and out; the Dwelling-house is well built and commodious;—the Land is very productive, and generally in good order; and nearly all the deep draining requisite has been effected under the care of an experienced drainer. The owner wants a skilful agriculturist, of good character, and sufficient means as a tenant; and such a person offering will find this a really good opportunity, and meet with reasonable terms in every respect.—Address, by letter, to A., Box No. 30, Post-office, Liverpool.

Printed by William Bradbury of No. 13, Upper Woburn-place, in the parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County, where all advertisements and communications are to be addressed to the Editor.—Saturday, December 13, 1851.

ERRATUM.—In the Advertisement of A FARM TO LET IN WESTMORELAND, inserted last week at p. 800, for "A, Box No. 80, Liverpool," read "A, Box M. 80, Liverpool."

THE LONDON FLORICULTURAL SOCIETY.—The Annual Meeting of this Society will take place at Exeter Hall, Strand, on TUESDAY, the 13th of JANUARY next, at 6 o'clock precisely, for the purpose of electing Chairman, Treasurer, Secretary and Committee for the ensuing year, and for general business.

The days appointed for Exhibition and Meetings for the ensuing year, are January 13, February 10, March 9, April 13 and 27, May 11 and 25, June 8 and 22, July 13 and 27, August 10 and 24, September 14 and 28, October 12, November 9 and 23, and December 14.

45, Lime-street. J. W. JEWITT, Hon. Sec.

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their Descriptive Catalogue, with the Treatise on the "Cultivation of American Plants," can still be had, by enclosing six stamps for postage.

Gentlemen requiring the services of a Landscape Gardener, can procure such by applying to the Advertisers.

Bagshot, Surrey, Dec. 20.

GREAT SALE OF NURSERY PLANTS.

PETER BOOTH, NURSERYMAN, Falkirk, is selling off, at moderate prices, at his extensive Nursery Grounds, a very large stock of transplanted LARCH, SCOTCH, and SPRUCE FIR PLANTS, of strong and smaller sizes, including seedlings, with a great variety of many of the other kinds of Forest and Ornamental Trees, generally grown in large nurseries; also Fruit Trees, Gooseberry, Currant, and Raspberry bushes, &c.

A large stock and great variety of very fine, strong, healthy, Ornamental Shrubs.

A very fine stock of Standard, Half Standard, and Dwarf Roses, many of them of the new kinds, and also of the approved and most beautiful sorts.

N.B.—As the advertiser wishes to retire from business, a Lease of all his Nursery Grounds, which belong to himself, and every encouragement would be given to a purchaser of the above stock, and the good-will of the business, which has been carried on by his relations for more than 70 years past, and with great success.

Should a purchaser not be found, a partner with capital, and a good knowledge of the business, would be agreed with.

TO NURSERYMEN, PLANTERS, &c.

J. OGDEN begs to offer from 3000 to 4000 fine well-grown TREES, from 10 to 15 feet high, comprising grafted English Elms, Birch, Ash, Beech, Limes, Horse and Spanish Chestnuts, English Oak, Italian Poplar, Hornbeam, Mountain Ash, Purple Beech, &c. Several hundred Spruce Firs, 6 to 9 feet.

Also a fine collection of SPECIMEN WEEPING PLANTS, and a general assortment of Nursery Stock. Nurseries adjoining the railway station.—Coventry, Dec. 20.

TO NURSERYMEN.—Tenders or Offers are required for the supply of several Hundreds of the undermentioned TREES and SHRUBS, viz.:—Black Italian and Balsam Poplar, Spanish and Horse Chesnut, Sycamore, Silver Beech, Scarlet Maple, Mountain Ash, Larch, Elm, Spanish Oak, about 10 feet high.

Thorns (various), Lilacs, Laburnum, Guelder Rose, about 5 feet high.

Spiræa Frutex, Persian Lilac, Scarlet Dog-wood, Laurel, Arbor-Vitæ, Lauristinus, Aucuba, Evergreen Oak, Phillyreas, 2 feet 6 inches.

To be delivered, if in London, at the Bricklayers' Arms Station; and, if in the country, at the nearest Station on the London, Brighton, and South Coast Railway. Letters addressed to Mr. LEWIS SLIGHT, Brighton, will meet with immediate attention.

LANDSCAPE GARDENING.
EXCLUSIVELY PROFESSIONAL.

MR. THOROLD, of Norwich, offers his services to the Nobility and Gentry as a LANDSCAPE AND ORNAMENTAL GARDENER, in the highest style of the Art, including Decorations around a House, forming Water, Approaches, Picturesque Scenery, &c.

AMERICAN APPLE TREES.

J. GREGORY has for sale about 1000 Choice APPLE TREES, imported from America in the autumn of 1850, including the following:—Northern Spy, Spitzenburgh, Jersey Blue, Rhode Island Greening, &c., all grafted on Seedling Stocks of three years' growth, and are in a thriving condition, having advanced from 2 to 4 feet since planted in this country. Price 12*s.* per doz.

Post-office orders made payable to JEREMIAH GREGORY, Yardly Gobion, near Stoney Stratford, Bucks.

MANNINGTON'S PEARMAIN.

JAMES CAMERON, NURSERYMAN and FLORIST, returns his best thanks to his friends and the public in general for their liberal support, and begs to say he has now for sale a sufficient quantity of the above valuable APPLE, and is thus enabled to offer them at so reduced a price as to ensure their extensive cultivation. It is a middle sized variety, and different from any in cultivation, and remarkable for its rich sugary and aromatic flavour. It is in its height of flavour from January till the end of May, and a very good bearer. Strong maiden plants 2*s.* 6*d.* each. Remittances from unknown correspondents previous to the trees being sent, by Post-office orders, made payable to JAMES CAMERON, Nurseryman, Uckfield, Sussex.

J. C. has also an extensive stock of Spruce, Larch, Fir, and Forest Trees of all descriptions; Fruit Trees, Evergreens, and Roses of first-rate quality.

HOME GROWN SEEDS.

SUTTON'S COLLECTIONS OF GARDEN SEEDS.—*The superior quality of our Seeds is plainly testified by the numerous orders we are daily receiving from parties who have had them in previous seasons, very many of which contain remarks, such as the following:—*

Extracts from letters now before us, which may be seen at our office. The names of the writers may be known by post, if required.

*From a Clergyman, near Darlington.*

"The best kitchen garden seeds I ever had were furnished by you."

*From Doneraile, Ireland.*

"Lord D. would be glad to have," &c., &c. "The seeds sent last year were excellent."

*From Cirencester.*

"I never received such a numerous collection, so good in quality, from any house."

*From Ripon, Yorkshire.*

"At one of the Horticultural Shows at Harrowgate, my gardener took 20 prizes, most of them from the produce of your seed; we also gained several prizes at other meetings, as many as 18 at one of them."

*From an eminent Horticulturist, at Sunninghill.*

"My gardener speaks very highly of your seeds."

*From Girvan, N.B.*

"I have much satisfaction in recommending your seeds to various friends, as I find they are much pleased with them."

*From a Clergyman, at Newport, Monmouthshire.*

"I have invariably found your seeds of all kinds very good."

*From North Walsham.*

"Your seeds are decidedly superior to those I can procure in this neighbourhood; I shall at all times be glad to recommend you to my friends."

*From a Clergyman, at Meonstoke, Hants.*

"I always recommend my friends to supply themselves from your establishment."

*From another Clergyman, at Kinsale, Ireland.*

"Being so much pleased with the garden and flower seeds sent last season, induces me to send to you for my agricultural seeds also."

*The very best kinds of seeds in cultivation may be obtained at 30 per cent. less than the prices charged in most parts of the kingdom, by ordering one of the undermentioned "complete collections."*

SUTTON'S COLLECTION OF GARDEN SEEDS.

| | £ | *s.* | *d.* |
|---|---|---|---|
| No. 1.—A COMPLETE COLLECTION OF GARDEN SEEDS, FOR ONE YEAR'S SUPPLY OF A LARGE GARDEN; including 20 quarts of Peas, in the best eight sorts for succession; the best eight sorts of Broccoli, together with the choicest Melons, Cucumbers, Lettuces, Cauliflowers, and every other sort of Vegetable required, and in full quantities ... ... ... ... ... ... | 2 | 10 | 0 |

| No. 3.—A COMPLETE COLLECTION, EQUALLY CHOICE SORTS ... ... ... ... | 1 | 1 | 0 |
| No. 4.—A SMALL AND VERY CHOICE ASSORTMENT ... ... ... ... ... ... ... | 0 | 12 | 6 |

*If some kinds of Seeds are already possessed purchasers are requested to name them, that increased quantities of others may be sent in lieu of them.*

EARLY ORDERS ARE PARTICULARLY REQUESTED, *and will have the preference of scarce sorts.*

Remittances *are not required* with the orders from clergymen, noblemen, and resident gentlemen, or their gardeners.

Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

SUPERB NEW EARLY PROLIFIC MELON, "VICTORY OF BATH."

GARAWAY, MAYES, AND Co. having purchased the entire stock of the above MELON, beg to offer it to the public as a variety unequalled in flavour and productiveness. It obtained a Certificate of Merit at the April Show, in Bath; First Prize at Chiswick, in May; also two First Prizes at Bath, in May and June last. It was grown in pots with Bromham Hall, under precisely the same treatment, and Ripe Fruit cut full six weeks earlier. The whole of the fruit exhibited were grown in pots.

| MELONS. | Per Packet—*s.* | *d.* |
|---|---|---|
| Victory of Bath ... | ... 2 | 6 |
| Bromham Hall ... | ... 1 | 0 |
| Camerton Court ... | ... 1 | 0 |
| With all other approved sorts. | | |

| Kelway's Victory | ... 1 | 0 |
| With all other approved sorts. | | |

G., M., and Co. also beg to inform their friends that they are now prepared to send out their well selected stock of Agricultural, Kitchen, and Flower Garden Seeds, the latter grown under their own inspection. Catalogues to be had on application.

G., M., and Co. can with confidence recommend their stock, as every article is thoroughly proved before sent out.

Durdham Down Nurseries, Bristol, Dec. 20.

SEEDS DIRECT FROM THE GROWERS—CARRIAGE FREE TO ANY STATION ON THE GREAT NORTHERN, GREAT WESTERN, SOUTH-WESTERN, OR SOUTH-EASTERN RAILWAYS.

JOHN SUTTON AND SONS, SEED GROWERS, Reading, Berks, can supply their choice sorts of KITCHEN GARDEN SEEDS, NEW AND TRUE, at THIRTY PER CENT. LESS than the prices usually charged in most parts of the Kingdom. Carriage free, as see their Advertisement in the last page of last week's *Gardeners' Chronicle.*—Further particulars may be had by post, on application (enclosing one postage stamp), addressed, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

KNIGHT AND PERRY, in very gratefully acknowledging the liberal patronage they have been honoured with during the current season, beg respectfully to inform those among their patrons who may have transmitted their instructions and have not yet received the seeds ordered, that several seed lists have come to hand without a signature or any other mark by which it can be ascertained from whence they come. This fact, it is hoped, will fully explain to those, who unfortunately may be disappointed, the reason why their orders remain unexecuted.

K. and P., under these circumstances, will feel extremely obliged if their patrons will advise them by post, so that they may be in a position to prevent further delay or disappointment.—Exotic Nursery, Chelsea, Dec. 20.

GLASS FOR CONSERVATORIES,
GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO. beg to hand in their prices of SHEET GLASS for cash:

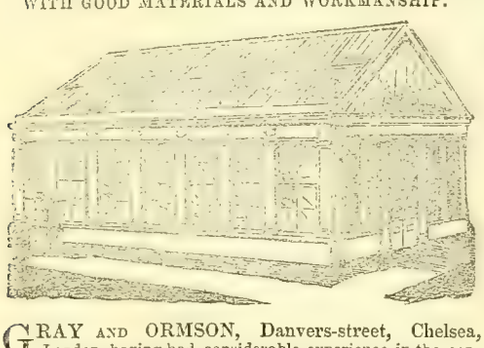
HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's Road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's Road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's Road, Chelsea, London.



GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GREEN AND HOTHOUSE BUILDER. — Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1⅝ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra. J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

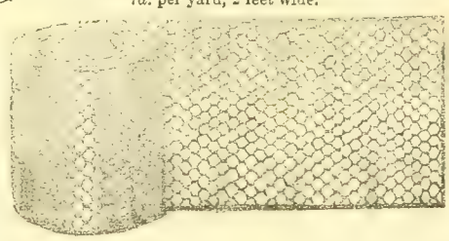
F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.



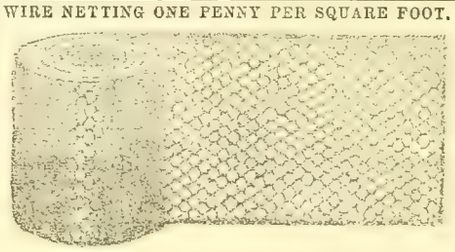
FOOD FOR INFANTS, LADIES NURSING, AND INVALIDS.—BULLOCK'S SEMOLA is agreeable to the taste, easy of digestion, and the most nutritious substance ever introduced. This food is sanctioned by the leading members of the profession.—Sold in packets at 1*s.*, 2*s.* 6*d.*, and 7*s.* 6*d.* each, by LLOYD BULLOCK, 22, Conduit-street, Hanover-square, and may be ordered of chemists and druggists.

CHRISTMAS HOLIDAYS.—THE GARDENS of the ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY, except Sunday, from Christmas Eve to January 6, inclusive. The HIPPOPOTAMUS and the URAN UTAN are exhibited from 11 to 4 o'clock. The collection includes 1750 living animals, having recently been increased by the addition of 60 species from the collection at Knowsley.

BERDOE'S SUPERIOR OVERCOATS.—QUALITY THE TRUE TEST OF CHEAPNESS.— A very large Stock of first class Garments, adapted to every taste and purpose, and reduced to the lowest possible scale of charge; also Overcoats for Boys of all ages (at from 25*s.* to 35*s.*), kept for selection, or made to order, at same charge, at a day's notice. Waterproof Shooting Jackets, Riding and Driving Capes, Leggings, &c. All guaranteed to resist any amount of rain, and possess every quality essential to a really respectable and permanently satisfactory article.

W. BERDOE, 96, New Bond-street, and 69, Cornhill (only).

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



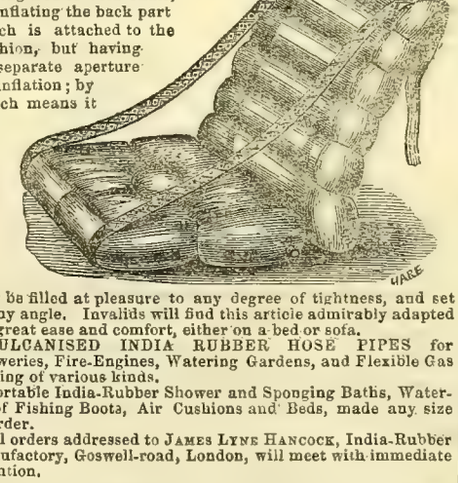
| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, .. | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1⅝-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1⅝-inch ,, strong ,, .. | 10 ,, | 8 ,, |
| 1⅝-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.



| | | | |
|---|---|---|---|
| 12 inches wide 3*d.* per yard. | | 30 inches wide 7½*d.* per yard. | |
| 18 ,, ,, 4½*d.* ,, | | 36 ,, ,, 9*d.* ,, | |
| 14 ,, ,, 6*d.* ,, | | 48 ,, ,, 1*s.* ,, | |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.

This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it

may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.

VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.

ENGLISH TIMBER cut to any length and scantling at from 2*s.* 4*d.* to 3*s.* per foot for Oak or Ash, 1*s.* and upwards for Elm; Oak Sash Sills from 2½*d.* per foot; Foreign Timber, Dantzic, at 55*s.* per load; Yellow Deals from 3*d.* per foot; Floor Boards, ¾ in. and 1 in., yellow batten, at 12*s.* 6*d.* and 15*s.* All other descriptions equally low.—Apply to Mr. MAY, 90, Leadenhall-street, London.

TO LANDOWNERS AND AGRICULTURISTS.
EXTENSIVE DRAINAGE.

MESSRS. EASTON AND AMOS (Consulting Engineers to the Royal Agricultural Society of England), have just erected an

APPOLD PUMP, AT WHITTLESEA MERE,

which is 20½ times larger than the one exhibited by Mr. Appold at the Crystal Palace, and five times larger than any of the kind yet made. This powerful pump was publicly tried on the 12th of November, in the presence of the landed proprietors and farmers of the county, assisted by several scientific gentlemen, and at various lifts from 1 to 10 feet. At two to three feet, it raised 101 tons of water per minute (which would cover an acre of land one inch deep); and at five feet, it raised 75 tons per minute.—Grove, Southwark.

CROSBY HALL VAULTS, No. 35, BISHOPSGATE-STREET-WITHIN.—CURRALL and SON beg to invite public notice to their STOCK of OLD BOTTLED WINES. They being desirous to secure that patronage which wines of the first quality, at fair and remunerating profits, will maintain, respectfully submit the annexed list of cash Prices:—

| | Per doz. | | Per doz. |
|---|---|---|---|
| Port, old bottled | 36*s.* and 42*s.* | White Port in pints, bottles and package inclusive | 30*s.* |
| Ditto, six years in bottle | 48*s.* | Sherry (excellent dinner wine) | 28*s.* |
| Sherries, pale and brown | 36*s.* | Port, superior draught | 28*s.* to 33*s.* |
| Ditto ditto | 42*s.* to 48*s.* | | |
| Marsala | 24*s.* | | |
| Champagne (1 doz. cases) | 54*s.* | | |

PALE BRANDY, 60*s.* per doz.; bottles, 2*s.* per doz.; hampers, 1*s.* per doz.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The public is respectfully informed the ALES of this season's Brewings are now ready for delivery, and may be obtained Genuine in Casks of 18 Gallons and upwards, either singly or in any quantity, at their respective Stores, as under, where also a list of the Bottlers may be had:—The Brewery, Burton-on-Trent; 61, King William-street, City, London; Cook-street, Liverpool; High-street, Birmingham; The Exchange, Manchester; Royal Brewery, Dudley, and 33, Virginia-street, Glasgow.

NUMBER ONE, SAINT PAUL'S CHURCH-YARD.—HAPPY OLD CHRISTMAS in his joyous rounds now rapidly approaches. All his votaries are preparing to welcome him with becoming honours, first among which are good fellowship and kindness. Presents are flying from one end of the country to the other, and mutual good wishes are exchanged. There is no present more acceptable to our country friends than a little good tea. It is received with thankfulness, and is esteemed a rarity; its excellence is appreciated, and its enlivening and invigorating qualities impart cheerfulness to the circle. Don't then at this time forget to remember

DAKIN AND COMPANY, TEA MERCHANTS,
AND PATENTEES FOR ROASTING COFFEE IN SILVER CYLINDERS,
NUMBER ONE, SAINT PAUL'S CHURCH-YARD.

December 20.

*** The celebrated collection of Chinese teas from the Great Exhibition is now on show at "Number One."

CHRISTMAS PRESENTS.—At this festive period of the year, when friends and lovers assemble at the social board, or join in the mazes of the dance, a more than usual anxiety is created for PERSONAL ATTRACTION, and the following unrivalled discoveries for the TOILET are called into increased requisition; namely — ROWLANDS' MACASSAR OIL, for creating and sustaining a luxuriant head of hair, ROWLANDS' KALYDOR, for rendering the Skin soft, fair, and blooming. ROWLANDS' ODONTO, OR PEARL DENTIFRICE, for imparting a pearl-like whiteness to the Teeth, and ROWLANDS' AQUA D'ORO, a fragrant and spirituous Perfume, an essential accompaniment to places of public amusement, and crowded assemblies.

BEWARE OF SPURIOUS IMITATIONS.—The only GENUINE of each bears the name of "ROWLANDS'" preceding that of the Article on the Wrapper or Label.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

FRIGI DOMO.—A perfect protector against frost, a non-conductor of heat or cold, and cheaper in price than bass matting. A canvas made of prepared hair and wool, adapted to many horticultural and floricultural purposes, for covering up, where a fixed temperature is required. It is 2½ yards wide, and of any required length at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, Oxford-street, London.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION. — Beware of the words "From METCALFE'S," adopted by some houses.

DOMESTIC SANITARY MEASURES.—Places in Gardens rendered as comfortable as the best-constructed water-closets, by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Sold only at FIFE and Co.'s Scientific Repository, 26, Tavistock-street, Covent Garden, London, sole depôt for the Patent Hermetically-Sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also improved Portable Water Closets, with pump, cistern, and self-acting valve. Orders by post attended to.

FORD'S EUREKA SHIRTS and FORD'S EUREKA SHIRT COLLARS are not sold by any hosiers or drapers. The Collars possess an improved method of fastening, which entirely dispenses with the use of strings, loops, or elastic contrivances. Adapted to any size, suitable for once or twice round cravats. They may be had in three different sizes, and either rounded or pointed. Price 1*l*s. 6*d.* per dozen. Two, as samples, sent post free on receipt of twenty-eight postage stamps.—RICHARD FORD, 185, Strand, London.

THREE THOUSAND LONDON POLICE CAPES, fresh dressed, 18*s.* and 24*s.* per dozen, for labourers and farm servants. Waggon and cart Waterproof Covers, 2*s.* per square yard, made up. Horses' loin Cloths, 7*s.* for shaft, and 9*s.* 6*d.* for fore horse. Driving Aprons, Waterproof Coats, Sou'-Wester Hats, 1*s.* each, large sized Capes, to effectually preserve a man from wet while stooping down, 3*s.* each. Transparent Sheeting, for garden use, 1*s.* per yard, nearly two yards wide: a large quantity of second-hand thick Tarpaulings, in excellent condition, 1*s.* per square yard, any size required. ROBERT RICHARDSON, 21, Tonbridge-place, corner of Judd-street, New-road, London.

ESTABLISHED 1786.
WEST OF ENGLAND AGRICULTURAL AND HORTICULTURAL ESTABLISHMENT,
For the supply of every requisite for the Farm and the Garden,
UNION ROAD, PLYMOUTH
(Adjoining the Station and Terminus of the South Devon Railway.)

NEW KITCHEN GARDEN SEEDS, GROWTH OF 1851.

WILLIAM E. RENDLE AND Co., Plymouth, have much pleasure in announcing that they have just prepared a

PRICED CATALOGUE
OF KITCHEN GARDEN AND FLOWER SEEDS,
Being an Appendix to the "Garden Directory," issued last season, as a guide to those who do not require the FULL COLLECTION.

*The prices are affixed to every article, and will be found as low as any respectable House in the Trade.*

They would particularly direct attention to the COLLECTIONS of Vegetable and Flower Seeds, which they have the fullest confidence in recommending, from the universal satisfaction they have given to their numerous customers.

COLLECTIONS OF GARDEN SEEDS.
Containing all the choicest Sorts offered, at the following prices:

| | £ | s. | d. |
|---|---|---|---|
| No. 1.—Complete Collection of 20 quarts of Peas, and all other Seeds in proportion, for One Year's supply ... ... ... ... ... | 2 | 10 | 0 |
| No. 2.—Complete Collection in smaller quantities ... | 1 | 10 | 0 |
| No. 3.—Ditto ditto ... | 1 | 0 | 0 |
| No. 4.—Ditto ditto ... | 0 | 12 | 6 |

The QUANTITIES for each Collection are STATED IN FULL in their "*Price Current and Garden Directory*," so that purchasers may see exactly what they are buying.

*Our* PRICED *Catalogue of Seeds may be had in exchange for* ONE PENNY STAMP. *There are also a few remaining copies of their "Price Current and Garden Directory," which will be sent in exchange for six penny stamps.*

*All Orders for Seeds, above 2l. (excepting heavy articles, as Grain, Tares, Clover, &c.), will be delivered* FREE OF CARRIAGE *to any Station on the following Railways:*

GREAT WESTERN
BRISTOL & BIRMINGHAM
SOUTHAMPTON AND DORCHESTER
BRISTOL AND EXETER
SOUTH-WESTERN
SOUTH DEVON,

*Or to any Market Town in Devon and Cornwall.*

OR TO

CORK, DUBLIN, AND BELFAST BY STEAMER.

For Catalogues and Price Currents, apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.
ESTABLISHED MORE THAN HALF A CENTURY.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, CONIFERÆ, ROSES, ORNAMENTAL SHRUBS, FRUIT AND FOREST TREES, &c., may be had on application, by enclosing two postage stamps.—Windlesham Nursery, Bagshot, Surrey.

MITCHELL'S MATCHLESS WINTER PARSLEY.—J. M. having saved a much larger quantity of Seed this season than last, can offer it to the public at a much reduced price. Wholesale, to seedsmen, 1s. 3d. per lb.; any quantity under 10 lbs. will be charged 2s. per lb. Can be sent to any part of the World, on receipt of a Post-office order, made payable to JOHN MITCHELL, Ponder's-end, Enfield, Middlesex.

SUPERB NAMED AND MIXED ASSORTMENTS OF ANEMONES, RANUNCULI, GLADIOLI, TULIPS, IRIS, CROCUS, LILIUM, IMPORTED DUTCH HYACINTHS, &c., with a large Collection of other Roots.—For BASS AND BROWN'S Priced Advertisement of the above, see *Gardeners' Chronicle* of Nov. 8th and 22d, or Catalogues sent free on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

RHUBARB.
MITCHELL'S ROYAL ALBERT
MYATT'S LINNÆUS ... ... ...
MYATT'S VICTORIA ... ... ... ...
Strong Roots, 50s. per 100.
WILLIAM MITCHELL, Enfield Highway, Middlesex.

SCARLET GERANIUM "THE AMAZON."

HUGH LOW AND Co. having purchased from Mr. Carpenter, of Bath, the entire stock of the above-named new SCARLET GERANIUM, have great pleasure in offering it to all admirers of showy ornamental plants. It is of robust habit, most brilliant colour, and a very free bloomer; and from the encomiums which have already been passed upon it by competent judges, who had opportunities of seeing it in perfection in the nursery of the successful raiser, H. L. and Co. feel confident it will be considered as ornamental an addition to our flower garden plants as its prototype was to the Great Exhibition. The following is the report of the Floricultural Editor of the *Gardeners' Chronicle*, and H. L. and Co. do not hesitate to say, it is the best Scarlet Geranium ever offered to the public:—

"PELARGONIUMS: *E Carpenter*. An excellent scarlet, robust in habit, and a profuse bloomer; trusses very large; each pip of excellent shape; petals substantial; together forming a globular head, rarely deformed by seed vessels; colour brilliant. A variety which is sure to become a favourite."

Strong well-established plants ... ... 7s. 6d.
Extra ditto, with flowering buds ... ... 10 6
Usual discount to the Trade.
Clapton Nursery, London, Dec. 20.

SANGSTER'S NEW EARLY No. 1 PEA.

HAY, SANGSTER, AND CO., in submitting the above valuable PEA to the public, can recommend it with the greatest confidence, as the largest podded and best Early Pea known, and of first-rate quality; height, 2 feet. Price 2s. 6d. per quart.

York Regent Potatoes, from prepared cuttings, 6s. per bush. Cambridge Radical do. (a first-rate second early) 6s. do. American Native, 10s. 6d. do. Early Manley, 10s. 6d. do. Early Ash-leaf Kidney, 10s. 6d. do.

For Testimonials, see *Gardeners' Chronicle*, Nov. 8, p. 705.

Post-office orders to be made payable at the Borough Post-office to HAY, SANGSTER, and Co., Nursery and Seedsmen, Newington Butts, London. One-bushel hampers and booking, 1s. 6d.; two-bushel, 2s. 6d. Sacks, 2s. 6d. each.

PLANTING SEASON.

W. H. ROGERS, NURSERYMAN and LANDSCAPE GARDENER, 130, High-street, Southampton, begs to offer any quantity and description of finely grown and well-rooted NURSERY STOCK, including Forest and Ornamental Trees, Evergreen and Flowering Shrubs, American Plants, Fruit Trees, Roses, Herbaceous Plants, &c., &c., at a very reduced price. Planting contracted for to any extent, engaging to replace failures. Gardens and Pleasure Grounds laid out and planted in the best taste.—All communications addressed to W. H. ROGERS, as above, will meet with immediate attention.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

THE AMERICAN NURSERY, BAGSHOT, SURREY.

JOHN WATERER begs to announce that he has just published a new CATALOGUE of Hardy Rhododendrons, Azaleas, Roses, Conifers, &c., and which may be obtained by enclosing two postage stamps.

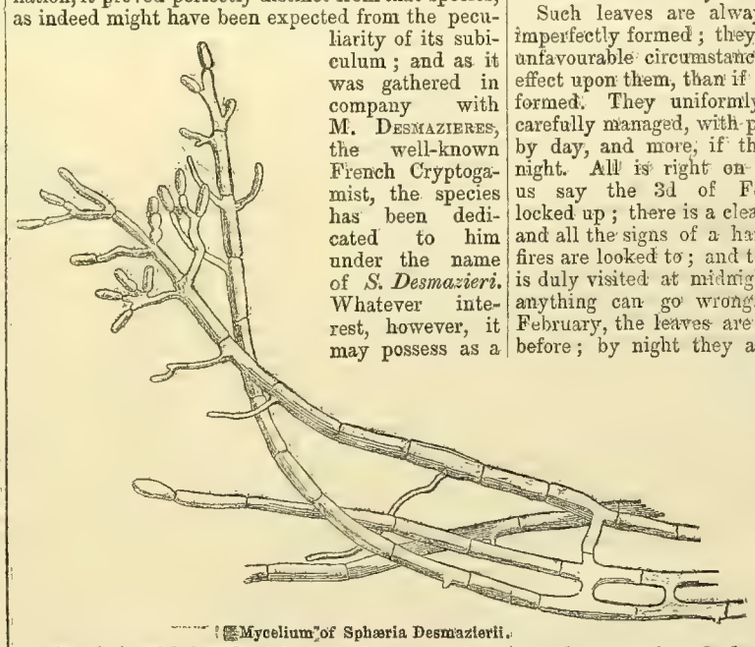
*** The Colours of all the Rhododendrons worthy of cultivation are described; thus purchasers are afforded every facility in making selections.

G. JACKMAN, NURSERYMAN, Woking, Surrey, (1¼ mile from Woking Station, South-Western Railway), begs to announce that he has published a new and complete Catalogue of his American Plants, Ornamental Evergreens, Conifers, Flowering Shrubs, Standard and Dwarf Roses, Fruit and Forest Trees, &c., and may be had on application by enclosing two postage stamps.—Woking Nursery, Dec. 20.

BEST LANCASHIRE GOOSEBERRIES, named, at 15s. per 100.
Also, APPLES, PEARS, CURRANTS, RHUBARB, &c., in all the best varieties, and at equally moderate prices.
Carefully packed, to carry any distance, or for exportation.
H. BIGLAND and Co., Manchester.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON AND Co. have the pleasure of informing their patrons and friends that they are now sending out this very excellent new Grape at 21s. each.



Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orleans Plum; when fully ripe are of a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware Road, London.

The Gardeners' Chronicle.
*SATURDAY, DECEMBER* 20, 1851.

MEETING FOR THE ENSUING WEEK.
TUESDAY, Dec. 23—Civil Engineers (Anniversary) ..8 P.M.

FACTS are every day multiplying, indicative of two forms of fructification in Fungi, as in Algæ. FRIES, with his usual tact, has in great measure anticipated many late discoveries, but so long as his notions rested upon mere acuteness of intellect, without the certainty of actual vision, many of his most profound views could be regarded merely as theories, suggestive indeed of matter for much investigation, but not entitled to be recorded as so many truths actually acquired by science. We have lately adverted to one or two instances of double fructification, and we have now before us one which is most striking. A large and beautiful *Sphæria* occurred during the present summer, running over the ground and spreading to every neighbouring tuft of Moss and fallen leaf, covering them at first with a mouse-coloured felt, and soon developing its large perithecia with very much the appearance of the well-known *Sphæria aquila*. On examination, it proved perfectly distinct from that species, as indeed might have been expected from the peculiarity of its subiculum; and as it was gathered in company with M. DESMAZIERES, the well-known French Cryptogamist, the species has been dedicated to him under the name of *S. Desmazieri*. Whatever interest, however, it may possess as a species, it is with its physiological character alone that we are at present concerned.

Mycelium of Sphæria Desmazierii.

The great peculiarity about it is, that the subiculum, apart from the anastomosing of its threads, and a certain compactness of growth, is as complete a *Polyactis* as can well be conceived. The free extremities of the threads are branched in the same fashion, and the spores are as highly developed as in any species of the genus; and yet there is not the least question about the connexion of the subiculum with the perithecia; or, in other words, the latter are not mere parasites, but the legitimate offspring of the byssoid threads. Similar phenomena will doubtless be exhibited by other species; indeed we believe it all but certain that *Sporotrichum Geochroum* and some neighbouring species are merely rudimentary states of certain *Sphæriæ*, but we have seen nothing so striking as the instance before us.

In connexion with this subject it may not be uninteresting to give a curious case of the production of a second form of fruit in an obscure Lichen, in a situation where nothing of the kind has hitherto been suspected. Two or three black apothecia, resembling some obscure *Peziza*, but with evident traces of a crust, and belonging, we believe, to that form of *Biatora vernalis*, published by MOUGEOT and NESTLER, under the name of *Lecidea sabuletorum* occurred upon a dead stem of the common *Ammophila arundinacea*, which had been sent by Mr. W. GARDINER from the sands of Barrie, on account of its being covered with a minute Sphæria. The apothecia were at first examined under the supposition of their being some *Peziza;* but a glance at the hymenium, even before the discovery of the crust, was sufficient to show their true nature. In addition, however, to the usual structure of a Lichen, the paraphyses were crowned with from one to three well formed purple-brown obovate vesicles, just after the manner of the sporophores of many Hymenomycetous fungi. We do not recollect anything approaching to this except possibly the spores of *Lichenopsis* as figured by SCHWEINITZ. The two cases of the *Sphæria* and Lichen are worth recording, were it only for the curious analogy exhibited, in the one case to a true *Polyactis*, and in the other to the normal mode of Hymenomycetous fructification in an ascosporous genus; even if they are not indicative of something more than mere analogy. We have given figures of the subiculum of the *Sphæria*, with its conidia or second form of fructification, and of the fruit-bearing paraphyses of the Lichen mixed with asci filled with sporidia. *M. J. B.*

Conidiiferous paraphyses of Lichen.

IT is not very uncommon to hear of VINE LEAVES being BURNT in the winter time. With the ground covered with snow, and a dull sun, if any, it seems impossible that such a thing should occur, unless a flue bursts or something becomes red-hot inside a Vinery. Nevertheless we every year receive samples of leaves, brown and soft, which have evidently met a violent death; and how can they have died unless they were burnt?

Such leaves are always young and thin, and imperfectly formed; they are in the state when any unfavourable circumstances are more likely to take effect upon them, than if they were hard and fully formed. They uniformly come out of Vineries carefully managed, with plenty of heat and moisture by day, and more, if there is any difference, at night. All is right on some eventful day, let us say the 3d of February; the house is locked up; there is a clear moon and a bright sky, and all the signs of a hard frost, and therefore the fires are looked to; and to make all sure the Vinery is duly visited at midnight. It is impossible that anything can go wrong. Next day, the 4th of February, the leaves are not so green as they were before; by night they are unmistakeably brown; and on the 5th half are evidently dead. "How is this?" "Oh!" it is said, "the 4th was a bright sunny day, and the leaves were sunburnt." This answer is considered satisfactory; blinds are provided against another year. When February comes they are drawn down every sunny day, and withdrawn at night. But, somehow or other, the leaves are tenderer than ever, and another disaster befalls them; they are again burnt worse than before.

Well, then, it cannot be the sun that has done it. A flue must have leaked; and gas must have escaped into the house. But the house is warmed with water in pipes. Then, in that case, it must have been something from the pipes; or a hole, which nobody can find, *must* exist between the inside of the Vinery and the furnace, or the stoke-hole. Yet, it is very strange, no one can smell the gas. At

last, the cause of the heating apparatus having been fairly heard, and all the evidence for and against it having been fully weighed, a verdict is given in its favour; and some other cause of mischief has to be sought.

Then comes the grand discovery that the Vines *must* be poisoned. It *must* be something in the soil, or in the water; and as the analysis of soil and water is a mystery which passes ordinary comprehension, or as the water that is blamed can no longer be brought up for trial, suspicion rests upon it, and the soil is pronounced to have been the criminal.

It seems never to have occurred to those who have the misfortune to suffer from these accidents, that more things exist in nature than are dreamt of in their philosophy; or that a *tertium quid* remains uninquired about. Least of all seems dryness likely to afford a solution of the puzzle. What! dryness in a house, the floors of which are watered, and the walls syringed, and which reeks like a vapour bath whenever a cold draught finds its way in. Dryness! when a man in spectacles can't see an inch beyond his nose! Such a suggestion seems to be the most absurd of absurdities. Nevertheless we believe that in the majority of the cases to which these remarks apply, dryness, and nothing else, is at the bottom of the mischief.

If we were to remind a gardener that it is of little use to pour water into a tub with a hole in the bottom, for that in a few minutes the tub will be as dry as if it had received no water at all, he would probably admit the truth of the observation, although he might not have much respect for its profundity. But if we say that the more you heat and damp a Vinery the drier it will become, he will lend a less ready acquiescence; and yet, under certain circumstances, the one assertion is as true as the other.

In the late Professor Daniell's excellent memoir on climate, in the "Transactions of the Horticultural Society," the danger to plants in a damp heated atmosphere of a sudden depression of the external temperature, was first pointed out to gardeners. We all know that if a piece of cold glass is introduced into a warm damp room, moisture, in the form of dew, is immediately formed upon the glass. Now, this moisture previously existed in the form of elastic vapour; and the dew that forms on the glass is at the expense of the vapour surrounding it; so that if a cubic body of such vapour be represented by 1000, and 250 parts of it be abstracted by precipitation, or condensation, upon the cold glass, it is clear that there will be only 750 parts left; in other words, the air will be one-quarter drier after the introduction of the cold glass than it was before. Now, if we suppose that this abstraction of vapour were carried to its utmost limits, it is evident that the end will be the total drying of the air, in consequence of the condensation of all its vapour on the surface of cold glass.

The Vine leaf, when young, will not bear an atmosphere the degree of saturation of which is much below 800. If the saturation falls to 500, it will be dried up and perish. Now, observe what Prof. Daniell says, "The heat of the glass of a hot-house at night *cannot exceed the mean of the external and internal air*, and taking these at 80° and 40° (respectively), 20 degrees of dryness are kept up in the interior, or a degree of saturation not exceeding 528. To this, in a clear night, we may add at least 6° for the effects of radiation, to which the glass is particularly exposed, which would reduce the saturation to 434, and this is a degree of drought *which must be nearly destructive*." ——"When it is considered that a temperature at night of 20° is no very unfrequent occurrence in this country, *the saturation of the air may upon such occasions fall to* 120°." That is to say, instead of the atmosphere surrounding Vine leaves amounting to 7 or 8 parts in 10, which is what they require, it may not amount to more than $1\frac{1}{4}$ in 10, which is fatal to them. And thus, in an atmosphere of heat and moisture, the Vine leaves may actually die of drought. And that this occasionally happens, and is a frequent though unsuspected cause of injury to tender foliage, near a glass roof, we entertain no manner of doubt.

## FUCHSIA SERRATIFOLIA.

This being a favourite of mine, I am induced to send you my method of cultivating it; during this dreary season (when anything in bloom is desirable), I find it one of the gayest ornaments of the conservatory. At the present time I have many plants in 11-inch pots, a complete mass of flower, on shoots about six inches long; these have been subjected to the following treatment:—cuttings were struck early in February, and, after being potted off, they were repeatedly shifted into a mixture of equal parts loam, peat, and leaf-mould, with a little silver sand, until about the middle of May, keeping them well-topped; by that time they were nice bushy plants. As soon as the weather permitted, I then turned them into the open borders, where the soil was not over rich, choosing as dry a place as possible, and I took no further notice of them till the end of September, when they began to show their flower buds. I then prepared the same soil for them as before, and carefully lifted them into suitable pots, according to their size, keeping them in a close pit for a few days, and syringing them every evening till they recovered from the check they had received, giving air by degrees, till they could be fully exposed. I then placed them in a shady situation until they were housed, which was when the other greenhouse plants were taken in-doors. I cut back two-year-old plants as soon as they have done flowering, reducing the ball when they commence growing; I afterwards shift them as they require it, subjecting them exactly to the same treatment as young plants. I find that two-year-old plants bloom more freely than young plants, but the flowers are not so large.

Under the above treatment this is found to be a most desirable plant, and it amply repays the trouble expended on it, blooming freely from November till February. I have many times treated Salvia splendens in the same way, and it has continued gay in the conservatory through the winter months. *W. J. Ward, Prospect-hill, Reading.*

## FOREIGN GARDEN GLEANINGS.

(Lisbon.)

Two years ago I sent you a few observations on the Lisbon and Cintra gardens (see Vol. for 1849, page 405). The following is a letter I have received, giving some account of the appearance of these gardens in the early spring of this year. *Dodman.*

"*March* 24.—I have not forgotten my promise of giving you some account of Lisbon gardens and flowers. I have only delayed doing so because this has been a most disappointing winter to me, who saw Lisbon from October, 1848, to February, 1849, during which time its gardens were never without flowers, and I cannot remember riding out without seeing scarlet and pink Geraniums and Heliotropes fringing and hanging down from the tops of tall walls that enclosed terraced gardens, and occasionally the great bells of the Datura waving above them. In January, large Barbadoes Aloes thrust their crooked flower stems in all directions from among these; and great bunches of the golden tree Sedum, with its bright green tabular-shaped masses of leaves, relieved the monotony of the red and green line. In the gardens of the British embassy the dense foliage of the Belleassombre, the waving graceful Bamboo, the shining leaves of the Azorian Jessamine and Alegro campi, in the bright sunshine, cheated you into the belief that summer was hardly at an end. The warmth was sufficient in Lisbon, though not in Buenos Ayres, to enable you to live without fire; and during the seven months I spent there, so little rain fell that, in the spring, the flocks were dying for want of water. Four seasons of drought have sadly changed the beauty of these gardens; during the last summer scarcely any rain fell at all, and so cold a winter as this last has scarcely ever been felt. My impressions on returning here are very different from those of my first visit. The very Orange trees in a quinta I visited, between Belem and the mouth of the river, had suffered much from frost, and more than 50 had been killed; these probably were unhealthy trees or in too forward a state; the situation being in a moist valley, it is very different from the warmer climate near Lisbon.

"The public gardens being those to which attention is usually first directed, I shall begin by giving some account of the largest. Here in fine weather a band plays on Sundays, ladies and gentlemen promenade, and nimble-fingered gentry exercise their profession. In the week days the garden is nearly desolate, especially since there is only a gate at each end, those of the sides having been closed to stop up an agreeable thoroughfare half through its length. When I first came here, on each side the gate, as you entered, there was a pretty small garden, divided, in the Portuguese fashion, by hedges (not edgings) of Box from the walks, and subdivided by thick smaller hedges into formal beds; these were filled with shrubs and flowers; in the centre before you, on entering, there is a large round basin of water, with shoals of gold and silver fish, and a fountain which, however, I never saw play. But, lately, *improvements* have been made which entirely destroy the originality of the garden. The hedges and edgings have been taken away, and little remains save two fine round bushes of the Rosemary of the North, a Diosma. A vile palisade of canes (to cover which creepers seem to refuse to grow) protects the shrubs; each is at least 5 feet high. The space gained by the destruction of the two little gardens has been planted with trees, and for two years has had an unfinished melancholy appearance. You may remember how gay and pretty this little garden was in October, 1848.

"The whole garden site is a parallelogram of which you may judge the size from Knight's Map of Lisbon. At some distance, but round the circular basin I mention, four seats, segments of circles, backed by Box hedges, are placed; plenty of open space is allowed between these seats and the water. On leaving the fountain you enter the main walk or mall, which is very wide. Six rows of trees on each side form six other walks, and before the late *improvements* you might, on a glaring sunny day, go from one end to the other of the garden, when once the basin was passed, under shelter of these trees. But now, midway on each side, many trees have been cut down, to form two flower-gardens, to replace those destroyed. I cannot approve either of the change of situation or the method of laying out; the old parterres with their formal Box hedges suited a garden situated in the centre of a town and the rest of the design. Now you are interrupted in these shady walks by the new gardens, the principal feature of which are irregular little basins of water surrounded by yellow rocks on which a pure white water-god reposes. Luckily the rocks are planted with Irises and rock plants; and at the rapid rate at which all things grow here, it may be hoped their ochry hue will be soon overcome. The parterres are formal, but have shrubs planted in them. There were some charming very dwarf Apple-trees in full flower yesterday; the yellow Tobacco that here becomes a great tree, was yet in bloom, although fresh green leaves were appearing: Eucalyptus, Mimosas, Poinsettia, and the large varieties of Fuchsias are planted here; the beds are margined with different kinds of edgings; Thrift now in bloom, tiny Pinks also in flower, Rosemary, Thyme, the Lavender with a serrated leaf, Polyanthus, and Gorterias; this last forms the most beautiful edging I ever saw. There were thousands of flowers open in the sun, and when they were closed even the dark green and white leaves, and its close habit of growing, make it a pretty plant for the purpose.

"The whole of the beds were gay with common Ranunculus, scarlet and yellow colours prevailing, some Gladiolus, Stocks, Verbenas of different colours, Toad Flax, Larkspur, different varieties of China Roses Anemones, white Petunias; white and purple Iris and Calla, with other plants, fringed the water and its rockwork. The beauty, however, of the garden at the moment I write is the tender green of Acacias mixed with the brilliant lilac of the Judas tree; this latter is a tree that flourishes especially in this country; it grows as fast as the Elm, and seems to attain almost the same size: the Elm is not, however, a very large tree in this country. It appears to grow in any situation, as young ones have been planted among and under the rows of trees in this garden; and though all are planted thicker than I think right for avenues of trees, they seem to flourish well. I have also seen trees sheltered and shaded of the Judas cut down to about 7 feet from the ground, when of a large size, throw up a single shoot from the top of the ring of bark, and soon form a good head. The tendency here to flower is so great that some of the trees in one of the public walks have the branches, and even part of the stem, covered with masses of bloom. This garden, though not carefully cultivated, employs several people, on account of the labour required, even at this season, in watering, when the sun is so strong that one is glad to retire once more under the trees. Then you observe that these side alleys are in part separated from the main walk because, between every two trees, there is a thick tall Box hedge; and you are astonished, by finding, that not only trees are easily reared under other trees, but that round great Elms, Poplars, Acacias, rings of brilliant Virginian Stock are in flower, and that the white Florentine Iris, the scarlet Geranium, Oxalis Braziliensis (?), and other plants, flower and flourish, there being in fact plenty of light. Near the end of the shaded walks, on each side, are tall hedges of Box, arranged so as to form an oval space, with four openings; against each Box segment of the oval a handsome stone seat is placed. The centre walk terminates in a large fountain placed in three arches against a wall; in the middle one is some ugly black rockwork, more covered with weeds than plants; the only one worth noticing, and belonging to the situation, being Adiantum Capillus-Veneris, with which formerly every fountain, or dropping well, or watercourse in the environs of Lisbon abounded, but of late it has been so much gathered for the manufacture of capilaire for the coffee-houses, that it threatens to become extinct. You know how it grows near Cintra; formerly there were more Box hedges between the trees in these walks, and it is a pity they were destroyed: a garden full of these hedges is the characteristic of the Portuguese style of gardening. Beckford has described them well; being in this case only planted in the space between two trees, and then a space left between the two next, they did not interrupt the passage from alley to alley."

## Home Correspondence.

*New Strawberries.*—When I ventured to express an opinion upon the merits of Mr. Cuthill's Black Prince and Kitley's Goliath Strawberries, I was prepared to encounter some little opposition to my view of their merits. But I confess that I did not expect to be honoured with a challenge from Mr. Kitley, little conceiving that so large and excellent a grower as I believe him to be (in a locality so pre-eminent for this fruit), would select a person who only grows for private consumption (and who consequently has but a comparatively limited space of ground to select from), for an antagonist. Truth is often unpalateable, and I fear it may be so on this occasion; but still I have no hesitation in saying that neither of these kinds has realised the expectation I had formed of them, although subjected to the most liberal culture. Mr. K. takes exception at my expression "insipid;" and he is right, for I admit that it was indefinite; but I will substitute for that word, that it did not prove high flavoured with me. Were I to say that it is not a fine large kind, I should do it injustice; but every one who tasted them at Nuneham preferred the British Queen. Mr. Kitley refers me to testimonials; I refer him to the Journal of the Horticultural Society of London, where, at p. 283 (if he will

refer to it), under the head of "New Fruits," he will find "Kitley's Goliath Strawberry: Fruit very large, but not so large as Myatt's Mammoth; red, with a coarse surface; flesh pale, with a large core; too acid. This variety cannot be recommended for cultivation." As I cannot see that if I were to accept Mr. K.'s challenge, it would be of any use to the gardening public, I must respectfully decline his offer, as unsuited to "my book." He will therefore, in this matter, walk triumphantly over the course. When I say that I have been "victimised," I mean that I paid much attention, and took great pains, to cultivate Goliath, thinking I had got a prize; but it proved, in the opinion of myself, my employer, and many other gentlemen, a blank. Certainly my stock did not come from Mr. Kitley himself direct. Perhaps the gentleman who has so kindly elucidated the history of the Black Prince, in a former number of your Paper, will favour us with that of the "Aberdeen Beehive;" a kind, I believe, that originated with some honey-seekers in the "far north." In justice to Mr. Cuthill, I ought to say that I have heard that the Black Prince "forces well," and it may be useful from its earliness in small gardens, where there is not convenience for forcing. To the market gardeners it is so, for a day or two in ripening must make a great difference in price. In the Journal of the Horticultural Society, at page 282, under the head of "Cuthill's Black Prince," it is said that "earliness is the principal merit of this Strawberry;" and, again, "flesh dark red, tolerably rich, but scarcely equal in this respect to the Roseberry." Now, the Roseberry, as every one knows, has been in existence for these 30 years, and the Horticultural Society admits that it is slightly superior to this *very Black* Prince. Mr. Kitley scarcely gives me fair play when he says that I make Mr. Myatt and the late Mr. Wilmot victimisers, because I said that Eleanor was too acid to be agreeable to my taste; but I added that it would prove valuable on account of its lateness and also for preserving. I have known both these growers intimately for some years, and never had a Strawberry or any other kind of fruit from them which did not maintain the character they gave it. Many years ago Mr. Wilmot sent out his "Superb," and superb it was, according to the general run of Strawberries at that time; but it was coarse and hollow, and too much like the Chili Pine in texture, which said Chili Pine is, I believe, the source from which large size in the fruit was originally obtained. I do not accuse Mr. Kitley of crossing from this kind, as it is probably not to be found in England at this time, unless the Horticultural Society may have preserved it. It is an enormously large, hollow, coarse, yellow kind. To that institution I am indebted for what I know on this subject, and for the opportunity of seeing this curious and now obsolete variety. I ventured a remark upon the Bicton Strawberry, which I grew for two or three years, and then found it useless, except for variety of colour in a large dessert. "Can a Strawberry be valuable for its colour?" asks Mr. K. Let him ask the French cook or confectioner who is making jellies and ice creams, or even Strawberry jam. Myatt's Mammoth is a very large kind, which, though not fit to eat, is so truly magnificent that I grow it extensively for display. The desserts here (according to the style of dinner), are sometimes made up with high stands of confectionery and fruit; in the latter it is grouped and mixed, the Grapes hanging down, and the Pine or Melon surmounting the whole. In the intervals are placed the Peaches, Nectarines, Figs, or Pears, and a few of the Mammoth Strawberries mixed with them have a most improving effect; the white Strawberry is pretty for this purpose, but too small. I beg that it may be understood that any remarks I may have made upon the varieties of this fruit apply only to my own requirements, which oblige me to produce a vast supply of fine fruit, both early and late, for the kitchen and the table. I now take my leave of the subject, first assuring Mr. Kitley that I have acted conscientiously in the opinion I have given, that I am not at all unwilling to concede to him all the eminence as a grower which he claims for himself, humbly hoping he he will permit me to exercise my judgment upon the evidence of my senses; and promising to do public penance, in the way of recantation, whenever Goliath has driven British Queen and Eliza from Covent Garden Market, and the Philistines form an army of occupation at Manor Farm, Deptford. *Henry Bailey, Nuneham Park, Oxford.*

*Bad Seeds* (see p. 789).—I was glad to see the remarks which were appended to "Falcon's" account of bad seeds. I for one have suffered as "Falcon" describes, *i. e.*, either from carelessness or wilful neglect; last spring I sowed Broccoli seed from four packets, with the names on them as ordered, but when they came up it would have puzzled anyone to make more than two kinds of them—these, viz., Walcheren and Winter Imperial Broccoli, were, however, very fine; two kinds of Beet were ordered, but the seed was evidently from one bag, for no distinction whatever could be perceived between the two. *Commoneo.* [Yes; that's the way.]

*Potato or Underground Onions.*—I have grown a quantity of these during the past season, but they are not to be depended upon, as every third or fourth season proves fatal to them. They become rotten very early in the autumn, and so often does this happen that few now attempt their growth. One thing in their favour is that when the general crop of spring sown ones is a failure, they are likely to be good, as in 1849, while in the present year I do not expect to be able to save one to plant next season, and the crop of spring ones here, as in most other places, has been good. *An Old Gardener.*

*Victoria Regia in the Calcutta Botanic Garden.*—It will also be doubly gratifying to such of your readers as are interested in this Lily (and few I suspect are not), to learn that it is now flowering in these gardens. Our plant was raised from seeds received, last March, from Chatsworth; on reaching Calcutta one of the seeds was found to be sprouting, and this produced the plant which is now in bloom. On the 26th of May the seedling had got sufficiently large to be planted out on a hillock of prepared earth in one of the tanks. On the 5th of September the first flower-bud opened; since then seven other flowers have been produced. They average ten inches across; at first they are of a purer white, and subsequently of a brighter pink or rose than those flowers I have seen on the parent-plant at Chatsworth; while the fragrance, which cannot in my opinion be compared with that of any other flower or fruit with which I am familiar, is most delicious, and is quite perceptible at a considerable distance from the plant. The leaves are developed with great rapidity, but they show no rim at the edges, except during the first 12 hours of their existence on the surface of the water. Being naturally much interested in the success of the plant, I have watched its development closely. From daily observations made on the growth of the leaves, the following may be regarded as a statement of facts. July 25th, 4 P.M., entire foliaceous surface 45 square feet, four-fifths of which had attained full growth. July 26th, 4 P.M., entire foliaceous surface 54 square feet; increase, 9 square feet, produced by the united efforts of three leaves during a period of 24 hours, in an average temperature—air 89°, water 94°, Fah. The youngest leaf trebled its foliaceous surface by adding 4 square feet, nearly one half of the work. At that time (July 26th), none of the leaves, when fully grown, exceeded 3 feet in diameter, and all leaves produced since have been under 4 feet across. The number and size of the flowers, however, offer a proof that the leaves, although not attaining a large size, have at least done good duty. Do you consider the fact of the seed from which our plant was raised being matured on a plant growing under an English sky sufficient to account for the deficiency in the size of the foliage? [No.] As there is every prospect of the Victoria seeding soon, I shall observe to what extent the offspring develop their leaves, and give the result. *Robert Scott, Botanic Garden, Calcutta, Oct.* 6.

*Hints to Persons Making a Garden.*—Water is a no less important department in horticulture than rock and wood, and capable of being rendered a valuable addition to the garden; yet it is seldom well managed. Water may be considered in four points of view for horticultural purposes—as river, lake, cascade, or marsh. The advantage of running water for aquatic plants is generally acknowledged: some floating kinds are seen to the best advantage in a lake, while the stronger sorts, that flower above the water, stand well in a flowing stream, especially if backed by wood. On the borders of a lake or bay, of generally still water in a river, Hydrangeas not only grow well, but are seen in their greatest beauty, dipping their blue or rosy heads into the water, on the surface of which they are reflected. A cascade, or rather the damp rocks over which it must fall, may be made serviceable for mountain Ferns and Mosses, as well as for various Alpine plants that usually grow in such situations, Pinguicula, Adiantum, and some mountain Sedums, such as Monregalense, Saxifrages, especially of the mossy-leaved sorts, and other small plants—Saponaria, Silene, many dwarf Bell-flowers, &c., are adapted to the rocks within the spray of the waterfall. It may surprise many people to hear of a marsh as a garden feature. But many stately and beautiful plants are natives of marshes or shallow pools, dry half the year, where their strong roots go deep below the reach of frost. In a garden, most of such plants, Richardia æthiopica, Pontederia, Villarsia, &c., may be more ornamentally grown by the side of a lake, yet they compose a different class, horticulturally speaking, from the true floating herbaceous aquatics, as Water-Lilies, and will grow in deep moist soil, never covered with water; but here their flowering is doubtful. Under water, many roots are protected from frost, which would perish in the earth above its level. To flower them, however, the water must be of a certain warmth in summer, and had, therefore, better be only deep enough, where such plants are grown, to exclude the chance of freezing solid. The roots of many aquatics, even of the floating kinds, will bear to remain dry in the soil of a desiccated marsh, or even out of it, for many months, though they require immersion to grow and flower. Wood is the next important part of the pleasure-ground or garden, and a very important one in its capabilities. Most gardens, not very small, have some grove, coppice, or shrubbery, the management and adorning of which will come under this head. The first rule, then, should be, not to grow in a wood any but what are naturally wood plants. The forest admits of less latitude than the rock in the range of plants suited to it. But among those that are so, are many that are highly ornamental, and not fitted for any other situation. Such are the larger Ferns, many of the finest plants of the Boragineæ, herbaceous Orchids, Aroideæ, Hellebores, some leguminous plants, Lathyrus and Orobus, a variety of under-shrubs, evergreen and deciduous. In a peaty soil, the northern Pyrola, Convallaria, Rubus of many sorts, besides climbers, especially species from North America, Vaccinium, Azalea, Andromeda, Alliums, which would not meet encouragement in the flower garden, and other Liliaceous plants, will suit particularly well. It is a pity that the hardy species of Bignonia, Clematis, Virginian Creeper, &c., are not trained to trees in our groves. Celastrus scandens makes a fine effect so placed, with its amber berries. Aristolochia Sipho and Smilax excelsa are not to be judged of unless rambling in a state of nature over low bushes or climbing the loftiest trees of the forest. Wood may be properly connected with the moist or Alpine rocks, but should not be suffered near the arid or maritime ones, on account of their attracting damp, scattering dead leaves, and encouraging weeds. *S.*

*Plane Tree Timber.*—A correspondent at p. 725 inquires if any of your readers have any experience in the case of this timber. This is replied to at p. 757, where another correspondent says there are some bookcases made of this wood near Bridlington; but this correspondent (at p. 757) is evidently speaking of the Oriental Plane tree; whereas, I suspect the one at page 725 is speaking of the common Sycamore (Acer Pseudo-Platanus), which is universally called a Plane tree in the north of England; at least, I can scarcely suppose any gentleman would go and cut down such fine specimens of the Oriental Plane as are there spoken of—14 feet in circumference. If the Sycamore is meant, your correspondent may find an excellent market for it in the manufacturing districts, where it is in very extensive use for calendar bowls for bleachers, calico printers, &c., and fetches (for choice logs) as good a price as Oak; at all events it sells readily at from 4*s.* to 5*s.* per cubic foot. If your correspondent speaks of the Oriental Plane I can give him no information. *T. G., Clitheroe.*

*Vine Culture*—I should feel obliged if you would kindly give me some information on the following two points: 1st. I have a small house with Black Hamburgh, St. Peter's, Muscadine, Muscat, and Grizzly Frontignan Vines. The border (outside) has been most carefully made and drained, and is now covered with thick tarpauling for the winter. The house is not forced early, but we begin about the middle of March. The Vines bear most admirably, and have done so for several years; and their growth and general appearance proclaims that there is not very much wrong in the border or general management. The Grizzly Frontignan bears as well as, or even better, than its neighbours; generally showing two bunches, and in some cases even three on a spur; but in a length of rafter of 14 feet, I have never exceeded 15 or 16 bunches; last year I tried only 13, in the hope of preventing what I now proceed to describe. The bunches swell well, the berries becoming very fine (for the sort); they are always well thinned, and never shrink or shrivel at the points of the bunches; but many berries in each bunch remain green when the others colour, and never acquire flavour or sweetness. The footstalks only of these berries show a small black mark, and look pinched at that point; and I myself should describe the disease as a sort of shanking. I mean a decay of a small part of the footstalk only, instead of the stem or larger part of the bunch, as we generally observe in ordinary shanking. I have seven cart-loads of tan in a pit in the house, and perhaps I am too fond of moisture, but this is withdrawn as the Grapes begin to change colour (I mean both tan and moisture), abundance of air given, and fire heat if wanted. The thermometer is kept as near as may be to 75° without sun heat in the day time, and never above 65° at night; a trifle of air is admitted all night, so that I have never a rusted berry nor a scorched leaf. Hamburgh and St. Peter's colour admirably, and so do the unaffected berries of Frontignan, whose footstalks are sound: 2d. With the above sorts of Grapes I have one Muscat of Alexandria; I can grow the berries to a good large size, and get many almost up to the right proper amber colour by the end of September. I want to know what amount of heat I may give to the house, not to injure Black Hamburghs, St. Peter's, Muscadine, and Frontignan (Grizzly), so as if possible to help the Muscat a trifle more, and yet not injure any other Vines. The Muscats are even now very eatable, but not quite right. I want the best method of growing this magnificent Grape with the others. It is on the warmest rafter; my flue is the old smoke one, but with tan and abundant sprinklings, and we get on pretty well. *Novice.* [It appears from your statements that the general management of your Vines is good. Your border is protected from the chilling snow and rain of winter; but when you begin forcing, then an injurious discrepancy of temperature, as regards root and top, commences. From this cause, more perhaps than from any other, Vines are weakened and thrown out of condition; and shanking more or less is induced. Better remove the winter covering from your border by the 1st of March, and substitute plenty of hot dung for the purpose of warming the soil; this is more especially necessary for the Frontignan and Muscat of Alexandria. Fresh roots will thus be earlier formed; and you may afterwards increase the heat, for the sake of your Muscat, to 84°, without injuring the other sorts.][]

*The Banana.*—Is the Banana (Musa Paradisiaca) brought into England as a ripe fruit? If it is not, it might easily be brought from Egypt all the winter, as it seems to be cut and hung up in the pantry in Judea, to ripen, all the winter there! The Chaté Cucumber from Egypt may also be introduced fit for the table, with green Peas, French Beans, &c. *W.* [We fear that the Chaté Cucumber would not be to the taste of English people. The Banana is not unfrequently seen in London fruiterers' shops. We believe it comes from Madeira.]

*What is Pruning?*—In my remarks under this title

at p. 756, I omitted to notice what I think a great recommendation of Midsummer as the best season for pruning; which is, 1st, that the wound is smaller, by one whole season's growth, than it would be if deferred to the ensuing winter. 2d, that the healing process then begins immediately upon the amputation; a ring of young wood being formed round the edges of the wound in the same season. So that the practice of summer-pruning actually antedates, by two whole years, the final closing of the wound. *J. S. H., Perthshire.*

*Bats and Fireflies.*—I observe, at p. 789, a letter from Mr. Waterton, in which that gentleman regards my quotation from Dr. Buchanan's "Researches in the East," as apocryphal, characterising it as an 'Eastern nursery tale.' So high an authority, so emphatically put forth, is worthy of all regard; and I am really glad to be advised of my unintentional error. I may remark that the very same passages have been extracted into the columns of the "Penny Magazine," the "Saturday Magazine," and a variety of other literary journals,—in every instance it having been considered orthodox. I, like others, have fallen into the trap, and been deceived. *W. Kidd, Dec.* 15.

*Protection of Gooseberry and Currant Tree Buds from the Depredation of Birds.*—Mr. Rivers's mode of effecting this desideratum is as follows:—After the trees are pruned *secundum artem* for the ensuing season, he scatters thickly throughout the bushes "short muck," as we call it in Norfolk; or, in longer and more general parlance, "short litter from the dunghill." This is left on the bushes till the incipient leaves of spring burst from the buds, and perfectly preserves the bushes from depredation. *W. Mason, Nectou, Norfolk.*

*How to Crop a Small Kitchen Garden.*—Your correspondent "Vectis" now states, at p. 741, that he has got a good crop of Broccoli as well as Cabbage Sprouts; but I presume he is still deficient of the other things I mentioned, and many more I might have enumerated. Now, though I do not wish to blame him for adopting such a system, yet I think he should have done, what he evidently has not done, given it a fair trial himself before he recommended it to others. As he evidently, however, wishes to discover a mode of cropping by which he may make his garden more productive, and yet change his crops every year, I will endeavour to explain to him how I proceed to crop, so as to accomplish that object, as far as it can be done. If he attempts to grow many of the Brassica tribe he will, however, find it impossible to avoid having some of them on the same spot two seasons together; but by well manuring and digging for them he will find them equally as good; neither would he find the manure in any way injure their flavour, provided it was well decomposed. The manner in which I carry on the rotation of crops is by pre-arranging in my mind what each part of the garden is to contain for years. Thus I mark out a space 18 feet wide, in length according to the width of the garden, or from path to path. I well manure and ridge trench it now. About the beginning of March I plant it with 10 rows of early Potatoes, 2 feet row from row, and 8 inches set from set. I then sow spring Spinach broadcast, and rake it in; it is thinned out to about 5 inches apart; when fit for use, I cut that next the Potatoes first, it is all cleared off by the time the Potatoes are 6 or 8 inches high. I then fork the ground, earthing up the Potatoes; about the end of May I plant four rows of Brussels Sprouts between, placing the first row between the second and third row of Potatoes, the other three between the alternate rows. About the end of June, or beginning of July, I plant five rows of Broccoli; the first row between the first and second rows of Potatoes, the others between the alternate rows, so that the Broccoli and Brussels Sprouts stand 2 feet apart. The beginning of August I take up the Potatoes, forking the earth well up to the plants. In November I remove the Brussels Sprouts and transplant them thickly into some out-of-the-way corner; I then fork the earth up to the Broccoli as high as their lower leaves, in order to protect them from frost. In the first week in April I sow two rows of Peas where the Brussels Sprouts grew. About the end of the same month I sow two more. When the Broccoli are all off the Peas are earthed and staked. They are off by September, when the ground is again well dunged and dug, and planted with Coleworts 1 foot apart each way. When they are off it is again ridged and trenched without dung, and in March a trench is formed in the centre of the piece, 18 inches wide, with a bed on each side 4 feet 6 inches wide; a trench again on the outside, 18 inches wide, which leaves a space 2 feet 3 ins. wide on the outsides; the beds are sown with Onions, the trenches planted with Celery (and in early localities a row of White Cos Lettuce may be grown in each trench before the Celery is fit to plant out). A row of Cauliflowers is planted on the outer spaces, 15 inches from the trenches. When the Celery is off, the ground is again ridged, without dung, and in spring two beds are marked out, 4 feet 6 inches wide, with 1 foot for an alley between the beds; the same on the outsides. The beds are sown with Carrots, and a row of White Cos Lettuce is planted up the centre alley. The remaining 6 feet is sown with Scorzonera, 10 inches row from row. *J. Steel, Clitheroe.*

*Influence of Soil and Situation on Timber.*— The influence of soil, situation, and other circumstances on the quality of timber is perhaps greater than one is generally aware of, and I am led to infer (as far as a single instance can serve) that situation has much to do with the singular shakiness to which Chestnut timber is so liable. My instance is, that a number of Chestnut trees were lately felled in this neighbourhood, on a very high spot of sandy soil, the timber of which was found to be of excellent quality, very few of the trees being shaky; while among the Chestnuts felled in the low valleys below, though in similar soil, almost all the trees were found to be shaky. Oak trees will often flourish exceedingly on sandy soils, but I believe it is well known to sawyers that the timber grown on such soils is far inferior to that grown on clay lands. The vast difference in the quality of the timber of the Pinus sylvestris, as imported from the Baltic, and as usually grown at home, has led to an opinion that the trees from which such different timber is obtained must be of a different species or variety. I cannot help suspecting that this is an unfounded opinion, and that differences in soil, climate, or situation, are sufficient to account for the difference in quality; in fact, that perhaps nothing but age and slow growth are requisite to make our Scotch Fir timber equal in value to foreign red Deal. In confirmation of this opinion, I send you a a specimen cut from the side bough of a Scotch Fir, above 100 years old, in which the growth has been so slow, that most of the annual rings are too close to becounted. The wood is very hard, and, I suppose, durable in proportion. I have lately felled several Scotch Firs above 100 years old, the timber of which was pronounced excellent; and, in the opinion of the carpenter, nearly, if not quite, equal to foreign red Deal. *B.B.B.*

*Propagation of Eels.*—My attention has been called to a paragraph in a Worcester paper, giving an account of a so-called discovery by Mr. Boccius, that eels are propagated by spawn, like other fishes, and that they are not brought forth alive, as has hitherto been supposed! This may be true; but before I can give an unqualified belief to the assertion, I should like to have a few questions answered by Mr. Boccius. Who saw the fish from which these thousands of eggs were extracted, at the time this dissection was made? Are the parties who saw these eggs quite certain that the fish was an eel, and not a lamprey? Who saw the eggs from which Mr. Boccius produced living eels? Who, beside Mr. Boccius, ever saw eel-fry in a pond, which had no communication with a river? Will Mr. Frederick Allies, and Mr. Reed (the gentlemen to whom this spawn was exhibited), say whether the ovary which was shown to them was pretty much of the same form as that of the lamprey? And if not, in what respect did it differ? I am induced to ask these questions, both because, by inference, they show my own opinions on the subject, and because I am led, on undoubted authority, to believe that Mr. Boccius is inclined to claim all that belongs to him at least; and also because I have my doubts about the scientific attainments of Mr. Boccius in the natural history of fishes. It is difficult to prove a negative. My never having seen the strange things above mentioned certainly does not prove that other people, with better eyes and more discrimination, have likewise failed to do so; but I cannot help doubting, and I publish my doubt in the hope that the subject may be further inquired into. A true naturalist ought to wish only for the truth, without reference to his own pre-conceived notions; but, so far as my examinations have gone, I have failed altogether in detecting spawn in the fringes which I have fancied were the ovaria of the fish, or elsewhere; and I do not believe that eels are bred in fresh water at all. I see the fry ascending from the sea, in May and June, by thousands and millions; but I never met with one of these in a pond having no communication with a river. I have little doubt that I shall be pronounced in error touching this matter; except, perhaps, by those who know how perseveringly these little eels make their way up every stream, ditch, and driblet of water into which they can gain access. They penetrate into the water pipes and pumps; they climb up the perpendicular faces of the rocks and weirs, which obstruct the course of the river, even when they are only moist; adhering to the moss and stones almost as well as snails. The downward migration of the eels is observed here from July to the middle of September; but in the Manchester market, I find them up to this time (the end of November), and am informed that they are caught at the foot of Windermere in their downward migration. Pray will a dissection of the conger at various seasons throw no light on the propagation of eels? One would think that, in such large fish, the ovary would be much more easily distinguished than in smaller specimens. *T. G., Clitheroe.*

*Pruning young Fruit Trees.*—I have purchased at Mr. Bell's nursery, Bracondale, Norwich, a quantity of Pears and Apples (espaliers), vigorous trees, about four years old, and well rooted. They have been removed several times in this nursery, and root pruned. I shall feel obliged by your informing me if I am to cut them back, how much, and when; the trees were planted in October last. *C. G.* [Under the above circumstances, it will not be necessary to cut back, regularly, your newly-planted espalier trees. If you find that some of the branches have weak, soft, badly-matured wood at the extremity of the shoots, you cannot err in cutting several inches of it off. Side shoots, where they occur on the principal branches, should be cut back to within six inches of their bases.][]

## Societies.

Caledonian Horticultural, *Dec.* 4.—J. Hope, Esq., in the chair. Office-bearers for 1852 were elected on this occasion, together with three new ordinary members. —For the best four sorts of Pears fit for dessert, there were 10 competitors. A first prize was awarded to Mr. Hamilton, Gilmerton-house, for fine specimens of Marie Louise, Winter Beurré, Beurré d'Aremberg, and Doyenne d'Hiver; a second to Mr. Anderson, gr. to the Earl of Stair, for Marie Louise, Winter Nelis, Beurré d'Aremberg, and Beurré Diel; and a third to Mr. Ramsay, gr. to Sir D. Baird, Bart., for Beurré Rance, Beurré Diel, Beurré d'Aremberg, and Althorpe Crassane. —For the best six kinds of table Apples there were seven competitors, and three prizes were awarded—the first, to Mr. Calder, gr. to Lady Harris, Seacliffe, for Dickson's Emperor, Cambusnethen Pippin, Ribston Pippin, Gravenstein, Old Nonpareil, and Cornish Aromatic; the second, to Mr. Young, gr. to Mrs. H. N. Ferguson, for Ribston Pippin, Blenheim Pippin, Borsdorffer, Hollow-eyed Pippin, Doonside, and Old Nonpareil; and the third, to Mr. Morrison, Elvingston, for Redwell Pippin, Paradise Pippin, Old Nonpareil, Scarlet Nonpareil, Blenheim and Ribston Pippins.—For the best bunch of retarded Grapes, a first prize was awarded to Mr. Lees, gr. to the Earl of Haddington, for a bunch of Muscat of Alexandria; and a second to Mr. Thom, gr. to C. Balfour, Esq., for a bunch of Black Hamburgh. For 12 finest single clusters of Chinese Chrysanthemums, the first prize was gained by Mr. Young, Archerfield, with the following varieties:—Queen of England, Temple of Solomon, Minerva, Madame Chauviere, Queen, Princess Maria, Lucidum, La Reine d'Or, Queen of Gypsies, Salter's Annie, Defiance, and Queen of Yellows. The stand considered best entitled to a second premium was accompanied by no declaration, and the second prize was therefore voted to Mr. Reid, gr. to J. Wauchope, Esq., who produced the following:—Minerva, Mareschal, Queen of the Gypsies, Victory, Tasselled Yellow, Gem, Salter's Annie, Queen Victoria, Emma, Queen of Yellows, Beauty, and Julia. For the four finest flowered plants of Chrysanthemums, the silver medal was awarded, as first prize, to Mr. Pender, gr. to D. Anderson, Esq., his varieties being Princess Maria, Salter's Annie, Gem, and Pherasta. The second prize was assigned to Mr. Mitchell, gr. to Lady Keith, who produced Salter's Annie, General Marceau, Triumphans, and Lucidum. For the best two Chinese Primroses, the prize was assigned to Mr. Henderson, gr. to C. K. Sivewright, Esq., for well grown plants of the single and double white. For Savoys, one prize was given, to Mr. Gourlay, gr. to Sir J. Warrender, Bart. For four Leeks, each blanched to the extent of 6 inches at least: the prize was gained by Mr. Pousty, gr. to W. M. Innes, Esq., with specimens of a hybrid variety raised by him, which were superior to any entered for competition last year; the other sets produced on this occasion were inferior to those brought forward in 1850. For Celery, a prize was assigned to Mr. Goodall, Newbattle Abbey, for Cole's Red, and Goodall's Broad White Solid Celery. For three sorts of Onion, the first, Mr. Lees, Tynninghame, for James' Keeping, Strasburg, and White Globe; second, Mr. Nisbet, Summerfield, for James' Keeping, White Portugal, and Blood Red; and third, Mr. Goodall, for Strasburg, Yellow Portugal, and James' Keeping. For the silver medal offered by the Society for the best collection of dried specimens of British flowering plants and Ferns, there were two competitors, both producing excellent collections. The prize was awarded to Mr. Wilson, journeyman gardener, Minto House, near Hawick; his collection contained 719 species and varieties, the specimens being well preserved. A second premium was voted to Mr. Bell, journeyman in the Society's Garden, whose collection, although considerably inferior to the last in numbers, containing 591 species and varieties, was nevertheless deemed well worthy of a prize; the specimens had been well selected and carefully dried, and while displaying great neatness, the distinctive characters of the species were well preserved. The prize of two guineas offered by Messrs. P. Lawson and Son, for the best collection of dried specimens of hardy perennial herbaceous plants, was awarded to Mr. Anderson, journeyman in the Royal Botanic Garden, Edinburgh, for an excellent collection containing 2400 species and varieties. It seems necessary, however, to state that in this Herbarium, as in the one sent in competition for Messrs. Lawson's prize last year, the numbers have been swelled to an unnecessary extent by the introduction of Cyperaceæ, Gramineæ, and other plants not strictly "adapted for garden culture," as required in the Society's prize schedule. Messrs. Cunningham, Fraser, and Co., of the Comley Bank Nursery, contributed a flowering plant of Tillandsia splendens, Gynerium argenteum, &c.; Mr. Carstairs sent a collection of greenhouse plants, including Pelargoniums, Veronica Andersonii, Liliputian Chrysanthemums, &c.; and Mr. Stark exhibited a box of Chrysanthemums, of fine named varieties, and a pot of jelly made from the berries of Gaultheria Shallon. From Canonmills Cottage there was a beautifully flowered plant of Oncidium ornithorynchum; from Miss Wauchope, several greenhouse plants; from Mr. Laing, gr. to the Earl of Rosslyn, Calceolaria perfoliata in flower, and good Onions; from Mr. Young, a box of Chrysanthemums, and an Enville Pine-apple; from Mr. Stirling, Moray-place Gardens, Primula capitata, in flower; from Mr. Murray, gr. to the Marquis of Breadalbane, 11 varieties of Oranges, for which an honorary award was voted; from Mr. Calder, Seacliffe, a collection of 56 named Apples, 20 named Pears, and two seedling Apples, for which an honorary award was likewise voted; from Mr. M'Farlane, Lochend, five varieties of fine Pears; from Mr. Reid, Edmonston, a device of flowers; and from Mr. J. Street, Beil, samples of Minorca and other Holly berries, &c., accompanied by a communication on

the subject of the acclimatising of exotic plants at Beil. There were likewise several exhibitors of vegetables. Mr. Allison sent a large Drumhead Cabbage; Mr. Liddle, six large roots of Mangold Wurzel; Mr. Wardie, a head of German greens; and Mr. Aitken, nine large Onions.

At the *Meeting of Naturalists at Stockholm*, 1851, the following papers were read:—Prof. Fries, upon Najas flexilis, specimens of which were also presented.—Mr. Vaupell, on the Formation of Turf-moors in Denmark.—Bishop Agardh presented a Moss, Grimmia elongata, new to Sweden, and discovered by Mr. Hardin; also some observations on a form of Saxifraga, allied to S. tridactylites and controversa.—Prof. Liebmann produced a collection of Mexican Conifers.—Mr. Areschoug showed a collection of Corallines.—Mr. Vaupell made some observations upon anomalous structures in Rhizomes, upon cell formation and growth especially in perennial not woody stems; also upon fossil Conifers from Denmark, and upon a Greenland Pine.—Prof. Liebmann exhibited drawings of plants from Sweden and Norway, to be admitted into the Flora Danica.—Mr. Anderssen exhibited the drawings of his speedily-forthcoming "Agrostographia Scandinaviæ."—Mr. Lagerheim gave some information respecting the herbarium of the late Prof. Afzelius.—Bishop Agardh described the formation of the flowering parts of Willow-worts, whereupon Mr. Anderssen made observations on their nectaries.—Prof. Liebmann exhibited a collection of anomalous woods, and explained the formation of the stems of tropical climbers.—Mr. Areschoug made some observations upon Sarcophyce (?) potatorum, and a perfect specimen of this gigantic Algal was produced.—Dr. Angström presented a monograph on the northern species of the genus Botrychium.—Mr. Sandahl compared the vegetation of Kinnekulle with that of Billingen. *Botanische Zeitung.*

## Reviews.

*The Country House. No. I.—The Poultry-yard.* 12mo. Charles Knight.

This is one of a series of useful 'Manuals,' written in a plain and popular style, on the many adjuncts peculiar to a 'Country House.' It is, perhaps, one of the very best existing treatises on poultry, inasmuch as it discards all the superfluous matter generally introduced in books, and which puzzles rather than assists an inquiring reader. The writer evidently *understands* his subject, and this stamps his observations with a value which otherwise they would not possess.

We observe he strongly recommends the Spanish fowls for general use, and we quite agree with him that, for the sake of their flesh and eggs, they cannot be too strongly commended. The flesh is delicately white, tender, and juicy; and the hens are free layers. The eggs, too, are of very large size, and of first-rate flavour.

Inferior cross breeds of the Spanish variety, it is needful to remark, are very often to be met with; but such are not worth keeping. The pure strain is alone to be cultivated. They may be preserved from degenerating by the occasional introduction of males of the same race, up to the mark in every point, and which have descended by a collateral branch from the same root; having, therefore, only a remote connexion with the stock to which they are admitted. Breeders, by mutual exchanges, might in this way materially assist each other.

The classification of the various tribes and orders; the remarks on their structures and habits, their general character and origin, and treatment generally, cannot be too highly appreciated. The introduction, too, is replete with curious, valuable, and most interesting matter.

Towards the close of the book, are given particulars of the various maladies, diseases, and ailments to which poultry are occasionally liable; and the treatment recommended is judicious and useful. We can, however, plainly see that the author is, at heart, clearly of our opinion, that "the knife" is the best operator in nine cases out of ten. He remarks—"To speak the truth, neither are the diseases of fowls well understood, nor is the treatment of them anything but empirical." This is perfectly true; and as all the race invariably pursue each other, when sick, 'even to death,' if not separated, why not at once end their days, and their miseries, together?

We should add that this little volume is very correctly illustrated by spirited wood engravings, descriptive of fowls, ducks, geese, turkeys, pigeons, &c.; and that its scope includes the *Columbine* order, as well as the *Natatores*, all which are ably treated of.

The 'Dairy,' 'Piggery,' 'Stable,' 'Apiary,' &c., are announced to follow; and the series, when completed, will form three select tomes for all who are provided with a 'Country House.'

## Garden Memoranda.

Royal Botanic Garden, Kew.—The spirit of improvement, in this glorious national establishment, is, we are happy to see, as far as ever from manifesting any disposition to flag. On the contrary, the progress of works is manifest in every direction. A very fine new opening through the wood has been made from the Palm House to the Thames. Ground has been staked out for a new Victoria House. The enclosed land, lately in the possession of the King of Hanover, has been already thrown into the garden; the walls which surrounded it are falling, and walks are forming so as to connect it with the remainder of the garden. Many new rooms have been added to the beautiful museum, partly in order to receive Messrs. Lawson's fine Scotch collection lately presented to the garden, and partly to enable the numerous other acquisitions to be displayed. But after all, it is evident that a much larger space must soon be provided for the rapidly accumulating materials which the popularity of Sir W. Hooker's management is daily gaining for the museum; and it is to be hoped that funds will be provided for the construction of a building to which the hidden, and so far as the public is concerned, utterly useless collections now reposing in the British Museum, may, among other things, be transferred. Some idea of the large mass of valuable objects which still wait for accommodation, may be formed from the single fact that a great shed is actually filled with the precious collections of Palms, Tree Ferns, and similar objects obtained in the Himalayah by Dr. Hooker, at great cost, and at the peril of his life.

We may add, for the information of plant growers, that the Sikkim Rhododendrons here, in a cool house, are looking well, some of the species appearing to be as cultivable as *Rh. arboreum* itself.

Lucombe, Pince, and Co.'s Nursery, Exeter.—We understand that the rare Berberis nepalensis is just about to flower in this establishment. A plant in the show-house has six or seven fine long spikes of bloom, and is presenting a very grand appearance. Even if this plant should not prove quite hardy, it will at least be found to be one of the finest of all the species with pinnated leaves. The specimen at Exeter is, we believe, the first that has flowered in Europe.

## FLORICULTURE.

Chrysanthemums at Versailles Nursery, Hammersmith.—We lately made a morning call at this establishment, for the purpose of inspecting Mr. Salter's collection of this useful flower. Being formerly of Versailles in France, most of our floricultural friends are aware that we are indebted to Mr. Salter for many of the best foreign novelties, not only as respects the flower in question, but also as regards Dahlias, Fuchsias, Phloxes, Iris, &c.; and it is gratifying to know, that although now firmly established in this country, Mr. S. still retains his connexion with the continent; and an intimate knowledge of the leading growers of France, Germany, and Belgium, with their several ideas of quality, renders him a prominent and useful member to floriculture. Chrysanthemum growers need not be informed that Annie Salter, Queen of England, Campestroni, Jenny Lind, Lysias, Fleur de Marie, &c., rank among the best varieties of this flower in cultivation, and in the case of Dahlias, Toison d'Or, Empereur de Maroc, Gasparine, El Dorado, Striata Perfecta, John Edward, &c., number among his introductions, and merit a place in every collection. We anticipate a glorious harvest next season from the thousands of seedlings which Mr. Salter possesses, including Phloxes, Pentstemons, Chrysanthemums, &c. The place was remarkably gay with Pompone and the large flowering varieties of the last named flower; we commend Racine, bright deep orange with bister points, large, incurved; Madame Laborde, white and fine in form; Plutus, clear yellow, with broad petals and free from notch, fine and incurved; Anaxo, orange salmon, large and incurved; Miss Kate, delicate peach, full, of medium size; Nandee, lemon, medium size, but although double, thin; Rosa mystica, cream and rose, large, full, and incurved; Ne plus ultra, rosy lilac, similar, if not identical with Christine; President Perrin, reddish crimson; Monge, crimson, violet yellow points, medium size, and full. From Pompones, an improving class, we would select Surprise, white tipped rose, medium size, double, yet inclined to be thin; Asmodie, reddish brown, base of petals yellowish buff, double; Argentine, blush white, double, medium size; Adonis, white tipped with cherry, double, but thin; Modèle, pure white, and of exquisite form, in fact a model; Autumnum, brown, double, medium size; Perfectum, mottled white, with pale purplish lilac, double, flat, medium size; Sacramento, bright orange; Daphnis, reddish purple or claret, more than average size; Cybele, yellow, medium size petals, somewhat notched; Madame Lemerchez, deep lilac; Solfaterre, clear primrose, prolific, double, yet somewhat thin; Golden Drop, an anemone, centre elevated, guards numerous; Mignonette, golden yellow, tipped with red, remarkably double, and of exquisite form; Le Pygmée, deepish yellow, tinged with buff, double, but petals serrated; Nini, an anemone, centre reddish buff, elevated, guard petals few; Pomponette, an anemone, blush lilac, centre tinged with orange; La Ruche, an anemone, blush white, with but a single row of guard petals. We remarked here Versailles Defiance, to which the National Floricultural Society awarded a Certificate of Merit; Delicatum is large and full, peach blush; Conspicuum, mottled, rosy lilac, large and full, apparently well adapted for pot culture; these we look upon with some interest as regards 1852. Pentstemon variabilis was in good flower; it cannot fail to prove an attractive autumn and winter plant. A waxy, white variety of Fuchsia serratifolia, and a dwarf Scarlet Geranium, named Roseum Compactum, were among the list to be "sent out" next season. In the propagating house was a fine stock of Dahlia-roots, both English and Foreign; of those not "out" may be mentioned, Toison Orange (Cailloux); Marie Louise (Mignet); Evening Star (Salter); Annie Salter (Salter); Gloire de Kain (Cailloux); Sanspareil (Cailloux); Rembrandt (De Knyff); Spectabilis (Salter); &c. The late frost had damaged the beauty of out-of-door flowers generally, but there was, nevertheless, much to admire.

Birmingham Chrysanthemum Show, *Dec.* 15.—The lovers of this last but most showy flower of autumn, had a great treat at Birmingham on Monday last. The success which had attended the exhibitions at Stoke Newington, Highgate, Norwich, and other places, no doubt put the growers in the midland counties on the *qui vive*, for, after a lapse of 12 years, they resolved that the Chrysanthemum should again assert its claims to pre-eminence as the floral queen of December; and well have they backed their favourite, for the Corn Exchange, in which the trial took place, was in every respect adapted for the arrangement of plants to the best advantage. The specimen plants and collections in general showed great skill in cultivation, and some of them were quite equal in size and growth to those exhibited at Stoke Newington, particularly a Madame Poggi in Mr. Cooper's collection of twelve, than which nothing could be better, either as regards good culture or profusion of flowers. A Fleur de Marie in Mr. Craythorn's group was magnificent; several of the flowers must have been 5 inches across, and they were perfect models of form. Mr. Cooper also showed a Queen of England, in grand style, many of the blooms were 6 inches across; The Duke, Pilot, Vortigern, and Queen of Gipsies, were also greatly admired. Of new flowers of 1851, there were but few; Mr. Salter exhibited three blooms of his seedling Conspicuum, a rose lilac, distinct in colour, very double, and of good form—a flower that must be in request by the growers of specimen plants. No cut flowers were exhibited, except a collection of 50 new varieties of Pompons from Mr. Salter, of the Versailles Nursery, Hammersmith, which attracted their share of attention. The prizes for 12 plants were awarded as follows:—1st, to Mr. Cooper, for Queen of Gipsies, Madame Miellez, Park's Yellow, Hengist, Madame Poggi, Victory, Rosalind, Tasselled Yellow, Queen of England, Duke, Pilot, and the Warden; 2d, to Mr. Craythorn, for Fleur de Marie, Hengist, Peruvienne, Queen of England, Vièrge Marie, Col. Coombe, Annie Salter, Madame Poggi, Queen of Gipsies, Vortigern, Lady Talfourd, and Pilot; 3d, to Mr. Marsden, for Madame Poggi, Annie Salter, Fleur de Marie, Duke, Nancy de Sermet, Queen of Yellows, Rosalind, Madame Miellez, and Queen of Gipsies. Six plants: 1st, to Mr. Marsden, for Golden Cluster, Pilot, Vesta, Queen of Gipsies, Annie Salter, and Queen of Yellows; 2d, to Mr. Mayle, for Queen of England, Madame Foggi, Pomponette, Col. Coombe, Queen of Gipsies, and Golden Cluster; 3d, to Mr. Cooper, for Formosum, Competitor, Annie Salter, Lady Talfourd, Pilot, and Queen of England. Three plants: 1st, to Mr. Blackburn, for Fleur de Marie, Madame Poggi, and Chancellor; 2d, to Mr. Mayle. Mr. Cole's prize was awarded to Mr. Blackburn, for Pilot, Annie Salter, Madame Poggi, Queen of Gipsies, Orlando, and Chancellor. Pompones, 3 plants: 1st, to Mr. Cooper, for La Fiancée, D'or, and Pouledetto; 2, to Mr. Mayle, for Elize Miellez, Pouledetto, and La Fiancée. New varieties of 1851: 1st, to Mr. Mayle, for Sacramento; 2d, to Mr. Craythorn, for Petrarque. Seedlings: Ccertificate of Merit to Mr. Salter, for three blooms of Conspicuum. *J. E.*

Royal South London Floricultural Society.—At a general meeting held at the Horns Tavern, Kennington, on the 11th inst., J. Coppock, Esq., in the chair, officers were elected for the ensuing year, and a report from the committee read. From the latter it appeared that the number of subscribers who have paid during the past year is 221, against 209 in the preceding. Of this number 50 have joined during the year. It was shown that the prizes given by the Society in the year amounted to 270*l.* 7*s.* 6*d.*, in addition to 24*l.* 17*s.* 6*d.* given by members and others, making the total of prizes 295*l.* 5*s.* The auditor's report stated, that after all claims whatever had been paid, the Society was indebted to its treasurer the sum of 16*s.*, against which it was mentioned that there were good subscriptions unpaid to more than that amount. *J. E.*

North London Floricultural Society.—The anniversary general meeting took place on the 17th inst., at the Gate House, Highgate, the President being in the chair. The statement of receipts and expenditure for the current year proved highly satisfactory: after all claims had been paid, a balance was shown to be in the hands of the Treasurer. Officers for the ensuing year were then elected, and a long list of new members furnished. *J. E.*

Catalogues and Lists received from Messrs. Appleby, Rivers, Lane, Wilkinson, Francis, and Foster. *J. E.*

Cineraria: *D W.* A charmingly coloured flower resembling royal purple, and suffused with a golden bronze; petals free from notch and tolerably broad, but their arrangement, owing perhaps to the early season in which it is sent, is not in strict accordance with our notions of regularity; disc many shades darker than the petals; truss compact and large."

Scarlet Geraniums: *A B.* Brightness of colour, freedom of bloom, and size of truss characterise the following: Beauty of St. John's Wood, Commander-in-Chief, Dazzle, King of Nepaul, Mrs. Mayler, Oriflame, Punch, Reidii, Tedworth Horseshoe, The Amazon, Tom Thumb's Master, and Triomphe de Paris. *J. E.*

## Miscellaneous.

*Sale of Nees von Esenbeck's Library and Herbarium.*—Professor Nees von Esenbeck has lately published a catalogue of his library, from the preface of which the following is an extract:—"I am," says the author, "without property; my library, my herbarium, is all I possess—all I am able to leave to my family. In my career as a medical man I always considered the interests of the poor sufferers of primary, my own of secondary importance, and being devoted too much to scientific pursuits, I did not obtain a good, certainly never an extensive practice. A small estate, inherited from a relation, afforded for some years means and leisure of cultivating science successfully, until, during the French wars, the property became untenable, and I was induced to accept a professorship in Erlangen and the Presidency of the Imperial L. C. Academy of Naturalists. Having, by exchanging Erlangen for Bonn, settled in Prussia, it became a question whether the Academy should have its seat in Bavaria, because my predecessor resided in Erlangen when the German empire dissolved, or whether it should retain its position as a national institution over the whole of Germany. The negotiations which followed ended by the Academy keeping its independence, and, as far as circumstaces would permit, its position towards the Confederation; and it was by my exertions that the institution obtained a confirmation of its old statutes, and, so long as it should stay in Prussia, an annual grant of 1200 thalers. Since 1818, I have constantly laboured in restoring this ancient institution, and discharging my duties as Professor in the University; indeed my academical duties required my whole attention, and prevented me from accepting any of the more lucrative places which from time to time became vacant. Thus it happens that, since the government has deprived me of the professorship, I am labouring under circum-

stances which force me to part with my library and herbarium. Having no prospect of a pension, and no desire to solicit favours in high places, I address myself to the members of the Academy, and to my friends and contemporaries, begging them to exert themselves in trying to dispose of my collections. If my library and herbarium could be sold as a whole, I should be able to realise their value, and would consider that amount as an acknowledgment of 30 years' academical services. The herbarium consists of 297 packets in folio and 42 packets in quarto, and contains 80,000 sheets. It is valuable on account of being chiefly made up of exotic specimens, including plants collected by Sieber, Preiss, Wallich, Wight, Ecklon, Zeyher, Drege, Pappe, Wied, and others, and representing most fully the floras of Mexico, New Holland, North America, Brazil, Southern Africa, the East Indies, and Europe. What renders it still more important is its containing the original specimens on which my monographic labours, the dissertation on the Laurineæ, Solaneæ, Acanthaceæ, Hepaticæ, Astereæ, Cyperaceæ, Gramineæ, and Restiaceæ, are founded. The library is composed of 3000 volumes, embracing the standard works of Natural History and Natural Philosophy. It is to be sold in Brelau, on the 1st of May, 1852, by public auction, and commissions will be received by the Schlettersche Buchhandlung in Breslau, or any other great bookseller on the continent. The herbarium, if it cannot be sold as a whole, is to be disposed of in sets. It has been valued at 12,000 thalers, the Laurineæ at 280 thalers, the Acanthaceæ at 600, and the Glumaceæ at 3000." *Botanical Gazette.*

*Sale of Orchids.*—Twenty-six lots of Vanda cærulea were sold by Mr. Stevens, on Tuesday last. They fetched from 1*l.* to 8*l.* per plant.

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

In this department the chief things to be attended to during the present dull weather is to keep as low a temperature as is consistent with the health of the plants, as a high close atmosphere will, in a few days, do more injury than can be repaired in months of care after the mischief is done. Ventilate with judgment; but let there be ventilation even where the most tender plants are kept; and, if at the cost of a little extra fuel, to maintain the necessary temperature in connection with a circulation of fresh air. Where this advice is adhered to, there will be no sickliness for want of light. Watering will require to be done with great caution, and we cannot do better than repeat the simple directions we have so frequently given, that is, never to water till the soil immediately below the surface is sufficiently dry to warrant a full supply. Be careful to prevent sourness in the soil; as, if this takes place, and is not rectified, the loss of the roots will be the consequence. Avoid spilling water on the floor when watering, and endeavour by every means to maintain a sweet and not over damp nor over dry atmosphere.

### FORCING DEPARTMENT.

Let the heat of the litter about the roots of Vines lately excited be daily examined; and see that it is regularly kept at a temperature of 60°, until the Vines are coming into leaf, when a slight increase of heat should be obtained. It will be well, however, not to exceed 70° for some time yet; as too great a degree of root heat produces a weakly growth. The temperature of the atmosphere should be kept at 50° by night, and 60° by day, until the buds are all starting; when a rise of one degree each night may be indulged in, until you arrive at 58° or 60°, with a corresponding increase by day, according to the out-door temperature. But it will not be safe to go beyond 60° by night; and a small portion of air should be always allowed, to keep the atmosphere sweet, and in motion. With sun heat a rise of 10° with a gradual increase of air, must be obtained as often as possible; and to assist in this, the heat in the pipes must be increased early, whenever there is the appearance of sunshine. Peaches in pots should now be brought into the house, and plunged in Oak leaves, that are in a slightly fermenting state; 55° to 60° in the plunging material, whatever it may be, will be sufficient during the first month. The atmosphere should be 45° to 50° by night, and 55° to 60° by day. Syringe frequently during fine weather, but never when damp. Apricots, Plums, and Figs will require the same treatment as Peaches; but Cherries must have a lower temperature than these, after the first fortnight or three weeks. Vines in pots are greatly benefited by being plunged in a gentle bottom-heat, and their shoots should be depressed, so as to cause them to break all the buds. The atmosphere for these should be similar to that for Vines established in the border. Where very early Strawberries are required, some of the strongest plants of Keens' Seedling may be brought into the pit for starting, but no artificial heat need be applied for the first week or 10 days. Let the plants be freed from decaying leaves, and top-dress the surface with rich loamy soil, having a sprinkling of soot in it, to drive out any worms which may be in the pots.

### FLORISTS' FLOWERS.

During damp and foggy weather, both Auriculas and Carnations (in frames), will require especial attention; they are apt occasionally to have small portions of dirt lodge in the axils of the leaves. This must be carefully removed, for should this be damp and wet, serious injury to the plants will most certainly accrue. Carnations, too, if kept close, will contract mouldiness, being liable to the attack of both a black as well as white parasitical fungus. The leaves affected must be cut away; and, if possible, remove the affected plants from the others, giving plenty of air, the want of which, and late planting, superinduce these serious evils. Pansies, Pinks, Carnations, &c., on beds, should, if in exposed places, be protected; the best material is small pieces of the Spruce Fir. Hoop over Tulip beds, and cover in severe weather. The tops of the spike being now very near the surface, this precaution is essentially necessary.

### KITCHEN GARDEN.

Previous to the general manuring and trenching of vacant ground, the rotation of crops which are to be cultivated upon it during the ensuing summer, should be decided upon. One of the first principles to be attended to in this arrangement is that no annual crop be grown for two successive years on the same plot of ground. Another variation should be made by taking care that those crops which immediately succeed each other are not such as are liable to be preyed upon by the same kind of insect, as their increase is encouraged to a fearful extent by thus putting in their way the food of which they are most fond. It is important that both the manuring and the depth of the trenching be regulated by the requirements of the crops; and their rotation should be so arranged, that the ground be not trenched to the same depth for two successive seasons, but so that different portions of the soil be brought to the surface in turns. The perennial or permanent crops will of course form a class by themselves, as they do not require a change of situation for many years; but when this is necessary with any portion of them, the ground from which they are removed will fall into the ordinary rotation in the way of a regular exchange. By cultivating the Celery and Cardoon on the Scotch or wide bed system, a large ridge of soil is thrown up between the trenches, the surface of which is excellently adapted for the cultivation of dwarf Peas, Beans, Spinach, Turnips, and similar vegetables; observing, however, that only the earlier sowings of these several crops should be made on these ridges, that they may be removed in due course, before the ground is required for earthing up the principal crop. As a matter of course this arrangement must not interfere with the very earliest crops of Peas, &c., which are generally allowed a place on the side borders near the walls. For the latest crops of Peas, &c., a portion of ground must be allotted, which, with that occupied by the Celery and Cardoon ridges, will generally amount to about one-third of the ground occupied by annual vegetables. The extensive turning over which the Celery and Cardoon soil undergoes, acts admirably in preparing the ground for deep rooting plants, such as Turnips, Carrots, Onions, &c., and in the following year may be devoted to the cultivation of the Cabbage family, whose roots are confined more nearly to the surface. If the vegetable garden is so large as to allow of the cultivation of a portion of the general Potato crop within the walls, it will form a fourth course in the rotation, and will come in after the Brassica tribe. Working upon this system, Cabbages have been planted during the autumn on ground which had been occupied by late summer Turnips; and the ground which now requires trenching is that from which the later Turnips, Onions, Carrots, Beet, &c., have been removed, and which will next spring be planted with Cauliflower, Broccoli, &c. Preparation for these should be made by trenching in a very heavy dressing of manure, which shall serve for that and the succeeding crop; as the last few years have fully convinced us of the impropriety of planting Potatoes on ground recently manured.

State of the Weather near London, for the week ending Dec. 18 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th, 1827—therm. 58 deg.: and the lowest on the 24th, 1830—therm. 10 deg.
On the average of 25 years the night of the 25th December is colder than any other night throughout the year.

## Notices to Correspondents.

Apples: *A Sub.* Twelve sorts for table use, the soil rather heavy:—Wormsley Pippin, Ribston Pippin, Golden Reinette, Court of Wick, Blenheim Pippin, Boston Russet, Scarlet Nonpareil, Mannington's Pearmain, Pearson's Plate, Adams' Pearmain, Sturmer Pippin, and Court-pendu Plat. Six sorts for kitchen use:—Hawthornden, Dumelow's Seedling, Bedfordshire Foundling, Yorkshire Greening, Rymer, and Waltham Abbey Seedling.‖

Back Numbers. Full price will be given for the following Numbers:—1846, 25; 1848, 38, 42, and 48; 1851, 24, 27, 30, and 49.—*A G.* Much obliged, but we only require the numbers mentioned in the Paper.

Birds: "Sparrow Clubs:" *J D.* There can be no possible objection to your joining the proposed 'club.' These birds, just now are very numerous, and very destructive; and it would be mere affectation to talk about the "cruelty" of destroying them. As well might we object to the slaughter of an "innocent lamb." In the *spring*, sparrows are decidedly useful; indeed they are some of the gardeners' best friends. But being over-numerous, and their winter depredations heavy, do as you propose; and in the graphic phraseology of Dickens's hero 'Quilp,' load your gun-barrel, and "blaze away!"—*W S.* The soft-billed birds owe you many obligations. Your plan of providing for their winter accommodation and vigour of constitution, is admirable. When matured, we shall be happy to hear further particulars. —*Jane F.* Do not attempt to "pair" *any* birds until March. You have been wrongly advised.—*W E.* They will open immediately after Christmas. This foggy weather retards their progress.—*Arabella C.* Use a piece of soft flannel and common soap; and when your birds' perches are thoroughly cleansed, be sure and *keep* them clean.—*W J.* Snails and raw beef.—*Georgiana M.* The yolk of egg should be boiled hard, and mixed with some sponge cake; administer this twice a week.—*Maria P.* Saffron is really a bad medicine. Boiled milk is more effectual, and very palateable to the taste. Why not use it?—*Harriet.* You cannot have a handsomer bird than a starling. Their glossy coat and vivid colours always gain them admirers, and they may be rendered *very* tame by kindness.—*John T.* You may give them green meat all the year round, occasionally; it amalgamates with their food, and keeps them healthy.—*W N R.* Your kind favour has come to hand, and we have done what you requested us to do. Any information we can render you about your birds, pheasants, or poultry generally, is quite at your service.—*Sarah G.* Your shilling has not been ill disposed of. A yellow-hammer is a sprightly, cheerful bird, and certainly much handsomer than a canary. His song, however, is monotonous.—*Josephine:* Java Sparrows are delightful birds to keep in a cage; but of so truly affectionate a disposition, that we advise you to keep "a pair." If you begiven to moralise, as we *all* ought to be, you will glean from your observations of these faithful, affectionate creatures, many a lesson of great practical utility through life.—*Gulielmus.* The Song-thrush, by all means. If you want execution and effect, *he* is to be commended before all others. Feed him on German paste, sweet buns, snail's, and beef.—*Lucy.* You have yourself unwittingly described *the cause* of your Canary's restlessness, and of his continually pecking himself. The insects which you saw through your microscope inhabiting the crevices of his cage, are known as "vermin." They have been feasting for some time on your bird's blood, drawn from his veins in the night. *Burn* the cage immediately, and procure an entirely new one; then affectionately examine the skin and feathers of the innocent sufferer; and when quite cleansed, introduce him to his new abode. He will recover in a week, if prompt measures be taken. *W. K.*

Books: *Highlander.* Brown's "Forester."

Collinsia tinctoria: *T M.* This was introduced from California by Messrs. Veitch and by the Horticultural Society. It has no kind of resemblance to Calliopsis tinctoria.

Cottagers' Stoves: *S A S.* The most economical, the cheapest, and the best for cooking with which we are acquainted, is one manufactured by Messrs. Baileys, Ironmongers, Holborn. It was exhibited in Prince Albert's Model Cottages, which led us to have it tried; and we can say, after four months' experience, that we do not see how it can be improved. To cottagers it is invaluable.

Fenugreek: *J C* asks what will remove the smell of powdered Fenugreek seeds from the hands on which they have been rubbed.

Fruit Trees: *L H.* The Peaches and the Nectarines you mention will do for forcing; but you should likewise introduce the Bellegarde if possible, as it will afford an excellent succession. We should prefer, for a new Vinery, young plants from eyes.‖

Gooseberries: *Amateur Sub.* We never recommend dealers.‡

Laurustinus: *A M.* No doubt you may strike it from cuttings placed under a north wall in the autumn, without the aid of a hand-glass; but under a hand-glass the cuttings will root with more certainty, and grow faster. It is far better, however, to propagate the plant by layers.

Miniature Garden: *W M B.* Place it on a hollow metal case, filled every night with warm water, and in bad weather throw a woollen cloth over the whole apparatus. No lamp-heating will answer. If you cannot do this, introduce metal cases filled with hot water, as is done in French railway carriages. Always remember, however, that if the case is pretty dry, frost will not do much harm, provided the plants are thawed in the dark. Get Turner's (late Beck's) "Florist."

Mushrooms: *Croydon.* In the "Horticultural Transactions," vol. iii., p. 6, and vol. ii., p. 345, you will find good practical directions. Also in "Lindley's Guide to the Orchard," &c., Loudon's "Encyclopædia of Gardening," and in all such works. Nothing can be more easy. Perhaps you fail from too much or too little moisture and want of warmth.

Names of Fruits: *G F Unthank.* 1 and 2, notwithstanding their difference in form, appear to be the Princesse d'Orange; 3, Scarlet Crofton; 4, Court of Wick.‖—*F M.* Ribston Pippin.‖ —*H B R.* The slice of Apple was bruised; but, from your description, it is most probably the Dumelow's Seedling; if so, you will find the wood is very much spotted.‖

Names of Plants: *J W.* 1, Maxillaria punctata; 2, Zygopetalum brachypetalum.—*Tivana.* Your little delicate fronds are destitute of fructification. Similar sized fronds of Asplenium lanceolatum would be like what you have sent, but they are too flaccid to be it; and also, being slightly pilose, leads us to infer that your plant is not A. lanceolatum, but rather a seedling of Lastrea dilatata, growing in a warm place. Send a frond in fructification. *S.*—*W Mitchell.* 1, Acacia urophylla; 2, A. nigricans. Apply to Mr. Ross, Featherstone Buildings, Holborn.

Oak Coppice: *J S H.* "Old reserved Oak-trees with thick bark are apt, when felled, to prove barren stools. Is there any method of encouraging such trees, when destined to fall, to form eyes—such as paring off the spongy outer bark at the bottom of the stem, a year or two previously?" Some experienced forester will, we dare say, reply to this.

Reeves's Muscadine Grape: *S E W.* The following account of this sort, published in 1847, in Vol. III. of the Journal of the Horticultural Society, has been corroborated by subsequent fruitings:—"This was imported from the Cape of Good Hope, without a name, by John Reeves, Esq.; and as it appeared worthy of cultivation, it has been designated as above. Bunch large, broad-shouldered; stalk thick; pedicles short, stiff; berries oval; skin yellowish white, rather thick; pulp melting, juicy, and rich. A good Grape, ripening quite as early as the Black Hamburgh under similar circumstances." To the preceding account it may be added, that the variety in question is, under ordinary circumstances, a *sure* and *abundant bearer*. It requires less heat than the Muscat of Alexandria or Cannon Hall, and it cannot be said to equal these sorts in point of high Muscat flavour; neither should it be planted in a house specially adapted for these and similar sorts. As regards cultivation, it should be classed with the Royal Muscadine, &c.‖

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any re-sales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Turnip Manure, per ton ... ... ... | £7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

FOSSIL BONES AND PSEUDO-COPROLITES (FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD AND CO., Artificial Manure Manufacturers, Ipswich, Suffolk.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE, PEAT CHARCOAL, impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's Seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

MILK, CHEESE, AND BUTTER.

HENRY BAKER, OPTICIAN, 90, Hatton Garden, London, advises any one who keeps Cows to send two postage stamps, and obtain a description of his LACTOMETER, with its uses, and the results of experiments with it upon different Milks. Lactometers, complete, in a mahogany box, 10s. 6d.; Do., with cheaper fittings, 7s. 6d. and 5s.; Hydrometers for testing sulphuric acid, 5s., 7s., and 10s. No consumer of acid should be without one, as it is often sold highly diluted. Saccharometers for Brewing, with tables, 5s., 7s., and 10s. Pediment Barometers, from 1l. each. Wheel Barometers, from 1l. 1s. each. Packed carefully for the country, there being nothing to fear of them getting out of order, as they are warranted to be properly made and good instruments.

A PRIZE MEDAL FOR SUPERIOR LOCKS WAS AWARDED TO J. H. BOOBBYER, AT THE GREAT EXHIBITION OF 1851.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

THE ONLY PERFECT STOVE!—All who study Health, Comfort, and Economy, should throw aside their old Stoves, and replace them with the PATENT PORTABLE VENTILATING SUSPENSION STOVE, which consumes only *Three Farthings worth of fuel per day*, and is universally admired for the delightful temperature it produces, and for the extraordinary manner in which it purifies the air. It is strongly RECOMMENDED BY THE FACULTY, and is adapted for Bed-rooms, Churches, Chapels, Schools, Halls, Libraries, Greenhouses, Shops, Warehouses, &c. Prospectuses to be had free by post. In operation daily at DEANE, DRAY, and Co.'s, London-bridge.

"COATES'S HERD-BOOK."

MR. H. STRAFFORD begs most respectfully to inform Short-Horn Breeders that he is now preparing for publication the 10th Volume of Coates's Herd-Book, which will contain the Pedigrees of Bulls, Cows, and Heifers, with their produce to the 31st December, 1851. Returns to be made the first week in January, 1852. The Entrance Fee in this Volume will be 1s. for each Pedigree to Subscribers, and 2s. for each Pedigree to Non-Subscribers. Price of the volume, 21s.

List of Entries and Subscribers' Names to be sent to H. Strafford, 3, Camden Villas, Camden Town, London, of whom may be had any of the previous Volumes, or full sets of the Work.

COOKE'S NEW AGRICULTURAL DRAINAGE LEVEL IMPROVED. See notice in the Journal of the Royal Agricultural Society of England, 1849, Vol. X., Part I., page 165, and other most flattering testimonials. This level is adapted alike for the gentleman farmer, the practised drainer, or any ordinary workman. Has a powerful telescope, and combines great accuracy with facility in the using of it. The rise and fall can be correctly taken at one observation. The book accompanying the instrument gives an explanation of it, and an easy and correct system of levelling for agricultural purposes. Price, with levelling staff complete, 4l. T. Cooke, sole maker, optician and mathematical instrument maker, York; or L. Cassella and Co., appointed agents, 23, Hatton Garden, London.

AGRICULTURAL EDUCATION.—Several noblemen and gentlemen, advocates for combining "Science with Practice," and convinced of the importance of early education for those intended for Agricultural pursuits, either at home or in the colonies, have subscribed a Fund to educate a limited number, from each county. They will be instructed in all the Sciences connected with Agriculture, free of every cost, excepting Books and Chemicals. Parents may secure board and lodging in the village, or the pupil may be accommodated in the house of the head master, on payment of a moderate sum. Full particulars may be had on application, by letter, addressed "Agricultural Education," Messrs. Bagley and Co., 3, Old Broad-street, London.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blackfriars, London; and 36, Seel-street, Liverpool.

The Agricultural Gazette.

*SATURDAY, DECEMBER* 20, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, JAN. 1—Agricultural Imp. Soc. of Ireland.

WE are happy to announce the election of Mr. HARKNESS, of Dumfries, to the office of Secretary to the Royal Agricultural Improvement Society of Ireland, vacant by the resignation of Mr. BULLEN. Mr. HARKNESS has already proved himself an able agricultural improver, in his connection with the District Society of Stranraer, which was, and probably still is, one of the most active local farmers' clubs in the kingdom; and the influence he there so usefully exerted will, we are persuaded, now be earnestly and successfully brought to bear upon the agricultural condition of that larger field, in which the Agricultural Improvement Society is at work. The gentlemen who have had the appointment of Mr. BULLEN's successor to this office, seem to have had a somewhat difficult task to perform, no fewer than 54 candidates having presented themselves; and their appointment of a Scotchman seems to have wounded the easily offended nationality of some of the Dublin journals. We are persuaded that they have done right to choose the man whose testimonials certified the highest qualifications for the office; they have done right to confine their attention to those points only in the candidate for the office, which concerned his ability to perform its duties; and that Mr. HARKNESS will prove an efficient agricultural labourer in the field of Ireland, all our experience of his efficiency elsewhere goes to prove.

"WHAT 's 'Taxes,' TUMMAS?" quoth JOHN the footman to THOMAS the groom. What answer THOMAS made, history records not. An unconscious subject of concentrated taxation in himself, he might have well felt the pressure of the joke too keenly for reply, and only looked unutterable things.

'What's AMMONIA?'——If agriculture, like politics, had its 'Punch' or its 'H. B,' would not this be the corresponding question? From the stable and the cow-house, from the farm-yard, from the mixen, from the creaking dung-cart, from every heap that dots the laboured field, there rises into the atmosphere a certain tributary essence which if anything could be said to be omnipresent to the farmer's senses, to invite his curiosity, to dog his steps with 'inward questionings of outward things,' it would be this curious compound gas, this spirit that is ever floating around him, ever flitting from his grasp, this EURYDICE that the instant his senses acknowledge her presence is his no longer. In the midst of this eternal exhalation, toiling for it, and by means of it, putting it through an endless circle of productive and reproductive process and experiment, heaping it up as the miser does his gold, yet wasting it like the miser's spendthrift heir, unconsciously using it as the agent and re-agent of all his plans and purposes—the subdominant principle by whose *plus* or *minus* in the sum of life he either accumulates wealth, or sinks into poverty—our agricultural 'John' quietly pockets his hands, and with a calm indifferent *resumé* of voice and manner asks

'What *is* Ammonia?'

We are got so practical now-a-days that the difficulty is wonderful of exciting a belief in anything belonging to the Invisible world. Time was when if DICK the waggoner's boy came into the kitchen some dark night o' Christmas-time swearing that he had seen the Spirit of the old white cow that died in calf-bed last Lady-day, standing in the middle of the fold and beckoning him to come and milk her, the chances were he would create a decided and immediate sensation amongst the party round the fire. But the *ghost of a departed Dung-heap*—oh! come—that 's *too* much!

'What scribble tales—come cease to play the fool:
Christmas is past, and children *gone to school.*'

Of all the impediments to the admission of knowledge into the adult mind, the most obstinate and embarrassing is its *unbelief*. It is the veriest mistake to suppose that the untaught mind remains *empty*—in the sense of an empty vessel, which *at any time may be filled*. The mischief of mischiefs is that if not timely filled with what is true, it gorges itself with what is *not* true. 'Like an unweeded garden grown to seed, things rank and *gross in nature* possess it *merely*.' The partner and exact counter-part of the body in that respect, it *will* have food of some kind. If through the unlucky destiny of youth, it has never been "on the fair pasture made to feed" it "battens on the moor," swelling itself out with error—error more proud than the proudest science that ever veiled its head in silence, at the thought of its own nothingness compared to the VAST UNKNOWN,—more hard and fixed than the sternest efforts or resolves of the mind or body that systematically denies itself to seek the good of others. But never is it more proud, more hard, more tyrannical, than when you come to speak to it of that portion of creation which it cannot *see* or *handle*. From these two bodily senses—the sight and touch—its sole idea of existing things is derived. Talk to it about a cart-load of dung, you talk the language of an ordinary rational being; tell it that the essence, the spirit, to which this mass of matter owes its fertilising power, is an invisible gas that would find itself not incommoded within the space of a few quart bottles!—instantly you become before its pitying eyes a 'mere Theorist,' to be listened to, if at all, out of very charity and patience.

How are you to prove it? By no earthly means at hand! Why? Because 'Proof' implies not only a prover, but a mind to which the proof when given is intelligible. Translate the adult man back to childhood, educate the faculties within him, and he becomes the conscious owner of other senses besides 'seeing' and 'touching,'—senses far more certain and reliable,—mental sight, and mental touch, as infinitely superior to the deceptive bodily organs which are ever being imposed upon, as the purest ammonia is to the barren residue of a fire-fanged dungheap.

Aye! charm back the 'practical' opinionated man into the simple school-child. Eradicate the ingrained error that has hardened through thirty or forty summers and winters into fixed and habitual falsity of idea about the comparative importance of the visible and invisible in the creation around him, attaching the notion of reality and unreality as inversely *to the facts* as if he put Darkness for Light and Light for Darkness. Undo all that—tear it off—and return the grown-up man to the inquisitive docile child he was (actually he!) some 'forty year ago'—and how easily might you *then*, without doubt or difficulty, address him thus.

'Now my little man—you rosy-cheeked merry rogue, come here! You are going to be a Farmer: so come and learn the FIRST LESSON.'

The 'air' which we are all so busy breathing, without thinking of it, day and night, and which scientific folks call the 'atmosphere,' is a body—just as water is, only not so thick and heavy—which surrounds and clings to the Earth like the peel round an orange; but with this difference, that the orange-peel is equally thick throughout, while the atmosphere, like wool piled in a loft, is thicker at the bottom, pressed down by its own upper weight, against the Earth. Whatever gases or exhalations rise from the ground—as from a smoking dunghill *seen* on a frosty morning—rise only to a certain height, till they find their level, which is not very far. They don't go to some imaginary 'nowhere' up above the clouds; but the clouds rather show us about the height to which, at most, they ever *do* go. Now this particular gas, ammonia (consisting of two

gases which we will not speak of separately now), happens to have a strong affection for water, especially in its purest state; so when the clouds turn to water and come down, which they have a habit of doing under certain electrical conditions which we needn't trouble about at present, down comes the ammonia with the rain, giving to it a most delicious scent, especially if it has not rained for a long time before, and the quantity of ammonia collected in the air is considerable.

This same gas has one remarkable property, among others: it loves those, and falls on those, and blesses those who prepare for it and receive it kindly. It falls with the occasional shower, not to mention the nightly dew, to an extent exceeding *a hundred and fifty pounds weight* annually* on every acre of land. But, like that dew, it hates a stale surface. On a road, a neglected fallow, on any hard impervious sun-baked surface, it absolutely refuses to perch or settle: so if you wish to attract its sweet and sovereign influences—*stir the surface*—nay, keep it continually stirred; and no matter how coarse the subsoil you have brought to the top, the quantity of ammonia you may absorb in a single summer is such that, you may laugh—or mourn, as you please—at neighbor Drychaff's dung-cart, that creaking hearse that is carrying to the field the dead body whose departed spirit has descended weeks and months ago upon your acres, by the care you have taken to attract it. You may 'call spirits from the vasty deep' and from the dry land, and from every dung-hill, or other mass of decaying animal or vegetable matter for miles around you; and 'they will come when you do call for them,' which is more to the purpose—*if* only you will do one thing,—keep your soil in the condition to attract, receive, and *retain* them. Observe these three words, for there are some things that attract but do not retain,—rain-water for instance, which as it falls attracts all the ammonia of the air but parts with it again to the bare fallow it falls upon, which, again, *receives* but does not retain it; for the hot sun of July and August, as it glares on the unshaded field, draws the light spirit up again; and if you will stoop down and look along the ground on a bright hot day, you may sometimes even *see* it dancing and flickering to the eye, like a sort of bright tremulous sea of vapour. I do not tell you this is *all* ammonia; but it is that condition of the air in contact with the ground, in which ammonia is most constantly escaping, owing to its *affinity* for moisture, whether in the shape of vapour or rain. Now of all the attracters and retainers of ammonia, the most powerful and staunch, as Professor Way will tell you, and *show* you,—is fresh-broken loamy clay—provided only that you keep it pulverised and surface-moved, presenting a fresh morning face from time to time, and a deep hearty *free* welcome into its very bosom. Once get the spirit there, and it will stop.

But what to do for *shade* and shelter through the hot evaporating months of July and August?

A plan has been recently improved upon and perfected by which this desideratum is attained—by one of those happy accidents which escort and cheer the steps of true discovery—in the course of a system of Wheat-growing on clay soils, by which the field is sectioned into strips of Wheat and fallow, whereby the growing corn as it rises into stem closes over the alternate beds of rich fresh undersoil dug up and spread over the top mould, the previous autumn, before the winter's frost; and which, supported on its soft feather-bed below, has been during the spring and early summer, continually manured with this ammonia—Nature's own quintessence of the dungheap—distilled in the alembic of the air, and precipitated upon the fresh thirsty beds by her own minutely dividing and evenly apportioning hand—better than any dung-fork.

And only think that there are people professing to write about agriculture, who have the hardihood to assert that this is "opposed to every known principle connected with the cultivation of grain-crops, which the *experience* of man has *enunciated!*" When *you* grow up and write about the 'principles *connected with* the cultivation of grain-crops,' my happily in-'experienced' young farmer, mind and learn the meaning of words before you attempt to pronounce upon 'principles.' '*Experience*' does not '*enunciate.*' But Language does: and sometimes very significantly; exposing with an occult adroitness of its own the very source and centre of the error it seemed to be the tool of.

That extra cultivation would to a certain extent supply the want of manure, especially for grain-crops, is an 'experience' and a 'principle' as old and well-known as any in the whole round of husbandry. To *how great* an extent it will do so, few have attempted to prove. It is on this very point that 'experience' is sadly in the rear. *Why* it does so *at all*, has but recently received explanation; but that explanation has opened up such a mine of enquiry and experiment in the laboratory of Mr. Way; and has lately been illustrated by *facts* so well attested and deeply interesting in the fields of Mr. Smith, that the very sneer may be welcomed which provokes a more useful argument than its own, on such a problem, at the present moment, as the cultivation of clay soils. *H.*

* Dr. Fownes, Highland Agricultural Journal.

## HINTS TO PURCHASERS OF MANURES.

There is certainly nothing in the cultivation of crops that an agriculturist ought to be more particular in ascertaining than the true composition and value of the substances which he adds to his land, with the view of obtaining a suitable augmentation of produce; and yet how few there are among the farming class who trouble themselves about taking this precaution.

I am induced to offer the present remarks in consequence of the vast quantity of stuff that is sold in the market as artificial manures, possessing but little intrinsic efficacy; some of them with high-sounding names, and patented too, as if such distinctions can add anything to the scale of their worth. Now, the fact is, there exists in the preparation of many of these as much humbug and rascality as we find practised in matters of law. That there are some among them, however, which form an exception, inasmuch as benefiting by their application the crop raised, to a certain extent, I will not deny; but the question is, how far does their money value correspond with the result eventually derived therefrom? If the increase of crop obtained yields no more than will cover the cost of the application, it must, of course, be considered a failure. I have, unfortunately, myself been considerably duped, by placing too implicit a reliance upon the infallibility of various of these manures, as I was led to believe, by their vendors; whereas, in my practical trials, I could seldom discover any advantage to arise from them at all, equal to the expense incurred in their purchase. It may be said, that in procuring the article from parties of known respectability and integrity, these occurrences will be guarded against. But such is not always the case. Many of the manufacturers, although they may be very upright men, with regard to character, are but little, if at all, acquainted with the principles of chemical combinations, affinities, and changes. They fancy that by mixing together certain proportions of this and that elementary substance, which they have learnt from books or other theoretical sources, constitute a part of the food and construction of plants, their compound must prove to be of first-rate excellence, without taking at all into consideration how completely altered in their properties the respective ingredients used may have become by their action upon each other. Nor is it alone relative to the more complicated compositions that this circumstance will apply, for many of the more simple substances also offered for sale in the manure market are improperly prepared. I shall take, for instance, superphosphate of lime. Dr. Anderson, the talented and scientific chemist of the Highland Agricultural Society of Scotland has shown, as may be seen by a reference to their published Transactions, vol. 5, that the commercial superphosphate analysed by him, actually contained no *super*-phosphate at all, and that its money value was 1*l.* 5*s.* per ton less than the kind prepared as it ought to be! In further support, also, of the accuracy of what I have above stated, relative to the blending together of sundry substances, I was myself induced to form a compound as follows, each ingredient having been procured from a most respectable manure merchant in town:—

| | | Cost. | | | Parts in 100. |
|---|---|---|---|---|---|
| 98 lbs. | dry urate (prepared by precipitating gypsum in urine) ... ... ... | £ 0 | s. 1 | d. 4 | 29.56 |
| 56 ,, | superphosphate of lime ... ... | 0 | 3 | 6 | 16.224 |
| 42 ,, | sulphate of ammonia ... ... ... | 0 | 6 | 0 | 12.168 |
| 28 ,, | sulphate of soda ... ... ... | 0 | 1 | 6 | 8.112 |
| 21 ,, | sulphate of magnesia ... ... ... | 0 | 1 | 10½ | 6.84 |
| 14 ,, | sulphate of potash ... ... ... | 0 | 3 | 0 | 4.56 |
| 21 ,, | nitrate of soda ... ... ... ... | 0 | 2 | 7½ | 6.84 |
| 14 ,, | nitrate of potash ... ... ... | 0 | 3 | 6 | 4.56 |
| 14 ,, | chloride of potassium .. ... ... | 0 | 2 | 7½ | 4.56 |
| 28 ,, | chloride of sodium (common salt) .. | 0 | 0 | 4 | 8.112 |
| 336 ,, | or 3 cwt. | £ 1 | 6 | 3½ | 100.000 |

Now, as this mixture apparently contains every element in the way of ammonia, alkaline substances, acids, &c., proportionately divided, that are found to enter into the structure of plants, I certainly expected that it would have proved at least equal, if not preferable, to guano, its cost amounting to about the same as the best Peruvian. Conceive, then, my disappointment at receiving the annexed analysis of it made by Dr. Anderson, together with the accompanying letter, viz.—

| | |
|---|---|
| Water ... ... ... ... ... ... ... | 11.013 |
| Organic matter ... ... ... ... ... | 4.826 |
| Peroxide of iron and alumina ... ... ... | 1.154 |
| Phosphate of lime ... ... ... ... ... | 4.941 |
| Common salt ... ... ... ... ... ... | 5.275 |
| Sulphate of soda ... ... ... ... ... | 4.759 |
| Sulphate of potash ... ... ... ... ... | 4.230 |
| Sulphate of ammonia ... ... ... ... | 4.178 |
| Gypsum ... ... ... ... ... ... ... | 34 374 |
| Carbonate of lime ... ... ... ... ... | 10.946 |
| Carbonate of magnesia ... ... ... ... | 3.342 |
| Sand and insoluble matter ... ... ... | 11.151 |
| | 100.189 |

"Edinburgh, July 3, 1850.

"Enclosed, I send you the analyses of the manure you forwarded to me. I have made a careful analysis of it, because I think that the only way in which its value can be determined. The other sort of analysis to which you allude is merely the determination by tests of the absence of adulteration in such substances as nitrate of soda, or the like, a method totally inapplicable to the more complex manures, such as this. The manure seems to be made by saturating gypsum with cows' urine, and I do not imagine its value to be very high, certainly very far inferior to that of guano. Thomas Anderson."

Now, here is a most material discrepancy manifested between the substances I originally employed and their analysis subsequently. That a chemical action from their combination would take place, and produce a change in some respects, I was perfectly well aware of, but the analysis especially tends to show that adulteration of the simple ingredients must have existed to an enormous extent, reducing, indeed, the value of the compound, I may say, to one half of its cost, or even beyond that; and hence the necessity of caution being exercised with regard to purchased manures, either simple or compound.

So as that the farmer may be protected from the risk of disbursing his money unprofitably, in supplying himself with any of these portable manures, I would strongly recommend his insisting to be furnished, along with the commodity, by the party from whom it is obtained, with a minute analysis thereof, and when received, his having it again submitted to the investigation of an adept chemist employed by himself. The facilities afforded by means of the agricultural societies now established throughout the country, will enable him to effect this, without any difficulty, at a very moderate charge, and he will, no doubt, find the trifle thus expended well laid out. In this way all fraud or disappointment may be averted, as he will thereby be made fully cognisant, previous to his purchasing, of what the manure is composed, and can have his remedy if, upon delivery, it should differ in quality from the statement given. Without such information it is in fact like "buying a pig in a poke."

With the guano supplied by Messrs. Gibbs, a certificated analysis may always be had from them, and the price of the article is regulated according thereto, by which means the purchaser may be satisfied that he is fairly dealt with. By thus mentioning them, however, I beg to say, that I possess no interested motive whatever, being wholly unacquainted with them personally; indeed, never having even seen, to my knowledge, any member of their establishment. I do so merely because I have invariably found every reason to be satisfied with what I have on sundry occasions obtained from them; but there are, no doubt, also others in the trade who may be depended upon acting quite as honourably.

In a very able statement and numerous analyses of Professor Way, published in the Journal of the Royal Agricultural Society of England, Vol. X., he has most distinctly and satisfactorily demonstrated that, with regard to genuine guano, the purchaser obtains his full money value at the price now charged for it in this country. How far the same may occur in respect to the other manures of commerce in the market, simple or complex, or those that are home prepared, it is, of course, impossible for me here to determine. All I can repeat here to the reader is, in concluding my subject, let him take care to ascertain that such is really the case, before he parts with his cash, whether the commodity be patented or not. *Ver. Sap., Nov.* 28.

## UNDER-DRAINING.

All wet soils must be thoroughly drained, to render them in a fit state to be cultivated with the greatest advantage, whether the wetness arises from springs or surface water. After the land is drained, open furrows will seldom be required; if they are, the draining, in all probability, has been ineffectually and partially executed, and consequently the land will be only in a slight degree improved. One main object in draining is to admit the whole of the rain-water to percolate through the soil and subsoil, carrying with it air to the subsoil, and leaving the greater part of any fertilizing matters it contains in the surface soil, rendering the one more fertile, and gradually altering and ameliorating the texture of the other. When water is allowed to escape by open furrows it must carry with it a portion of the soil itself, together with some manure that may have been carried on the land at a great expense, with all the fertilizing matters the rain-water may itself contain. In this case, the subsoil remains unimproved, instead of gradually becoming ameliorated by a frequent percolation of water through it, and consequently a free admission of air into it.

There are two great points to be attained by effectual under-draining; first, to admit the rain-water to pass freely through the soil and subsoil, and, next, to render the surface soil in a more fit state for cultivation; and to produce better crops. Rain-water and air, it is now known, play a more important part in the economy of the vegetable kingdom than was formerly supposed.

Much has been said and written on the subject of deep and shallow draining. The proper depth to make the drains in clays and strong land will depend entirely on the capacity of saturation of the subsoil. During the descent of the water through the soil and subsoil, the drains cannot act any more than they would placed in a dry sand or gravel; but immediately the subsoil becomes saturated, the water ceases to descend, but rather to

ascend in conjunction with that which reaches the surface soil in rain. The drains prevent the ascending water rising above their level, and saturating the soil above. During rain, there is a constant percolation of water through the soil and subsoil, until it arrives at the level of the drains, below which the subsoil is already saturated, and cannot absorb more; and the drains prevent saturation above their level, except that arising from capillary attraction. Deep draining is, no doubt, most effective, by preventing the water rising near the surface by capillary attraction, and reducing the temperature of the soil; and, in land in which saturation of the subsoil commences at a great depth, it is clearly the proper system. On very retentive land, such as the Wealden clays, where saturation commences near the surface, shallow draining must be adopted. Were deep drains made here, they would not act until after a long period —many days after rain—and much mischief, probably, had been done to the surface soil on land of less stubborn texture, drained by placing some of the drains deep, and others shallow. The deep drains would be the first and the last to act; indeed, the shallow drains could not act at all, except during, or after, very heavy and sudden falls of rain, so that the subsoil should become saturated up to their level, in consequence of the deep drains not having the capacity to carry off all the water, or keep it down to their level; and it would be physically impossible for the shallow drains to act unless this took place.

Drains cannot act until after the subsoil below them is saturated by the rain-water, or until the water is arrested in its descent, and saturation is ascending. In clays drains carry off ascending, and not descending water.

All clays lose much of their moisture during the summer, and generally become hard, dry, and cracked —the cracks, or fissures, extending sometimes to the depth of several feet. During the autumnal or winter rains, the land again becomes saturated, and when this has arrived at, or risen to, the level of the drains, they begin to act, and not before. This is the correct theory on under-draining clays - and it explains the cause of upright drains—made directly up an ascent, being more effective than those laid across a hill or rising ground.

In draining clays, and other soils, a stratum of sand, or mingled sand and clay, is occasionally found at various depths—this holds the water. If the drain-pipes were laid in this stratum of sand and clay, a large body of water would constantly stand at their level, and would probably rise near the surface by capillary attraction. Therefore, to drain this description of land effectually, it is indispensable to place the drain-pipes a few inches below this stratum, with the clay beneath. In this instance, the water does fall into the drains—indeed it may be termed draining diffused springs.

To illustrate this theory of draining clays in a very simple and intelligible manner, let us suppose a barrel placed on one end, the uppermost end removed, and the barrel filled with mould, and drain-pipes inserted through the bung-hole across the centre of the barrel, with some substance placed round the outside pipe to prevent the escape of water between it and the edges of the bung-hole; then pour water continuously on the mould from a watering-pot with the rose on, that the whole surface of the mould may receive an equal quantity. The water will descend through the mould to the bottom of the barrel, passing the pipes, and not entering them; from thence it will rise and saturate the mould until it reaches the drain-pipes, which will then carry off the ascending water, and prevent saturation above them.

When a field is to be drained, and doubts are entertained of the proper depth to make the drains, it might be advisable to make, during the dry weather in the autumn, three short drains, 30 feet apart, and parallel to each other, one 5 feet deep, one 4 feet, and the other 3 feet. The proper depth for draining that soil would then be ascertained soon after the commencement of wet weather, and in time to execute the drainage that season.

No precise depth can be stated for making the drains either in clays or land wet from springs; capacity of saturation in one, and the position of the water in the other, must determine the necessary depth of drains. *W. C. Selby, Ightham, Kent.*

## Home Correspondence.

*Peat.*— There is a description of peat in Ireland, known by the name of "stone turf," which, if thoroughly dried and reduced to powder, would probably answer the purpose of fixing the ammonia of manure, without charring. It would be worth the trial, as the present price of prepared turf is too expensive for general use. Perhaps some of your readers, who have the means of testing the experiment, will do so, and report the result in the *Agricultural Gazette*, for the benefit of agriculturists. *Falcon.*

*Pinguedo.*—In reply to your correspondent "T. J.'s" inquiry, I beg to state that the "Pinguedo" is not sold nor manufactured by anybody now. In the years 1846 and 1847, I used to prepare it, and as "novelties" are never taken particularly by farmers, I discontinued the manufacturing of it; but knowing by experience that it does great good to all kinds of crops, and particularly to Wheat (which, by this artificial manure can be grown year after year), I thought proper not to be selfish, but to give the world the benefit of my discovery, and to expose its composition in the *Agricultural Gazette*, at page 716. Any one can mix the ingredients himself, and without much trouble or expense. The salts so named can be had at any drysalter's. I advise some of the artificial manure manufacturers, who advertise in your paper, to start the "Pinguedo" on a large scale, as it will pay well; provided they will still call it by the name I gave it, "Hopkins' Pinguedo." *J. W. Hopkins, Woodfields, Ashton-on-Mersey.*

*Liquid Manure.*—I have tried, as recommended by the *Gazette*, diluting liquid manure with water, in order to destroy the powerful smell, when using it on Grass, or in the garden, without the remedy having the desired effect. I have many hundred gallons of liquid manure in two deep wells, which I shall be obliged to lead into an adjoining brook, unless I can discover something to fix the perfume. If this note should catch Professor Way's eye, perhaps he will be kind enough to give me his valuable advice, as to the best means of depriving the liquid manure of its disagreeable qualities, without injuring its efficacy, as a fertilised charcoal or charred turf will not answer, as the mixture must be pumped out. *Ammonia.*

*Potatoes.*—Your directions in the last Number of the *Agricultural Gazette*, as to the best manure for Potatoes, are valuable, and calculated to be of great use to farmers; but there is one omission, much felt by practical farmers. This is, an uncertainty as to the mode of applying the different compositions recommended by you. In particular, should the compositions of guano, sulphates, &c., be mixed with the dung—or gently spread in the seed drills —or top-dressed? The two first plans of mixing with dung and scattering in the drills, I have tried, and my Potatoes are not quite so good as my neighbours'. *J. Murdoch Campbell.* ["W. D. S." will perhaps be good enough to explain more fully.]

## THE SMITHFIELD CATTLE SHOW.

We shall now ask our readers to walk round with us and notice some of the individual animals among the large number exhibited.

The first in Class I. is a roan short-horn steer, exhibited by Mr. Brickwell, of Leckhampstead, near Buckingham, weighing somewhere near 11 cwt. —a square, well-formed animal, of good quality, slightly deficient in the shoulder points, and drooping slightly in the back. It received the 2d prize of 15*l.*

3 is likewise a roan short-horn ox, exhibited by Lord Feversham, which may be described as not deep enough in the flank; his neck is too small; he is not fat enough; otherwise he is the best beast in the yard; he is a large, well made beast, and his faults are very slight; and his condition, were it improved, would cover them. He is descended from the well known herd of Mr. Bates—from his well known "Duchess" family.

4 is a very level well-formed beast, with very deep, good, wide, fore quarter; light offal—a Hereford ox, shown by Mr. Heath, of Ludham Hall, near Norwich; a perfect model of a beast, weighing at least 12 cwt. He received the 1st prize of 30*l.*

6 is a Hereford ox, shown by his Royal Highness Prince Albert, and received the 3d prize of 5*l.* He is remarkable for the firmness and exeellence of his flesh, and that is all that can be said in his favour, for he is by no means well formed, having high hips, with drooping rump, and thin thighs; and we should certainly have preferred seeing the prize that he received awarded elsewhere.

7 is a Devon ox, shown by Mr. Hole, of Dunster; he has good fine fore quarters, with low loins, but well covered; rather deficient in hind quarters, and rather a small beast.

8 is a Durham ox, shown by Mr. Leeds, of Lexham, in Norfolk; the heaviest beast we have yet seen, weighing at least 15 cwt. He is a fine gay looking animal, with deep and wide fore quarters, a very round well formed body, and deep flank; good twist; its flesh might have been firmer; but it is a better beast, in our opinion, than that of his Royal Highness Prince Albert.

9 (Hereford), is a straight, evenly covered little beast, deficient in its hind quarters. Exhibited by Lord Warwick.

12 is a short-horn ox, from the stock of Lord Spencer, shown by Mr. Herbert Langham, of Cottesbrook, in Northampton. He has a fine head and fore quarters, with broad back, but narrow loin; rump and flank good, but as a whole a plain beast.

13 is an ox for the most part short-horn, exhibited by Messrs. Martin, of Aberdeen; he has a nice head, good chest, fair loin and flank; droops a little in the rump; the twist might have been better.

14 has a good head and fore quarters; chest and crop are good; flank and twist pretty good; the fore loin rather narrow. Shown by Mr. White, of Harlow.

15 a short-horn, of rich roan colour, good quality, having a good head, deep and well developed chest, wide and well covered hip, good rump; altogether a good animal, but rather patchy. The whole class contains many good animals, though it does not come up to the quality shown by some of the other classes.

Class II.—Oxen between 3 and 4 years old, contains 26 beasts, among which we may name a few.

17 is a short-horn ox, shown by Lord Exeter; it has a good "crop," wide chest, wide and well covered loin, with good flesh; "plates" not good, and it droops a little in the back; tail set on too high; altogether is a very useful beast, weighing probably nearly 12 cwt.

18 possesses good head and fore quarters, and is well and evenly covered with good flesh. Hind quarters, rump, twist, and flank, very good. Fore loin somewhat deficient, but a very compact beast. Shown by Mr. Coombe, of Taunton.

20 carried off the 1st prize in this class (30*l.*). He is a well formed animal, evenly covered with first-rate quality of flesh, and looks a beautiful specimen of the Hereford breed. He might have been a little heavier in the flank. He is the best beast we have yet seen, and deserves the Gold Medal, which he received; as the best ox in the yard. Shewn by Mr. Longmore, near Ludlow.

21 (Hereford), has good head and fore-quarters, and plates; quality good, deficient in his rump and buttock; shown by Mr. Maydwell, of Ashstead, Surrey.

23 (Short-horn), shown by Mr. Stratton, of Swindon, was deservedly commended by the judges. He is got by a son of "Sir T. Fairfax," the winner at Bristol, and possesses a good deal of his style in the fore-quarters, but is firmer loined.

25, shown by Lord Fitzwilliam, is a square useful beast, head not very stylish.

26 (Devon), shown by Mr. Fouracre; has good fore-quarters, and good quality of flesh, and light offal; but slightly defective in hind quarters.

27 (Hereford), shown by Mr. Heath; received the second prize in its class. It had a good head, and good quality of flesh, loin, rump, twist, and flank good. He is remarkably evenly covered with very good flesh, but might have been a little better behind the shoulders.

29 is a good Hereford ox of remarkably good fore-quarters, chest both wide and deep, with very full plates, well covered with fine and good flesh, rather drooping in the rump. It received the third prize in its class.

31, a good short-horn beast, of large frame and fine fore-quarters, good quality, its twist and flank might have been deeper; shown by Mr. H. Hall, of Willesden.

32 (Hereford), head, fore-quarters, plates, flank, and twist, good and firm, and has good quality of flesh. Shown by Mr. Niblett, of Filton.

34 (Hereford), is a very compact evenly covered beast, of good quality. Its loin is good, and its flank hangs well, but it might have been heavier. It is deservedly "highly commended" by the judges, and is shown by Mr. Beisley of Romsey, Hants.

35 is a good Hereford ox, with good head and fore-quarters, and of good quality; hind quarters slightly defective. Shown by Lord Hatherton.

36 is a very straight, well-proportioned, fine looking animal, of good quality; if kept till another year, he would be a very "clever" animal. Shown by Mr. Kinder, of St. Alban's.

38 is a fine straight beast, with good flank, and hind quarters of nice quality; shoulders rather heavy, and plates might have been better. Shown by Mr. Marjoribanks, of Watford.

40 (Short-horn, shown by Mr. Drory, of Long Sutton, Lincolnshire), is of rich colour, good head, deep fore-quarters, plates and crop good, very deep and round in body, of good quality, perhaps too loose in flesh, good hips and rump, loin not wide enough, flank and twist fair; a very thick good beast, and if he had been firmer in his flesh, would have had a chance of being rewarded by a prize.

Class II. contained a large number of beasts, and generally of good quality.

Class III.—Oxen, above 2 and under 3 years old.

42 is a pretty little thick useful beast (short-horn), evenly covered with firm good flesh. Shown by Mr. Frost, of Linton.

44 (a cross-bred Devon and short-horn ox), is of very nice quality, rump and hind quarters pretty good, stands very nicely on its legs. Shown by Lord Leicester.

46, shown by Mr. Griffin, of Peterborough, is a very even fleshed animal, with good head and fore quarters, rump might have been a little better—altogether a very useful beast.

47, Mr. Thomas Bond showed a small Devon steer, having nice fore quarters and good flank, but rather narrow rump.

57 (Hereford, shown by H.R.H. Prince Albert), received the 2d prize in its class; a nice well formed beast, with very good fore quarters, chest wide and deep, plates good, evenly covered with good flesh; flank, loin and twist good; rump drooping, as in the other animals bred in the same neighbourhood, shown by his Royal Highness in the other classes. In other respects, No. 51 is a very clever animal.

52, a larger framed animal than 51, with good fore-quarters, and better twist than 51, but not so firm in flesh; he stands well. Shown by Mr. Niblett, of Filton, and received the 3d prize in its class.

54 (short-horn), a handsome animal, with good head and fore quarters, and rich colour. Shown by Mr. Newbath, of Sleaford.

55 (Hereford), good head and fore quarters, well filled in all points with good flesh, received the 1st prize in its class. Shown by Mr. Phillips, of Wantage.

58 is a cross animal between the Brahmin and short-horn breeds; a slightly formed but good sized animal, and fat. Shown by the Earl of Derby.

Class IV.—Oxen under 90 stone weight.

61 is a pretty little Devon ox, head and fore quarters good, well covered with good flesh; hind quarters might have been better. Remarkable for its lightness of offal. The 1st prize in its class was awarded to it. Shown by Lord Leicester.

62 received the 2d prize. Good head, plates, and crop; shoulder rather bare; loin, hips, flank, and rump good; full twist; firm good flesh. Shown by Mr. Maydwell, of Ashstead, Surrey.

67, shown by Prince Albert, is rather a compact, thick, useful beast, well covered with good flesh; rump good.

Class V.—Oxen under 80 stone weight.

76 (Devon, shown by Lord Leicester), received the

1st prize in its class. A small perfect animal; if faulty anywhere, it is in the hind quarters; fore quarters beautiful.

77, Mr. Frampton, of Farringdon, showed a nice fleshed, thick, useful Hereford ox.

78 (Devon) carried off the 2d prize. Good head and fore quarters; flank and quality good; light offal; narrow rump. Shown by Mr. Bond, of Taunton.

80, is a very thick, useful Scot, very compact, and well covered with good flesh. Shown by Mr. Rob, jun., of Thirsk.

81, another West Highland ox; is a very fine beast, perhaps not so compact as the other.

Class VI.—Oxen of any age, of Scotch, &c., breeds.

85 received the prize; it is a thick, useful beast. Shown by Mr. Kinderley, of Pembroke.

88, a very nice, thick, well-formed Scot, with nice head and horns; remarkable for excellence of hair. Shown by Mr. W. M'Combie, of Alford, Aberdeen.

91 is a very thick, useful, and fairly-formed beast. Shown by Mr. Rob, of Thirsk.

92, well-formed, but might have been evener in flesh. Shown by Mr. Jonas, of Ickleton.

93 (Scot), a fairly-formed beast; loins might have been wider. Shown by Mr. Knowles, of Aberdeen.

94, shown by Mr. Rob, has better loins, but is rather a smaller animal.

95 (Scot), of good size, well-formed, with even, good flesh. Shown by Lord Aylesford.

96 (West Highland ox), a noble looking beast; crop might have been better, but a fine animal.

Class VII.—Cows and Heifers under 5 years old.

101 (Short-horn) is a nice square well-formed beast; very good loin, shoulder points rather bare, plates not deep enough, but of good quality; commended by the judges; shown by Mr. Healy, of Folkingham, Lincoln.

102, a beautiful well-formed beast; all points up well and good; very nice head: 1st prize, 20*l.*; shown by Mr. Druce, of Eynsham.

105 well deserves the 2d, which it received; got by a son of "Sir T. Fairfax;" shown by Mr. Stratton, of Swindon; the only fault is a deficiency in the rump; colour rich roan; altogether a beautiful looking animal.

106 is a good strong useful beast, with firm flesh; shown by Mr. Calthorp, of Deeping Fen.

107 is a well-formed beast, broad in the back and loin, and good twist; flesh very hard; shown by Mr. Gurney, of Easton, near Norwich.

108, altogether a nice beast, and deservedly "commended" by the judges; shown by Mr. Phillips, of Wantage.

111 (Short-horn; shown by Mr. Niblett, of Filton) is a nice little beast, of good quality.

112 received the 3d prize: good head, and fore quarters, evenly covered with good flesh; shown by Mr. Phillips; every point full and good; altogether a first-rate animal, and there are few better in the yard.

115 (Devon) is a pretty little beast, of good quality, with narrow rump; "highly commended" by the judges.

120, a very neat, good fat beast, a cross of Brahmin and Ayrshire, and a better animal than the other individual of the same cross named before; exhibited by Lord Derby.

Class VIII.—Fattened Cows over 5 years old.

121 (Short-horn), rich roan, a good head, and a good broad back, capital loin, and is in every respect a very "clever" animal; twist might have been better. It received the 1st prize. She is a very stylish, and even grand cow, from the herd of Mr. Bates. Her loin is remarkable, and quality good, the union of which is characteristic of Mr. Bates' stock. Shewn by Lord Feversham.

122, good wide hind quarters, quality good, but far inferior to 121; received the 2d prize; shown by Mr. Gillett, of Wheatley.

Class IX.—Fattened Cows of 5 Years old, that shall have had Two Calves.

125 is a large-framed animal, of good quality, with great patchy rump, thin thighs, and not good twist; she received the 1st prize in her class; shown by Mr. Holland, of Halifax.

127 is firm, and evenly fleshed, straight, with good twist and hind-quarters; shown by Mr. Hicks, of Newbury.

129 is a very pretty, well-formed animal, of rich colour and good quality—very good indeed; shown by Mr. Beman, of Moreton-in-the-Marsh; received the 2d prize, and *ought to have had the first.*

132, a short-horn, shown by Sir C. Knightley, Bart.; head and fore quarter not very grand; flank fair; hips, rump, and twist first-rate.

Extra Stock.

66, a remarkably good Hereford ox; might have been more even, but of firm good flesh. Silver Medal.

139, a very large polled Scot; if well fatted would have been a tremendously large beast; length, 6 feet 3 inches; in girth, 9 feet 3 inches; height, 5 feet 10 inches. Shown by H.R.H. Prince Albert.

In this class various breeds are exhibited, but nothing very remarkable is shown.

SHEEP.

Class X.—Fat Wether Sheep of any Long-woolled Breed 1 year old.

155 (Leicester), a very equal pen of Leicester sheep; good backs, rumps, and plates; good wool; good head and neck. Shown by Mr. Bradshaw, of Oakham, and received the 1st prize in the class.

156 (Leicester), good size and quality; wool good. Shown by Mr. Walmsley, Bridlington. 3d prize.

159, very good sheep; nice looking heads, good wool; received the 2d prize. Shown by Mr. Hall, of Bawtry, Notts.

Class XI.—Fat Wether Sheep 1 year old, under 220 lbs. live weight.

164, pretty little sheep. Shown by the Marquess of Exeter, and received the 3d prize.

168, heads fair, back and plates good, wool fair; 2d prize. Shown by Mr. Pulver, of Kettering.

171, good heads, broad backs; plates, rumps, and legs good; 1st prize. Shown by Mr. Willmore, of Leicester. One sheep in the pen somewhat faulty in the back.

Class XII.—Fat Wether Sheep—Long-woolled.

173 received the prize; Cotswold sheep shown by Mr. Beman, of Moreton-in-the-Marsh; very useful sheep of fair quality.

174 are larger framed sheep than 173, not so much wool.

Class XIII.—Cross-bred Wethers.

188, a pen of cross-bred sheep shown by Mr. Druce, characterised by frames of good quality, with good wool; neck, back, and plates good—an excellent cross; received the 2d prize.

189 well deserved the 1st prize, which they received. Shown by Mr. Overman, of Burnham Market, Norfolk. Heads pretty, wool very good; compact sheep.

In Class XIV. Mr. Overman again carried the prize for his smallest pen of cross-bred wethers, of the same character as those in 189.

Class XV.—Fat Wether Sheep of Short-woolled breed.

202, Mr. Sainsbury's pen of southdown wethers carried the second prize; they are characterised by well-formed frames, pretty heads, and good wool, backs broad, and legs good.

205 is a pen of good sheep, good in every point, altogether well formed sheep, "highly commended;" shown by Messrs. Askcoll, of Eastbourne, Sussex.

211, the most perfect sheep in the yard, too much cannot be said in their praise. They deservedly received the first prize and gold medal; exhibited by His Grace the Duke of Richmond. No. 1, the length 4 ft., girth 4 ft. 9½ in.; No. 2, length 4 ft., girth 4 ft. 10½; No. 3, length 4 ft. 1 in., girth 4 ft. 7 in. These sheep were weighed and were within 2 lbs. weight of one another, so evenly matched.

Class XVI.—Short-woolled Fat Sheep, under 200 lbs. live weight.

213, Mr. Sainsbury's pen gained the prize; heads very good, a good deal of wool, neck, back, and legs very good; very well matched.

216, the pen shown in this class by the Duke of Richmond are very good, firm, and compact sheep; good wool; not so good a countenance as 213.

Class XVII.—Fat Wether Sheep, 2 year olds.

217, very well made, quality good; heads might have been better. No. 1, length 4 ft. 1 in., girth 4 ft. 9 in.; No. 2, length 4 ft. ½ in., girth 4 ft. ½ in.; No. 3, length 4 ft. 5½ in., girth 4 ft. 10 in. Received the 2d prize. Shown by Mr. Villiers Shelley.

220 is a pen shown by the Duke of Richmond, and of similar quality to 211. They received the 1st prize in their class. No. 1, length 4 ft. 4 in., girth 4 ft. 11 in.; No. 2, length 4 ft. 4 in., girth 5 ft. 1¾ in.; No. 3, length 4 ft. 6 in., girth 5 ft. ½ in.

Class XVIII.—Fat Short-woolled Wether Sheep, not Southdown.

Three pens were shown here, but to none of them was a prize awarded.

Extra Stock.

226 is a very clever sheep, shown by Mr. Sainsbury, and exhibiting the same character as 213. It received the silver medal.

Class XIX.—There was a very good show of Pigs,

243 received the prize; 3 black Dorset pigs, of good quality, good heads, and of good size. Shown by Mr. Coate, of Blandford.

246, Mr. Barber's (of Slough) pigs received the 2d prize; nice quality.

245, very nice little pigs, not so large as 246; shown by Prince Albert.

247, useful pigs, of nice quality, and of great size, if no older than specified. Shown by Sir J. Conroy, Bart.

Class XX.—Pigs between 26 and 52 weeks old.

201, perfect beauties; cannot be too highly praised. They received the 1st prize. Shown by Mr. Coate, of Blandford.

256 is a pen of very nicely bred Berkshire pigs, of good quality. Shown by Mr. Thomas King, of 12, Paddington-street.

Class XXI.—Pigs of any Breed, between 12 and 18 months old.

258 is a pen of good sized black pigs, well deserving the 1st prize, which they have received, and which Mr. Coate, of Blandford, their owner, has carried off in all the three classes in which he has shown.

260 is a pen of Coleshill pigs, shown by Lord Radnor, and receiving the 2d prize. They have beautiful heads, and quality; the cheek almost covering the nose. One pig not so good as the others, or this pen must have carried the first prize. One of these pigs, we think, the best in the yard.

Extra Stock.

263 was an enormous beast. Had had two litters, and was spayed. Weighed 140 stones.

271 was a very fat sow, well formed, and of nice quality, with a good deal of hair. Shown by Mr. Maw, of Tetley.

## BIRMINGHAM CATTLE SHOW.

Class I.—Hereford Oxen.

3 was a well-formed Hereford ox, with good loin. Not very good about the head. Shown by the executors of the late Sir F. Lawley; received 2d prize.

5, head good, chest deep and wide, plates good, evenly covered with fair flesh; shown by Prince Albert, and received the 1st prize; rump drooping, and somewhat deficient in flesh on the shoulder.

Class II.—Hereford Steers.

12, a fair beast, but not very good, shown by Lord Hatherton, received the prize.

Class III.—Hereford Cows.

14, which received the prize, is deficient in shoulder top; twist full, but not well formed, firm flesh, rather a gay looking beast. Shown by Mr. Vaughan, of Leominster.

15, received the 2d prize. Rather a compact beast, somewhat smaller than the last, but better made on the whole. Exhibited by Mr. Hill, of Bridgenorth.

Class IV.—Hereford Heifers.

21 received the 1st prize, although, *having had a calf*, she is, one would suppose, disqualified. She is a fair beast. Exhibited by Mr. Morris, of Therrow.

22, a good beast; points well "up." Exhibited by Mr. Hill, of Bridgenorth, and received the 2d prize.

Class V.—Short-horn Oxen.

28, a large, well-formed, useful beast; not striking in colour, flank not quite deep enough, but a very good animal. Got by the well-known bull "Lord Warden." Exhibited by Lord Spencer.

37 has a beautiful head, and is evenly covered with good flesh; hardly fat enough. Exhibited by Mr. Spraggett, of Warwick, and received the 1st prize.

Class VI.—Short-horn Steers.

47, good crop, fair loin and hind quarter, light flank. Exhibited by Mr. Pulver, of Broughton.

Class VII.—Short-horn Cows.

☞51. The well-known "Lady Thorn," never beaten before, and the winner of many prizes; exhibited by Mr. Towneley. She is now beaten, from her age, by Mr. Beman's cow, 63, and Mr. Wiley's, 54. She is remarkable for fine quality of flesh.

54 is a good fleshed, thick, heavy, useful cow.

63, Mr. Beman's cow, which gained the first prize, is a very good cow, slightly deficient in the crop.

Class VIII.—Short-horn Heifers.

76 is a pretty compact little heifer, of good flesh, and light offal. It received the first prize. Exhibited by Lord Hill.

Class IX.—Devon Oxen.

88 is a very pretty ox, of good form; exhibited by Lord Leicester; it received the 1st prize. Deficient in the chest.

Class X.—Devon Steers.

89 deserves the prize it has received; a very pretty little beast. Exhibited by Lord Aylesford.

Class XII.

A pretty little beast, with rather loose flesh, was exhibited by Lord Leicester, and received the 2d prize. The 1st prize was carried off by a small, compact, firm-fleshed heifer, remarkable for lightness of offal; shown by Mr. Newbold, of Coventry.

Class XVII.

Mr. Rob, of Thirsk, showed a remarkably even lot of Scotch oxen, for one of which he received a 2d prize. Mr. Rob's oxen, both here and at Smithfield, do great credit to his judgment as a purchaser.

Class XVIII.—Scotch Heifers.

Mr. J. Pickthall, of Kendal, exhibited a beautiful little beast; not a nicer animal in the yard.

The show of sheep was an improvement upon that of last year, both as regards quantity and quality. The Leicester prize sheep were remarkable for their size and quality, and the show of Downs contained many good specimens; but our report has already arrived at such a length that we must postpone our further remarks, with those upon the show of pigs, till next week, when we will enter into a comparison of the animals exhibited at the two shows, in point of average weight, as ascertained by measurement.

# Societies.

## ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 10th December; present, the Earl of Ducie, president, in the chair, Duke of Richmond, Lord Berners, Sir M. W. Ridley, Bart., Mr. Ambrose, Mr. Raymond Barker, Mr. John Bethell, Mr. A. Carden, Captain Stanley Carr, Colonel Challoner, Mr. J. W. Clarke, Mr. E. Davy, Mr. Duncan, Mr. Dyer, Mr. Gadesden, Mr. Garrett, Mr. R. F. Gower, Mr. Fisher Hobbs, Mr. Hudson (Castleacre), Mr. Kinder, Mr. Lawford, Mr. Adams, Mr. Mainwaring Paine, Mr. Paul, Mr. Rowlandson, Mr. Shaw (London), Mr. Shelley, Mr. Sollifant, Professor Simonds, Mr. Smith (Exmoor), Mr. C. Townley, Mr. Tunno, Mr. Turner (Barton), Professor Way, and Mr. Wight.

The names of six other candidates for election at the next Monthly Council were read.

Mr. Nesbit favoured the Council with an experimental illustration of his new mode, by which farmers and others, little conversant with chemical manipulation, may, in a simple manner, ascertain whether the guano they are about to purchase is adulterated.—Captain Stanley Carr, on his return to England, gave an interesting statement of facts connected with his observations of the occurrence and amount of guano in different geographical localities.—Mr. Turner undertook inquiries in reference to Mr. Amos Bryant's communications on

cultivation of land.—Professor Simonds reported on the cattle probang submitted to the notice of the Council at a former meeting, and referred to his examination. The result was not favourable to the claims advanced.—Mr. Murcott transmitted a further communication on the Clover insect.—Mr. Parish and Mr. Davy addressed letters to the Council, on the subject of Flax-cultivation and management.—Captain Chapman, R.A., made enquiries on the flooring of barns. Mr. Chivas transmitted specimens of Turnips.

The Council ordered their usual acknowledgments for the favour of these communications.

---

A Special Council was held on Thursday, the 11th of December, for deciding on the prizes to be offered for live-stock at the Lewes meeting. Present: The Earl of Ducie, President, in the chair, Lord Camoys, Lord Portman, Sir M. W. Ridley, Bart., Mr. Raymond Barker, Mr. Barnett, Mr. S. Bennett, Mr. Brandreth, Col. Challoner, Mr. Fisher Hobbs, Mr. Law Hodges, M.P., Mr. Hudson (Castleacre), Col. Hulse, Mr. Jonas, Mr. Milward, Mr. Popham (Littlecote), Mr. Shaw (London), Mr. Shelley, Mr. Sillifant, Prof. Simonds, Mr. Smith (Exmoor), Mr. Turner (Barton), and Mr. Jonas Webb.

The prize sheet was arranged, and the final adjustment of general regulations deferred to the 4th of February.

---

A Special Council was held on Friday, the 12th of December, for receiving the report of the General Lewes Committee, and agreeing to the report to be made by the Council to the ensuing general meeting. Present: The Earl of Ducie, President, in the chair; Lord Ashburton, Mr. Raymond Barker, Colonel Challoner, Mr. Druce, Mr. Fisher Hobbs, Mr. Shelley, Professor Simonds, and Mr. Thompson. The report of the Lewes Committee having been read and adopted, the Council agreed to their report to be made to the general meeting on the following day.

---

The December General Meeting was held at the Society's House in Hanover-square, on Saturday last. The Earl of Ducie, President, in the chair.

The Secretary, by direction of the President, read the following Report from the Council:—

REPORT.

The Council have to report that, since the last General Meeting, 132 Members have been elected; 69 have died, and 149 have been removed from the list, so that the Society consists accordingly of 91 Life Governors, 158 Annual Governors, 690 Life Members, 4076 Annual Members, and 19 Honorary Members, making a total of 5034 Members on the list of the Society at the present time. The Council have filled up the vacancy in their body occasioned by the loss of the Hon. Capt. Pelham, by the election of Mr. Law Hodges, M.P. for West Kent.

The Finances of the Society are in a highly favourable state: the floating cash-balance in the hands of the Bankers being equal to the discharge of current claims; while the Council have been enabled to purchase Stock in Government Securities to the amount of 11,190*l.*, on account of the investment of Life Compositions of Governors and Members, made in accordance with the principle originally laid down as essential to the security of the Society.

The Windsor Meeting has been held, under most gratifying circumstances, and with perfect success. The Members were honoured on the occasion by the gracious presence of her Majesty the Queen, the Royal Patroness of the Society; and his Royal Highness Prince Albert, as one of its Governors, evinced a lively participation in the proceedings of the Meeting, and with kind condescension sat down to dinner, in the Pavilion, with 2000 guests of the Society, whom he most heartily bid welcome to the Home Park. The Mayor and Corporation, and the Local Committee, with the most zealous co-operation, anticipated and executed the wishes of the Council on every point connected with the convenience and accommodation of the Society, and the perfect preservation of the peace of the borough. The Railway arrangements were in every respect as complete as the increased pressure of traffic and the multiplicity of details would allow; and the Stock of the Exhibitors was liberally conveyed free of charge in both directions by the principal Railway Companies throughout the kingdom. The number of the stock, the variety of the breeds, and the high character so great a proportion of the animals exhibited, rendered the Show at Windsor one of the most remarkable, perhaps, that has ever taken place in this or any other country; and notwithstanding the increased expenses attending so large an exhibition, the balance-sheet of the meeting will be found to present a result more favourable to the Society than on any former occasion.

The Council have arranged that the Lewes Meeting shall be held in the week commencing Monday, the 12th of July next. They have also decided on the Prizes to be offered at that meeting, for Agricultural Implements and Machinery, and for Live Stock intended for breeding purposes. The former include important additions, intended to draw the attention of Agricultural Engineers and Machinists more strongly to the different degrees of motive power required by farmers under different circumstances, and to its convenient adaptation to agricultural purposes: and it is hoped that an opportunity will be afforded for obtaining a satisfactory trial of the efficiency of those reaping machines which have attracted so much attention subsequently to the period when the Prize Sheet for Implements was arranged by the Council for the year 1852. The latter comprise distinct classes of prizes for the Sussex breed of Cattle, the Romney Marsh or Kentish Sheep, and Domestic Poultry; having reference respectively to the counties of Sussex, Kent, and Surrey, constituting the district of the Country Meeting to be held next year at Lewes. They have made the rule more stringent by which fines are levied on exhibitors for not sending to the show the stock they have entered, and for which the Society provide accommodation in the show-yard. They have resolved that no prize of the Society shall be given to bulls exceeding five years old; they have limited the competition in the class of agricultural stallions hitherto known as that of any age, to horses that are above two years old; and they have decided to require in the class of three years old heifers not in milk, the same certificate as in the case of in-calf cows not in milk before paying the amount of the prize, namely, a certificate that such in-calf heifer had in due course produced a live calf. The Council have under their anxious consideration two most important questions connected with their Country Meeting: namely, the best mode of appointing the Judges, and the conditions under which their attention should be directed to a veterinary inspection of the animals. The Council consider that the stock to which the prizes of the Society are awarded ought not only in the opinion of the judges to be the best specimens of their particular class in the yard, but that in condition and function they ought also to be fully qualified to propagate their species, without communicating to their offspring any tendency to hereditary disease or imperfection; and in order more clearly to call attention to the circumstances under which such tendency might be apprehended, the Council have offered a prize of 20*l.* for the best Essay on the subject. The Council have received from Colonel Le Couteur the scale of points for Jersey cattle, which has been found so satisfactory in enabling the Judges of the Royal Agricultural Society in that island to arrive at uniform decisions. At his request these points were placed by the Council in the hands of the Judges of Channel Islands' cattle at Windsor; and the award of the first prize in that class, although made to an animal bred in the county of Sussex, as well as the other awards, have, it is believed, given entire satisfaction to the Channel Islands' breeders. This scale of points, and the accompanying illustrations, having been placed at the disposal of the Society for publication, in the hope that an equally successful attempt may be made for other breeds of cattle in England, the Journal Committee have directed their insertion in the ensuing number of the Journal. The Council have given directions for the preparation of a plan of the show-yard at Lewes, and have decided that a pavilion for the great dinner shall be constructed to accommodate 1000 persons. At their request, Prof. Simonds has kindly consented to deliver a lecture in the week of the Lewes Meeting, on such practical and important questions connected with the management and diseases of animals on a farm, as may be considered most interesting for the purpose. The position of Lewes in reference to the Southdown district, its immediate vicinity to Brighton, its connexion by a navigable river with the sea, and its direct railway communication with London and the West of England, will no doubt render it a place of convenient access both to the breeders of Sussex, the members and exhibitors of the Society, and the public generally, who intend to be present at the meeting; while the great facilities offered by the authorities of the borough, and the immediate residence of so many active members of the Society, will secure the most advantageous arrangements for the occasion.

The Duke of Richmond has reported to the Council the progress of the communications he was requested by them to enter into with Viscount Palmerston, her Majesty's Principal Secretary of State for the Foreign Department, on the subject of a cheap and abundant supply of guano to this country. His lordship has signified his entire willingness to lend every aid in furtherance of this important object, by requesting the Admiralty to instruct the commander of every ship in her Majesty's Navy to search for deposits of guano in the rainless regions within the tropics, and every surgeon of such ships to be prepared to examine on the spot the amount and quality of each deposit of guano that may be discovered: the search for mineral phosphate of lime in any part of the world being also included in this instruction. Lord Palmerston having also stated his desire that the Council should draw up a code of such instructions and queries they would wish to have distributed by the Admiralty, they have requested the Chemical Committee of the Society to prepare these instructions and queries accordingly. The announcement of this most gratifying participation of her Majesty's Government in a question affecting in so high a degree the cause of practical agriculture, will be received with satisfaction by the Society; and these measures of the Government, with the prize of 50*l.* already offered by the Society for a statement of the geographical distribution and the discovery of new sources of guano, will, it is hoped, lead to interesting details and important results. In the meantime, as the large proportion of ammonia resulting from guano constitutes, in a great measure, its essential value, it will be an important object to discover a mode by which a cheap and abundant supply of that valuable element may be obtained. The simple and effectual modes now available for detecting adulteration in the guano of commerce, ought to prevent the great loss and disappointment to which farmers at the present time are very liable; and in furtherance of this object, Prof. Way has reduced his charge for an analysis of this manure to a rate which brings it within the means of every farmer who will take the trouble to guard himself by this analysis from fraud.

The Journals of the Society contain from time to time the results of Professor Way's Chemical Investigations, instituted under the instructions of the Chemical Committee of the Society; and the lectures which he has delivered to the members since the last general meeting, on the agricultural employment of lime and gypsum, have been valuable in themselves, and have led to interesting practical discussions.

The Council have taken means to bring before the members various suggestions made during the past year for extending in this country the growth of Flax, as an agricultural crop. The conditions of soil and culture, the management of fibre, and the question of there being or not a sure market for its sale, are practical and prudential considerations, which will no doubt of themselves engage the attention of farmers, without any special caution being given to them by the Council; who, although well aware that there are, under ordinary circumstances, no difficulties attending the cultivation of this crop, yet feel at the same time that at present adequate means are not generally available for taking the crop off the grower's hands.

The Council, in conclusion, have the continued satisfaction of calling the attention of the members to the gradual and vigorous development of the Society in its practical and useful objects, and to the addition of new members to its list from among the friends of agricultural improvement in every part of the United Kingdom.

By order of the Council,
James Hudson, Sec.

On the motion of the Rev. James Linton, of Hemingford, Huntingdonshire, seconded by Mr. Wingate, of Hareby House, Lincolnshire, this Report was received and unanimously adopted by the meeting.

Mr. Raymond Barker, Chairman of the Finance Committee, reported to the meeting the following balance-sheet of the auditors:

Half-yearly Account, ending the 30th of June, 1851.

| Receipts. | £ | s. | d. |
|---|---|---|---|
| Balance in the hands of the Bankers, 1st January, 1851 | 738 | 2 | 8 |
| Balance in the hands of the Secretary, 1st January, 1851 | 11 | 9 | 1 |
| Dividends on Stock | 169 | 6 | 1 |
| Life-Composition of Governors | 90 | 0 | 0 |
| Life-Composition of Members | 360 | 0 | 0 |
| Annual Subscriptions of Governors | 625 | 0 | 0 |
| Annual Subscriptions of Members | 3002 | 7 | 0 |
| Receipts on account of Journal | 266 | 19 | 6 |
| Windsor Subscription to Country Meeting of 1851 | 600 | 0 | 0 |
| | £5854 | 4 | 4 |

| Payments. | | | |
|---|---|---|---|
| Permanent Charges | 170 | 12 | 6 |
| Taxes and Rates | 18 | 2 | 2 |
| Establishment | 481 | 11 | 0 |
| Postage and Carriage | 28 | 0 | 11 |
| Advertisements | 3 | 19 | 9 |

| | £5854 | 4 | 4 |

(Signed) Thomas Raymond Barker, Chairman,
C. B. Challoner,
Thomas Austen,
Henry Blanshard,
} Finance Committee.

Examined, audited, and found correct, this 12th day of Dec., 1851.
(Signed) Thomas Knight,
Geo. I. Raymond Barker,
} Auditors on the part of the Society.

On the motion of Mr. Astbury, of London, seconded by Mr. Woodward, of Worcestershire, the thanks of the meeting were voted to the auditors, for their care in auditing its accounts.

On the motion of Mr. Astbury, seconded by Mr. C. Druce, of Oxfordshire, Mr. Knight, Mr. G. J. Raymond Barker, and Mr. George Dyer, were elected auditors for the year ensuing.

On the motion of the Duke of Richmond, seconded by the Rev. James Linton, the best thanks of the meeting were voted by acclamation to the Earl of Ducie, for his conduct in the chair, and his devotion to the interests of the Society. His lordship acknowledged the compliment paid to him, regretting that indisposition had prevented his attendance as the President-elect at the Windsor meeting.

The meetings of the Council stand adjourned over the Christmas recess to Wednesday the 4th of February.

---

## Notices to Correspondents.

Books: *Nemo.* Dickson's work is out of print; at Bohn's Library, Covent-garden, it may probably be heard of, as well as the translations you wish for. The other questions you would find answered in Hoskyns' "Inquiry into the History of Agriculture," published by Bradbury and Evans.

British Guano: *Walter.* What is it?

Chalk: *Sussex.* It will in the long run have the same effect on land as caustic lime, but we cannot answer your question quantitatively: 40 or 50 cubic yards per acre is a common dressing.

Drains: *A Subscriber.* The only remedy we can suggest is to make the drains *very* deep through the parts interlaced with the tree roots. We would not make the main drain through them at all, as to risk it would be to risk the whole drainage of the field. The better plan would be to cut a main for the general drainage just out of the reach of the trees, and to cut two or three deep—say 5 feet deep—parallel drains through the rooty part for the drainage of that part of the field.

Fallow-land: *Sussex.* It is not good to harrow fallow now. Let the land lie rough till after winter.

Grass Seeds: *J Dodwell.* For permanent pasture, Blackie's Cyclopedia recommends—Alopecurus pratensis, 2 lbs.; Dactylis glomerata, 6 lbs; Festuca duriuscula, 2 lbs; F. elatior, 2 lbs.; F. pratensis, 2 lbs.; Lolium italicum, 6 lbs.; L. perenne, 8 lbs.; Phleum pratense, 2 lbs.; Poa nemoralis

*sempervirens*, 2 lbs.; P. trivialis, 3 lbs.; Medicago lupulina, 1 lb.; Trifolium pratense, 1 lb.; T. perenne, 3 lbs.; T. repens, 6 lbs.

Mr. Watson's Ventilators. In reply to several inquiries on this subject, we have simply to state that Mr. Watson's address is 31, Rhodes-street, Halifax.

Pale Ale: *A Correspondent* says, he would be much obliged if any of our readers would be kind enough to give him a recipe for making pale ale from sugar, as recommended by Mr. Donovan, in his "Domestic Economy."

Pigs: *J Dolwell*. The boiled Swedes, Beans, and Barley will make better bacon, and probably make it as fast as if a portion of the grain were replaced by Linseed.

Poultry: *Georgius*. We must refer you for dealers to our advertising columns.

Reaping Machine: *Agricola*. Many such machines have been invented. You probably allude to the one acting on the principle of the shears, invented by the Rev. P. Bell, of Carmyle, in Forfarshire, which was worked in 1827, and was rewarded by a prize of 50*l*. from the Highland Society.

Water from Steamed Roots: *Sigma*. We have used the water from steaming Mangold Wurzel for throwing over the straw chaff given to cattle, and have no doubt that the same from Swedish Turnips will be equally harmless.

Wheat: *Caradoc*. In circumstances tending to a bulky growth of straw, you should choose kinds that grow a short straw, such as "Piper's Thickset."

Yeast: One of our correspondents inquired for the best means of getting the bitter out of yeast. *T W T, Cheshire*, says: "The following plan has been tried with success in my family for several years. For every pound of yeast put a handful of bran into a sieve, and run the yeast through it."

## METEOROLOGICAL REPORT.—December.

(*Continued from p. 798.*)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| 9 | 1 p.m. | 30.03 | ... | SSW. Brisk. Barometer steady; drizzling and foggy. |
| 10 | 8 a.m. | 29.92 | ... | SSW. all day; dense, overcast. |
| * | 11.30 a.m. | ... | 29.87 | Stiff breeze, and small driving |
| | 4 p.m. | ... | 29.87 | rain. |
| | 7.30 p.m. | ... | 29.93 | |
| | 10.15 p.m. | 30.03 | ... | Night bright and cloudless. |
| 11 | 7.10 a.m. | ... | 30.24 | NW. Slight frost. Bright and sunny. |
| | 6.10 p.m. | 30.37 | ... | Evening calm. |
| 12 | 7.40 a.m. | 30.31 | ... | E.N.E. Gentle, calm day; |
| | Noon. | ... | 30.29 | dense fog; barometer steady. |
| 13 | 8 a.m. | 30.25 | ... | N. Moderate. Dense, overcast; very hazy. |
| † | 11.30 a.m. | ... | 30.22 | NW. Do. do. do. |
| | 6 p.m. | ... | 30.24 | Calm. Do. do. |
| | 10.30 p.m. | 30.25 | ... | Evening. Barometer rising. |
| Sun. 14 | 8 a.m. | ... | 30.30 | NNE. Gentle, overcast. |
| | 12.55 p.m. | 30.31 | ... | NE. Gentle, overcast. |

* This is a storm crossing England from west to east, the centre lying to the northward.

† This fog travelled up the Channel, coming from the westward. It was over Cornwall on Thursday, and reached London on Friday, the wind being westward; on Saturday the storm's-eye was over London; and on Sunday, the storm having passed to the German Ocean, the fog came back again with the back draught of the hinder quadrants.

Dorchester, Dec. 18. *F. P. B. M.*

(*To be continued.*)

# Markets.

## COVENT GARDEN, Dec. 20.

English Pine-apples and Grapes continue to be plentiful. Pears are still furnished from Guernsey. The best English kinds fetch 2*s.* to 4*s.* a doz., and 8*s.* to 12*s.* per hf. sieve. They consist of Glout Morceau, Winter Nelis, and Chaumontelle. Oranges are plentiful and good. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are still dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

### FRUIT.

Pine-apples, per lb., 3*s* to 6*s*
Grapes, hothouse, p. lb., 2*s* to 5*s*
— Lisbon, per lb., 9*d* to 1*s*
Apples, kitchen, per bushel, 2*s* to 3*s* 6*d*
Pears, dessert, p. doz., 2*s* to 4*s*
Lemons, per doz., 1*s* to 2*s*
Walnuts, per bush., 12*s* to 24*s*
Almonds, per peck, 6*s*
— sweet, per lb., 2*s* to 3*s*
Oranges, per doz., 1*s* to 1*s* 6*d*
— per 100, 6*s* to 10*s*
Nuts; Barcelona, p. bsh, 20*s* to 22*s*
— Brazil, p. bsh., 12*s* to 14*s*
Filberts, per 100lbs., 70*s* to 90*s*

### VEGETABLES.

Cabbages, per doz., 8*d* to 1*s*
Cauliflowers, p. doz., 2*s* to 4*s*
Broccoli, p. bunch, 3*d* to 1*s* 3*d*
Potatoes, per ton, 45*s* to 80*s*
— per cwt., 2*s* to 5*s*
— per bush., 1*s* 6*d* to 2*s* 6*d*
Turnips, p. bunch, 1*d* to 2*d*
Cucumbers, each, 6*d* to 1*s*
Radishes, per doz., 9*d* to 1*s*
— Turnip, p. doz., 9*d* to 1*s*
Celery, p. bundle, 6*d* to 1*s* 6*d*
Carrots, per bunch, 4*d* to 6*d*
Brussels Sprouts, p. half sieve, 1*s* 6*d* to 2*s*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Onions, p. bunch, 1*d* to 5*d*
— Spanish, p. doz., 1*s* 6*d* to 3*s*
Endive, per score, 9*d* to 1*s*
Beet, per doz., 6*d* to 1*s*
Parsnips, per doz., 6*d* to 1*s*
Leeks, per bunch, 1*d* to 2*d*
Shallots, per lb., 6*d* to 8*d*
Garlic, per lb., 6*d* to 8*d*
Artichokes, Jerusalem, per hf. sieve, 9*d* to 1*s*
Lettuce, Cab., p. score, 4*d* to 1*s*
— Cos, per score, 3*d* to 1*s*
Small Salads, p. punn., 2*d* to 3*d*
Horse Radish, p. bundle, 1*s* to 4*s*
Mushrooms, p. pot., 1*s* to 2*s* 6*d*
— per bushel, 7*s* to 10*s*
Sorrel, per hf. sieve, 6*d* to 9*d*
Fennel, per bunch, 2*d* to 3*d*
Savory, per bunch, 2*d* to 3*d*
Thyme, per bunch, 2*d* to 3*d*
Parsley, per doz. bun., 2*s* to 3*s*
Mint, per bunch, 1*d* to 2*d*
Basil, p. bunch, 3*d* to 4*d*
Marjoram, do., 3*d* to 4*d*
Watercress, per doz. bunches, 4*d* to 6*d*

## POTATOES.—Southwark, Monday, Dec. 15.

The committee report that the arrivals coastwise have been limited, but the supply by rail has been very large. The trade continues very dull, and lower prices for some sorts have been submitted to. The following are this day's quotations; — Yorkshire Regents, 75*s.* to 80*s.*; Scotch ditto, 65*s.* to 70*s.*; Kent and Essex do., 70*s.* to 80*s.*; ditto Shaws, 60*s.* to 70*s.*; Lincolnshire and Wisbeach, 60*s.* to 75*s.*; French, 65*s.* to 70*s.*

## HAY.—Per Load of 36 Trusses.

## HOPS.—Friday, Dec. 19.

Messrs. Pattenden and Smith report that the demand for Hops continues good and that a considerable advance is expected after Christmas.

## SMITHFIELD, Monday, Dec. 15.

As is usual on the Great Market Day, we have a good collection of fat Beasts; the number, however, is not so large as exhibited last year. The general quality is very choice; trade is slow, and prices are by no means good. The supply of Sheep is small. Big Sheep are not so much in request as on former occasions, but those of moderate size are selling well. There are a few choice Calves; there is not much demand, but owing to shortness of supply they are dearer. From Holland and Germany there are 544 Beasts, 2470 Sheep, and 24 Calves; from France, 220 Sheep and 13 Calves; from Scotland 350 Beasts; from Norfolk and Suffolk, 400; and 3200 from Leicester, Northampton, and Lincoln.

| Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Hereford, &c. ... | 3 | 8 | to 4 | 0 |
| Best Short-horns | 3 | 6 | — 3 | 10 |
| 2d quality Beasts | 3 | 0 | — 3 | 2 |
| Best Downs and Half-breds ... | 4 | 0 | — 4 | 4 |
| Ditto Shorn ... ... | | | | |

| Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools | 3 | 8 | to 3 | 10 |
| Ditto Shorn ... ... | | | | |
| Ewes & 2d quality | 2 | 10 | — 3 | 4 |
| Ditto Shorn ... ... | | | | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 3 | 0 | — 4 | 2 |
| Pigs ... ... | 3 | 4 | — 4 | 4 |

Beasts, 6103; Sheep and Lambs, 23,420; Calves, 74; Pigs, 482.

Friday, Dec. 19.

We have (the day considered) a very moderate supply of Beasts. There is certainly this year a considerable deficiency in the weight of meat sent to this market. The average quality is good—not too fat. There is a numerous attendance of buyers, and prices generally are better than on Monday. We have very few Sheep on offer; trade is brisk at a small advance. The number of Calves is large, but choice ones are scarce, consequently the best qualities are readily sold at an advance of nearly 4*d.* per 8 lbs.; middling ones are very low. From Germany and Holland we have 112 Beasts, 360 Sheep, and 189 Calves; from Spain, 20 Sheep; from Norfolk, 200 Beasts; from the northern and midland counties, 500; and 118 Milch Cows from the home counties.

| Best Scots, Hereford, &c. ... | 3 | 10 | to 4 | 2 |
|---|---|---|---|---|
| Best Short-horns | 3 | 8 | — 3 | 10 |
| 2d quality Beasts | 3 | 0 | — 3 | 4 |
| Best Downs and Half-breds ... | 4 | 0 | — 4 | 4 |
| Ditto Shorn ... ... | | | | |

| Best Long-wools | 3 | 8 | — 4 | 0 |
|---|---|---|---|---|
| Ditto Shorn ... ... | | | | |
| Ewes & 2d quality | 3 | 0 | — 3 | 4 |
| Ditto Shorn ... ... | | | | |
| Lambs ... ... | 0 | 0 | — 0 | 0 |
| Calves ... ... | 2 | 8 | — 4 | 4 |
| Pigs ... ... | 3 | 4 | — 4 | 4 |

Beasts, 1321; Sheep and Lambs, 3410; Calves, 329; Pigs, 362.

## MARK LANE.

Monday, Dec. 15.—The supply of English Wheat by land carriage samples to this morning's market was small, and, with the exception of a few picked samples, was sold at a decline of 1*s.* per qr. upon the prices of this day se'nnight, being generally out of condition. The demand for foreign continues to be most trifling, but its value is fully supported.—Flour is a slow sale, but there is some inquiry for barrels.—The supply of Barley increases, and the trade is dull with a tendency to a decline in prices.—Beans and Hog Peas are the turn cheaper. We reduce our quotations on White Peas 1*s.* to 2*s.* per qr.—Oats are a slow sale at a reduction of 6*d.* per qr. from the rates of last Monday.

Friday, Dec. 19.—To-day's market was but thinly attended, and although we are without any arrivals of foreign Wheat or Barley, the business doing in all descriptions of corn was most limited, and prices of each may be considered nominally as on Monday. In Floating cargoes of Wheat from the South of Europe, the firmness of holders prevents business. The dulness of last week has since been pretty generally succeeded by a slight decline in the value of all descriptions of grain throughout the kingdom, without producing any activity in trade.

Arrivals this Week.

Liverpool, Tuesday, Dec. 16.—At our market this morning there was a fair attendance of the trade, but, as usual at this period of the year, the business done was quite of a retail character, and where sales of Wheat were made, a reduction of 1*d.* per 70 lbs. was submitted to. Flour of good quality, both sack and barrel, supported late rates. Oats and Oatmeal, with a languid demand, were 1*d.* per 45 lbs. and 3*d.* per load lower. Barley and Peas were without change, but Beans were 6*d.* per qr. dearer. Indian Corn met with little attention, but holders generally refused to submit to any decline.—Friday, Dec 12.—The attendance at our Corn Exchange this morning was thin, and the business transacted was small. Wheat was 1*d.* per bushel worse than on Tuesday. American and French Flour barely supported late rates.

SUNDAY READING FOR EVERY FAMILY.

May be ordered of any Bookseller,
In Weekly Numbers, 16 pp. 8vo, 1½*d*.; Monthly Parts, with Engraving, 7*d*.,

THE WEEKLY VISITOR, AND CHRISTIAN FAMILY READER.

Edited by the Rev. R. BICKERSTETH, M.A., Incumbent of St. John's Church, Clapham Rise.

The contents of the Magazine, the very favourable reception it has met with, and the numerous private testimonies received of benefits which have resulted from it, justify the Publishers in urging the members of Christian Families, the Clergy, District Visitors, Sunday School Teachers, and others, at once to become Subscribers to it. The character of the work will be seen by the following selection from nearly 100 favourable Notices by the Public Press.

"This is a periodical intended for Christian family reading, and most admirably adapted for the purpose. Beginning in each number with an exposition, in plain and popular language, of some portion of Scripture, with a suitable prayer subjoined, it proceeds to give choice papers upon other subjects of varied interest, all instructive without being corrupting. Indeed, the grave and the light are here so judiciously combined, that the young and the old may alike find something suited to their taste, without any pandering to a vicious appetite. But what renders this periodical especially suited to the present times is, that it aims to meet both the subtle plausibilities of the Romanist, and the diseased discontent of the Socialist, with silencing and satisfying arguments; tending at once to establish in the true faith those who do believe, and to quiet the minds of doubters. Such being the features of this publication, we strongly recommend it (its cheapness places it within the reach of all) for general circulation. District visitors and Sunday School teachers, as well as parochial clergymen and heads of families, will find it to be, if we mistake not, of great utility. We need only add that its being under the able editorship of the Rev. R. Bickersteth (who, to the sound evangelic orthodoxy of his late respected uncle, throws into his compositions the charm of a surpassing gracefulness of style), must ensure it the patronage of all who have any esteem for the true, or taste for the beautiful."—*Morning Herald.*

". . . . . We hail with sincere pleasure the publication of such a work as 'The Weekly Visitor and Christian Family Reader.' It will supply a need which thousands of families are feeling, and from which thousands who do not feel their need of it, are suffering. . . . . From the judicious combination of expository, instructive, and entertaining matter, suited as it is for all occasions and all classes, we pronounce 'The Weekly Visitor' to be the Magazine for the times. It will not have its due measure of circulation till it is received into every family in the kingdom."—*Hampshire Chronicle.*

". . . . . A charming variety pervades the columns of the work now before us, exhibiting a faithful yet pleasing portrait of genuine Scriptural piety. We cordially recommend our readers to receive 'The Weekly Visitor' into their families. Wherever it goes, it must convey an influence for good. . . ."—*Chester Courant.*

". . . . . A weekly publication replete with Christian teaching and practical warning, useful alike for the poor and the rich, the highly educated and the more humble scholar, and peculiarly adapted for the lending library . . . . . forming at once a mine of study and of innocent recreation. . . . The editorship of Mr. Bickersteth assures us of the spirit of the work."—*Britannia.*

"We heartily commend this periodical to the support of our readers, feeling confident that in pious families 'The Weekly Visitor,' once introduced, will be emphatically The Welcome Visiter."—*Stockport Advertiser.*

"We find its contents judiciously varied, so that the mind shall not be repelled from the instruction it presents by discovering it to be too purely instructive. . . . . It is pervaded by a tone of sober, practical piety, based upon a clear, consistent, and comprehensive view of the great fundamental truths of Christianity. A 'weekly visit' from such a periodical cannot fail to be productive of the most beneficial results in the dwellings of our labouring population. . . . . ."—*Liverpool Courier.*

"The religious world has had reason to rejoice in the establishment of this good work, and its wide circulation. . . . . We have been much struck and pleased with the remarkably interesting variety of subjects it contains, and with the winning and attractive manner in which they are written. The name of Bickersteth has been long and honourably connected with publications of a religious character, and has become a guarantee for the value of any work with which it may be associated. The present is a very gratifying instance of this, and we feel not the slightest doubt that the work will continue to spread freely and widely."—*Nottingham Mercury.*

". . . . . An admirable work, published at a small cost, in order to ensure it a large circulation, the laudable object of its promoters being to increase the growth of true religion. Those who wish to aid 'the good work,' cannot do better than to assist in the further extension of the useful little publication; the name of its conductor is a pledge of its truly Christian character."—*Plymouth Herald.*

"'The Weekly Visitor' is devoted to the advancement of personal piety, and to the advocacy of Evangelical Protestantism. Its tone and temper are unexceptionable. The name of its conductor—the Rev. R. Bickersteth—will be sufficient recommendation to most; if any opinion of ours could aid its circulation, that opinion should be expressed in the most cordial and cheerful manner. A better 'visitor' need not be asked for, and could not easily be found."—*Bradford Observer.*

". . . . . An air of kindness and sympathy of a very soothing nature pervades all the articles."—*Glasgow Examiner.*

Vol. I. (from January to June, 1851), 406 pages, with six handsome engravings, and neatly bound in cloth, price 4*s*. 6*d*. New subscribers are advised to order of their booksellers, Vols. I. and II., (the latter will be ready at Christmas), and the future parts as they are published.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from a celebrated grower to sell by Auction, at the Mart, Bartholomew-lane, on TUESDAY, December 23, 1851, at 12 o'clock, about 400 STANDARD AND DWARF ROSES, consisting of Hybrid Perpetuals, Bourbons, Chinas, Noisettes, &c.; a first class collection of DUTCH BULBS, comprising Double and Single Hyacinths, Narcissus, Crocus, Jonquils, Gladiolus, Tulips, &c.—May be viewed the morning of sale. Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FULHAM ROAD.—SALE OF VALUABLE NURSERY STOCK, &c.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton (one mile from Hyde-park Corner), on MONDAY, December 22, and following day, at 12 o'clock (without reserve) an assortment of fine Evergreens, comprising Arbor-Vitæ, Cypress, Box, Euonymus, Holly, Laurels, and American Plants, of choice sorts, Shrubs in great variety, a large quantity of Ornamental Trees, Walnut, and other Standard Fruit Trees, choice Gooseberries and Currants; Tulips, Iris, and other Bulbs; an excellent 6-inch wheel Market Cart, a large Conservatory Stage, Alcove, Arches for garden walks, Flower Stands, Trainers, and other Ornamental Wireworks, &c.—May be viewed prior to sale, and Catalogues had of the Auctioneer, Brompton Nursery, Fulham-road, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market, and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO NURSERYMEN, SEEDSMEN, GARDENERS, AND OTHERS.

TO BE LET, on Lease, in Essex, a DWELLING-HOUSE, with extensive Barn, Stables, &c., and 10 acres of excellent Staple Land, well adapted for the above purposes, situate about 2½ hours' ride from London by rail, and 2½ miles from a town containing above 8000 inhabitants, without a nursery.—Apply by letter to G. H., Gray's-inn Coffee-house, Holborn, London.

TO BE LET, a most convenient COTTAGE ORNÉE, with immediate possession, in a most retired and pleasant situation, consisting of two Parlours, five Bed-rooms, two Kitchens, Cellar, Larder, with all other convenient offices; also Stable and Coach-house, with good Garden and Lawn, and 28 acres of Land, consisting of Pasture, Arable, and Coppice: the neighbourhood is highly respectable, and scenery from the property exceedingly picturesque, embracing views of the Bristol Channel and Welch Hills in the distance. A van passes daily to and from Bristol, and the premises are within half an hour's walk from the Yatton Station of the Bristol and Exeter Railway. The premises are in most complete order, and have long been occupied by the proprietors and tenants of respectability. For further particulars apply to Messrs. Cox Brothers, No. 4, Welsh Back, Bristol.

EXTRA NUMBER FOR CHRISTMAS OF HOUSEHOLD WORDS.—This day is published, price 2*d.*, AN EXTRA NUMBER OF HOUSEHOLD WORDS. Conducted by CHARLES DICKENS, showing WHAT CHRISTMAS IS TO EVERYBODY.

Office, 16, Wellington-street North.

Just published, in One Volume, 8vo, price 5*s.* sewed,

AN IMPROVED SYSTEM OF FARM BOOK-KEEPING: in which will be found Weekly Statements of all the Proceedings of the Year, regarding the Management of the Land; Team and Task Work; Cost of Daily and Yearly Labour; Sale and Purchase of Live Stock, Breeding, and Stall-fed Cattle; Rotations of Crops; Disposal of Farm Produce; Hops, Flax, and Felling of Coppice; the Orchard, Dairy, and Charges of Harvest; Payments and Receipts; Diary of House Expenses; Cash and Running Accounts with Tradesmen, appertaining to the Work in Hand. Containing Separate Accounts for the different Labours of the Farm, from which the Tenant may select whatever especially suits his purpose. Thus enabling the Farmer to ascertain, in a most simple manner, the exact state of his concerns. With an Appendix of Weights and Measures, and Useful Tables for calculating the Expense of Dibbling, Hoeing, Draining, Ditching, Reaping, Mowing, and all sorts of Task Work. By the Author of "BRITISH HUSBANDRY."

*** Paper, headed "Bailiff's Weekly Report of Team Work, Labour, and Stock," ruled on both sides for entries on the improved system of Farm Book-keeping, may be had separately, price 2*s.* per quire.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

HOUSEKEEPING, FURNISHING, COOKERY, &c.

KIDD'S LONDON JOURNAL:

A Literary, Scientific, Instructive, and Amusing Family Paper.

Conducted by Mr. WILLIAM KIDD, of Hammersmith.

Author of "British Song Birds," "Birds of Passage," "Essays on Natural History," "Instinct and Reason," "The Aviary and its Occupants," &c., now publishing, weekly, in the *Gardeners' Chronicle* Newspaper.

From the *Critic*, London Literary Journal, No. 257, December 15, 1851:—

"A NEW WEEKLY JOURNAL OF NATURAL HISTORY.—We observe that Mr. William Kidd, of Hammersmith, the author of so many interesting and instructive works on Natural History, is about to address himself to the public, through a cheap Weekly Journal of his own. This we take to be a wise step; for the amateur and the experienced naturalist alike require an organ and a friend. Such, we anticipate, KIDD'S LONDON JOURNAL will be; and our readers can judge of the reasonableness of the anticipation, for we have, by means of Extracts from his Essays published in the *Gardeners' Chronicle* and elsewhere, made them familiar with the generality of WILLIAM KIDD'S mind, and the correctness of his acquirements as a student of nature. KIDD'S LONDON JOURNAL is, we observe, to be the same size as 'Household Words,' and will contain other information than that which the Editor has spent a life in obtaining and generalising."

London: Published by GEORGE BERGER, Holywell-street, Strand (to whom Books for Reviews and Communications should be forwarded), and procurable, by order, of every Bookseller and Newsvender in the Kingdom.

On the 1st of January, price 5*s.*, 8vo,

GARDENERS' BENEVOLENT INSTITUTION —NOTICE is hereby given, the ANNUAL GENERAL MEETING of the Members of this Institution will be held at the London Coffee-house, Ludgate-hill, on Wednesday, the 14th January, for the purpose of receiving the report of the Committee and the accounts of the Society for the past year, and electing Officers for the ensuing year. The chair to be taken at 1 o'clock precisely.

By order, E. R. CUTLER, Sec.

97, Farringdon-street, 26th Dec. 1851.

P.S. Subscriptions are due on the 1st of January.

GERMAN SEEDS.

MESSRS. PLATZ AND SON, SEED GROWERS, Erfurt, Prussia, inform the trade that their CATALOGUE for 1852 is now ready, and may be had on application of their Agent, Mr. ROBERT KENNEDY, Conservatories, Covent Garden, London. The universal approval which their Articles have obtained, induce Messrs. P. and SON to solicit a trial of the present year's Stock, which includes many new and interesting varieties. All charges paid to London.

Erfurt, December 27.

OF GREAT IMPORTANCE.

TO EXHIBITORS OF CUCUMBERS AND OTHERS.

EDWARD TILEY has great pleasure in being enabled this season to offer his celebrated and unrivalled new Cucumber "CAPTIVATION," which has not been equalled or surpassed by any other Cucumber ever sent out. He has been many times asked for this superb variety by growers who have seen it, but he has been unable to supply it, in consequence of the small quantity of seed it produces. E. T. has no hesitation in saying that this will be found "the standard of perfection of a Cucumber," and he has never seen one so before till he raised this. It possesses the following unrivalled qualities: It is a splendid black spine, of a very dark-green colour, and entirely free from ribs or shrivels, with scarcely any or no handle, and carries its bloom well to the last. Length, from 24 to 28 inches. It is a very quick grower, sets well, prolific bearer, and second to none for exhibiting. To show its perfection, a brace of these Cucumbers, when cut last season, were found to measure exactly 10 of its diameter long, being 25 inches, and not more than half an inch handle. As a proof of the productiveness of the above, a bed was made for a two-light frame, and four plants placed therein; the first brace of fruit was cut on the 29th March, and the last brace on the 25th November last, during which time the unaccountable number of 102 brace was produced from the four plants; total length of the whole amounting to 56 yards 2 feet.—Sold in packets of three Seeds, 5*s.*, or five Seeds, 7*s.* 6*d.* Also,

TILEY'S CUCUMBER "PHENOMENA,"

which Cucumber gave universal satisfaction last season. This is also a splendid black spine, abundant bearer; in length, from 22 to 28 inches, and very easily grown, with little heat. Packets, of six Seeds, 2*s.* 6*d.*, or a packet of this and one of "Captivation," 6*s.*

E. T. has also Seed of the undermentioned fine varieties:—

Chamberlain's "Essex Hero," a fine black spine, per packet of four seeds ... ... ... ... ... ... 3*s.* 6*d.*

Hunter's "Prolific," fine white spine, 2*s.* 6*d.* per packet of 3 seeds; or, per packet, of 7 seeds ... ... ... 5 0

"Lord Kenyon's Favourite," a fine winter Cucumber, per packet ... ... ... ... ... ... ... ... 2 6

The above Cucumbers have been exhibited at the Botanic Gardens, Regent's Park, London, Colchester, Ipswich, Chelmsford, Bath, and other places, where they were successful in carrying off first prizes. Also—

| | Per packet.—*s. d.* |
|---|---|
| Victory of Bath Cucumber, extra fine black spine | ... 1 0 |
| Gordon's White Spine ... ... ... ... ... ... | 1 0 |
| Hamilton's Black Spine ... ... ... ... ... ... | 1 0 |
| Conqueror of the West, a good frame Cucumber ... | ... 0 6 |
| Butcher's Stratford-upon-Avon Cucumber, do. do. | ... 0 6 |

And numerous other older varieties at 6*d.* per packet.

A remittance must accompany the order from unknown correspondents, either by Post-office Order or Penny Postage Stamps, when the whole or any quantity of the above varieties, as the case may be, will immediately be forwarded to any part.

*Numerous Cucumber growers, on visiting the Cucumber grounds last season, expressed their astonishment at the quantity and perfection in which they were then growing.*

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church-yard, Bath.

LANDSCAPE GARDENING.

EXCLUSIVELY PROFESSIONAL.

MR. THOROLD, of Norwich, offers his services to the Nobility and Gentry as a LANDSCAPE AND ORNAMENTAL GARDENER, in the highest style of the Art, including Decorations around a House, forming Water, Approaches, Picturesque Scenery, &c.

OR TO

CORK, DUBLIN, AND BELFAST BY STEAMER.

For Catalogues and Price Currents, apply to WILLIAM E. RENDLE and Co., Seed Merchants, Plymouth.

ESTABLISHED MORE THAN HALF A CENTURY.

CAMDEN NURSERY, PECKHAM.

WILLIAM BARNES begs respectfully to announce that he has taken the above named Nursery (late in the occupation of Mr. Thos. Watts), and that it is his intention to keep a well selected stock of Choice Plants, Shrubs, Seeds, &c; and he trusts, from his long and successful experience as a grower of superior Horticultural and Floricultural productions, that his judgment may be relied upon by those who may favour him with their commands.

W. B. would also assure his patrons and friends that he is determined to meet the demands of the times, and supply every article from his stock at the most moderate charges.

W. BARNES during the last 19 years (15 years of which he was in the service of G. W. Norman, Esq., of Bromley, in Kent, and four years at Poles Gardens, Herts, the seat of R. Hanbury, Esq.), has had awarded to him by the judges at the Gardens of the Horticultural Society, at the Royal Botanic Society, and at the provincial Exhibitions, more than Eight Hundred Prizes.

Address, WILLIAM BARNES, Camden Nursery, Peckham.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

HOME GROWN SEEDS.

SUTTON'S COLLECTIONS OF GARDEN SEEDS.—*The superior quality of our Seeds is plainly testified by the numerous orders we are daily receiving from parties who have had them in previous seasons, very many of which contain remarks, such as the following:*—

Extracts from letters now before us, which may be seen at our office. The names of the writers may be known by post, if required.

*From a Clergyman, near Darlington.*

"The best kitchen garden seeds I ever had were furnished by you."

*From Doneraile, Ireland.*

"Lord D. would be glad to have," &c., &c. "The seeds sent last year were excellent."

*From Cirencester.*

"I never received such a numerous collection, so good in quality, from any house."

*From Ripon, Yorkshire.*

"At one of the Horticultural Shows at Harrowgate, my gardener took 20 prizes, most of them from the produce of your seed; we also gained several prizes at other meetings, as many as 18 at one of them."

*From an eminent Horticulturist, at Sunninghill.*

"My gardener speaks very highly of your seeds."

*From Girvan, N.B.*

"I have much satisfaction in recommending your seeds to various friends, as I find they are much pleased with them."

*From a Clergyman, at Newport, Monmouthshire.*

"I have invariably found your seeds of all kinds very good."

*From North Walsham.*

"Your seeds are decidedly superior to those I can procure in this neighbourhood; I shall at all times be glad to recommend you to my friends."

*From a Clergyman, at Meonstoke, Hants.*

"I always recommend my friends to supply themselves from your establishment."

*From another Clergyman, at Kinsale, Ireland.*

"Being so much pleased with the garden and flower seeds sent last season, induces me to send to you for my agricultural seeds also."

*The very best kinds of seeds in cultivation may be obtained at 30 per cent. less than the prices charged in most parts of the kingdom, by ordering one of the undermentioned "complete collections."*

SUTTON'S COLLECTION OF GARDEN SEEDS.

EARLY ORDERS ARE PARTICULARLY REQUESTED, *and will have the preference of scarce sorts.*

Remittances *are not required* with the orders from clergymen, noblemen, and resident gentlemen, or their gardeners.

Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

THE POTATO DISEASE.—Agriculturists, Farmers, and Gardeners are respectfully informed that the Advertiser is in possession of a Remedy that will entirely prevent the Disease that has for a very long period been so destructive to that valuable plant—the Potato; it will not only very materially increase the crop, but much improve the quality, as also improve the growth of WHEAT, BARLEY, GRASSES, TURNIPS, &c., as it totally annihilates all Insects, such as the Fly, Wire-worm, Blight, &c.—Direct, free, enclosing a Post-office order for 10*s.*, to THOMAS BRUCE, Marshall-place, King's-road, Reading, Berks, when the same will immediately be forwarded free of expense.

SELECT NURSERY STOCK.—The Subscribers beg to offer the following Choice Stock at the annexed greatly reduced prices. Goods from these extensive Nurseries have given great satisfaction throughout the Kingdom for many years.

| | £ | *s.* | *d.* |
|---|---|---|---|
| 100 fine double prize Hollyhocks, strong, 4 years old | 1 | 0 | 0 |
| 100 Dwarf Roses, handsome prize varieties, two of a sort | 1 | 10 | 0 |

Prices of all other Nursery Stock, and every other information on application. A reference or remittance is respectfully solicited from unknown correspondents.

WM. JACKSON and Co., Bedale, Yorkshire, Dec. 27.

This Advertisement will not be repeated.

COCHIN CHINA FOWLS.—An Amateur, who obtained two prizes for this breed at the late great poultry show at Birmingham, has several pairs of these splendid Fowls to dispose of; also a few Cocks, separately.—Apply to JOSEPH LEMON, Post-office, Sandbach, Cheshire.

DOUBLE ITALIAN TUBEROSE ROOTS, *4s.* per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. CORBETT'S Foreign Warehouse, 18, Pall-mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

SUPERB NEW EARLY PROLIFIC MELON, "VICTORY OF BATH."

GARAWAY, MAYES, AND Co. having purchased the entire stock of the above MELON, beg to offer it to the public as a variety unequalled in flavour and productiveness. It obtained a Certificate of Merit at the April Show, in Bath; First Prize at Chiswick, in May; also two First Prizes at Bath, in May and June last. It was grown in pots with Bromham Hall, under precisely the same treatment, and Ripe Fruit cut full six weeks earlier. The whole of the fruit exhibited were grown in pots.

| MELONS. | Per Packet—*s. d.* | CUCUMBERS. | Per Packet—*s. d.* |

LESS than the prices usually charged in most parts of the Kingdom. Carriage free, as see their Advertisement in the *Gardeners' Chronicle* of the 6th instant.—Further particulars may be had by post, on application (enclosing one postage stamp), addressed, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

EWING'S PATENT GLASS WALLS. —One of the greatest defects in British gardening has hitherto been the uncertainty of securing a crop of fruit on common brick or stone walls, owing to the variableness and humidity of the climate. This is now remedied by substituting hollow Glass Walls, by means of which not only will the young wood in autumn be fully matured, but the blossoms will be completely protected from the frosts and biting winds of spring, and a climate secured equal to that of southern Europe.

These walls are particularly adapted to the growing of Grapes, Peaches, Nectarines, Apricots, Oranges, Lemons, and the finer sorts of Pears and Plums, producing fruit equal to that of France or Italy at no more expense than usually attending trees upon a common stone or brick wall.

Glass Walls must eventually not only take the place of brick and stone walls, but will, in a great measure, supersede the present mode of erecting hothouses, from their cheapness at first cost, the great economy of fuel and heating apparatus, the small space they occupy, and their peculiar elegant appearance. They are also admirably adapted for climbing Exotics, and a variety of other purposes.

The highest authorities on Horticultural matters in this country have expressed their unqualified approbation of these designs, at the head of whom is Dr. LINDLEY, and for whose opinion the public are referred to the leading columns of the *Gardeners' Chronicle* of December 6; also of Robert Marnock, Esq., Curator of the Royal Botanic Gardens, Regent's-park, London, in the leading columns of the *Gardeners' and Farmers' Journal*, of December 20. The patentee having made arrangements with some of the largest firms of iron-founders in the kingdom, and also with one of the most extensive British Glass manufacturers; and from the well-known respectability of those gentlemen who have become Agents, feels confident that he furnishes a sufficient guarantee that all orders in connection with the Glass Walls will be promptly and efficiently carried out in any part of England, Scotland, or Ireland.

The following are the accredited Agents, and with whom drawings of the Glass Walls can be seen, and all particulars as to prices, &c., obtained on application:—Messrs. Knight and Perry, Exotic Nursery, Chelsea; Messrs. Henderson and Co., Pine-apple-place, Edgware-road, London; Messrs. Whitley and Osborn, Nurserymen, Fulham, London; Mr. Glendinning, Nurseryman and Landscape Gardener, Chiswick, London; Messrs. Veitch and Son, Nurserymen, Exeter; Messrs. F. and J. Dickson, Nurserymen, &c., Chester; Messrs. Lawson and Son, Edinburgh, Nurserymen and Seedsmen to the Royal Agricultural Society of Scotland; Messrs. Dickson and Turnbull, Nurserymen, Perth; Mr. M'Intosh, F.R.P.S., F.R.S.S.A., author of the "Practical Gardener," "Book of the Garden," &c., late Curator of the Royal Gardens of his Majesty the King of the Belgians, and now to his Grace the Duke of Buccleuch, at Dalkeith Palace, Scotland; Mr. Fleming, F.H.S., Head Gardener, &c., to his Grace the Duke of Sutherland, Trentham, Staffordshire; Mr. Ewing, Gardener, &c., Bodorgan, Anglesea; Messrs. Pilkington, Crown, Sheet, and Plate Glass Works, St. Helen's, Lancashire.

*** Prices for facing existing brick or stone Walls with glass and iron will be given on application.

TO BE SOLD, THE LEASE OF A SIX ROOMED COTTAGE, with nearly 4 acres of Land, well stocked with Fruit Trees. There is every convenience; a small Cottage for a Man; well suited to a Gentleman who wants a country residence at a small cost.—For particulars inquire by letter, address B., to the Office of this Paper. Also a detached 12 Roomed House, with half an acre of Garden.

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—*1-8th, 6d.; 3-16ths, 9d.; ¼ inch, 1s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

JAMES PHILLIPS & CO, HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs*.

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | |
|---|---|---|---|---|
| 6 inches by 4 and | 6½ by 4½ | ... ... ... | 13*s.* 0*d.* | |
| 7 ,, | 5 and 7½ by 5½ | ... ... ... | 15 | 0 |

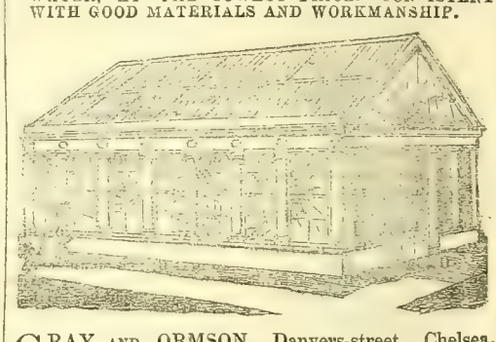
Milk Pans, 2*s.* to 6*s.* each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND Co., King's Road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's Road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's Road, Chelsea, London.



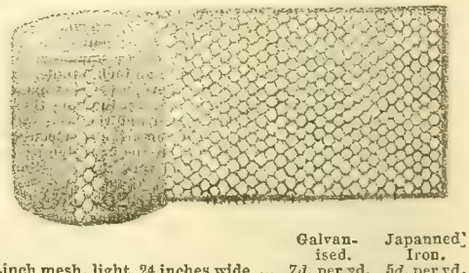
GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1⅞ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 1*d.* per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

THE BRITISH HEATING AND VENTILATING COMPANY, Offices, 14, Lincoln's-inn-fields, London. Under Hazerd's Patent.—The Company has now been successfully employed in all parts of the Kingdom, in PUBLIC and PRIVATE BUILDINGS, CHURCHES, CONSERVATORIES, FACTORIES, DRYING-HOUSES, &c., where a genial and healthy atmosphere is required.—Particulars and testimonials can be obtained by applying at the Company's Office.

Parties about to build, or those who suffer inconvenience from present arrangements, will save expense by consulting the Patentee, Mr. Hazerd, who has made ventilation and warming a peculiar study for years.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & Co. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

NUMBER ONE, SAINT PAUL'S CHURCH-YARD.—HAPPY OLD CHRISTMAS in his joyous rounds now rapidly approaches. All his votaries are preparing to welcome him with becoming honours, first among which are good fellowship and kindness. Presents are flying from one end of the country to the other, and mutual good wishes are exchanged. There is no present more acceptable to our country friends than a little good tea. It is received with thankfulness, and is esteemed a rarity; its excellence is appreciated, and its enlivening and invigorating qualities impart cheerfulness to the circle. Don't then at this time forget to remember

DAKIN AND COMPANY, TEA MERCHANTS, AND PATENTEES FOR ROASTING COFFEE IN SILVER CYLINDERS,

NUMBER ONE, SAINT PAUL'S CHURCH-YARD.

December 20.

*** The celebrated collection of Chinese teas from the Great Exhibition is now on show at "Number One."

CHRISTMAS HOLIDAYS.—THE GARDENS of the ZOOLOGICAL SOCIETY, in the Regent's Park, will be open to VISITORS, on payment of SIXPENCE each, EVERY DAY, except Sunday, from Christmas Eve to January 6, inclusive. The HIPPOPOTAMUS and the URAN UTAN are exhibited from 11 to 4 o'clock. The collection includes 1750 living animals, having recently been increased by the addition of 60 species from the collection at Knowsley.

HOSEA WATERER'S Descriptive Catalogue of AMERICAN PLANTS, CONIFERS, ROSES, &c., for the ensuing Autumn, is just published, and may be had on application, enclosing two postage stamps, to Mr. HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

STANDISH AND NOBLE'S detailed Advertisement will appear in this Paper on the first Saturday in every Month, to which they invite the attention of all interested in HARDY ORNAMENTAL PLANTS. Their Descriptive Catalogue, with the Treatise on the "Cultivation of American Plants," can still be had, by enclosing six stamps for postage.
Gentlemen requiring the services of a Landscape Gardener, can procure such by applying to the Advertisers.
Bagshot, Surrey, Dec. 27.

BEST LANCASHIRE GOOSEBERRIES, named, at 15s. per 100.
Also, APPLES, PEARS, CURRANTS, RHUBARB, &c., in all the best varieties, and at equally moderate prices.
Carefully packed, to carry any distance, or for exportation.
H. BIGLAND and Co., Manchester.

GEORGE BAKER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, CONIFERÆ, ROSES, ORNAMENTAL SHRUBS, FRUIT AND FOREST TREES, &c., may be had on application, by enclosing two postage stamps.—Windlesham Nursery, Bagshot, Surrey.

MITCHELL'S MATCHLESS WINTER PARSLEY.—J. M having saved a much larger quantity of Seed this season than last, can offer it to the public at a much reduced price. Wholesale, to seedsmen, 1s. 3d. per lb.; any quantity under 10 lbs. will be charged 2s. per lb. Can be sent to any part of the World, on receipt of a Post-office order, made payable to JOHN MITCHELL, Ponder's-end, Enfield, Middlesex.

SUPERB NAMED AND MIXED ASSORTMENTS OF ANEMONES, RANUNCULI, GLADIOLI, TULIPS, IRIS, CROCUS, LILIUM, IMPORTED DUTCH HYACINTHS, &c., with a large Collection of other Roots.—For BASS AND BROWN'S Priced Advertisement of the above, see *Gardeners' Chronicle* of Nov. 8th and 22d, or Catalogues sent free on application.
Seed and Horticultural Establishment, Sudbury, Suffolk.

RHUBARB.
MITCHELL'S ROYAL ALBERT
MYATT'S LINNÆUS ... ... ...
MYATT'S VICTORIA ... ... ... } Strong Roots, 50s. per 100.
WILLIAM MITCHELL, Enfield Highway, Middlesex.

AMERICAN APPLE TREES.
J. GREGORY has for sale about 1000 Choice APPLE TREES, imported from America in the autumn of 1850, including the following:—Northern Spy, Spitzenburgh, Jersey Blue, Rhode Island Greening, &c., all grafted on Seedling Stocks of three years' growth, and are in a thriving condition, having advanced from 2 to 4 feet since planted in this country. Price 12s. per doz.
Post-office orders made payable to JEREMIAH GREGORY, Yardly Gobion, near Stoney Stratford, Bucks.

MANNINGTON'S PEARMAIN.
JAMES CAMERON, NURSERYMAN and FLORIST, returns his best thanks to his friends and the public in general for their liberal support, and begs to say he has now for sale a sufficient quantity of the above valuable APPLE, and is thus enabled to offer them at so reduced a price as to ensure their extensive cultivation. It is a middle sized variety, and different from any in cultivation, and remarkable for its rich sugary and aromatic flavour. It is in its height of flavour from January till the end of May, and a very good bearer. Strong maiden plants 2s. 6d. each. Remittances from unknown correspondents previous to the trees being sent, by Post-office orders, made payable to JAMES CAMERON, Nurseryman, Uckfield, Sussex.
J. C. has also an extensive stock of Spruce, Larch, Fir, and Forest Trees of all descriptions; Fruit Trees, Evergreens, and Roses of first-rate quality.

**The Gardeners' Chronicle.**

MEETINGS FOR THE ENSUING WEEK.

| | | | |
|---|---|---|---|
| WEDNESDAY, | Dec. 31 | Microscopical | 8 P.M. |
| THURSDAY, | Jan. 1 | Zoological | 3 P.M. |
| FRIDAY, | — 2 | Botanical | 8 P.M. |

OUR correspondents think us right in the interpretation we ventured to give last week of the BURNING OF VINE LEAVES in winter; they only complain of the antidote not having been offered at the same time. But is it not obvious? If Vine leaves are burnt by excessive condensation of water on the glass of a greenhouse, and if that condensation is caused by a very low external temperature, it seems evident that the practical mode of counteracting the evil is to prevent the external temperature from becoming dangerously low, or rather to prevent any excessive difference between the temperature inside and outside of the house. This, of course, may be done by lowering the internal heat, as well as by raising the external.

The ingenious philosopher who first pointed out the probability of plants being scorched in hothouses by the action of external cold upon a glass roof (for we claim no part in the discovery), has some excellent remarks upon the principle on which the evil is to be met. "Lower your temperature," he says, "or cover your houses at night with mats or canvas." The philosophy of this very important subject is still so generally forgotten or misunderstood, that we cannot do better than submit a few of the more striking passages in Professor DANIELL'S memoir which elucidate it.

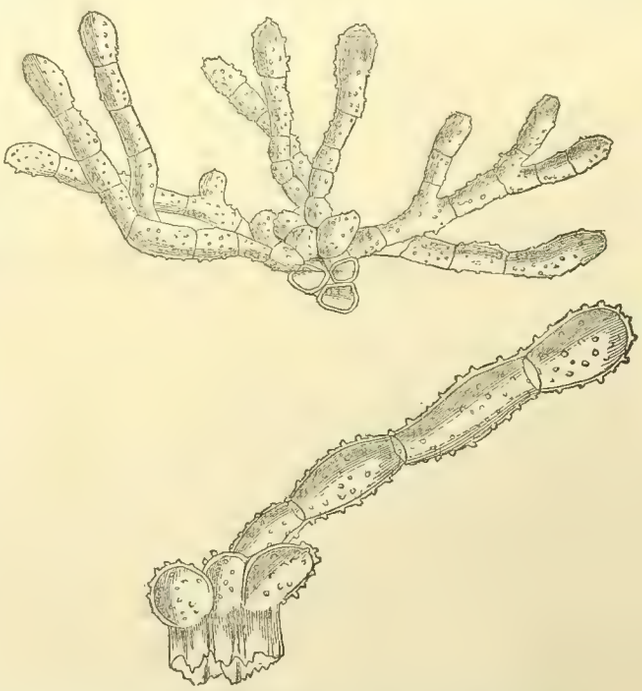
"The power of emitting heat in straight lines in every direction, independently of contact, may be regarded as a property common to all matter; but differing in degree in different kinds of matter. Co-existing with it, in the same degrees, may be regarded the power of absorbing heat so emitted from other bodies."

"If a body be so situated that it may receive just as much radiant heat as itself projects, its temperature remains the same; if the surrounding bodies emit heat of greater intensity than the same body, its temperature rises, till the quantity which it receives exactly balances its expenditure, at which point it again becomes stationary: and if the power of radiation be exerted under circumstances which prevent a return, the temperature of the body declines."

"Any portion of the surface of the globe which is fully turned towards the sun receives more radiant heat than it projects, and becomes heated; but when, by the revolution of the axis, this portion is turned from the source of heat, the radiation into space still continues, and being uncompensated, the temperature declines."

"But this unequal effect will only be perceived when the atmosphere is unclouded, and a free passage is open into space; for even a light mist will arrest the radiant matter in its course, and return as much to the radiating body as it emits. The intervention of more substantial obstacles will of course equally prevent the result, and the balance of temperature will not be disturbed in any substance which is not placed in the clear aspect of the sky. A portion of a grass-plat under the protection of a tree or hedge, will generally be found, on a clear night, to be eight or ten degrees warmer than surrounding unsheltered parts, and it is well known to gardeners that less dew and frost are to be found in such situations than in those which are wholly exposed."

"Anything which obstructs the free aspect of the sky arrests in proportion the progress of this refrigeration, and the slightest covering of cloth or matting annihilates it altogether."



"Experience has taught gardeners the advantages of warding off the effects of frost from tender vegetables, by loose straw or other litter, but the system of matting does not appear to be carried to that extent which its simplicity and efficacy would suggest. Neither does the manner of fixing the screen exhibit a proper acquaintance with the principle upon which it is resorted to; it is generally bound tight round the tree which it is required to protect, or nailed in close contact with its foliage. Now it should be borne in mind, that the radiation is only transferred from the tree to the mat, and the cold of the latter will be conducted to the former in every point where it touches. Contact should therefore be prevented by hoops or other means properly applied, and the stratum of air which is enclosed will, by its low conducting power, effectually secure the plant."

From these details, the great merit of which is their clearness, it is quite evident that the mode of preventing an excessive difference between external and internal temperature, and therefore the burning of leaves consequent upon such difference, is to cover Vineries at night *loosely* with mats or some kind of screen. And we entertain no doubt whatever that four-fifths of the injury sustained by plants in glass-houses would be obviated if this precaution could be taken. In fact, we have only to look to the robust health of Camellias and similar plants grown in cold pits covered in very bad weather or at night with mats, in order to assure ourselves of the fact. Many excellent gardeners constantly adopt this practice, even with their houses, but many others neglect it, fancying that plenty of heat in the inside of a house will compensate for the want of it on the outside; their opinion being that mats only keep plants warm, and that, provided there is warmth enough, it matters not at all how it is obtained. Let us hope that these remarks will assist in correcting that fatal mistake.

The objection to external coverings are, 1st, their expense; and, 2d, the trouble attending them. If, however, the needless cost of fuel, and the injury sustained by plants be placed in one scale, and the expense of an external covering in the other, it would be found that the balance would turn unmistakeably in favour of the latter. The trouble of covering a house with mats, every night, is no doubt the main obstacle to their employment; and to this we would urgently invite the attention of those who have mechanical ingenuity. Long ago, Sir JOSEPH PAXTON used moveable thatched roofs, running in a sort of groove or rail, capable of being pushed over a house every night, and pushed off again at one end every morning; and this device left nothing to be desired in principle. But it demanded space. For every 50 feet run of glass house, 50 more feet were required at the end of it to receive the moveable roof during the day, and it is only here and there that so much space can be afforded. Nor is the plan applicable at all to houses of any considerable dimensions. It therefore still remains for some ingenious person to show how glass houses may be covered every night *cheaply*, and *without trouble*, by a moveable roof. And we may add with perfect confidence, that this is a want very much greater than any other horticultural desideratum now remaining, except ventilation. We know how to build, and glaze, and warm, and we have little to learn as to mere cultivation; but of the right way to prevent nocturnal radiation, and how to secure perpetual ventilation, we are very nearly as ignorant as we were a century ago.

EVERY one must have observed the little white downy lines running across the inner surface of the carpels of Apples. We are not, however, aware that any notice of them has ever been published, nor had we ourselves any notion of their beautiful structure till our attention was called to them by Mr. PONSONBY LYONS. A question, however, arose as to their real nature. Externally they resemble exactly some parasitic mould, and a microscopic examination of their component threads is at first in favour of this view; but the history of their growth, their very frequent presence in so peculiar a situation, unaccompanied by the slightest symptom of decay, a peculiar feel when touched with the point of a lancet on the field of the microscope, the want of fructification, and the similarity to the soft tissue beyond the carpels with which they are in immediate connection when tested with chemical agents, all indicate rather a hypertrophy of the soft cells exposed by the fissure of the hard substance of the carpels, in some measure resembling what CORDA has published under the name of *Septotrichum*, and of which SPRENGEL'S *Erineum melastomatis* is a good example.

A close examination has confirmed our views as to this very curious, and, we may add, elegant production. The white elongated or sometimes radiating sori, which are often considerably elevated, are always coincident with ruptures in the indurated walls of the carpels, so that they have a direct communication with the subjacent larger and more tender cells. The base of the sori generally consists of a few closely packed cells, of which those which are external send forth radiating often forked threads, consisting of slightly swollen articulations clothed through their whole length with scattered granules, some of which swell out above so as greatly to resemble spores. These granulations are clearly little raised nodules or cæca in the outer membrane, very much after the ashion of the asperities on the surface of many hairs in Phænogams, of which the Nettle sting, as figured by KÜTZING, is an example. By one of those curious analogies, which are so frequent in natural productions, the threads resemble almost exactly those of the genus *Rhinotrichum*, of which it might very pardonably be considered a species. If a thin slice through the carpels, together with the sori and the subjacent tissue, be first steeped in iodine, and then in sulphuric acid, the thick walls of the carpellar cells become of a dark yellow, while those of the softer tissue and of the sori assume a beautiful violet of precisely the same

Hypertrophy of Cellular Subcarpellar Tissue in Apples.

tint, a few only of the threads of the latter, and those the most external, presenting now and then a deep yellow tinge. It is true, that where the wall of fungal cells, as in the asci of *Pezizæ* is very distinct from the central substance, the membrane so treated is violet; but even then the nitrogenous contents are very conspicuous; in most cases, especially in the very youngest fungal tissues, the colour of the protein mass within quite overpowers the violet of the cellulose. We have no doubt, then, of the real nature of the sori.

This example may serve to show how possible it is that certain Cryptogams, such as *Elachistea scutulata*, may, after all, be only cases of hypertrophy of cellular tissue, though it will not sanction the views of authors who would resolve most epiphyllous parasitic fungi, even where mycelium is very evident, into mere instances of anomalous development of cells.

It may be remarked also that this chemical test is often very valuable where it is requisite to ascertain the state of diseased tissues. We have been able to establish with the greatest certainty the presence of mycelium in morbid plants, by this treatment, where we could ascertain nothing certain by the unassisted microscope. Such tissues exhibit sometimes the most beautiful appearance. A slice of *Cucurbita verrucosa*, for instance, or of an Apple when just beginning to be attacked by mycelium, is a most beautiful object. The delicate violet of the cell walls, the yellowish tint of the fluid contained in them, the deep indigo of the starch grains, and the orange threads of the mycelium creeping amongst them, afford the most charming effect. Under such treatment, there will be no danger of confounding either the sections of the walls themselves or the folds which so often appear on them with threads of mycelium. The merest glance is sufficient to show the difference. Our figures give two views of the threads; in the latter case, which is more highly magnified, the connection of the granular threads with a large torn folded cell is very evident. *M.J.B.*

## ON THE PRESERVATION OF TIMBER BY CREOSOTE.*

By J. E. Clift, of Birmingham.

In the present day, when the requirements for timber in the various mining, engineering, and other works are so great, it becomes necessary to consider carefully the best means of rendering it as durable as possible, and that at the least expense; and the writer cannot think that sufficient attention has been paid to the subject by the parties most interested, from the fact that but few of the larger consumers of that article have adopted any plans for its preservation; and this fact must be the apology for bringing before the Institution a paper upon a process which has been partially in use for several years.

In looking through the colliery districts, it is found that thousands of loads of timber are taken green from the forests and used every year; and the greater portion is used in the pits where, owing to damp atmosphere and increased temperature, it is rotted in a few months; whereas, with a small expense, it might be made to last for years. It may be observed, also, that the railway engineers are seeking for a more durable bearing for the rails in iron sleepers, and overlooking the means of making wood, which is allowed to be the most agreeable for travelling upon, and the most durable, as well as the most economical, material for the permanent way.

The plan which is the subject of the present paper is the one invented by Mr. Bethell, for the use of a material obtained by the distillation of coal-tar. This material consists of a series of bituminous oils, combined with a portion of creosote, this latter substance being acknowledged to possess the most powerful antiseptic properties. The action of this material may be thus described:—When injected into a piece of wood, the creosote coagulates the albumen, thus preventing the putrefactive decomposition, and the bituminous oils enter the whole of the capillary tubes, incasing the woody fibre as with a shield, and closing-up the whole of the pores, so as entirely to exclude both water and air; and these bituminous oils being insoluble in water, and unaffected by air, renders the process applicable to any situation. So little is this oil affected by atmospheric change that the writer has seen wrought-iron pipes that had merely been painted over with it, and laid in a light ground 1 foot beneath the surface, taken up after 20 years, and they appeared and smelt then as fresh as when first laid down. By using these bituminous oils, the most inferior timber, and that which would otherwise soonest decay from being more porous and containing more sap, or being cut too young or at the wrong season, is rendered the most durable. This will be readily understood when it is considered that this porous wood will absorb a larger portion of the preserving material than the more close and hard woods: in fact, the soft woods are rendered hard by this process. By this means, therefore, engineers will be enabled to use a cheaper timber with greater advantage than they could use a more expensive timber uncreosoted; thus, taking the cost of a sleeper of American Yellow Pine at 4*s.*, and one of Scotch Fir at 3*s.*, and then adding 1*s.* to the latter for creosoting, the two would be the same cost; but the former one would last, under the most favourable circumstances, not more than 10 or 12 years, and the other would be good, under any circumstances, in all probability, in a hundred years.

This system of preserving timber has been in use on several railways, and other works, for several years past. A portion of the London and North-Western Railway, about 17 miles in length, has been laid with the creosoted sleepers from 9 to 11 years, during which period the engineer reports that no instance has occurred in which any decay has been detected in them; and they continue as sound as when first put down. On the Stockton and Darlington Railway creosoted sleepers have also been laid for 10 years, and are found to continue without any appearance of change or decay; also, on the Lancashire and Yorkshire Railway, creosoted timber has been used for five years, as paving-blocks, posts, &c.: the upper part becomes very hard, and the part underground appears as fresh as when taken out of the creosote tank, though the timber was of inferior, sappy quality. In a trial commenced 12 years since, by Mr. Price, of Gloucester, of the comparative durability of timber in the covers of a Melon-pit, where it was exposed constantly to the combined action of decomposing matter and the atmosphere, the unprepared timber became decayed in one year, and required replacing in a few years; a portion of the timber that had been Kyanised lasted well for about seven years, but then gradually, though very slowly, became quite decayed; but the timber that had been creosoted still continues as sound as when first put down, 12 years since. From these facts, it appears not unreasonable to infer, that if timber be made to continue unchanged, and to show no symptom of decay for 10 or 12 years, under circumstances that reduce unprepared timber to dust in two years, and in the absence of any proof to the contrary, we may expect to find it will last an unlimited period, and that 100 years will be a moderate life to assign to it. And not only does this creosoting process render wood free from decay, but it also preserves it from the attacks of the teredo worm, when used for ship-building, harbours, docks, and other works contiguous to the sea.

This has been satisfactorily proved at Lowestoft Harbour, where the plan has had a very extensive trial for four years; and the superintendent reports that there is no instance whatever of an uncreosoted pile being sound; they are all attacked by the limnoria and the teredo to a very great extent, and the piles in some instances are eaten through; but there is no instance whatever of a creosoted pile being touched, either by the teredo or the limnoria, and all the creosoted piles are quite sound, though covered with vegetation, which generally attracts the teredo. This extraordinary fact is to be accounted for by the creosote remaining intact in the timber, either wet or dry; and, being destructive to all animal life, is proof against the attack of these parasites;—whereas, with the other processes, the metallic salts are washed out, or that portion which unites with and coagulates the albumen is rendered quite innocuous by the process. Several specimens exhibited proved that the ravages of the worm reduce the unprepared timber to a completely honeycombed state in two years; but the creosoted timber remains untouched after a period of four years.

There are two processes in use by Mr. Bethell, for impregnating timber with creosote;—one is by placing the wood in a strong iron cylinder, and exhausting the air from it by an air-pump, until a vacuum is created, equal to about 12 lbs. on the square inch; the creosote is then allowed to flow into the cylinder, and afterwards a pressure is put upon the creosote, by a force-pump, equal to about 150 lbs. on the square inch; the timber when taken out is fit for use.

The second process is by placing the timber in a drying-house, and passing the products of combustion through it; thereby not only drying the timber rapidly, but impregnating it, to a certain extent, with the volatile oily matter and creosote contained in the products given off from the fuel used to heat the house. When the timber is taken out of this house, it is at once immersed in hot creosote in an open tank, thus avoiding the use of a steam-engine, or pumps.

Specimens were exhibited of creosoted sleepers which had been in use for 10 years on the London and North-Western Railway, they were still perfectly sound and unchanged; also specimens of creosoted piles from Lowestoft Harbour, which had been in the sea for four years, and continued quite fresh and sound, and without being touched by the worm; with specimens of similar piles uncreosoted, from the same situation, which were completely eaten away and honeycombed by the worm in the same period.

Mr. Bethell observed, that when he first commenced to preserve timber, he found that no pressure would get the creosote into the timber, from the presence of the moisture in the pores, and it became necessary to adopt the system of drying the timber first; and after 14 days he found that the wood lost 3 lbs. in weight in every cubic foot; this was by the old process of drying. He then introduced the present drying-house, and in 12 or 14 hours they lost 8 lbs. per cubic foot, in Scotch sleepers, and these then absorbed an equal weight of creosote. An average of 11½ lbs. of creosote per cubic foot was now put into all the Memel timber at Leith Harbour works; it was forced in with a pressure of 130 lbs. per inch. One piece of creosoted timber had been observed at Lowestoft, which had been half cut through for a mortice, but not filled up again, and a teredo had penetrated a little way into it at that part, and then attempted to turn to the right, and then to the left, and had ultimately quitted the timber without proceeding any further. Young wood was the most porous round the exterior, and consequently absorbed most creosote, which formed a shield to keep off the worm. The creosoted sleepers were better after eight or ten years than when new, because the creosote got consolidated in them and rendered them harder. He had taken the idea originally from the Egyptian mummy; it was exactly the same process; any animal put into a creosote tank assumed the appearance and became in like condition to a mummy. Timber creosoted was now chiefly used in railways, but he believed that if it was introduced into coal-pits it would be found that no timber so used in those places would rot.

Mr. Clift said he had taken up the subject in the present paper with the object of drawing attention to pit timber, and he was satisfied that if the timber used in coal-pits was creosoted, it might, when done with in one situation, be again taken out to use in another place; whereas now, because the dry rot seized the timber so quickly, it was left behind in the workings of the pits.

Mr. Bethell, in answer to questions put by the chairman, said that every piece of timber was weighed before it was put into the creosote tank, and again when taken out, and each piece was required to be increased in weight by the process 10 lbs. per cubic foot; the quantity of oil used always rather exceeded the weight gained in the timber, on account of the loss of weight from the moisture extracted by the exhaustion of the air-pump. Oak only absorbed half as much creosote as Memel timber. Common Fir creosoted would last double the time of hard wood creosoted, because it took more creosote. Beech made the best wood, being full of very minute pores, and they could force a greater quantity of creosote into the Beech than into any other wood; consequently it took a more uniform colour throughout from the process.—Long pieces of timber were found to require more time to saturate them in proportion to their length, and the creosote appeared to enter at the two ends and be forced up through the whole length of the pores. The progress was known by the quantity of creosote forced into the tank after it was filled, according to the number of cubic feet of timber contained in the tank. *Civil Engineer and Architects' Journal.*

* Paper read at the Institution of Mechanical Engineers, October 22d, 1851.

## BRITISH SONG BIRDS.

("Instinct" in the Larger Animals.*)

No. LIX.—Our observations hitherto have, of course, been principally confined to the instinct of the feathered tribes—our legitimate subject of investigation; and we have shown how Nature varies her gifts to all and each of her children, on particular occasions. When they are breeding, for instance, they have a double share of affection (Στοργή) given them, and when their offspring are able to "run alone," the latter are immediately forsaken, and recognised no longer. So also, at the end of the breeding season, a separation takes place between the parent birds, who, for the most part, seldom again commit matrimony without selecting each a *new* mate. All that has passed between them during summer, in the way of love and affection, becomes in the autumn forgotten; and each successive season opens for them new views, new occupations. We will now, as our space is becoming circumscribed, take a glance at certain animals whose intelligence is of a still higher order. (If we were to shrink from this, we should be accused, justly, of having acted with unfairness, and of having "garbled" the inquiry.) Of these there are so many, that we must of necessity select a few only to dilate upon. Let us take at random the Elephant, the Fox, the Hare, the Beaver, the Cat, the Horse, and the Dog.

It would be folly in us to attempt to prove, that in all the creatures we have named there does not exist a wonderfully instinctive power of perception and ready wit, most of them coming continually before us in some way or other. We cannot but feel amazed at their intelligence. Still, we find them all partaking of the same natural endowments, and, however cultivated, never able to get beyond a certain point,—at which point all their sagacity terminates. They are born for a purpose, and that purpose they fulfil. With us, that which we call reason is never stationary—we shall know to-morrow more than we know to-day; and every year adds to our wisdom in a marvellous degree. A talent is given us, and we gain other ten talents. Our talent, Reason, is always "out at interest." *Vires acquirit eundo*, like the running stream.

The Fox is an animal of a predatory character, and therefore obnoxious to mankind, who are his natural enemy. He is therefore gifted with a very astute cunning—only look at his countenance!—that generally enables him to save his life; though sometimes at considerable hazard. *All his race are equally cunning*—they are born so. One of these animals has been known to get access to a hen-roost, and having eaten to repletion, enlarged his proportions so as to prevent his egress through the hole at which he entered. Throwing himself on his back, as if killed by surfeit, he has laid apparently dead and waited the opening of the door. Being "taken up for dead," he has watched his opportunity, darted from the hand that held him, and escaped!

* As this is the last week of the present year, we think it right, as promised, to bring this very popular discussion to a close. The further we advance in it, the more intensely interesting does it become. We have said quite sufficient to produce "thought," and to lead to "investigation." *Patience* must do the rest.

Hence the saying, 'cunning as a fox.' We see no "reason" here, but *very much* animal sagacity.

The HARE is an animal born, 'fated' if you will, to be hunted; and the instinctive knowledge of this fact haunts the poor creature day and night. It is said—and truly, we believe—to sleep with its eyes open. To compensate for this, it is endowed with large, projecting eyes, the conformation of which enables it to see equally well behind, before, and on either side of it; so that it has often timely notice to escape the very many threatened dangers by which it is encompassed. Still it ever lives in bodily fear. We often wonder at the brutality of man—lord of the Creation!—who revels so luxuriously in the tortures he inflicts upon this poor, helpless, harmless animal. In this instance, if we see little "reason" in the pursued, we see even less in the pursuer. There certainly is more than 'a dash' of the savage in our composition!

The CAT is a domestic animal with whose habits we are all familiar. Anecdotes of the race—some of them true, more of them false—abound. They are sagacious and cunning, but assuredly *not* reasonable creatures. If you take away their kittens, they will suckle a rat, a rabbit, a puppy, or indeed any other animal that may be put to them. They are strongly attached to the house of their birth, and have been known by a remarkable instinct to travel to almost incredible distances. Beyond this, we need inquire no further.

Of the Dog we can all be eloquent; and I could relate "true anecdotes" of some of my canine favourites that would hardly be credited. Still, with all my success in teaching dogs to do marvellous things, *I never could teach them that when they jumped up with dirty feet there was an injury done to my clothes.* When they obeyed the command of "Down, sir!" sometimes enforced by a gentle *coup de main*, they never could reason about the 'why and because.' Nor have I ever yet met with any dog, or ever heard of any dog, that *could* be "argued with" on these moral proprieties and observances. Talking of the memory of dogs—one of mine, 'Dash' by name, was once stolen from me. After being absent 13 months, he one day entered my office in town, with a long string tied round his neck. He had broken away from the fellow who held him prisoner. Our meeting may be imagined. I discovered the thief; had him apprehended, and took him before a magistrate. He swore the dog was *his*, and called witnesses to bear him out. "Mr. Kidd," said Mr. Twyford—I see him now—addressing me, "Can you give us any satisfactory *proof* of this dog being your property?" Placing my mouth to the dog's ear, first giving him a knowing look, and whispering a little masonic communication, known to us two only, 'Dash' immediately reared up on his hind legs, and went through a series of gymnastic manœuvres with a stick, guided meanwhile by my eye, which set the whole Court in a roar. My evidence needed NO FURTHER CORROBORATION, the thief stood committed; 'Dash' was liberated; and amidst THE CHEERS of the multitude we bounded merrily homewards. The *réunion* among my 'household gods' may be imagined. It would be farcical to relate it; nor must I dwell upon certain other rare excellences of this same dog; with whom, and his equally sagacious better half, 'Fanny,' I passed many years of happy intimacy.—I did intend to speak of the GEOMETRIC SPIDER, and of the truly marvellous sagacity of the WHITE ANTS, or *termites*, which abound in the tropics; but these matters will bear keeping.

Before closing this our final Chapter on "Instinct and Reason," let us here assist in immortalising the remark of COLERIDGE on the bounties of the Creator: "In wonder," exclaims he, "all philosophy began; in wonder it ends; and admiration fills up the interspace. But the first wonder is the offspring of IGNORANCE; the last is the parent of ADORATION." I must to this just add, with a view of reverentially closing the "good Old year"—"1851"—*Gloria Deo in excelsis! William Kidd.*

## Home Correspondence.

*Special Inorganic Manures for Melons.*—The following hints, taken from the experience of Dr. Hull, of Newburgh, New York, may be acceptable to English cultivators. They are abstracted from Mr. Downing's "Horticulturist." For three consecutive years, namely in 1849, 1850, and 1851, Dr. Hull has been making experiments with specific inorganic manures, in regard to their influence on the size, productiveness, and flavour of Melons. 1849.—It appears that the soil about Newburgh is naturally clay loam, lying upon "hard pan." The site selected for the experiments was trenched 3 feet deep, the strata incorporated, and well rotted horse manure freely distributed through the whole mass. Hills 6 inches high were raised, in which the soil was lightened by fine sand, and these were distinguished with one exception by the addition of the following materials faithfully commingled. Bed No. 1, Superphosphate of lime and sulphate of potash; No. 2, Burned turf; No. 3, Muck neutralised by potash; No. 4, Ashes; No. 5, No mineral addition. The beds were mulched with long litter. The kind of Melon grown was the Nutmeg; on the 14th September No. 1 exhibited the greatest number of large Melons; Nos. 2 and 3 were the earliest to offer ripe fruit, No. 5 the latest, No. 2 produced Melons grouped in beautiful clusters, more numerous for the space covered than the others; Nos. 3 and 4 gave larger samples than the others. Note, 28th of September: No. 1 has afforded the largest amount of Melons of full size, and contains most at present matured and maturing. No. 2: The clusters have been closer than either of the others, the total amount less than No. 1. No. 3 has produced an amount equal to No. 2; nearly all have been matured for some days, evidently exceeding all the others in this respect. No. 4 has exhibited the greatest number of very large Melons, but has not equalled No. 1 in productiveness. No. 5: The produce has been intermediate between 1 and 4 as to size; between 2 and 3 as to productiveness. It would seem, therefore, that the produce from the superphosphate of lime and sulphate of potash excelled in size, quantity, and lateness; that from muck neutralised by potash, in the early maturing of the entire crop; that from ashes and the unmanured bed, in the size of select specimens, their productiveness being inferior to No. 1. Dr. Hull, himself, preferred the flavour of those grown in Nos. 1 and 3, where superphosphate of lime, and sulphate of potash, and the humate or gyate of potash exercised their specific influence. Mr. Downing on this point states, that the flavour was very distinct in the different beds, the produce of the burnt turf being to his taste the most sugary and rich, that of the superphosphate the most juicy and melting. 1850.—Holes were dug in 2 feet trenched ground, and hills formed by the addition of sand, old manure, &c. The beds were manured with the following substances:—No. 1, Potash in muck; 2, Ashes in muck; 3, Burned turf; 4, Superphosphate of lime; 5, the same with sulphate of potash; 6, Sulphate of soda in muck; 7, Salt and lime mixture; 8, Poudrette. The results are briefly stated thus: the Melons fed by humate of potash exceeded in number, size, and flavour; those by poudrette equalled these in number and size; those by superphosphate of lime, and lime and sulphate of potash equalled the first in flavour, and approached the two foregoing in size. 1851.—The experiments were again repeated, but owing to illness, the results were not so accurately stated. Dr. Hull's gardener, however, gave a decided preference to the produce of the beds modified by preparations of potash and superphosphate of lime. Mr. Downing mentions Dr. Hull's success as surpassing all precedent in America. From a plot, 40 feet by 180 feet, the enormous number of sixteen hundred Melons was produced. *T. Moore, Chelsea.*

*Nymphœa.*—In the first days of September, Nymphæa cærulea threw up a flower-bud in my pond; but it never succeeded in expanding its petals. It has another bud now under the water, which of course can come to nothing, unless indeed it could live through the winter. *A. H.*——We beg to inform you that Nymphæa cærulea is in full flower in our open heated pond. *J. Weeks and Co., King's-road Nursery, Chelsea, Dec.* 19.

*Gardens in Cornwall.*—Though we often hear of the wonderful climate in Cornwall, we hear but little of the gardens of that part of England. I think that it would be interesting to many of your readers if some of the western gentlemen would give accounts of the best among the gardens in the county; we hear often of the fine evergreen Oaks scattered apparently throughout the west, of great age and large size, but we should like to hear something definite, as they may possibly be inferior to those in Goodwood Park, and also with regard to the shrubs and plants said to prove hardy in the far west, which are supposed to be tender in the other parts of England; for if Rhododendron arboreum (true), Acacia affinis, Melianthus major, Benthamia fragifera, and many other plants which have failed in the more eastern part of the kingdom really arrived at anything like perfection, the western gardens must be worth a journey to see; but we are at present in ignorance which gardens to choose, in order that we may see the best things: I have no doubt but that the travellers of Messrs. Lucombe and Pince and Messrs. Veitch would give the clearest information; and as the West is proverbial for hospitality, I have no doubt that a stranger would be allowed to feast his eyes. *C. B., Chichester.*

*The Ostrich.*—I am not surprised at my comment on the Ostrich, at p. 740, having attracted attention; for I find, on inquiry, that the habits of the bird are by no means well known; and that hardly any two persons are agreed upon the subject! I would not for an instant venture, nor presume to doubt, the correctness of your correspondent "Observator;" but his, I believe, differs so very widely from all literary authorities, that one almost feels inclined to question whether the bird disputed about be one and the same. I have received a private letter from a very clever man, who tells me that the instinct of the ostrich is remarkable. Immediately on the parent dropping her eggs, and covering them in the sand, she lays yet *another* egg at some little distance,—after first breaking the extreme end, so as to admit the air. By this ingenious manœuvre, the heat of the sun soon causes the egg to putrefy, and a host of maggots are produced in readiness for the young to feed on when hatched. Another thing is disputed by naturalists,—viz.: the *impossibility* of the ostrich, whose legs are of great length, and very thick, being *able* to perform the duties of incubation. To me it appears incredible. I am well aware that it is polygamous, like our domestic fowls, and that it lays many eggs in the same nest,—merely a hole in the sand, whose heat preserves the vital warmth necessary for hatching; but "Observator" must not think me rude if I say that I cannot at present understand *how* they contrive to sit without breaking their eggs. I will diligently inquire, till I get further corroborative proof that we both are talking about the same bird. If the *stork* be the bird, I can well understand the prevalent affection (Στοργή), for its large family of young ones, or even of another's young ones; for the Hebrew word *chasidah* indicates the stork to be possessed of "excessive fondness" for its offspring. I have consulted Alexander CRUDEN on the subject of the ostrich, a man whose researches and inquiries are too well known to be dwelt upon. He says,—"the ostrich is made the symbol of cruelty and forgetfulness. We are told of it, that it lays its eggs upon the ground, hides them under the sand, and *the sun hatches them.* Being extremely large and heavy, she would break her eggs if she were to sit upon them like other birds. She therefore hides them in the sand, watches them, and hatches them,—as it were, with her eye. The male and female stay with them alternately, and whilst one of them goes to seek its provision, the other does not leave sight of them. However, if either of them should be driven away, or go too far from their nest, they could not find their eggs again. And it is probably this," he adds, "that has given occasion to what is said of their cruelty and forgetfulness." *W. Kidd, New Road, Hammersmith, Dec.* 19.

*The Lucombe Oak.*—This is classed among the varieties of Quercus Cerris, or mossy-cupped Oak, in Loudon's "Arboretum Britannicum," where it is stated to bear so close a resemblance to the Fulham Oak as scarcely to be worth keeping distinct. Be this as it may, it is unquestionably a very handsome, free growing, sub-evergreen tree, attaining a large size in situations favourable to its growth, and producing a very striking effect during the winter months, when most other trees are deprived of their foliage. There are some fine specimens of it at this place, growing on a sloping part of the park eastward of the house, where the soil is a friable loam resting on a dry, hard, clayey subsoil, and where the trees are to some extent protected by large Sycamore and Elms from the cutting north-west winds, which prove so destructive to vegetation in this part of the kingdom. The group consists of 10 trees, the largest of which measures 9 feet 3 inches in girth at 4 feet from the ground, and has an erect stem from 45 to 50 feet high, furnished with numerous spreading branches. Its height altogether is about 90 feet, and the diameter of the space covered by its branches is 20 yards. The other trees are all nearly of the same height, but vary in girth from 8 feet 9 inches to 7 feet 4 inches, which is the smallest in the group. To persons residing in the midland counties where large Oak trees are more common than in Cornwall, the above dimensions will probably not be considered anything very remarkable; but in so far as they have reference to the Lucombe Oak, I think they are worth recording, were it only for the sake of bringing this noble sub-evergreen tree under the notice of the planter, and thereby leading to its more frequent introduction near a residence, where it is certain to prove highly ornamental, if sufficient room is allowed for it to spread. From a tree which was cut down some years ago, I ascertained the wood to be very clean grained, and beautifully marked when sawn up into plank. It was one of the first planted here, and considered to be about 70 years old. *Wm. Beattie Booth, Carclew.*

*Clark's Preparation for killing Mealy Bug.*—It is generally admitted that this is the greatest pest which a gardener has to deal with. I have tried various things recommended for its destruction, but I always found that when they killed the insect they also injured the plant. This, however, does not apply to Mr. Clark's excellent preparation, which I have found to be an effectual remedy, without harming in the least the plant. *J. Rust, Enfield.*

*Cherries.*—Mr. Lindley, in his "Guide to the Orchard," in describing Hunt's large Tawny Nectarine, says that it originated from another Nectarine (Hunt's small Tawny), but not through a seminal process. He says that Mr. Knight described a Mayduke Cherry which on one of its branches had oblong fruit, which ripened later, and were of greater weight than those of any other part of the tree. I am induced to quote this, because I have two Mayduke Cherries which exhibit the same peculiarity; the trees grow against a south wall, and in one the sport is confined to a small horizontal branch, but in the other the leading shoot, which now forms one-half of the tree, exhibits the same peculiarity; the blossom is a fortnight later than the other part, and however favourable the weather may be when this plant is in blossom, there is never more than a tithe of a crop. This has now continued for so many years, that I feel strongly tempted to cut out this offending branch; but I have gone on hoping that some year, when the frost destroys the other blossoms, I may get a crop from this part of the tree (which is 30 feet high), but so far I have been always disappointed. The few Cherries which are produced on his part of the tree are fully a fortnight later than the others, and they are very fine and good-flavoured; but I must acknowledge that I don't admire those very fine sorts of fruit from which I never gather a crop. I was foolish enough to try to grow Peaches for 10 years, and in that time I certainly never gathered 10 good Peaches, whereas, if the same extent of good wall had been covered with Capiaumont and Beurré Rance Pears, I should have gathered thousands of fruits of much better quality. Would you recommend me to cut this part of the tree away? I don't admire cutting off large branches from either Plum or Cherry trees, on account of the gum. But I don't like to cover a large extent of wall with a tree which gives me no fruit. *T. G., Clitheroe.* [There is no probability of the objectionable branch behaving better. Its peculiarities are constitutional, fixed, and capable of being propagated by grafts, &c., as is the case with other "sports," of which this is but an instance.]

*Pruning Forest Trees.*—Your correspondent, "Expertus," intimates (p. 630) that the advocates for pruning forest trees are probably not convinced of the error of their doctrine—although silenced—because the matter in controversy can only be decided by experience and observation. In this I am inclined to agree with "Expertus;" but as none of us live long enough to see timber trees, subjected to systematic pruning, arrive at an age when they can be converted into massive beams, or cut into planks fit for the shipwright—the point of experience must be left for a future generation. Now, as to what observation can do for the subject. I should beg to refer "Expertus," and others who think with him, to the immense Pine logs from the prairies of America, that never had a branch touched by any pruning instrument, in their life, and yet they attain an immense length of stem, with scarcely the semblance of a knot to be seen, when sawn up into boards. Would pruning have improved them? Look again to the Fir timbers imported from the north of Europe; it is true some of it is found knotty (as the joiners call it), but would pruning have improved it? that is the question. Again, recurring to home-grown timber, three years ago a number of Oaks were felled, under my own inspection, a very little distance from where I now write, that I am confident were never touched by any pruning instrument; most of these had stems of large size—from 30 to 50 feet in length—with scarcely a flaw, from dead boughs grown in, or other causes. Now, would early pruning have improved these? I think not. It might have retarded their growth. Again, "Expertus" says, what may seem very plausible at first sight, about the branches of unpruned trees dying, and healing over, leaving the same defective union, &c., as in the pruned branch; now this looks very feasible, and I have seen instances of faults in timber from that very cause—but they are the exception, and not the rule. I have looked at the matter with anxiety in young growing Oaks; and, however inexplicable it may seem, there is, in most cases when an under-side branch dies, a sort of compression by the living stem, that nearly or quite obliterates in a few years all trace of the defunct member, and leaves scarcely a mark behind; so much for "observation." As to the cases of necessity mentioned by "Expertus," these are exceptions altogether to the general systematic pruning of plantations with a view to improve (?) the timber; where lopping or pruning at all becomes a necessity, then cut close, by all means. On the whole, I would like to conclude, that, as the pruning advocates are "silenced," they are on the high way to conviction, and will lose no time in abandoning a practice involving much labour only to do mischief. *Quercus.*

*Propagation of Eels.*—At p. 806, "T. G." denies the possibility of eels breeding in fresh water. We have a pond here, covering from three to four acres, which swarms with eels of all sizes. I have caught them from the size of my little finger up to the weight of five pounds; the supply of water is from nothing else but land springs, there being no communication between the pond and any river; when much rain occurs, I am obliged to put up a sluice board, in order to prevent the banks from overflowing. I have taken from 1 to cwt. at a time from a box, which the water flows through at the bottom of the sluice board; the large quantity that has been taken out of this pond leaves no doubt that they breed to a great extent, but whether they are propagated by spawn, or brought forth alive, I am unable to say. *G. H., Finedon Hall.* [We have also a letter upon this subject from Mr. Boccius, who, we are sorry to see, is offended at the remarks of "T. G." As no offence was meant, it is needless to print the complaint].

*Parrots.*—Mr. Kidd having taken up the cudgels against the noisy parrots, I beg to inform him that I know a parrot, brought from the Gold Coast this summer, that already is in excellent music.(!) It has caught the cluck of a hen when calling its chickens, the bark of a dog, mewing of a cat, the cackle of geese, &c.; says "Pretty Polly Hop," "Cook," "Poor Poll," and several other words. I also know a parrot near Matlock, in Derbyshire, that was much attached to a pet dog which some time ago died, and, on calling the dog by its name, the parrot immediately repeated "Carlo—why where's Carlo? he's dead!" and exhibited signs of great distress. This bird repeats after its mistress the greater part of the song of "Polly Hopkins," and when it sees a beggar at the gate, it immediately bawls out, "Be off! you've no business there!" and many other droll tricks and sayings. I do *not*, however, argue from my observations that the parrot is gifted with "reason," but phrenologists may say it has the bump or organ of imitation *C. P., Boston.*——Mr. Kidd may be amused at hearing that there is in this city a parrot, which, not content with talking, which he does excellently well, actually turns heels over head on the floor of his cage, in a manner which might excite the jealousy of Mons. Oriol; Mr. Potter, to whom he belongs, assures me that he never tried to teach him, but that he copied some tumblers in the street; to say the least, his performance is very original for a bird. *C. B., Chichester.*

*Peach Trees and Fixing Ammonia.*—Although I doubt not the point has been often settled, I wish some one would once more inform such ignoramuses as myself, what depth of soil should cover the roots of Peaches and Nectarines. Also, what is the best method of managing stable dung to prevent the escape of the ammonia? One of your correspondents is anxious to fix the perfume of the liquid in his tank. Can he not bear it for the one day during which he is laying it on its final destination? From sunrise the following morning it will have departed as entirely as if it had been disposed of a century ago. If he doubts the truth of this, let him try it, by saturating a heap of common earth with it to-day, and in 24 hours let him take a handful of the same, and put it to his nose. He will have little, if anything, but his servants' word that the earth was saturated at all. *Enquirer.*

*Hints to Persons making a Garden.*—The last point—many would think it the first—on which it is necessary to touch in making a garden, is soil. As to quality, it may be naturally classed under the head of sand, lime, or clay; as to peculiar character, it may be ferruginous, saline, or otherwise chemically affected; as to condition, it may be wet, dry, rocky, arid, or peaty. There is so little sandy soil in England, as compared with the continent, and the dampness of our climate goes so far to counteract the complete pulverisation of other soils, even in our summer, that it is not wonderful that many very ornamental hardy plants fail with us from that cause alone; such are the Astragali, several Dianthi, &c. Lime is generally a poor soil, but the Leguminosæ, and many of the smaller ornamental and rock plants, flourish on it, perhaps more on limestone than on any other sort of rock. Clay is more favourable to the arborescent and shrubby plants than either of the former, but many fine-rooted plants refuse absolutely to take to the soil. On the whole, a clay soil would seem to grow a smaller number of species than either sand or lime. It may sound like a paradox; but a rich, natural, alluvial soil, the best for a field or kitchen garden, is far from being equally good for a flower garden. A very moderate, or even poor, workable, manageable soil, well drained, is preferable to the richest meadow land, as the basis of a flower garden. It should be light, or hundreds of delicate plants will not thrive in it. It can be made rich at pleasure, but should never be heavy. The reason is obvious. A variable soil will accommodate the largest variety of species; and as in our most temperate climate we try to, and with care and skill can, associate plants from the Arctic circle to the edge of the tropic, from the High Alps to the shores of Egypt, it follows that a very rich earth which grows the tallest specimens of a few strong plants, Dahlia, Helianthus, Silphium, and equally Cardoons, Urtica, and Rumex, will suit but a few and spoil the natural character of the rest. Any one who has grown the plants of a dry climate in England will bear witness to this. The ferruginous or saline properties of a given soil may be very important in stimulating the growth and perfection of some plants, but they certainly injure some others. These points can only be ascertained by local experience. Dryness or wetness of soil, or of the situation, not exactly the same thing, is an all important item in the choice of garden-ground, and of the management of it afterwards. Good drainage need hardly be insisted on at the present day, but as some plants require wet soils, they must be especially provided for. It is a common error to confound marsh and marsh-plants with peat, and the plants belonging to a turfy moor; both qualities of soil being commonly, but carelessly, called bog. It is as necessary to distinguish between these two descriptions of soil and plants, as between the Alpine and other rocks before alluded to. Hibiscus palustris, from the rich mud of a Virginian swamp, requires very different conditions from Parnassia palustris from the peat mosses of the north. Near the sea, Pines and other Conifers seldom succeed well, nor do Rhodoraceæ, except in very sheltered spots, prosper much better. On the other hand, all saline, alkaline, succulent, and rigid plants, though not truly maritime species, grow and flourish to a degree unknown in the inland counties. These observations are now at an end, and it is hoped they may call forth more from your more experienced correspondents. *S.*

*Paulownia.*—At the extremities of the main branches of this plant I have slender buds or shoots, forming elongations in a right line of those branches. None laterally from those branches; and none at all on the minor branches. These I hope are flower buds. *A. H.* [We fear not. The flowers are all lateral.]

*Coal-tar Walks and Bees.*—Some of your correspondents have inquired about coal-tar for garden walks. It is in very extensive use here for foot-paths, but it is unsuited for garden walks, except at a distance from houses, both from its appearance and smell. I use it in my kitchen garden, but I think it very prejudicial to the bees. When fresh, it appears to produce on them a stupifying effect, similar to chloroform; at least, immediately after it was applied the walks were strewed with thousands of my bees, crawling about, in an apparently dying state. I could attribute it to nothing but the vapour from the coal-tar, and shall remove my hives before I venture to apply it again. It must be acknowledged that it makes a dry and firm walk, which is neither troubled with worms nor weeds for several years. *T. G., Clitheroe.* [If gravel walks are only painted, as we have recommended, *and then sanded* or *covered with coal ashes*, no inconvenience arises from the smell except to bees.]

*Vines in Pots.*—In answer to numerous inquirers respecting the culture of Vines in pots, I beg to advise those interested to pursue the following plan. Procure strong well-ripened Vines from eyes; they can be trained up rafters or on a trellis, but they look better and are more portable trained low, round sticks placed in the pots. Proper sorts can be selected either for the forcing-house, Vinery, or out of doors. During their growth use weak manure water; but withhold it nearly altogether, or use it very sparingly, during the time the fruit is ripening; otherwise, it will injure its colour and flavour. It is not essential to use manure water, unless fine bunches are required. After the fruit is gathered, let the plants remain dormant till the turn of the year, then cut the Vines down close to the ground, and shift them into rich compost, to enable them to throw up a good-sized cane; but, above all, ripen their wood well, the following year it will bear fruit. Thus, every alternate year a crop will be obtained from the same plant. Of course, by keeping up a succession of Vines, a crop of this excellent fruit may be got every year with scarcely any expense, and with so little attention as to be a mere amusement. *J. R., Nov.* 26.

*How to Crop a small Kitchen Garden.*—If early Peas and Beans have been sown across an open part of the garden, and succeeded by Cauliflowers, as I recommended, let the ground be cropped next year in the following manner. As soon as the Cauliflowers are all off, give the ground a slight dressing of manure, and ridge trench it. About the latter end of February, or beginning of March, fork down the ridges, plant Potatoes 2 feet row from row, and sow Spring Spinach broadcast over them, raking it in. When it has formed its first rough leaves, thin it out to 3 inches apart. When fit for use, cut that next the rows of Potatoes first. When it is all cut, fork the earth up to the Potatoes. Plant one row of Broccoli between the first and second row of a sort to come in for use the following April; it will be off in time for a row of Runner Kidney Beans. Let the second and third rows be taken up for use as soon as fit; when they are off, draw three drills, 10 inches apart, and 3 inches deep. Plant a row of Leeks in each drill, 6 inches plant from plant, shorten their tops, thin their roots, and well water, if the weather is dry. Leave the three next rows of Potatoes without putting any other crop between them; take them up the first week in August, and sow Turnips, 10 inches row from row; thin them out to about 3 inches apart; when large enough, thin as required for use, taking out every other one. Let Savoys be planted between the remaining rows of Potatoes, a row between each, at 20 inches apart in the rows. Take up every alternate row, as required for use, which will give the Savoys the benefit of light and air, much sooner than they would get it were the rows to be taken up regularly. When the alternate rows are all removed, proceed to take up the others, and fork the earth well up to the Savoys. The above mode of cropping will answer equally well for a border (provided the Peas were sown there), with the exception of the row of Broccoli, which must be grown on an open quarter. *J. Steel, Clitheroe.*

*Audacity of the Robin.*—The little history of the wren's nest, given by Mr. Kidd (p. 756), may be overmatched by the history of a robin's nest, built last spring in my garden at Hammersmith. The pair of old birds had already reared off one brood, and commenced building a second nest in some Ivy growing on a wall close to which my family were in the constant habit of passing. Unfortunately they had selected a spot where there was not sufficient support for their materials, which fell to the ground almost as soon as put together. Seeing this state of things, I determined to help the ill-judging pair, and nailed and tied up some twigs beneath the spot, into which I thrust a handful of dead leaves, &c., which had already fallen to the ground. Notwithstanding this interference, which is I believe often followed by birds in the act of building leaving the place which they had selected, the robins soon set things to rights, and hatched their second brood. By constantly passing close to the nest, however, they became not only used to our presence, but absolutely audacious, especially to the females of my family, flying at them, and on several occasions actually pulling off their caps and other head gear. *J. O. W.*

*Calla æthiopica.*—I get on poorly enough with this Calla, and I wish for some theoretical explanation thereupon. Taking 4 inches for the thickness which ice very rarely exceeds, why is it said this plant requires 18 inches of water above the crown of its roots, and dies in 12 inches; or, in other words, must be removed 14 inches below the line of frost? What other causes, besides frost, and at a distance from frost, work its destruction? Is the water underneath a given thickness of ice warmer, as though a frame of so much glass were spread over it; or is it for any reason colder than before the ice was formed above it? *A. H.* [We take it that the reduction of temperature will be in proportion to the bulk of water to be cooled; that shallow water loses heat much faster than deep water; and hence that a tender plant may survive a winter if 18 inches under water, although it may die if only 4 inches under water.]

## Societies.

Botanical of Edinburgh, *Dec.* 11.—The President in the chair. Several donations were announced. Mr. M'Nab read the following extract of a letter from Mr. Goldie, Ayr, Canada West (late of Ayrshire):—"I observed in the *North British Agriculturist*, that at one of your botanical meetings there was a discussion about what kind of trees were generally struck by lightning. Since I came here I have learnt something on the subject. One morning no less than four trees were struck by lightning within three miles of this place, one of them close at hand. Of the four trees alluded to, all were gigantic specimens of the Weymouth Pine, Pinus Strobus. Indeed, I may say, that I do not recollect of seeing any other sort of tree being injured by lightning in this part of the country. Whether this occurs from the Pine being taller and more pointed than any of the trees here, or from any other cause, I shall not presume to say. In

all the lightning-struck trees which I have examined, the electric fluid proceeded from the top to the root, following the grain of the wood, and cutting out the bark 2 or 3 inches all the way, as if it had been scooped out with a gauge." The following papers were read:—1. *Notice of a new British Viola.* By C. C. Babington, M.A. 2. *On the Fuchsia, considered morphologically.* By the Rev. Dr. M'Cosh, Brechin. 3. *On Monstrosities of the Dandelion and common Clover observed near Turin.* By Charles Murchison, M.D. 4. *On the Flora of Bonn, on the Rhine.* By G. S. Blackie, Esq. The author noticed some of the objects of interest in a botanical point of view, in the neighbourhood of Bonn, including the Botanic Garden, and the Museum of Natural History at Poppelsdorf, remarking particularly upon the geological collection, containing many interesting specimens, some of which were from brown coal pits at Friesdorf, three miles distant. "The stratum at Friesdorf is in fact a forest buried at an exceedingly remote period, and now converted into brown coal. The trunks of trees lie in beds of clay and sand, and are found in various stages from the perfect fossil tree in which the form and structure are plainly visible, to this coal. The layers of coal alternate with layers of aluminous earth which furnishes materials for a large alum work, on the same hill. This coal also yields the pigment known by the name of Burnt Umber or Cologne earth. At Putzberg, near Friesdorf, trunks of trees 10 and 12 feet in diameter have been frequently found." The author then proceeded to remark:—"Bonn possesses a salubrious climate, severe winter, early spring, and very warm summer. It stands near the head of that immense plain which extends from the seven mountains to Rotterdam. There are no very high hills in the neighbourhood except the Drachenfels and its six brothers, eight or nine miles up the river, though between Bonn and these seven mountains the country is gradually rising, and below Bonn there is hardly a hillock. Many of the smaller heights, if not covered by vineyards, are clothed with forests of short stunted trees, and inhabited by deer, roe, and even, though very rarely, by the wild boar. The soil of the country is in general rich, though in many places very stony; the whole country has been formed by volcanic agency, and consists of lava, trachyte, and basalt, and one or two of the hills are plainly extinct volcanoes, more especially that of Rodeberg, which is opposite the seven mountains. This is one of the largest extinct volcanoes on the Rhine. It has a circular crater about a quarter of an English mile in diameter, and 100 feet deep, and great quantities of tufa and scoriæ are found in and around it. The country is under a high state of cultivation, and the hills are drained and cultivated to their summits. Many of the fields yield two crops in the year. One great want is the entire absence of pasture; for all animals are fed at home, and never put out to graze. The appearance of the country, on this account chiefly, is curious to an English eye, as, instead of fine large fields, they have small patches of different crops, of one or two acres in extent, growing side by side without hedge, fence, or tree, giving a patchwork appearance to the whole, which does not at all add to the picturesque character of the scenery, and, indeed, after the fine trees and hedge-rows of old England, makes the country look plain. These small crops, however, have this advantage, that as in that country there are mostly small farmers, one crop failing, they have one or two more to rely on. The chief plants cultivated near Bonn, are Rye, Wheat Oats, Barley, Potatoes, Cabbage (near the towns and villages, chiefly for *sauer kraut*), rich Grasses and Clover for the cattle, Ervum Lens, the Hop (Humulus Lupulus), Valerianella olitoria, Brassica oleracea, Rapa and Napus, Buckwheat, Hemp and Flax rarely, the Vine; and among cultivated trees Robinia pseud-Acacia, brought from North America, and Æsculus Hippocastanum, introduced first at Vienna from the East Indies in 1575, are most universal. It is astonishing to remark the perseverance and diligence with which the Vine is cultivated. On the almost perpendicular banks of the Rhine between Mayence and Coblence, or nearer Bonn, the steep heights of the valley of the Ahr are cultivated to their summits, soil being carried up the rocks by means of ladders, and placed in baskets fixed on ledges of the rock, and then dyked round, lest the wind and rain should carry off the plants. In this Ahr valley there are hills higher than Arthur's Seat, cultivated to their peaks in this way, a specimen of industry, rivalling even that of the sands of Holland. The Vine is not properly a native of this country, having come from the southern parts of Europe, but it has in some places escaped from cultivation and appears wild, and is even held to be so by some authors. Further up the Rhine, towards Mayence and Frankfort, the climate is warmer, and on account of the absence of heights the cultivation of the Vine almost ceases, while Tobacco and Indian Maize are grown in abundance. Though much Tobacco is grown on this part of the Rhine, the greater part of that smoked in Germany comes from Holland, where the rich damp soil is very favourable to it, though it soon exhausts a soil. 5. *Microscopic Observations on a kind of Paper made from Vegetable Tissue.* By John Mathews, Esq. Mr. M. stated that he had examined the specimen of paper presented at last meeting of the Society, and found that it exhibited beautiful cells with stomata. It was, therefore, the cuticle of a plant, and from the quadrangular stomata he was disposed to think that it was allied to Agave.—Office-bearers were elected for the ensuing year; six gentlemen, chosen Fellows; and Mr. J. B. Davies, entered as an Associate.

## Notices of Books.

*A Popular History of British Ferns and the Allied Plants.* By Thomas Moore, F.L.S. Square 12mo. Reeve and Benham; pp. 354, with 20 coloured plates of 48 species.

Among the works which a taste for the study of British Ferns has produced, this stands at the head, beyond all comparison. Excellent as were Mr. Newman's woodcuts, and clever as his letter-press, yet even that beautiful volume belongs to a less popular order of publication. In the work before us the plates have been drawn on stone by Mr. Fitch, who is now without a rival among English botanical draughtsmen. Mr. Moore very properly dedicates his book to Mr. N. B. Ward, "whose invention," as he truly says, "of close glazed cases has extended the cultivation of Ferns to the parlour, the window-sill, and the city court-yard," and we have no doubt will lead to a still greater extension of the taste. We wonder indeed that these beautiful objects, cultivable with such an inconsiderable amount of either care or skill, should still be so seldom seen, either in the open garden or in glass houses. Assuredly no race excels them in delicacy of texture, or grace of outline or beauty of colour. The exotic kinds being more varied than others, most especially merit the attention of those who have heat and glass at command. In Orchid houses they produce the most charming effect, entirely destroying by their infinitely diversified forms and way of growth, the monotony of foliage proper to the whole order of epiphytes. It is to moisture, shade, and protection from winds that the finest of these plants trust for their existence, and to those conditions only. Old sandstone quarries, the north face of damp cliffs, loose stone walls supporting a considerable depth of earth, through which water percolates, the borders of waterfalls, are their favourite resorts; and all that the gardener has to do is to provide an imitation of these natural conditions. This is so much more easily done under glass than in the open air, that we entertain no doubt about cold Fern houses becoming in time as common as greenhouses. Mr. Moore's book has however more of a practical than of a speculative turn, and therefore we will ourselves offer a suggestion for the construction of a very cheap and suitable place, in which they may be easily cultivated without even a gardener. Throw a span roof over a ditch through which water is usually flowing. Make the south roof of weather-boarding, and the north roof of glass; break up the sides of the ditch as deep as circumstances will permit, for the reception of burs or fragments of stone, among which the Ferns are to be planted, and the thing is done. Water, damp air, shade, shelter, are all provided without further care.

Of *Railway Literature* the supply is kept up by Mr. Murray and Messrs. Longman, without a symptom of deterioration. If it is continued, we shall have the most remarkable Cabinet Library in any language, unrivalled in price and quality. Mr. Murray has furnished *The Road*, by Nimrod, and *The Turf*, by the same clever author, both volumes embellished with capital woodcuts; and a small edition of *James's Fables of Æsop*, with Tenniel's clever illustrations. In the same period we have from Messrs. Longman's *Madame Pfeiffer's Voyage Round the World*, *Eothen*, and *Macaulay's Essay on the Life of Addison and Horace Walpole*, all well known and very interesting works, of standard reputation. Reading-rooms, with limited funds, would do well to keep an eye upon this class of publications, which cannot fail to raise the standard of feeling among the lower classes.

*The Family Economist*, for 1851 (Groombridge), is full of useful information. A shilling cannot be better spent than in its purchase. Another work, from the same publishers, called *Rural Economy for Cottage Farmers and Gardeners*, compiled from the writings of Martin Doyle and others, also deserves commendation as a useful addition to the cottager's little library. It is just the book for small prizes in country schools, or for a new year's present to young deserving labourers.

## FLORICULTURE.

The Chrysanthemum.—It is stated in your list, at p. 790, that Nonpareil is light coloured; now I had this first-rate variety direct from Mr. Bell, of the Bracondale Nursery, from which it was first let out, and with me it is a peculiar shade of purple, certainly not light. [It is considered about London to be correctly classified.] It is beautifully incurved, but the petals are rather sharp pointed. It never shows an eye. I consider it to be one of the best in cultivation as regards colour and form, at least it is so under my system of management; therefore the number of times exhibited at the London shows, compared with that of other varieties, is no criterion of its merits; in fact, so high does it stand in my estimation, that it is one of four particularly recommended in my treatise. Vesta is represented by No. 29, in comparison with Defiance, No. 46. Now in what point is Vesta second to Defiance, or any other light or white sort? With me it is without a rival; indeed I grow several plants of it. The habit, colour, and size of blooms, the freedom with which they expand (rarely producing a defective bud), are points which render it second to none; and I think I am not singular in this opinion, for it was the admiration of all who have seen my plants during this and previous seasons. Queen of Yellows I consider indispensable to a good collection. Its colour is peculiar and distinct, and with me the blooms are very large, with their centres well up; and although in your list it is placed low, in comparison with other yellows, I should recommend it even for a collection of six or twelve, either for exhibitions or for decorative effect. Its power of resisting the effect of damp is greater than that of many others. Superb Clustered Yellow is, without doubt, the best and brightest of the class; Annie Salter is next, then Queen of Yellows. Marshal de Crique does not appear in your list at all; yet, what variety, in its way, has superseded it? In colour, habit, number and fragrance of blooms, what can surpass it? I say fragrance, for it is sweet as a Violet. I have another variety, known in Norfolk as Freestone's Queen Victoria. I imagine it is little known, as its name has not figured in any list I have seen; its colour is light peach blossom, the petals are very broad, flowers medium-sized, but rather too thin for some purposes. In habit it is dwarf (15 to 18 inches), and it requires no support from sticks. It is worthy of a place in any collection; in colour it is distinct from anything I have seen; I have known it for 10 or 12 years; it is admired by all who have seen it. Perhaps it may be cultivated under some other name; and if so, I shall feel obliged by being informed of it. *William Ivory, Gardener to Rev. G. Chetwode, Chilton House, Thame, Oxford.*

### NOTICES OF BOOKS FOR DECEMBER.

*The Midland Florist* (a double number), is as usual full of good floricultural and ordinary gardening information. The editor's address to his readers is in all respects admirable.

*Beck's Florist* (now Turner's), contains some capital articles, and is altogether a useful number.

*Floricultural Cabinet* (double number). The illustrations are "Dr. Horner" Tulip and three Gloxinias. "Orion" brings his "Progress of the Pelargonium" to a close, and well deserves the compliments of the conductor.

*The Gardeners' Magazine of Botany.* It turns out that we announced the discontinuance of this periodical a month too soon. We have now before us the acknowledged concluding number, which, however, wants the two coloured plates, and the index promised on the 1st of January.

In *Paxton's Flower Garden* is Pentstemon azureus, a Californian azure or blue perennial of considerable merit; Wrightii is stated to be deep rich rose. The number is beautifully illustrated, and in every way "well got up."

*Birmingham Magazine.* This contains some good practical matter. We hope to see Fuchsia "King Charming," at an early date. We know the taste of the Birmingham men in these matters. *J. E.*

Chrysanthemums: *Reader.* Apply to Mr. Ivory, Chilton-house, Thame, Oxford. *J. E.*

Fancy Dahlias: *Eremita.* You will find an answer to your question at page 599 of the current year's volume. *J. E.*

Florists' Flowers: "Crito" asks, "What constitutes a florist flower?" *J. E.*

Fuchsias: *T.* These, with Verbenas, Antirrhinums, and similar subjects, are mostly sent out in spring. *J E.*

Liliums: *A R.* No better time than the present; "the where" may be known by reference to our weekly columns: it is not for us to say more. *J. E.*

List and Catalogue received from Messrs. A. Paul and Son. —Lists have been received from Messrs. Wood and Curtis. *J. E.*

Picotees: *H F., Isleworth.* Mrs. Barnard (Barnard), light-edged rose; Alfred (Dodwell), heavy edged purple; Princess Royal (Wilmer), heavy edged red. Yellows: Euphemia, Princess Alice, and Conrad. We never recommend dealers. *J. E.*

Rose Amateur: The critique given in your favour confirms the view we have ever taken. We have reason to know that the very suggestions thrown out on the 20th of September were not only taken as intended, but that inquiries have been instituted by the proper authorities concerning them; it would therefore be a pity to disturb the kindly flow of feeling at this juncture, when all promises so fairly. *J. E.*

Tulips: *J C.* You shall quickly hear. *J. E.*

Misc: *Rosa* Willing to give you the benefit of our observations on floral subjects; annual flower seeds are out of our province. *J. E.*

## Miscellaneous.

*Salads.*—Amidst our old school of garden literature the name of Evelyn marks quite an epoch. His "Kalendarium Hortense, or Gardener's Almanack," set the pattern for a multitude of similar productions, and may even yet be referred to as a useful reminder. His "plant Potatoes in your worst ground" is what we are obliged to come to after all. It is now the fashion to resuscitate from long forgotten seed-drawers many of his plants that had been shelved for years, as Chervil and Basil: and attempts are being made to render others more popular, as Orache and Lamb-lettuce or Corn-salad. Purslane, we hope, will follow in the list of revivals; in Germany it is still in great request for spring soups. Ourselves, long baffled in an attempt to raise a crop of Skirrets from seed, found in him the wrinkle which a host of gardeners had failed to supply: "March. Sow Skirrets in rich, mellow, fresh earth, and moist; and when about a finger long, plant but one single root in a hole, at a foot distance." His new conservatory or greenhouse was the beginning of a series of results which it would be very long to relate. His translation of the "Compleat Gardener, by M. de la Quintinye, chief director of all the gardens of the French King," which, when "made English," he believes to be "first and best of that kind that introduced the use of the Olitorie garden to any purpose," must have had its effects; as also his "Acetaria, or Discourse of Sallets," proving (even although pickles are included in the term), that a more varied and artistical *Sallet* could be served 200 years back than now, and that our only mode of advancement in this line is to revive old fashions. Where is our list of "Sallet-plants reduced to a competent number, not exceeding *thirty-five?*" We

may be inclined to refuse the Sow-thistle, so "exceedingly welcome to the late Morocco ambassador;" but such a thing as a good Salad is now never dished in England, if there be truth in the proverb:

"L'insalata non è [illegible] bella,
Ove non è la pimpinella."

This Pimpernel is our common Burnet; "but," says Evelyn, "a fresh sprig in wine recommends it to us as its most genuine element," which may well account for its being "of so cheering and exhilarating a quality." "Sampier," too, is cruelly neglected:—"Not only pickled, but crude and cold, when young and tender (and such as we may cultivate and have in our kitchen-gardens almost the year round), it is, in my opinion, for its aromatic and other excellent vertues and effects against the spleen, cleansing the passages, sharpening appetite, &c., so far preferable to most of our hotter herbs and sallet ingredients, that I have often wondered it has not been long since propagated in the potagere, as it is in France, from whence I have frequently received the seeds, which have prospered better and more kindly with me than what comes from our own coasts. It does not indeed pickle so well, as being of a more tender stalk and leaf, but, in all other respects, for composing sallets it has nothing like it." We are all acquainted with

"One that gathers Samphire"

half-way down the face of Dover cliff; but how many of our readers know the taste of the produce of that "dreadful trade"? The Samphire business now-a-days must be a small concern. One or two species of Glasswort are sold and pickled in Norfolk by the style and title of Samphire, but are as false a substitution as was the fair maid who listed "under the name of Richard Carr." The pickled Salicornias taste of nothing but the vinegar and the spices, and altogether differ from that classic umbellifer the Crithmum maritimum. Were it not unfair to disturb the repose of so good a man, one would almost wish to raise the ghost of Evelyn to solve a great difficulty of modern times—what is the mode of dressing sallet? Family quarrels have arisen on the subject; the salad-bowl may yet lead to divorces *à mensâ*. With us, an early recollection is simple lettuce shred tolerably fine, just moistened all over with vinegar, and dusted with sugar; a preparation to be tried by those hitherto ignorant of it. A mode that has been dogmatically insisted on, as the only orthodox one, is to wipe each leaf of Lettuce (which is alone admissible) dry; then to bring the oil in contact with every part of the surface, finishing with the least dash of vinegar and sprinkle of salt. This would be the order of the day—pure and simple. A favourite Parisian top-dressing is to place a little flock of fresh-water crayfish on the summit of the verdant mass; an appropriate garnish for fish salads, and, with us, imitable by shrimps and prawns when crayfish are not. The azure and blue flowers of Borage, and the orange and brown ones of Nasturtium, are grateful to two senses at least; but it is not easy to have them fresh on a London sideboard. Faded, they are as bad as the flowers out of Madam's last summer's bonnet. Dr. Kitchener's cooked salad, strewn over with a stratum of uncooked, deserves a serious and unprejudiced consideration. Tarragon vinegar, or anything else which must predominate, we hold to be heretical. Salad is good society; whatever is obtrusive must be excluded. Therefore we think that the quality of the oil is not criticised with sufficient strictness: if it has the least twang, it predominates over everything, and you continue to taste it after it should have been long forgotten. At this juncture our readers will thank us for producing (by permission courteously granted) a "Receipt for a Winter Salad," written many years ago at Castle Howard by the late Mr. Sydney Smith. He so rarely (after school-days) used his admirable talent for versification, that this specimen of it would be valued, even although the prescription were not—what it certainly is—in itself an excellent one:—

"Two large Potatoes, passed through kitchen sieve,
Unwonted softness to the salad give.
Of mordant mustard add a single spoon—
Distrust the condiment which bites so soon;
But deem it not, thou man of herbs, a fault
To add a double quantity of salt.
Three times the spoon with oil of Lucca crown,
And once with vinegar, procured from town.
True flavour needs it, and your poet begs
The pounded yellow of two well-boiled eggs.
Let Onion atoms lurk within the bowl,
And, scarce suspected, animate the whole;
And lastly, on the flavoured compound toss
A magic teaspoon of anchovy sauce.
Then, though green turtle fail, though venison's tough,
And ham and turkey are not boiled enough,
Serenely full, the epicure may say—
Fate cannot harm me—I have dined to day!"

*Quarterly Review.*

## Calendar of Operations.

*(For the ensuing week.)*

FORCING DEPARTMENT.

Should the weather continue wet and cold, an additional quantity of litter will be required for maintaining the heat in the outside Vine borders. It often happens that a heavy fall of rain very much chills the fermenting material; and to bring the heat again into action, a little fresh litter spread over the top is all that is required. Keep up a genial, but not excessively moist atmosphere within, guarding against too much vapour, as well as against the opposite extreme; and where there are vapour pans upon the pipes, and the soil of the inside border is exposed to the atmosphere, this can always be managed without much difficulty. Thin, flabby leaves are produced by an excess of moisture, and an insufficient quantity of fresh air; and too much attention cannot be paid to providing proper ventilation for the Vines, at all times giving more or less air, according to the state of the external atmosphere and the command of heat within. No gardener can produce good fruit early in the season, unless there is a proper command of heat from the pipes, and the flues in the back wall; but with perfect appliances he can create an artificial atmosphere, which will do wonders even in the dull days of winter and early spring. There is much work requires doing in the houses at this season, that can be carried on to greater advantage, during inclement weather, than out-of-door work. The dust and soot should all be washed off the glass, rafters, and walls; after which the Vines should be dressed over with a little sulphur and soap, and tied. Inside painting may also be done, and the walls whitewashed. Before commencing to force any house, the state of the furnace should be properly examined into, and all the flues cleared of soot, which should be stowed away in some dry place, ready for being used upon the ground before it is prepared for sowing, or planting in the spring. Few insects can stand it when applied in a dry state; and besides this, it is an excellent manure for most things.

HARDY FRUIT GARDEN.

In giving the Gooseberry and Currant compartments their annual dressing, we seldom remove much of the young wood, as the bulfinches, with the occasional assistance of sparrows, destroy so many buds, that there are sometimes scarcely any left to produce fruits; and when the trees have plenty of foliage on them in March and April, the fruit is less liable to be injured by frost. Should too many fruit set, they can easily be removed, along with some of the shoots, after all danger of frost is over. These plants should have a little manure over their roots every year, and in digging or forking among them, avoid cutting the roots as much as possible. Any Pear or Apple trees which grow near the vegetable compartments, and are becoming too gross, from feeding upon the rich substances supplied to the vegetable crops, should be root-pruned; as it is anything but desirable that they should be allowed to get into a rampant growth in the kitchen garden, where everything should be kept to a certain size, so as not to deprive the vegetables of any portion of light and air. The orchard is the proper place for large trees to be grown in; and there, the sooner they arrive at their full size the better, as they will then cease making gross wood, and will bear more and better flavoured fruit. Keep the heads of large fruit trees from getting too much crowded, or you will perhaps have a greater number of fruit, but at the expense of size and flavour of quality. Remove Moss and Lichens, by first scraping it off, and then washing over the branches with a thick paint of lime, soot, fresh cow-manure, and clay; and if, in addition to being mossed over, they are becoming exhausted with long bearing, top-dress them with some good turfy soil and manure. The fruit-room will at this season require daily attention. The fruit least likely to keep should be picked out for immediate use, or when they decay they will injure the sound ones. Let an uniform temperature be preserved, and give sufficient ventilation to allow of the damp escaping.

FLOWER GARDEN.

This is a good time to prepare labels for all ornamental trees and shrubs in the flower garden and pleasure ground; and when well painted, and thoroughly dry, they can be put in their proper places, and will give much interest, and an air of good management to the whole. Turf may still be laid; and where the ground is wet, and liable to be infested with worms, a few inches of coal ashes should be used for laying it on. Crocuses will now be pushing through the ground, and the mice will soon become very troublesome, unless they are stopped in time. Traps should be laid in immediately to destroy as many as possible, before they discover the Crocuses; as afterwards they are very particular about taking the bait. If there are any choice seeds of Rhododendrons or Azaleas, which it is desirable should be saved, they must be seen to at once; as during sunny days in January, the capsules will open, and the seed drop out.

FLORISTS' FLOWERS.

Much of the routine culture lately recommended must be persevered in.—Polyanthuses in frames are sometimes attacked by mice; they eat the hearts out of the plants, whilst Auriculas they do not meddle with; traps should be set as soon as their ravages are apparent or they soon do serious mischief; in frosty weather give the bed for Ranunculuses a turn over.

KITCHEN GARDEN.

Let the trenching of vacant ground be done with all convenient despatch, unless when it is frozen; as the clods, if turned over in that state, will remain a long time ere they thaw; as, by loosening of the soil, non-conducting cavities are created, which check the progress of heat, either upwards or downwards. Instances have been recorded of ground being trenched during a severe frost, and of the clods being found, or by partially thawed at Midsummer. In mentioning the protection of kitchen garden crops, we omitted to recommend the branches of Spruce Fir, Yew, or other evergreens. These are quite as effectual, if used in sufficient abundance, as litter and other matters, which are too untidy to be seen in a well kept kitchen garden. Attend to the forcing of Rhubarb, Seakale, Asparagus, Chicory, &c., and keep up a supply, if possible, equal to the demand. Let Cauliflowers, Endive, and Lettuce, in frame, be frequently examined, and divested of decaying foilage; and protect from the ravages of slugs, by carefully sprinkling a little lime and soot upon the surface of the soil.

State of the Weather near London, for the week ending Dec. 25, 1851, as observed at the Horticultural Garden, Chiswick.

Dec. 19—Fine; exceedingly fine; overcast.
— 20—Hazy and drizzly; cloudy; densely overcast and mild.
— 21—Rain; boisterous at night.
— 22—Constant rain throughout the day; clear at night.
— 23—Fine; clear; overcast.
— 24—Hazy; very fine; overcast; frost at night.
— 25—Clear; very fine throughout; cloudy at night; frosty.
Mean temperature of the week, 2¼ deg. above the average.

State of the Weather at Chiswick, during the last 25 26 years, for the ensuing week, ending Jan. 3, 1852.

| Dec. and Jan. | Average Highest Temp. | Average Lowest Temp. | Mean Temp. | No. of Years in which it Rained. | Greatest Quantity of Rain. | Prevailing Winds. N. | N.E. | E. | S.E. | S. | S.W. | W. | N.W. |

| Satur. 3 | 42.0 | 31.0 | 36.5 | 14 | 0.56 | 1 | 2 | 5 | — | 5 | 5 | 3 | 5 |

The highest temperature during the above period occurred on the 30th, 1833—therm. 56 deg.; and the lowest on the 1st, 1837, and 3d, 1827—therm 12 deg.

## Notices to Correspondents.

Back Numbers: *T S P.* You can have the number for June 14th, 1851.

Birds: *E C.* We are indeed pleased to know that our "advice" has been so useful to you, in saving the lives of your two birds; but raw beef and egg must be only occasionally used, as it is of too laxative a nature for such small birds. Keep them warm through the winter, and all will be well.—*J C W.* Your favour came to hand, and we will not lose sight of your request. The new year will give new life to all these little creatures, and we will speak of them in turn. The Sky-lark, being young, will open 'early.' Keep him from draughts.—*Jane L.* We have just saved the life of a favourite and valuable canary, who has been suffering in the precise manner you state. We gave him a little stale bun, dipped in milk, and afterwards in moist sugar. He refused food in *every shape*—this alone excepted. This shows how we must study the "peculiarities" of Song Birds. Write again. —*W P.* These bat-folded birds are too often "wild." You must suspend him at some considerable height, and not let him see the light of a candle. The shadows thereby produced 'fright him from his propriety.'—*Eleanor.* Procure a bird that is at least two years old, and a fine songster; you may then teach your young birds "how to excel."—*Ninetta.* Give him, immediately, some fresh-boiled milk; and, to induce him to partake of it, soak in it some crumbs of stale bread. He will rally.—*W J.* Discontinue the Hemp-seed at once.—*Winnifred.* From 21*s.* to 42*s.* Such birds are well worth their cost. — *Dorothea.* Prevent your birds seeing each other. This is *alone* the cause of their "silence." —*Lucy.* Our advice last week was minutely correct. You will return in armies. Procure a common cage, having three sides of wood, and the front wire. The cost will be about 2*s.* 6*d.* Also, let the top be of wood. If your *large cage* be of mahogany, which we much doubt, it must be taken to pieces, and well washed with spirits of wine and turpentine before being again put together. *Still*, we must be faithful—all will avail nothing, and your bird will eventually perish. All cages, excepting those made of mahogany, are to be dreaded. *W. K.*

Glass Walls. We have many communications upon this interesting subject. It is, however, desirable to reserve them for a short time, until we have further details concerning Mr. Ewing's plan.

Hops: *X Y Z.* These are climbing plants, and will grow 15 or 16 feet long in rich stiff soil. They do not bear a berry; the Hops from which beer is made are the female inflorescence. The male Hop is not worth growing.

Medlars: *J P.* The change of colour in the Medlar is not decay, but ripeness; that kind of ripeness which is called bletting. The austere qualities of the Medlar become saccharine, and with the change in quality comes a change in colour. The young lady is perfectly right.

Names of Fruits: *J W.* 1, Napoléon; 2, 4, Beurré Rance; 3, Beurré Diel; 5, Glout Morceau; 6, Passe Colmar; 7, King of the Pippins; 8, Golden Noble.‖—*H B.* 1, Court of Wick; 2, Golden Pippin; 3, Northern Greening; 4, Blenheim Pippin; 5, St. Germain; 6, Beurré Diel.‖—*S A.* 1, 4, Blenheim Pippin; 2, Kilkenny Pearmain; 3, Court of Wick; 5, King of the Pippins; 7, Hornread Pearmain; 8, Northern Greening; 9, Probably Wormsley Pippin; 10, Baxter's Pearmain; 12, Golden Noble; 14, Hollandbury; 16, Alfriston; 17, Dumelow's Seedling; 19, Pennington's Seedling.‖—*A C.* 1, 28, King of the Pippins; 2, Hollandbury; 3, Reinette Grise; 4, Reinette du Canada; 7, London Pippin; 8, Winter Pearmain; 9, Bedfordshire Foundling; 10, Fearn's Pippin; 11, Golden Reinette; 12, Dutch Mignonne; 14, Pennington's Seedling; 16, Court of Wick; 19, Early Nonpareil; 20, Beurré Diel; 22, Glout Morceau; 23, Beurré Rance; 24, Forelle; 25, Beurré d'Aremberg; 27, Buchanan's Spring Beurré; 29, Bezo de Caissoy.‖—*Arundel.* 1, Brabant Bellyfleur; 3, Boston Russet; 4, Northern Greening; 5, Beauty of Kent; 6, 16, Blenheim Pippin; 7, Calville Blanche d'Hiver; 8, Old Nonpareil; 9, Yorkshire Greening; 11, Api Noir; 12, Pomme de Neige; 13, Brickley Seedling; 14, Pearson's Plate; 15, King of the Pippins; 18, Dumelow's Seedling; 20, Kirke's Lord Nelson; 26, Hoary Morning; 1, Buchanan's Spring Beurré; 3, Knight's Monarch, *true*; 4, Knight's Monarch, *the false* and worthless.‖

Names of Plants: *Erzeroum.* 206, Telephium orientale; 652, Polygala comosa.—*W O H.* The Deodar, or Indian Cedar.—*J W.* The genus Cupressus and the genus Juniperus cannot be distinguished except when in fruit. The first has a cone, the second the fleshy body called a Galbulus.

Spruce Firs: *J A.* You will not strike them from cuttings. You may graft the shoots when quite soft next year, by inserting them on the soft young wood of the common Spruce.

Vines: *J B.* We cannot precisely state the properties of the Prince Albert Grape. The Black Alicant is the same as the well known Black Prince. It is a good bearer, and it colours well. In this respect it has the advantage of the Black Hamburgh.‖

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer PERUVIAN GUANO, warranted perfectly genuine; Superphosphate of Lime, Wheat Manure, Concentrated Urate, Irish Peat Charcoal, Gypsum, Nitrate of Soda, and every artificial Manure, on the best terms. Also a constant supply of Salt for Agricultural Purposes, at a low rate. English and Foreign Linseed Cake, Rape Cake, &c.

EDWARD PURSER, Secretary, Bridge-street, Blackfriars.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Turnip Manure, per ton | ... | ... | £7 0 0 |
| Superphosphate of Lime | ... | ... | 7 0 0 |
| Sulphuric Acid and Coprolites | ... | ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of ammonia, &c.

FOSSIL BONES AND PSEUDO-COPROLITES (FROM THE SUFFOLK CRAG).

EDWARD PACKARD AND CO., of Ipswich, having erected very powerful Machinery for the purpose of reducing these Phosphatic Nodules to a fine Powder, and being in the immediate locality of where they are found, are now prepared to supply them on the most economical terms, in any quantity, either Ground, Whole, or Dissolved in Acid. They form the cheapest source of Phosphate of Lime in the market, and are peculiarly eligible for manufacturing Superphosphate of Lime in conjunction with Bone.

Prices and every information connected with their use forwarded on application to EDWARD PACKARD AND CO., Artificial Manure Manufacturers, Ipswich, Suffolk.

FARMERS AND GARDENERS are invited to try the NEW and VALUABLE MANURE, PEAT CHARCOAL, impregnated by pressure with the fertilising matter of the LONDON SEWAGE, the Ammonia, Phosphates, and Fæces being absorbed, and the water left bright and palatable. Sold at the Charcoal and Sewage Works, Stanley Bridge, Fulham, Middlesex, at 60s. per ton, 4s. per cwt., and 2s. 6d. per half cwt.

A PRIZE MEDAL FOR SUPERIOR LOCKS WAS AWARDED TO J. H. BOOBBYER, AT THE GREAT EXHIBITION OF 1851.

PATENT SPADES, DAISY RAKES, SCYTHES, Draining, and other Garden Tools. Mole Traps, 6s. per dozen. Carpenters and Smiths' Tools, &c. Ladies' Garden Tools, 7s. 9d. a set. Sword-scrapers for Gardens, 1s. 2d. each. Patent Fumigators for destroying insects on plants, in greenhouses, &c.: at Messrs. J. H. BOOBBYER and Co.'s (late STURCH and BOOBBYER), Ironmongery, Brass-foundry, Nail and Tool Warehouse, 14, Stanhope-street, Clare-market, London. Established nearly 200 years for the sale of goods from the best Manufactories at the lowest prices. Goods forwarded to any part on the receipt of remittance.

THERMOMETERS.

HENRY BAKER'S (90, Hatton Garden, London), List of Prices. Every instrument made by him warranted accurate.—Vertical self-registering THERMOMETER, for heat and cold, of the best construction, and not liable to get out of order, 14 inches high, in copper case, 1l. 5s.; in japan case, 1l. 1s., and 1l; 10 inches high, in copper case, 1l. 2s.; in japan case, 18s. Horizontal Thermometers for registering the extreme of cold only, 4s. 6d.; Hot-bed Thermometers, in oak frames, 1l. 1s.; copper frames, 1l. 5s. Thermometers for Brewing, Baths, &c., in copper cases, 14 inches, 7s. 6d.; 10 inches, 5s. 6d.; 8 inches, 4s. 6d.; in japan cases, 14 inches, 5s.; 10 inches, 3s. 6d.; 8 inches, 2s. 6d. Dr. Mason's Hygrometer, or wet bulb Thermometer, for showing the humidity of the air, with tables, ivory scale, 1l.; wood, 15s. An invaluable instrument in Hothouses, Sick Chambers, &c. Wheel Barometers from 1l. 1s. each, sent, securely packed, without fear of getting out of order.

WARMING AND VENTILATING.

D. AND E. BAILEY, 272, Holborn, having had many years' experience in warming buildings by Hot Water, continue to erect Hot Water Apparatus on the most approved principles, for Mansions, Warehouses, Conservatories, and other Horticultural Buildings, and they beg to introduce to the public a BOILER of their invention, which has been used with great success, and has this season been put up in the gardens of the Horticultural Society, Chiswick, and is noticed and commended in the *Gardeners' Chronicle* of Saturday, Sept. 20, 1851, page 598. Dr. Arnott's Ventilating Valves, upon the best construction, many having been made under the kind superintendence of Dr. Arnott himself. Also a very complete, cheap, and efficient Portable Cooking Apparatus or Cottagers' Stove.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H.R.H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

PORTLAND CEMENT, as manufactured by J. B. WHITE and SONS, possesses all the properties of the best Roman Cement, but has the advantage over that material of wholly resisting frost. When used as a stucco, it does not vegetate or turn green in damp situations, and requires no colouring. Employed as an hydraulic mortar for brickwork, it carries four to five measures of sand to one of cement, and is proved by trial to become harder and stronger in these proportions than Roman Cement with but one measure of sand. This superior connecting power, combined with its eminently hydraulic properties, point it out as the fittest material for building sea and embankment walls, the lining of reservoirs, cisterns, and baths, and for all those purposes where strength and a perfect resistance to water are required.

Manufacturers—J. B. WHITE and SONS, Millbank-street, Westminster; 11, South Wharf-road, Paddington; and Earl-street, Blakfriars, London; and 36, Seel-street, Liverpool.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much Improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as references of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the Kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.

*SATURDAY, DECEMBER* 27, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Jan. 1—Agricultural Imp. Soc. of Ireland.

WE had hoped to have given in the present Number our usual comparison of the cattle shows at Smithfield and Birmingham, respectively, in order to illustrate, so far as the few specimens concerned are competent to do so, the relative merits of the different breeds at different ages; but the demands upon our space require us to postpone this attempt. Two duties remain to us, however, in connection with these shows. The first relates to the specimens of green crops exhibited at Smithfield, of which no notice has hitherto been taken, and which we now name merely to call attention to the fine collection of specimens of Irish grown crops sent by the Earl of Clarendon, which certainly illustrates most admirably the capabilities of Irish soil and Irish climate for green crop cultivation. And the second relates to the show of pigs at Birmingham. We can place entire confidence in the judgment of our reporter, whose statement appears in an adjoining page. And it appears from his report that the authorities who regulate the details of that exhibition will need to exercise the closest supervision of all certificates of entry, and to make investigation into the circumstances of any case where the slightest suspicion of dishonesty arises, if they would have their exhibition maintain its character for excellence. The words "small breed," too, should be defined as implying a certain limit as to weight at a certain age—or the competition of the *bona fide* breeders of such animals will altogether cease. And in order to insure attention to the condition requiring ownership for a certain period before the show, it might perhaps be advisable to require longer notice of intention to exhibit than is now demanded.

OUR readers will do well to bear in mind that GUANO GRINDING is carried on as vigorously as ever, in spite of chemistry, and guardian societies, and exposures to the contrary.

The following communication has just been received from the Manchester Society of Guardians for the Protection of Trade.

"It may, perhaps, interest the readers of the *Agricultural Gazette*, to be informed that the manufacture of guano is now largely carried on here. It is principally made from street sweepings, which probably contain sufficient ammonia to deceive, and a kind of yellow clay; these ingredients, together with other rubbish, are ground together in the common horse grinding mill.

"Your Lincolnshire friends should be warned as to this stuff, especially as I know that one person named DARCY sent last week no less than nine truck-loads, or between 40 and 50 tons of this guano (?) to Brigg station by the Sheffield and Lincolnshire Railway, and the Lancashire and Yorkshire have also carried a great deal of it. The stuff is barely worth the freight.

IT appears that Mr. MECHI, like the rest of us, has been losing money by farming during the past year. He has valued his Wheat at 4s. 9d. per bushel, his Potatoes at 5l. 10s. per acre, his Mangold Wurzel at 6s. a ton, his Swedes at 5s. 6d. a ton, his pasture at 3l. and his Clover at 4l. an acre, and other green produce at similar rates; and yet he has made only 71l. profit off 170 acres. But in most of the above particulars his valuation is higher than average experience justifies. We have frequently, in the case of particular lots of oxen, made as much as 9s. a ton for Swedes and Mangold Wurzel, after paying for the expense of attendance and of purchased food; but over the whole of several years' transactions in the manufacture of beef and mutton out of Clover, roots, and purchased food, we have not received more than 4s. a ton for the green food consumed; and Mr. MECHI's experience tallies with our own in this matter; for while his *farm* account, with the above valuations, represents a profit of 71l., his *live stock* account shows that instead of having paid for their food as much as he supposes to be its "consuming" value, his cattle have landed him in a loss of 576l. To be sure this loss appears after charging 9s. a ton for all roots, beside the cost of purchased food, though 6s. and 5s. 6d. only were charged for them before—a discrepancy we do not understand; but even reducing this charge upon the cattle to the lower rate, a great loss appears. In fact, though the live stock be supposed to have received their green food gratis, the cost of grain purchased for them will, it appears, altogether swamp the increase of their value under Mr. MECHI's management.

Now if we assume this management to have been perfect, then we are driven to the conclusion, everywhere, of course, most eagerly seized, that all this is the unavoidable result of the present prices of agricultural produce; but is it not more reasonable to suppose, that both the management and the result of it admit of improvement? Most of the discussions we have hitherto seen on this subject have turned almost exclusively upon Mr. MECHI's character as an agricultural teacher: but this surely is not anything like the main point at issue. The main point at issue is the light thrown upon the present position of the farmer by this very rare phenomenon—the published experience of a year's proceedings in agriculture. And our opinion is that Mr. MECHI's experience is by no means conclusive of the matter. We have no hesitation, after inspection of his balance sheet, in saying that the management of stock adopted at Tiptree-hall can by no means be held to furnish the premisses out of which any inference of the profits of the meat manufacture generally can be drawn. Take the item of 235l. spent per annum in the labour of managing 1700l. worth of cattle—an extraordinary amount, as any farmer will at once perceive. Or take the extraordinary item of 1500l., spent per annum on a farm of 170 acres, in the purchase of cattle food! We do not say it is impossible that such a purchase should be profitable, but we say, that it could be profitable only in the case of the very best bred cattle in the country; and these, certainly, are not to be found at Tiptree Hall.

But how will Mr. MECHI's opponents remedy his losses? To double the price of the Wheat he has grown will not do it. And if they raise the value of the 2000l. worth of meat which he has sold, they must also raise the price of the 1500l. worth of grain and other cattle food which he has bought; so that little gain will arise out of that transaction. THE MAIN CAUSES OF MR. MECHI'S LOSSES EXIST IN HIS adoption of a system of farm management, involving a most extravagant expenditure on cattle food—and probably, also, though here we do not speak from personal knowledge, in the absence of that market ability, on which, more perhaps than on any other thing, the profits of the farmer generally depend. These two causes would, we believe, have landed him in loss, though the prices obtained for his produce had been what farmers generally would have been satisfied with.

We have been silent hitherto on a subject which is making so much noise, because its discussion hitherto has turned exclusively upon the comparatively immaterial point of Mr. MECHI's status as a teacher, and we have had no desire to assist in the work of bandying personalities on that point. But as several correspondents have applied for information, we shall next week do our best to state the principal points of the case in detail.

A WITTY correspondent favoured us some weeks ago with the description of a machine not exhibited in the Crystal Palace, whose wonderful performances, nevertheless, claimed for it, in his opinion, the very closest attention. This machine, according to him, is already in extensive operation—it affects the whole surface of a farm, and the condition of all connected with it at once—it harrows, threshes, grinds, to any conceivable degree—it does all sorts of agricultural work in the "rough" line with precision—and according to "Bastinado," who undertook to expose it, its influence is most mischievous. The "mercantile relation" machine, to which all these effects are attributed, is one however, we imagine, which will continue to operate in spite of any writing to the contrary. The mercantile relation is the only one which can be assumed to exist between the parties to a business transaction; and to suppose either that its operation in agriculture is a novelty, or that its operation generally is mischievous, is simply a mistake. All that agricultural writers can do as regards its influence on the subjects coming within the range of their remarks, is to state the true interests of the several parties to an agricultural bargain, in order that the particular and justifiable form of selfishness developed in the mercantile relation may not be of that ignorant and

near-sighted description to which "Bastinado" appears to refer.

This, however, is not immediately and directly the subject of our present remarks: it is to another agricultural machine that we would direct the attention of our readers—a machine for the very purpose of conferring that knowledge and far-sightedness which will render the mercantile relation everywhere beneficial. It is certainly one of the most efficient and economical machines for this purpose that we have anywhere seen. Gentlemen come from all quarters, and after examination of its parts and its processes, they are astonished that so little is known of this machine—that an instrument so thoroughly adapted for the very important purposes it is intended to serve, should not be more fully and constantly employed. Only supply this machine with an amount of the raw material on which it is designed to operate, in some measure proportioned to the powers and means which it possesses, and the land would very soon be covered with intelligent landowners and intelligent farmers, and the mercantile relation between the two would produce nothing but good to either. We are sure we cannot better employ the leading section of our Paper in this, the last Number for another year, than by once more calling attention to the Royal Agricultural College at Cirencester—the machine to which we refer.

Having lately been over the college, and the farm connected with it, it is with perfect confidence that we can speak of their present condition; and we say that, considering, on the one side, the efficiency of every department within this institution, and on the other, the 100*l.* premium which in hundreds and thousands of instances is paid in this country and in Scotland for the mere privilege of a year's residence on a farm, it is shameful that an educational apparatus so perfect should in any degree lack employment. Ignorance of its existence must be the main cause of the still comparatively small, though gradually increasing, number of students on its roll. If so, we shall endeavour to remove this ignorance, so far as our own readers are concerned; and other journals ought, for mere patriotism, to do the same. No doubt the many changes which during past years have taken place in the management of the Agricultural College have been one cause of its comparative inactivity; but the present staff of professors and office-bearers is beginning to exert its influence, and the number of students is increasing; it ought to be overflowing, for the constant employment of such an institution to the full extent of its power is a matter of national importance. The college is presided over by a gentleman admirably qualified for the superintendence of an educational institution; the several departments are in the hands of most excellent teachers; Prof. Voelcker is well known as a chemist, and especially as an agricultural chemist, by his performances in the laboratory of Prof. Johnston, and by his late contributions to agricultural literature: the several branches of natural history are efficiently taught; the different departments of agricultural engineering form the subject of special instruction; lectures on veterinary science are delivered by a gentleman, to whose skill in this department the admirable condition of the museum bears testimony; and that the practice of agriculture is well taught, the present condition of the farm under Mr. Vallentine's skilful and energetic management is ample proof.

On the occasion of a meeting of agriculturists in the town of Cirencester during a past year, Mr. Peter Mathews, one of the most energetic and intelligent practical farmers in the neighbourhood, took occasion to laugh at the management on the College farm. The same gentleman has lately been again addressing a Cirencester audience; but we find no exhibition of sarcastic criticism on that subject now; on the contrary, Mr. Mathews is now "an advocate for improvement" himself.

And we take the omission of the College from among the topics commented upon in his speech to indicate a consciousness that public opinion in its neighbourhood had altered in its favour. This we are glad to know is the case: and we strongly recommend any who may be enquiring after the means of agricultural education, to take it as a proof that the Agricultural College deserves a visit before they decide.*

And now we may, perhaps, be allowed to digress, in a concluding remark on the mercantile relation referred to at first. The speech of Mr. Mathews, just named, altogether ignores this relationship—"the poor labourer looks up to us for support, and we, in our turn, have a right to assistance from the landlord,"—is the burden of its cry. "Every man has a right to the market value of his goods, whether they be land or labour," is the true doctrine, and the only chance of relief for the farmer; apart from that, "farm high, drain deep, and cultivate better"—the constant exhortation to which Mr. Mathews refers with such indignant scorn—lies in an increased market value of the goods he sells, or in a diminished market value of the goods he buys. Now the country will not permit any attempt at an artificially high price of agricultural produce, and so Mr. Mathews is unavoidably driven to a reduced market value of land as the only hope of its cultivators. Well! but if so, why does he crow with such triumphant sarcasm over those who, in the face of falling prices, have thrown up their farms. Does he not see that a single act of that kind, so far as influence upon the market value of land is concerned, must be worth any quantity of talk? Let 10,000 men follow his own example, and make speeches full of sarcasm and complaint, and we shall have things just as they are. Let 10,000 men follow the example he derides, and farmers would begin to lift up their heads again; for we believe that land is in general too highly rented, and 10,000 farms seeking tenants would bring it down. We make no apology for the personal character of these remarks, for Mr. Mathews has himself exhibited no consideration for the trifle, as he doubtless considers it, of professional reputation in others; and we venture therefore to submit to him individually, that acting is more influential than speaking, and that if he were to throw up his farm because of the ruin he foresees, then though he ceased his complaint, he would be heard more influentially than he ever yet has been; the gain to the tenant farmers from his *act* in that one particular, would go very far indeed towards making up to them for the loss of his *tongue*.

* For further particulars the reader is referred to advertisements—or to the College itself, where his enquiries will, no doubt, receive attention.

## EMIGRATION AND THE POTATO.

It has been said that a tree shall be known by its fruit. The prosperous state of Ireland for years and years past, of one-third of the homestead of the British dominions, of all that can alone be depended on as the integer of the British crown, proclaims with trumpet tongue, the fulness and efficiency of all governments to which she has been submitted. I was wrong to question it. It had escaped me that every accident has been wisely foreseen, and as wisely provided for; every remedy promptly and judiciously applied, every measure well timed; that, with the fixed stability of Mede and Persian law, so well has the collective wisdom of the state been applied that further change has been uncalled for, and inadmissible; that the wise laws of our fathers have been carried out by the wiser laws of their sons; that the fabrics they built have been strengthened and secured by the conservative hands of their children, till nothing more is required than to discover the best mode of perpetuating the blessed fruits of our wonderful economy; and it has been found. With a benevolence and liberality truly astonishing, at the cost of all that is dear to us, our bones, our sinews, and our blood, we are to enrich, and strengthen, and ennoble the vast western continent, not our own share of it, with the descendants of the Celt, the brave and hardy Highlanders of Scotland, and the intelligent, spirited, and grateful sons of Ireland—grateful of British rule—who go forth to spread their satisfaction, to renew and add intensity, and extend more widely from the shores of the Atlantic to those of the Pacific, those kindly feelings which the fire and sword enkindled in a struggle for independence; to give power, and strength, and numbers, and to bring on with redoubled speed that period when America shall add to the will the ability to command and control us. But it is the immutable law of creation, and it is vain to attempt to contravene it. Nations, like men, grow old and succumb to those of younger birth.

Now this may all be very generous, but is it very politic? With a population thinned down to the mere numbers necessary, with the aid of machinery, for ordinary production, in what position shall we be placed when comes the tug of war, when convulsed Europe in all her tempest of revolution shall roll her democratic waves upon us; or should continental freedom lie prostrate at the feet of absolutism and young, rising, ambitious Russia, freed from other employment for her arms, pour on us the full tide of her force, our Indian empire invaded and our homes defiled? How shall we deplore the wide waste of depopulation, the destruction of those humble homes from which our armies in the days of our strength, when we withstood the world in arms, were recruited, the hardy Highlander and the active child of the western isle.

But will emigration stop with these? Has it not began from the shores of more happy, or, as we were wont to say, in other days, of merry England? The small end of the wedge has been introduced; can we say how far it will be driven? The same social associations which are now acting in geometrical progression in Ireland may find a corresponding feeling in England; the spirit of adventure, the love of change, that curious predisposition of expecting prosperity anywhere but where we are, have only to become strong enough to conquer the love of home, as they have done in Ireland, and the tide of emigration will roll as strong in England as it is flowing in Ireland.

In this excessive and increasing emigration I see the first step of our decline. Am I to be met with sarcasm when I express the danger I apprehend, or when I deplore the apathy with which it is regarded, or the inability (from whatever cause it may arise) of our rulers to check it, or the unfortunate circumstances which gave rise to it and those which have nourished its growth? We know that we must fall; it is a fond conceit to imagine we may prove an exception to the general rule of Nature; yet it were wise to watch every symptom of decline—to keep the hand upon the pulse—that we may prolong our existence and extend the period of our prosperity.

There are, however, peculiar circumstances which distinguish us from all other nations, and which, with due watchfulness, may tend to the continuance of our prosperity. We have a happy constitution, the gradual growth of ages, continually renewing, and, as we hope improving, a humane amelioration of our laws, a growing care of and regard to the welfare of the poorer classes—a purer working out of the principles of a religion which in its truth has never yet been fully developed. In these and many other matters we differ from all examples of bygone nations, and in this difference affords us the best founded hopes that our march of prosperity may be further extended than theirs.

But to return to Ireland. I am free to admit that, looking alone to individual interests, from Irish emigration under existing circumstances, almost every objection has been removed. The tears of his relatives and friends no longer accompany the parting emigrant, he no longer goes from his home, for it has ceased to be in Ireland; but he proceeds to provide a home for those whom he is compelled to leave behind in the lost land of his love, where they expect to find the prosperity that it is vain to look for in Ireland, and where they will find all those associations that constitute a home. It is not then for the Irish people, as they are, that I complain of emigration, but I deplore the circumstances that have brought on so frightful an evulsion of every feeling of country and of home.

I deeply regret that absence of foresight, that ignorance of conditions, or that want of ability to provide, which has tended so much to augment the predisposition to emigrate—it is an advice to the young huntsman when shaken from the saddle to regain it with as little delay as possible—when, by a severe dispensation of Providence, the working capital of so large a portion of the empire had been destroyed (for it was not the mere loss of a crop that gave sustenance to near three-fourths of the people, as some have weakly thought, but the annihilation of all means of future employment, that left utterly prostrate every employer in the country), it had been wise to restore the equilibrium with as little delay as possible, at any cost; it is lamentable there was not sufficient talent in the council of the nation to discover the means, and moral courage to use them.

To remove a blot from the page of our humanity 20 millions of public money was not thought too much, but the re-establishment of a third part of the empire was not entitled to such consideration; we were satisfied with limiting our views to the administration of food to the starving people, and that though largely, yet perhaps necessarily so, parsimoniously supplied, that it left a million of corses on the land; and this is to be said of an empire on which the sun never sets, and whose navy floats on every sea, commanding the resources of the world.

"But emigration has been the resource of every people where the population has become greater than the means of subsistence." Except in tribes of wandering Arabs, and in the single instance of the passage of the sons of Israel into the land of Egypt, both sacred and profane history is very barren in such evidences; I find it not in the eruptions of the Huns and other barbarous nations. The occupation of South America was not the consequence of an excess of population in a country from which the Moors had just been expelled, and which to this day is most thinly inhabited. That of North America is as little to be attributed to excessive population in a country thinned by the Wars of the Roses, and in which premiums were given on the exportation of her grain. Nor is the emigration of Ireland at this moment proceeding because "the population has become greater than the means of subsistence," for she is still a very large exporter of food and is capable of far exceeding her present productiveness. When her population did not amount to two millions, she was not more competent to their support; to what amount, then, is it requisite to reduce it?

Prostrated by the hand of Heaven, helpless of her own hand, Ireland had and has every claim on the sympathies of all mankind; is it manly, is it befitting a British yeoman to meet her calamities with jeers? A pull on the Treasury—on what Treasury? On that of England, or on that of the United Kingdom? to put her on her feet again, that she may stand by the side of England, adding to her wealth and her consequence, as she erst did in the fields of fame, to her glory; to raise her from the abism of degradation, which has made her a blot and a shame on the escutcheon of England; to bring her from a maudlin state of scarce being to a glorious angel by her side.

Is she to be twitted with the various and even contradictory views, which in her desperation she entertains of the modes of relief, when these, from their very numbers, show the necessity of her case, and when the right to entertain this glorious variety of opinions on every matter is a proud privilege of Englishmen?

I should have been happy long ago to see established the Belgian system, for which the Irishman, both from

his intelligence and from the small extent of his holdings, is well adapted; but instruction was required, and Belgian farming is about as much known in Ireland as farming in the moon is known in England; and another very great deficiency exists in the want of agricultural capital—it does not exist to the extent of a pound an acre. I would not make a pull on the Treasury to supply this capital, but it would be a politic administration of the public funds; but surely the intelligence of the Legislature might be taxed to frame a law that would give security to borrowed capital so employed. And years ago, the want of agricultural education ought to have been supplied by similar means to those now adopted at the eleventh hour, and even by wider ones, by parochial model farms of six or eight acres each. But the Government had its theoretical schemes, and the people theirs, and between the two stools practical measures found the ground. *J. M. Goodiff, Granard, Nov. 8.*

## Home Correspondence.

*Barley after Wheat.*—I have never yet seen any notice in your Paper of the exceedingly prejudicial effects of growing Barley on land which is afterwards intended for Wheat; it may be that I am mistaken in my supposition; but I think not. Some years ago I attempted to grow Wheat on the same land, year after year, and for six or seven years succeeded tolerably well; but after that time, partly owing to the arguments of the thin seed school, and partly to an unfavourable winter, there were so few plants left in the spring, that it was judged advisable to drill in Barley to make up the crop; this was done, and Barley and Wheat, taken together, produced an excellent crop (48 bushels to the acre); the field was again sowed with Wheat, which up to the time of flowering looked exceedingly well and gave promise of another abundant crop; but after that time three-fourths of the Wheat died at the root, without ripening any grain, and the crop was a failure. This was a puzzle to me, and was so discouraging that I gave up the experiment; but in reading the Agricultural Society's Journal, some months afterwards, I found, in an essay on the Agriculture of the East Riding of Yorkshire, that the farmers of that district had, in a great measure, given up the growth of Barley in consequence of the after crops of Wheat going off by night ripening, and the explanation of this night ripening proved that it was identical with what I had observed in my own field; if such effects are general, it becomes a question whether it is desirable to grow Barley so frequently at the expense of the after crop of Wheat; and it may be as well for Barley growers to ascertain this generally, which I think may be easily done in the following manner:—Let two plots of land in the same field, manured in the same manner, be sowed, one with Wheat and the other with Barley, and when the crop is reaped plough up the land and sow both plots again with Wheat—if, as I suppose, that on which the Barley grew the previous season, the Wheat perishes by night ripening, whilst no such effect is observed where the Wheat was grown the year before, it will show what an exhausting crop Barley is on Wheat land, and it may make some farmers pause before they determine to sow Barley, at least in every four years' rotation. I found, in my Wheat growing experiments, that soluble silicate of soda was a very valuable manure, and I attributed the bad effects of the Barley to its abstracting so much larger a portion of this from the soil than was required by the Wheat. Query—Am I right in this supposition? if not, what is the cause of this? or is such an effect generally observed? if it is, what is the remedy? The Clover sickness seems to puzzle all the knowing ones. Does not night ripening also? I have again commenced growing Wheat on the same land, year after year. Last year I had 40 bushels to the acre; this year I have 50, and hope, with a tolerable season, to have 60 next year. Give me a Wheat short enough in the straw, and I will engage to grow 80; this looks very like an idle boast, but I really do not see any difficulty in it, if I could get the straw to stand upright. Do any of your correspondents possess a Wheat of good quality, which is shorter in the straw than "Piper's Thickset?" If so, where is it to be obtained? *Clitheroe.*

*Cream Cheeses.*—In your "Notices to Correspondents" in your last Paper (that of the 6th Dec.), you say that it is made by adding the cream of one meal's milk "to the milk immediately taken from the cow—this, after being *made* and pressed two or three times, and carefully turned for a day or two, is fit for use." With all due deference to you, Mr. Editor, this is anything but a good receipt. How is anybody who never made a cream cheese to make one by it? Do you mean that all the cream from one meal of milk, and all the milk from the next, are to be added together? If so, it would be a very so-so affair; and what do you mean by being *made?* The lady who never made one, will be apt to say, "If I knew how to make it, there would be no occasion to ask; and here is a learned editor assuming we are all as wise as himself." That I may not be guilty of the fault of which I am complaining, I add a receipt or two for making cream cheeses, for the excellence of which I will vouch. Gentle reader! Do you wish to make a cream cheese for your own eating? If so, observe what Dean Swift says:—

> "Put no water at all,
> For it maketh things small,"

and I say put no milk at all, but take a quart of good cream, and having prepared a piece of good stout Barnsley linen, by soaking it in salt and water—made strong enough to float an egg—place this in a bowl, and pour the cream into it; tie it up loosely, and hang it up in a tree in your garden. Next day break down the cream with a wooden spoon, and then hang it up again. Repeat this process for two or three days, and by that time the whey will have separated from the cream, which will be about the consistency of butter; collect this carefully into a muslin cloth, place it on a board with another board upon it (that is, supposing you have no cheese mould), and put a 4lb. weight upon it; turn it daily for two or three days, and then take it out of the cloth and lay it upon the board without weight, daily turning it until it is ripe, which will be in about 10 days in cool weather; if you don't want a rich cheese use one quart of milk to one quart of cream, and put in a little salt (a pinch), and keep the mixture in a warm kitchen, stirring it daily for two or three days; it will then have thickened considerably, and may be hung up in the linen cloth and treated as before described. A lady friend, to whom I have submitted this receipt, tells me I am wrong in not using milk. She says, "the addition of a little milk (say one pint to one quart of cream) makes the cheese more velvety and handsomer than when made all of cream." (Try both.) A much readier way of making a cream cheese than this has been successfully practised in this neighbourhood. Take your cream (a quart), tie it in your salted linen cloth, giving it as much room inside as the size of your cloth will allow, and then bury it in moist river or sea sand which has been thoroughly washed; if this is done overnight the capillary attraction of the sand will have carried off the whole of the whey by next morning, and you will have a cream cheese, almost impromptu. If your cream is not very good, or if you use half milk, the precaution must be taken of mixing the milk and cream some days previously, stirring it and keeping it in a warm room to give it consistency, otherwise it will almost all escape through the cloth. *Clitheroe.*

*Turnipy Butter.*—I may as well make a clean breast of it, and give all the receipts I am in possession of, which are likely to interest your dairy readers. When angling in Wharfdale two or three years ago, I was driven by a heavy shower of rain to shelter in a small farm-house, when the farmer's wife was just starting to market with her basket of butter. As the rain detained her as well as me, I got into conversation with her about her dairy. She observed, "However many Turnips our cows get, we have never Turnipy butter." "Well, that is a secret worth knowing. How do you manage?" "I mix half a pint of scalding hot water with each gallon of milk when I syle (strain) it, before setting it away in the bowls, and this simple plan entirely removes all the taste of the Turnips." This is very easily tried, and those of your readers who are troubled with butter of this kind, may make the experiment with little trouble. *Clitheroe.*

*Game.*—It grieves me to see the violent way in which some people are attacking the Game-laws. Now listen, Mr. Cuthill. I am a proprietor (I wish I was), of some 3000 acres, principally surrounding my house, wherein I reside for at least 10 months out of the 12, doing as much good as I can to my neighbours, by spending most of my income on the spot. One of the greatest pleasures I have through the year is to get some of my friends around me, and turn out on a fine day, and shoot my 10 or 20 brace of partridges, or a few pheasants, or hares, as it may be, and thoroughly do we enjoy ourselves. Now why should you take from us this enjoyment? My tenants have no cause to complain, nor do they; for in letting my farms, I look upon it as a commercial transaction, and if I prefer taking any part of the yearly value in game chasing, thus to pay for my pleasure, what right have you to step in and say "No, you shall take it all in money?" My neighbours don't complain, for, since the hare killing act, a shilling will find them a license to kill and destroy *ad libitum*; so the remedy is in their own hands. Rabbits I consider vermin, though they are good enough to eat (when did you eat a cat last, that you know her pussyship to be as good, Mr. Cuthill?), and I take care to keep them down. Winged game I am convinced, as Mr. Wilkins says, do far more good than harm. As for your saying that the land will rise in price when the Game-laws are abolished, it is just stuff. The extent of land where game is highly preserved is very small; what, then, should make all the land rise in price? "Oppressed farmer!" I'll undertake to say that if the votes of all the farmers in England were taken as to the abolition of the Game-laws, there would be a decidedly large majority in their favour. How many farmers are fond of shooting, themselves? And how many more delight to show their sportsmen friends some game on their farms? The fact is, Mr. Cuthill, you choose to look at those estates only where game is preserved for battue shooting, which I, passionately fond of shooting as I am, consider a tame, unsportsmanlike, gluttonous amusement. They are exceptional cases, and serve to bring all advocates of the Game-laws into disrepute. But don't, for their sake, spoil one of the principal pleasures a country life brings; that evil will cure itself; or, rather, free-trade will cure it. When these inordinate game preservers find that their rents must fall yet a little lower, they will sink their game, and if they are really fond of sport, will take it in a rational way. You speak as if all game were to be extirpated. Why? Those animals were not created for nothing. One might as well say—extirpate market gardeners. "But they are articles of luxury;" so are Strawberries; there is more nourishment even in the despised rabbit than in a tenpenny pottle of them. And if laws are to be abolished because rascals break them, then I claim to walk into your garden, Mr. C., and help myself as I like, and have any law abolished whereby I may be punished. *A. R. T.*

## BIRMINGHAM SHOW OF POULTRY.

It is almost impossible on viewing this exhibition of 1851, to believe it is the offspring of the small show of 1848, and the result speaks volumes for the enterprise and capabilities of the people of Birmingham.

If the efforts of the committee and directors had been confined to the mere exhibition of poultry, and the gratification of the sight-seeing public, little would have been attained beyond the mere addition of one more spectacle to the many that are the harbingers of Christmas.

But they had higher objects in view; they saw in poultry a valuable auxiliary to the agriculturist; they found it a neglected, and almost despised, class, and they directed their best energies and endeavours to rescue it from what they considered a position below its merits. To do this, they prepared a long list of prizes embracing every known breed, and lest any should be excluded, they empowered the judges to award extra medals or money prizes to new and distinct varieties.

They also issued instructions that "high condition, beauty of plumage, and purity of race, should be preferred above mere weight;" thus leaving judges free from a rule which has been too often the bane of infant societies, and has disheartened the possessors of really valuable and profitable specimens.

These are not the only merits of their arrangements; they have neglected nothing that could contribute to to make the exhibition the first of its class. Their liberal treatment of the dealers who send extra stock; the care taken of the birds while exhibited, and the regularity with which they are sent off when the show is closed, entitle them to the thanks of all interested in the subject.

It would be unfair to conclude here, without giving the due meed of commendation to Messrs. Wright, John Lowe, and Shackel, to whose endeavours the town of Birmingham and the lovers of poultry are mainly indebted for this display.

If any were sceptical as to the good result of this exhibition, the gradual progress and improvement in the more useful breeds would prove that when such societies as this are directed aright, success must be the result. This introduction is rendered necessary because Penzance, Salisbury, and other towns are following the example of Birmingham; the note of preparation has sounded; and while they cannot hope to equal "the Midland Counties," they may, by framing their rules and conduct after their model, ensure the accomplishment of their desires.

At this show, worthy of the year in which it was held, there were 1056 entries for competition, comprising 3440 birds, exclusive of pigeons or pheasants.

The first in order on the prize list came the Spanish. This was not so well contested as last year; the birds were not so good, and all the principal prizes were carried off by Mr. Peck, of Wigan.

It would be a pity this breed should fall off; the beauty of the birds, the size of their eggs, and their peculiar fitness for a residence in the back-yards and scanty outlets of a town, render them in many respects desirable. There were 53 entries in this class.

A far more satisfactory display awaited the admirers of the grey and speckled Dorkings; the entries amounted to 107; the gradual appreciation of this most useful bird of the gallinaceous tribe cannot be better proved than by the increase of this class, and the quality of the birds sent for competition. Many were perfect, and all were good. It is hard to look on a Dorking pullet, and not to think while weighing her good qualities (and the century and a half she has stood her ground against all new comers), that she realises in herself the valuable properties the Vicar of Wakefield's wife sought in her wedding dress, which was chosen "not for its fine glossy surface, but for such qualities as would wear well." The Hon. and Rev. S. W. Lawley, here gained a first prize, and extra silver medal for unusual merit; and Mr. George Lowe, of Birmingham, was equally successful.

The class in which those who are seeking their fancy, rather than utility, and that in which the greatest interest was excited, both from the quality of the birds, their value, and the number of entries, was the Cochin China; the competitors here numbered 153.

The amateur may see such an exhibition again, but he will never see it surpassed; for nothing could exceed the beauty of many of these birds. There were hens uniting to faultless symmetry and colour the weight of 10 lbs., and a cock, the property of Mr. Sturgeon, of Gray, weighed 11½ lbs. There were, doubtless, heavier birds, but their visible defects and deviations from the "line of beauty," rendered any appeal to the scale unnecessary, even to give them hope by the side of their more favoured competitors.

The first prize and extra silver medal for unusual merit were awarded to Mr. G. J. Andrews, of Dorchester; they were richly merited by a pen of birds which have never yet been equalled. Mr. Sturgeon, of Gray, had similar success; his birds were very beautiful, and heavier than his rivals, but, on the whole, the balance leaned to the first lot. The difference was but trifling, and it may fairly be doubted whether two such pens ever before competed; next in rank came Mr. Steggall, of Weymouth. These three gentlemen took ten prizes in this class. Mr. Herbert, of Powick, Worcestershire,

successfully exhibited some choice specimens of white Cochin China fowls.

Little can be said of the Malays. Either these birds are out of fashion, or the owners are careless to exhibit, for the display was much below the average.

The admirers of the game fowl were regaled with a magnificent display of this beautiful bird; 126 pens entered the lists; and although in this, as in many other classes, the judges exceeded the number of prizes to be awarded, they with regret left many deserving birds undistinguished, and were obliged to content themselves with a general commendation of the whole class. Messrs. France, Parkes, and Bullock received large silver medals in this competition.

Next in rank came the elegant and useful gold and silver pencilled Hamburgh, the "beau ideal" of a fowl for a lodge gate, and the caterers for the breakfast-table, when others have ceased to lay. There were many beautiful pens of these birds; and so careful has one gentleman, Mr. Edward Lowe, of Cumberford Mill, near Tamworth, been in breeding and selecting his birds of the golden variety, that he carried off the three principal prizes. In the silver, Mr. Thomas Lowe, of Whateley, near Fazeley, did the same.

Yorkshire claims pre-eminence in the "Spangles," and maintained her reputation by securing the prizes.

The Poland fowls, in the different classes, were of average merit; the best pen (silver) being the property of Mrs. Hosier Williams, of Eaton Marcott, Shrewsbury.

Among the new varieties were two Scotch fowls, the property of his Royal Highness Prince Albert, which gained a prize; some remarkably fine cuckoos, the property of the Lady Guernsey; and some Ancona fowls, admired, like some other things, on account of their extreme ugliness. There were same good pigeons; and the bantams, though not good, were better than last year.

So many fine geese have seldom been seen together; their weights may speak for them, the pen rewarded with extra silver medal weighed (three birds) 63 lbs. of this the gander alone brought 29 lbs. to the scale. Mr. Towneley Parker, of Sutton Grange, gained three prizes in this class; and the merit of the whole may be imagined when it is stated the unsuccessful competitors averaged from 50 lbs. to 59 lbs. per pen.

The ducks were a good and numerous class.

The turkeys were excellent.

These were the principal points of this great exhibition; but, among the extra stock, there were birds requiring especial notice.

The most beautiful and interesting to the naturalist were three hybrids between the golden and common pheasants. These exquisite birds show the mixture of both parents, but lean more to the golden in shape and tail. The more brilliant colours are sobered down by the mixture of plain brown with all the feathers, except behind the ear, where a small tuft stands out in relief from the otherwise sober plumage. There is plain distinction of sex, two having a small ripper, and the golden cock's tail in full length, while the third is evidently a hen. Mr. Shackel, of Blenheim House, exhibited fine specimens of the gold and silver pheasants, which both gained prizes. Mr. C. Sturge, of Birmingham, was successful in three classes of pea-fowls. There were some very perfect hybrids between the pheasant and fowl exhibited by Lord Guernsey, and a beautiful bird bred between the pintail and wild duck, by Lord Wenlock.

Forty thousand persons were admitted, and the money taken at the doors amounted to 1665*l.* The amount would be greater were it not that subscribers are admitted gratis, on showing their cards. Hundreds of the nobility and gentry were there from all parts of England, and many of them were competitors in the different classes.

The advantage of a poultry show is manifest, because it opens the arena of competition to the many who, from situation or circumstances, cannot compete where quadrupeds are alone admitted. It points out the most useful breeds, and it gives the uninitiated the opportunity of forming and maturing a judgment on them.

The judges were—the Rev. E. S. Dixon, of Cringleford Hall, Norwich; Henry Hinxman, Esq., of Dumford House, Salisbury; John Mott, Esq., of York; and Mr. John Baily, 115, Mount-street, London.

Class I.—Spanish (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. John Henry Peck, Wigan; 10*s.*, Mr. John Henry Peck, Wigan; 5*s.*, Mr. John W. Ward, Repton.

Class II.—Spanish (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. John Henry Peck, Wigan; 10*s.*, Mr. Edward Simons, Dale End, Birmingham.

Class III.—Spanish (Cock and one Hen).—10*s.*, Mr. John Henry Peck, Wigan.

Class IV.—Dorking (Cock and three Hens).—*1l.* 1*s.*, and Extra Medal, Mr. George Lowe, Smithfield, Birmingham; 10*s.*, Mr. T. B. Wright, Great Barr, Staffordshire; 5*s.*, the Hon. and Rev. Stephen Willoughby Lawley, Escrick Rectory, near York.

Class V.—Dorking (pen of six Chickens).—15*s.*, and Extra Medal, the Hon. and Rev. Stephen Willoughby Lawley, Escrick Rectory, near York; 10*s.*, the Rev. John Hill, the Citadel, Hawkestone, Shrewsbury; 5*s.*, Thomas Townley Parker, Esq., of Sutton Grange, near St. Helen's, Lancashire; and Mr. Edward Mander, Park Farm, Beau-desert, Henley-in-Arden.

Class VI.—Dorking (Cock and one Hen).—10*s.*, Thomas Townley Parker, Esq., Sutton Grange, St. Helen's, Lancashire; 10*s.*, Mr. George Lowe, Smithfield, Birmingham; 10*s.*, Mr. George Lowe, Smithfield, Birmingham.

Class VII.—White Dorking (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. Joseph Jennens, Moseley; 10*s.*, the Right Hon. the Earl of Beauchamp, Madresfield Court, Worcestershire; 5*s.*, the Rev. George Hutton, Gate Burton, near Gainsborough.

Class VIII.—White Dorking (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. Nathaniel Antill, Portsea, Hants.

Class IX.—White Dorking (Cock and one Hen).—No prize awarded.

Class X.—Cochin China (Cock and three Hens).—*1l.* 1*s.*, and Extra Medal, Mr. George James Andrews, Dorchester; *1l.* 1*s.*, and Extra Medal, Mr. Thomas Sturgeon, Manor House, Grays, Essex; 10*s.*, Mr. Frederick Charles Steggall, Weymouth, and Mr. George James Andrews, Dorchester.

Class XI.—Cochin China (pen of six Chickens.)—15*s.*, and Extra Medal, Mr. Thomas Sturgeon, Manor House, Grays, Essex; 15*s.* or small Silver Medal, for White Cochins, Mr. Edmund Herbert, Powick, Worcestershire; 10*s.*, William Cust Gwynne, Esq., M.D., Sandbach, Cheshire; 10*s.*, for White Cochins, Mr. Edmund Herbert, Powick, Worcestershire, and Mr. Thomas Sturgeon, Manor House, Grays, Essex; (Extra), 15*s.*, or small Silver Medal, Mr. Thomas Sturgeon, Manor House, Grays, Essex; (extra), 10*s.*, Mr. Thomas Sturgeon, Manor House, Grays, Essex, and Mr. George James Andrews, Dorchester; (Extra), 5*s.*, Mr. Charles Frderick Steggall, Weymouth; and William Cust Gwynne, Esq., M.D., Sandbach, Cheshire.

Class XII.—Cochin China (Cock and one Hen).—10*s.*, Mr. James Cattell, Hartfield House, Mosely; 5*s.*, Mr. Frederick Charles Steggall, Weymouth; 10*s.* (white), Mr. George Graham, Yardley, Worcestershire; 5*s.* (white), Mr. Edmund Herbert, Powick, Worcestershire.

Class XIII.—Malay (Cock and three Hens).—5*s.*, Mr. Edward Armfield, Edgbaston.—No 1st and 2d prizes awarded.

Class XIV.—Malay (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. James Oldham, Nether Whitacre; 10*s.*, Mr. James Oldham, Nether Whitacre.

Class XV.—Malay (Cock and one Hen).—5*s.*, Mr. Edward Armfield, Edgbaston.

Class XVI.—Game Fowl (Cock and three Hens).—*1l.* 1*s.* and Extra Medal, Mr. Edward H. France, Ham-hill, near Worcester; 10*s.*, Mr. Benjamin Williams, Lozells, Handsworth; 5*s.*, Mr. James Thomas Wilson, Redditch; *1l.* 1*s.*, or large Silver Medal, Messrs. William and James H. Parkes, Camphill, Birmingham; *1l.* 1*s.*, or large Silver Medal, Mr. Edwin L. Bullock, Hawthorn House, Handsworth; 10*s.*, Mr. Isaac Avery, King's Norton, Worcestershire; 5*s.*, Mr. Thomas Smith, Cheapside, Birmingham.

Class XVII.—Game Fowl (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. Edward Glover, Olton Green, Solihull; 10*s.*, Mr. William Williams, Ox Hill, Handsworth; 5*s.*, Mr. Edward Barber, Monkspath.

Class XVIII.—Game Fowl (Cock and one Hen).—10*s.*, Mr. George Graham, Yardley, Worcestershire; 5*s.*, Mr. Edward Lowe, Comberford Mill, near Tamworth; 10*s.*, Mr. Edwin L. Bullock, Hawthorn House, Handsworth; 10*s.*, Mr. Thomas Smith, Cheapside, Birmingham.

Class XIX.—Golden Pencilled Hamburgh (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. Edward Lowe, Comberford Mill, near Tamworth; 10*s.*, Mr. James Oldham, Nether Whitacre; 5*s.*, Mr. John Whiting Ward, Repton.

Class XX.—Golden Pencilled Hamburgh (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. Edward Lowe, Comberford Mill, near Tamworth; 10*s.*, Mr. John Whiting Ward, Repton.

Class XXI.—Golden Pencilled Hamburgh (Cock and one Hen).—10*s.*, Mr. Edward Lowe, Comberford Mill, near Tamworth.

Class XXII.—Golden Spangled Hamburgh (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. Henry Clapham, Aireworth, near Keighley, Yorkshire; 10*s.*, Mr. Joseph Silk, jun., Beehive Inn, Handsworth; 5*s.*, Mr. Charles John Mold, Makeney House, Belper.

Class XXIII.—Golden Spangled Hamburgh (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. James Blackham, Thorohill Farm, Handsworth; 10*s.*, Mr. William Banister, Handsworth.

Class XXIV.—Golden Spangled Hamburgh (Cock and one Hen).—10*s.*, Mr. William Dawson, Handsworth.

Class XXV.—Silver Pencilled Hamburgh (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. Thomas Lowe, Whateley, near Fazeley; 10*s.*, Mr. Thomas Lowe; 5*s.*, Mr. William Hazeldine Austin, Norton, Shiffnall, Shropshire.

Class XXVI.—Silver Pencilled Hamburgh (pen of six Chickens).—10*s.*, or small Silver Medal, Mr. Thomas Lowe; 10*s.*, the Right Hon. Viscount Hill, Hawkstone, Salop.

Class XXVII.—Silver Pencilled Hamburgh (Cock and one Hen).—10*s.*, Mr. Thomas Lowe.

Class XXVIII.—Silver Spangled Hamburgh (Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. William Ludlam, Bradford, Yorkshire; 10*s.*, Mr. Timothy Town, Keighley, Yorkshire; 5*s.*, Mr. John Harlow, Moseley, near Birmingham.

Class XXIX.—Silver Spangled Hamburgh (pen of six Chickens).—15*s.*, or small Silver Medal, Mr. Joseph Rinder, Elmwood Grove, Leeds; 10*s.*, Mr. James Whilock, High-street, Birmingham.

Class XXX.—Silver Spangled Hamburgh (Cock and one Hen).—10*s.*, Charles Robert Colville, Esq, Stretton Hall, near Atherstone.

Class XXXI.—Poland Fowl (black, with white crests—Cock and three Hens).—*1l.* 1*s.*, or large Silver Medal, Mr. Edward Hewitt, Eden Cottage, Sparkbrook, near Birmingham; 10*s.*, Mr. George H. Smith, Villa Road, Handsworth; 5*s.*, Mr. Edward Simons, Dale End, Birmingham.

Class XXXII.—Poland Fowl (black, with white crests—Pen of six Chickens).—No prize awarded.

Class XXXIII.—Poland Fowl (black, with white crests—Cock and one Hen).—5*s.*, Mr. John Charles Mould, Makeney House, Belper; no first prize awarded.

Class XXXIV.—Poland Fowl (golden—Cock and three Hens).—1*s.* 1*s.*, or large Silver Medal, W. G. Vivian, Esq., Singleton, Glamorganshire; 10*s.*, Mrs. Hosier Williams, Eaton Mascott, near Shrewsbury.

Class XXXV.—Poland Fowl (golden—Pen of six Chickens).—10*s.*, W. G. Vivian, Esq., Singleton, Glamorganshire.

Class XXXVI.—Poland Fowl (golden—Cock and one Hen).—10*s.*, Mr. T. B. Wright, Great Barr, Staffordshire.

Class XXXVII.—Poland Fowl (silver—Cock and three Hens)—*1l.* 1*s.*, or large Silver Medal, Mrs. Hosier Williams, Eaton Mascott, near Shrewsbury.

Class XXXVIII.—Poland Fowl (Silver—Pen of six Chickens)—15*s.*, or small Silver Medal, Mr. John Whiting Ward, Repton. No second prize awarded.

Class XXXIX.—Poland Fowl (Silver—Cock and one Hen).—10*s.*, Mr. James Bissell, Birmingham.

Class XL.—For any other distinct breed.—10*s.*, his Royal Highness Prince Albert; his Grace the Duke of Sutherland, Trentham Hall, Staffordshire.

Cuckoo.—15*s.*, or small Silver Medal, Mrs. Hosier Williams, Eaton Mascott, near Shrewsbury; 10*s.*, the Right Honourable Viecountess Guernsey, the Bury, near Leamington.

Rumpless.—15*s.*, or small Silver Medal, Mr. George C. Peters, Charlton Cottage, Moseley; 10*s.*, Mr. Thomas Beetenson, Vauxhall Grove, Birmingham; 5*s.*, Mr. Thomas Beetenson, Vauxhall Grove, Birmingham.

Andalusian.—10*s.*, Mr. John Taylor, Crescy House, Shepherd's Bush, near London.

Ancona.—10*s.*, Mr. Edward Simons, Dale End, Birmingham,

Italian or Frizzled.—*1l.*, W. G. Vivian, Esq., Singleton, Glamorganshire; 15*s.*, or small Silver Medal, Mr. Charles Sturge, Birmingham; 5*s.*, Mr. George Wigley, Golden's-court, Bull Ring, Birmingham.

Shanghae China.—10*s.*, Mrs. Hosier Williams, Eaton Mascott, near Shrewsbury.

White Poland.—10*s.*, W. G. Vivian, Esq., Singleton, Glamorganshire.

Mixed.—5*s.*, George Fleming, gardener to his Grace the Duke of Sutherland.

Class XLI.—Bantams (Cock and two Hens), "Gold laced."—10*s.*, Captain Clement, Delves Hill, Summerhill, Newport, Shropshire; 5*s.*, Mr. James Bissell Birmingham.]

Bantams, "Silver Laced."—10*s.*, Mr. James Bissell, Birmingham; 5*s*, Mr. Edward Hewitt, Eden Cottage, Sparbrook, near Birmingham.

White Bantams.—10*s.*, Mr. Joseph Rinder, Elmwood Grove, Leeds; 5*s.*, the Rev. John Hill, the Citadel, Hawkstone, near Shrewsbury.

Black Bantams.—10*s.*, the Rev. John Hill, the Citadel, Hawkstone, near Shrewsbury; 5*s.*, Mr. James Dixon, West Brook-place, Horton, near Bradford, Yorkshire.

Other Varieties.—10*s.*, Mr. Joseph Rinder, Elmwood Grove, Leeds; 5*s.*, Mr. Joseph Rinder, Elmwood Grove, Leeds.

Owing to want of room we are forced to omit the commendations of the judges, as well as the prize list of pigeons and water-fowl.

## BIRMINGHAM SHOW OF PIGS.

Class XXIX.—Fat Pigs, not exceeding 10 months old.

210, first prize was awarded to three thick, well-formed white pigs; heads pretty, and quality good; a slight defect behind the shoulder, plenty of size for 9 months. Shown by Mr. Taylor, of Moseley Hall.

212, 2d prize; very pretty pigs; straight, well-formed, and of good quality. Shown by Mrs. Martha Emus, of Handsworth.

Class XXX.—Fat Pigs, under 15 months.

231, 1st prize; very useful white pigs. Shown by Mr. Wilkins, Sutton Coldfield.

232, 2d prize; very plain sort of pigs, long legs and noses, which is the characteristic of the Tamworth breed. Shown by Mr. Hollister, of Birmingham.

Class XXXI.—Fat Pigs, over 15 months.

250, 2d prize; large well-made pig, with pretty head, and fine quality. Shown by Mr. Shilcock.

251, 1st prize; large, useful pigs, but nothing very striking. Shown by Mr. Perks, of Kingsbury.

In the three classes for fat pigs there are some very large and good animals, and many are highly and justly commended. One was disqualified for incorrectly stating the age.

Class XXXII.—Pigs of Large Breed, not exceeding 7 months old.

263; five very pretty sort of pigs, the truest specimen of the Berkshire I saw there. Not many of that breed were exhibited.

272, received a Silver Medal. This pen contained a great long sow, with long and strong legs, and a nose to correspond. The sow of course, is not shown for a prize, and she does her offspring but little credit; the little ones look very pretty, from their various colours. I suppose this fancy colour has won the medal for them, for I see nothing else very attractive about them. Shown by Mr. Cartwright, of Burton-on-Trent.

278, 1st prize. These pigs are very large for the age, five months and ten days. To be precise, I do not say that Mr. Perks would make an incorrect statement knowingly; but I do say, that though I am acquainted with both large and small breeds of pigs, I never saw pigs come to the same height at the same age as these and several others in this class.

271 is the next I will mention, stated at 15 weeks old. There appears to be more than one sort in this pen; and certainly there is a great difference in size and quality—one of them measures from the setting on of the tail to the setting on of the ear, 3 feet 7½ inches, and girts the same (this must be truly a large breed); besides it is only in fair store condition. I have had in my care a very large sow, which won the first prize at Leeds (the very nursery of large pigs), and at Scarborough, Huddersfield, Bradford, and the Royal Agricultural Society of England's first prize for the large breed, besides several other local shows; and bred some very large pigs, some of them kept upon new milk till three months old, and afterwards well kept, but I never could come anywhere near the pig in question.

276 and 277, shown by Mr. Abbott, of Leeds; one of these pens, to a close inspection, look like two families. Perhaps some follow the father, and some the mother!

Class XXXIII.—Breeding Pigs of Small Breed, not exceeding 7 months.

293, 2d prize; these are very pretty compact pigs, equal in size and quality, and are a first-rate sort; and are in my opinion justly entitled to the first prize. Shown by Mr. Ludlam, of Bradford.

294, 1st prize, shown by Mr. Ludlam; thick useful pigs; fair quality, not so equal as 293; they are too large to stand in the class. If such pigs are allowed to compete for the prize of the small breed, the most valuable specimens will never appear in competition against them. It appears both pens are by the same boar, but the dams I will venture to say are not own sisters, nor yet both of the same breed.

Lord Radnor may be justly proud of the perfection that he has brought his pigs to, and he has exhibited some good specimens in this class; but what chance has he against pigs that can easily be made to weigh 20 score at an early age, and 30 at full age? These in my opinion ought to be in the large class.

296, shown by Mr. Pemberton, Leeds. In this pen like has not produced like. One is a fine well made pig, with a very fine coat; had his plates and flank been a shade better there would be few in the yard so good, while some of the others present a very different appearance, being dressed in a very much coarser jacket, nor equal in size. The best boar pig was purchased, I understand, by Mr. Graham, of Yardley.

304, shown by Mr. Brown, of Wigton, Cumberland. This pen is an excellent specimen of the Cumberland white pigs of the small breed; had they been a little older they would, in my opinion, have stood second to none in the class; their hair, quality, and symmetry cannot be surpassed. As a proof of their excellence, I would just state that they were all readily sold at good prices, and further orders were given. It will be re-

membered that Mr. Brown exhibited the same breed of pigs in several classes last year with great success. When the same stamp of pigs are exhibited every year by the same exhibitor, it shows that attention is paid to breeding.

The Tamworth breed appears to be great a favourite in the neighbourhood of Birmingham, and I am quite at a loss to know why they claim preference over any other breed. There certainly was a few fair pigs shown of that breed, but the generality of them are long and coarse legged, with bad hams, with long noses, and as free from cheek as a greyhound. They do not, in my opinion, possess that propensity to fatten that many other breeds exhibit. I would rather be the eater than the feeder of them. Last summer, a gentleman from Kentucky was with me, wanting to purchase pigs, when I showed some very good ones. He admired them much, but did not buy, on the ground of their carcase being too heavy for their small legs! He wanted them stronger and longer in the leg, as he had to send them a 70 days' journey to market. When he calls again, in the spring, I shall be able to inform him where he can get suited to a hair's breadth. *K.*

## Societies.

CARRICK.—Mr. KENNEDY, of Myremill, made the following remarks on the *Feeding of Stock*, at the late annual meeting of this Society:—

I hold true the old saying, "the more cattle the more corn;" that is, I think a very sure evidence of a farm being in good order is, when it supports a large herd of cattle upon it. You have thus a strong argument for supplementing your green crops by giving whatever substance you can find cheapest, taking into account its feeding properties. I admit, however, that there is room for difference of opinion as to these substances. Turnips, like the Grasses, are the best test of quality of the land on which they are grown. I mean roots grown on land of the best quality will lay on as much beef or mutton, without either cake or corn, as roots grown on land of inferior quality will do with a moderate quantity of either of these auxiliaries. It is, of course, impossible to lay down a rule to be followed, applicable to every farm, as every one will be guided by circumstances, according to the quality of his land and the facility of procuring manure in the locality in which he resides. It may be laid down as a general rule that, when cattle are put up to fatten, the temperature of the byre must be kept as even as possible. Their improvement will depend very much on the temperature at which the animals are kept. If the place is cold, they will consume more food without a corresponding degree of improvement; for a large proportion of their food will then be consumed, to keep up the heat of the body. I have found my cattle thrive better on a moderate quantity of roots than when they have been supplied with as many as they could consume, provided, however, that they also got bulk of other food. A bullock of 7 cwt. will require to get from 60 to 70 lbs. of roots per day; a larger quantity, in my opinion, is only lost as bulk, and is not assimilated by the animal. Bulk being necessary to enable the digestive process in herbivorous animals to proceed; for without it they cannot ruminate, and rumination is necessary to ensure their thriving and keeping in health. I have given my cattle for some years past a cooked food, composed of Linseed or oilcake-meal, Bean-meal, bruised Barley, Oats, or bran, being guided by their respective prices, viewed in connection with their feeding properties, and laying it down latterly as a rule never, if possible, to exceed 5*s.* or 6*s.* a month for extra food for each animal. These ingredients, made up with chopped Oat-straw or hay, given as a midday feed, being in a succulent and easily digested form, the animals eat greedily, thrive on it, and the Turnips are economised. By this means you convert a great deal of the fodder of the farm to a more valuable use than when given in a dry state. I have likewise found Rye-grass hay a very good supplement to Turnips. Cattle, given roots grown on good land, and what Rye-grass hay they will eat, will generally thrive as well as those fed on straw, with cake or corn, as auxiliary to Turnips. I think it better to give a small quantity of extra food to cattle for a length of time, in preference to giving them none for the first three or four months, and a large quantity the last two, because when a large quantity is given, a good deal of it passes through the animal without its being assimilated. In proof of this opinion, it is generally found that cattle long fed on a moderate allowance of extra food, kill better than when given a large quantity for a short time. Cattle should not be fed oftener than three times per day; when fed oftener they do not thrive so well, being kept more on their feet, and having less time for lying to ruminate their feed. I am satisfied that the extra expence of washing and cutting the Turnips for cattle will pay, and that a more perfect preparation of their food, rendering it more soluble, will amply repay any one who tries it. How is it that dairy cows, after calving in the spring of the year, and while in the house, yield more milk if their food is given them in a prepared or more soluble state, than when dry? Why, just because the organs act more easily on the feeding ingredients contained in that food, whatever it is. I think it quite clear that the same results will follow with feeding cattle. Dr. Anderson stated, in my hearing, that he thought it could be proved cattle convert into flesh the greatest amount of nitrogen when it was in the most digestible condition, or when it was in a state to be taken up by the organs with the greatest rapidity. In this opinion I entirely agree, having found my cattle thrive better on prepared food at a less expense than when they got Bean-meal, or cake in a concentrated form. This opinion, however, I am aware, is very much laughed at by many of the feeders in some parts of the country. I hold a distinct opinion that oilcake and Beans are the two articles which contain the most valuable feeding properties. Dr. Anderson has also stated this to be proved by scientific analysis, and my own experience enables me to concur with him. A ton of Beans contains 99 lbs. of nitrogen, and 32 lbs. of oil or fatty matter. A ton of oilcake contains 103 lbs. of nitrogen, and 224 lbs. of oil, these being the most valuable ingredients. Rape-cake contains nearly the same amount of feeding properties as oil-cake, and I have used it extensively for some years past, as its price is about half that of oilcake, and it helps to cheapen the feed. It can, however, only be given in small quantities, as it is bitter in taste, and cattle will not eat it by itself with relish. I hold, that those farmers who give extra food to their stock have been better paid than those who give none. In 1849 it was considered that the Turnip crop in this country was almost entirely lost, that feeders did not realise more for their stock, over the inlaid price, than paid for their extra food; this, I am sorry to say, was true; but those who gave no extra food could not turn their stock into money, while those who fed high could always sell, and had the satisfaction of putting a good article into their customers' hands, besides obtaining an increased quantity and quality of manure.

## Farmers' Clubs.

CIRENCESTER.—The annual meeting and show of cattle, connected with this Society, took place lately. The most vigorous speech delivered on that occasion was from Mr. Peter Mathews:—

"I am an advocate for improvement, gentlemen (said Mr. Mathews with much energy), but most inveterate against deception. The theorists held out that wonderful results would flow from free trade, and it had led the farmers, the public, and he believed the legislature, astray. The state of things commenced about 10 years ago, when farmers could not travel in a railway carriage, without being taunted about want of skill; but time had proved that there was more difficulty in performing farming than in writing about it. At a meeting, held a few years ago, at the White Hart Inn, a gentleman got up and said there was five times more corn grown on Whitfield Farm, than on any farm round Cirencester. That was too great an insult to be put up with, and I then contradicted the gentleman," continued Mr. Mathews, "and said I had as much corn as Lord Ducie, and could farm as well as his Scotch steward. This was high treason, but time has gone on, and two years ago the 9th of last July, I had the pleasure of telling Lord Ducie before 4000 people that I would defy him to show a balance-sheet, and he admitted he could not do it. What has Mr. Morton done? Why, after writing works to instruct the farmer, given up farming in despair! First of all it was called "The Experimental Farm," next "The Example Farm," but now, I think, we must call it "The Profitless Farm!" (Loud Cheers.) Then there is that fine fellow, the Rev. Mr. Huxtable, who has found out the secret, that pigs can be fatted with bacon. Next, Mr. Hewitt Davis; and then there is the London shopkeeper, Mr. Mechi, who comes all the way from Leadenhall-street, to teach us farming. Well, I went to inspect him—(cheers and laughter)—and a very slovenly gentleman I found him. He has lost more by farming than is the fee simple of his estate. He has not a bad flock of sheep, but I never saw any half so badly managed. Then there is a gentleman who lives in Scotland, a Mr. Caird (I do not know how to pronounce his name), the biggest humbug of the lot. But the greater the humoug the more notice he is taken of; for Sir James Graham spoke of Mr. Caird's pamphlet in the House of Commons. We are sold for very little; we are the middle class of agriculture (I am not speaking of towns), but the labourer looks up to us for support and assistance, and we know that without him we can do nothing, and the land is not worth a farthing. Then, have not we as much right to look to the aristocracy as the poor have to look to us? Did not our landlords formerly say, that we must sink or swim together? Yes, but I am sorry to say, that they have now sailed off, and taken away the boat. I defy contradiction. Under present circumstances we cannot go on. If rents got up to wheat at 7*s.* a bushel, how can we do now, when it is at 4*s.* 6*d.*? The rent of the country is 60,000,000*l.*, and Mr. Villiers—[A voice: What! Lord Villiers?]—no, the Hon. C. Villiers, in the House of Commons, said that the consumption had gained 90,000,000, but I will put it at 60,000,000, by the cheapness of food. I will ask if they have got it, have we not lost it? I believe it is worse than madness for the landlords of this country to look on so coolly and see us ruined. You may depend upon it, if they remain quiet much longer, their time will come next. Taxes must be lowered—the salaries of all public officers must be reduced according to the price of provisions. (Hear.) The salaries of the county officers should be diminished. Another thing is very important, and that is the fundholders; they can live much cheaper—would it be very bad to take from them 9,000,000, if they have taken from us 60,000,000. I do not know but what the landlords have been very much benefited up to this time by the alteration—some of them return from 5 to 15 per cent. of their rents, but a very great number have not reduced it one single farthing, and mine is one of the number. (Hear.) The average taken off is not more than 10 per cent. I have been talking lately to a great many landlords, and some of them seem to think we can wriggle on without any reduction in rent or taxes. If you attend meetings, you will find them exhorting us to farm high, to drain high, to cultivate better. Yes, and see our wives and children come to poverty. That is all we get. I have used my utmost endeavours to get the present state of things altered, but without avail. It is useless to attempt to do so without the landlords will assist us, and if they will do so, we have but two alternatives; either to embark in another business, or emigrate to a distant country. All we want is evenhanded justice—favour we scorn. I hope next year we shall meet under more favourable circumstances.

## Miscellaneous.

*Price of Corn.*—There has been a remarkable rise in the price of flour in the Paris market during the week. Choice samples were sold as high as 51f. the sack of 159 kilogrammes; superior quality, at from 49f. to 50f.; and second quality, from 44f. to 46f.—being a rise of from 5f. to 6f. the sack within 10 days. Many experienced speculators calculate that as the last wheat crop was deficient in quantity although fine in quality, it is possible that the grain which has been hitherto sold to speculators at prices disastrous for the producers, may be resold before long at an exorbitant price to the consumer. There has been a visible improvement in the cattle fairs, particularly in those departments which have not been disturbed. *Times.*

*Paving for Cattle Stalls.*—At a meeting of the Highland Agricultural Society, held last week, Mr. Maxwell, before the commencement of the discussion, called the attention of the meeting to specimens of grooved bricks for laying the floors of cattle stalls, invented and manufactured by Mr. Forbes at the Newark brickworks, near Ellon, in Aberdeenshire. Their peculiarity consisted in the bricks being slit in the surface and grooved in the centre; the grooves communicating with a larger brick of similar construction, on the principle of a main drain, which receives their contents, and forms the grip or gutter. He mentioned that he had received from Sir John Forbes, and various practical farmers in Aberdeenshire, statements certifying the advantages of the invention in point of cleanliness, economy of litter, and comfort, and that he understood the bricks were sold at the kiln at 8*s.* per 100, 160 being sufficient for four animals. *From the Builder, Dec.* 6.

*Benefits of Science.*—The practical view of agriculture cannot be more clearly or profoundly conceived than it was by the North American chief, whose speech on the subject is reported by Crèvecœur. The chief, in recommending agriculture to his tribe, the Mississean Indians, said: "Do you not see that the whites live on corn, but we on flesh; that the flesh requires more than 30 moons to grow, and it is often scarce? that every one of the wonderful seeds which they scatter on the soil returns them more than an hundred-fold? that the flesh has four legs to run away, and we only two to catch it? that te seeds remain and grow, where the white man sows them? that the winter, which for us is the season of laborious hunts, is to them a time of rest? It is for these reasons that they have so many children, and live longer than we do. I say, then, to every one who hears me, before the trees above our huts shall have died of age, before the maples of the valley cease to yield us sugar, the race of the sowers of corn will have extirpated the race of flesh-eaters, unless the hunters resolve also to sow." In his difficult and laborious life of the chase, the Indian consumes in his limbs a large sum of force, but the effect produced is very trifling, and bears no proportion to the expense. Cultivation is the economy of force. Science teaches us the simplest means of obtaining the greatest effect with the smallest expenditure of power, and with given means to produce a maximum of force. The unprofitable exertion of power, the waste of force in agriculture, in other branches of industry, in science, or in social economy, is characteristic of the want of true civilisation. *Liebig.*

METEOROLOGICAL REPORT.—DECEMBER.

(*Continued from p.* 814)

| Date. | Time. | Max. | Min. | Wind and Weather. |
|---|---|---|---|---|
| 15 | 7.30 a.m | 30.31 | ... | NNE. Calm. Densely overcast; thick scud. |

| | 10.50 p.m. | 29.78 | ... | |
| 23 | 4.30 a.m. | ... | 29.91 | NNW. Almost calm. Bright, sunny day. Barometer rising steadily. |
| | 10.30 p.m. | 30.08 | ... | |

* This storm came from the westward, and crossed England to the eastward: at 8 A.M. of the 19th I had a very good opportunity of watching the passage of the storm's-eye, just as one would the progress of an eclipse; and though the morning was fair, apparently promising a fine day, nevertheless, agreeably to my anticipations, the evening was wet, notwithstanding the barometer rose.

† From the extreme warmth of Saturday, whilst the barometer was falling, I imagine this storm to have come from the southward, and to have travelled up the Irish channel, and then to have curved eastward and crossed over the centre of England towards the Baltic. The passage of the storm's-eye on Sunday afternoon was very remarkable; as the downward tendency of the barometer was suspended soon after noon, and the clouds cleared away, and a very fine evening succeeded a most wet boisterous forenoon. As this happened on a Sunday, and I travelled up the South-western line the next day, I had an opportunity of ascertaining that the clearing up of the weather, which at Dorchester was before the commencement of the afternoon service, was observed at Southampton as the congregation came out of church, and at Dover not until 6 o'clock P.M. This would therefore allow about 50 miles an hour for the passage of this storm.

Dorchester, Dec. 25. *F. P. B. M.*

(*To be continued.*)

## Notices to Correspondents.

CHICORY: *A G D.* Having grown the roots, wash them, cut them into pieces the size of a Walnut, dry them on a malt-kiln; they are then saleable at 10*l.* to 12*l.* a ton, or more, and are bought by those who roast them as coffee beans are roasted, by which process the root is prepared for use.

DUNG OF CARRIAGE HORSES: *J H.* Your questions have not been received, or they certainly would have received answers. You want to know the value of the dung at the stable. It depends much on the way the animals are littered. The dung may be worth 5*s.* a ton, if well made—*that is*, not fire-fanged, and not too strawy; the quantity made per week of course depends on the way the animals are littered.

HAY CHAFF: *Clericus.* Relative weekly expense of keeping horses:

| | | | | | |
|---|---|---|---|---|---|
| 1.—*2 cwt. of Grass hay, at 8*s.* 6*d.* per cwt.... | | | | 7*s.* 9*d.* | —7*s.* 9*d.* |
| 2.— 2 cwt. | ,, | at 3*s.* 6*d.* per cwt.... | | 7 9 | |
| †1½ peck of Oats, ¼ peck per diem, at 2*s.* 6*d.* per bushel | | | | 1 1 | —8 10 |
| 3.—2 cwt. of Oat straw, at 1*s.* 6*d.* per cwt. | | | | 3 0 | |
| 8½ pecks of Oats, or 1½ peck per diem, at 2*s.* 6*d.* per bushel | | | | 5 5½ | —8 5½ |
| 4.—2 cwt. of Bean straw, at 1*s.* 6*d.* per cwt. | | | | 3 0 | |
| 4 pecks of Oats, at 2*s.* 6*d.* per bushel | | | | 2 6 | |
| Cutting to chaff | | | | 0 6 | —6 0 |
| 5.—160 lbs. of Bean straw, at 1*s.* 6*d.* per cwt. | | | | 2 0 | |
| 300 lbs. of Carrots, at 1*s.* 6*d.* | ,, | | | 3 10 | |
| 1½ pecks of Oats, at 2*s.* 6*d.* per bushel | | | | 1 1 | |
| Cutting straw and Carrots | | | | 0 6 | —7 5 |
| 6.—1½ cwt. of Bean straw, at 1*s.* 6*d.* per cwt. | | | | 2 4 | |
| ‡9 pecks of small Potatoes, at 2*s.* 6*d.* per sack | | | | 1 10½ | |
| 1¾ pecks of Oats, at 2*s.* 6*d.* per bushel | | | | 1 1 | |
| Cutting straw and boiling Potatoes | | | | 0 8 | —5 11½ |

* I have several times weighed for our horses, and find they eat and waste 75 lbs. of hay, uncut, in 24 hours, and when cut, 4 lbs. to 5 lbs. less. Best hay is generally 3*l.* 10*s.* per ton.

† Oats are generally sold in Somersetshire, from 16*s.* to 18*s.* per qr.

‡ Small Potatoes, for pigs, can generally be bought for about 2*s.* 6*d.* per sack; and this year I have bought many sacks (a little infected, so as not to be likely to keep long, but large Potatoes), at 2*s.* per sack.

KEEPING COWS IN THE YARD: *B R.* The course of cropping is stated in the article referred to. No corn is grown.

MALT DUST FOR COWS: *X Y.* It may be steeped in either hot or cold water, and allowed to stand for some hours and so given as a mash. A peck a day may thus be given with other food.

PASTURE: *Constant Reader.* If the land grows Moss, you might spread some lime and salt over it. Slake 40 or 60 bushels of lime with brine, and mix the slaked lime with any vegetable earth and spread the compost whenever you can safely cast it on the land.

POTATOES: *W D S*, in his article on the "Experiments with various Manures in the Cultivation of Potatoes," does not mention the time of planting; nor do I quite understand whether he spread the artificial manures over the Potato sets or on the top of the drills. If the farmer was the case, did he not plough up a great deal of the dung in opening the drills? Do you recommend early planting? [Yes.] *Sussex.*

POULTRY: *M W.* If the poultry be not over-done in cooking, the cause must be the bad quality of the food, from which the fat and flesh is produced: try more generous diet. Poultry will fatten on poor food, as Potatoes, but the fat will not stand in cooking.—*S V.* True black Spanish fowls must have white faces; the cheek is often confounded with the ear-lobe, which is white in many fowls; but a real Spanish bird should be white from the ear-lobe to the beak, and completely round the eye and face. I cannot say whether the two Messrs. Barber are identical.—*Y Y.* A pure Cochin China fowl has very little tail, and nothing like sickle feathers in it. The fifth claw cannot be admitted, but a double or rose comb is entirely out of the question. —*A Poultry Fancier.* I know no book giving all the details you require. The Rev. E. S. Dixon's is the best work we have at present on poultry.—*A R S.* Clay, well rammed down, with a layer of gravel stones on the top, will make a floor for a poultry house, or clay alone. I should prefer this to asphaltum, and know of hundreds of such floors which will bear sweeping with a birch-broom, without injury to the surface. Crooked breasts are sometimes caused by small perches, but are more frequently, in fast-grown large birds, the result of weakness. Lacking strength to support the body by the clasp of the feet on the perch, they, while the bones are young and soft, rest the breast constantly on it, and it takes the curve. It may be avoided by using, while the birds are young, a bar raised about 12 inches from the ground, and covered with straw until it presents a good wide surface, on which they will roost with impunity until they are strong enough to perch in the ordinary way. A laying pullet should not be too fat; she wants something wherewith to form the shell of her eggs. Let her have chalk and lime, also gravel; give her some whole corn for a change, and do not feed too much on Potatoes. There should not be more than one cock to six hens.—*P.* When you speak of the season, I presume you mean the present time. The pullets of this year are the fowls now laying, and they are few in number; by your own account you have no younger birds than 1849. They will not lay till after next month, unless the weather be very mild. *J. Baily*, 113, *Mount-street*

SHEEP: *B.* They are the better for straw certainly; though wicker hurdles are not harder than, during the past fortnight, the ground has been on which flocks have been folded. A little straw would suffice.

# Markets.

COVENT GARDEN, Dec. 27.

English Pine-apples and Grapes continue plentiful. Pears, though in small quantities, are still furnished from Guernsey. The best English kinds fetch good prices They consist of Glout Morceau, Winter Nelis, and Chaumontelle. Oranges are plentiful and good. Nuts are nearly the same as last quoted. Carrots, Turnips, Cabbages, &c., are sufficient for the demand. Potatoes are generally good in quality. Lettuces and other salading are sufficient for the demand. Mushrooms are still dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Stephanotis, Bignonia venusta, Chrysanthemums, Camellias, and Roses.

COAL MARKET.—FRIDAY, Dec. 26.

The Market is closed until Monday for the Christmas holidays.

HOPS.—FRIDAY, Dec. 26.

Messrs. Pattenden and Smith report that the Hop market continues very firm.

SMITHFIELD, MONDAY, Dec 22.

The number of Beasts and Sheep is small, but larger than on the corresponding day last year. The butchers having generally provided for the Christmas consumption, buy very sparingly to-day. Trade is dull, and prices on the average lower; our top quotations are only realised in extreme cases. There is scarcely any alteration in the trade for Calves. From Holland and Germany there are 242 Beasts, 1690 Sheep, and 110 Calves; from France, 22 Beasts and 12 Calves; and 110 Beasts from Scotland.

Beasts, 1232; Sheep and Lambs, 12,200; Calves, 167; Pigs, 360.

FRIDAY, Dec. 26.

To-day is quite a holiday market. There are very few things indeed on offer, and the demand is smaller even than the supply. We retain Monday's quotations, although it is a mere nominal affair; however, it pretty fairly represents the small amount of business that is transacted. Our foreign supply consists of 109 Beasts, 120 Sheep, and 44 Calves. The number of Milch Cows is 80.

| | | | | | | | | | |

Beasts, 272; Sheep and Lambs, 590; Calves, 106; Pigs, 200.

MARK LANE.

MONDAY, Dec. 22.—There were no arrivals of foreign Wheat or Barley into this port during last week, an occurrence we have not witnessed for many years past. The supply of English Wheat by land carriage samples to this morning's market was small, the condition being generally bad; considering which prices must be noted the same as on this day se'nnight, but the sale is heavy. Foreign met with rather more inquiry without leading to any increase in business, and its value remains nominally unaltered.—Barley is a very dull sale at somewhat lower rates.—Beans and Peas are 1s. per qr. cheaper. —The value of Oats remains unaltered, but the trade is very heavy.—There has been rather a large arrival of American Flour, and less money is offered for barrels, but holders are not disposed to give way in price.

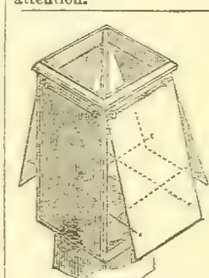
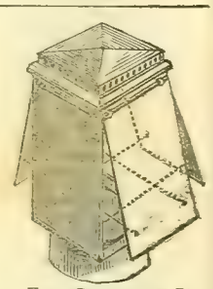
LIVERPOOL, TUESDAY, Dec. 23.—The arrivals from Ireland and coastwise during the week are light. From foreign ports, however, the supply has been large. The trade has been extremely quiet, and the few transactions which have taken place have been quite of a retail character, at previous rates. The weather continues damp and unseasonable. At our market this morning there was only a moderate attendance of the trade; but, notwithstanding the dull accounts from Mark-lane, a fair business was done in Wheat and Flour, at the rates of this day week. Other articles, with the exception of Indian Corn, which was 6d. per 480 lbs. cheaper, were without change in value. — FRIDAY, Dec 19.—There was a very fair business doing in Wheat and Flour by millers and dealers, at Tuesday's prices, the tone of the trade being decidedly stronger. Oats and Oatmeal were likewise as on Tuesday, with a scarcity of fine quality of the former. There was no observable change in the value of Indian Corn, Barley, or Peas.

J. L. HANCOCK'S INFLATED INDIA-RUBBER AIR-PROOF BED-CHAIR.



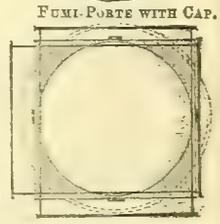
This novel and useful article may be used simply as an ordinary Air Cushion, or as a Reclining Bed or Sofa Chair, by inflating the back part which is attached to the Cushion, but having a separate aperture for inflation; by which means it may be filled at pleasure to any degree of tightness, and set to any angle. Invalids will find this article admirably adapted for great ease and comfort, either on a bed or sofa.



VULCANISED INDIA RUBBER HOSE PIPES for Breweries, Fire-Engines, Watering Gardens, and Flexible Gas Tubing of various kinds.

Portable India-Rubber Shower and Sponging Baths, Waterproof Fishing Boots, Air Cushions and Beds, made any size to order.

All orders addressed to JAMES LYNE HANCOCK, India-Rubber manufactory, Goswell-road, London, will meet with immediate attention.



FUMI-PORTE.

FUMI-PORTE WITH CAP.

LAWRENCE AND CO., No. 55, Parliament-street, Westminster; and No. 10, York-place, Lambeth, ZINC DEALERS and MANUFACTURERS.

Chimney Shafts, 9d. per foot; various Cowls and Tops for Chimneys; Perforated Zinc, 3½d. per foot; Drawn Bell Tube, &c., 3d. per lb.; Rain Pipe, 3 inches, 4d. per foot; 2 inches, 3d. per foot; Skylights and Windows, Drawn Bay, Cottage, and Church Lights, made to order and plan; Brass and Zinc Plates engraved and fixed on glass; Sheet Zinc, Nails, and Spelter, at market prices.

PASSAGE OF SMOKE.

CHRISTMAS PRESENTS.—At this festive period of the year, when friends and lovers assemble at the social board, or join in the mazes of the dance, a more than usual anxiety is created for PERSONAL ATTRACTION, and the following unrivalled discoveries for the TOILET are called into increased requisition, namely — ROWLANDS MACASSAR OIL, for creating and sustaining a luxurian head of hair, ROWLANDS' KALYDOR, for rendering the Skin soft, fair, and blooming, ROWLANDS' ODONTO, OR PEARL DENTIFRICE, for imparting a pearl-like whiteness to the Teeth, and ROWLANDS' AQUA D'ORO, a fragrant and spirituous Perfume, an essential accompaniment to places of public amusement, and crowded assemblies.

BEWARE OF SPURIOUS IMITATIONS.—The only GENUINE of each bears the name of "ROWLANDS'" preceding that of the Article on the Wrapper or Label.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

CHRISTMAS FESTIVITIES.

SEWELL AND Co's great SALE of NOVELTIES for BALL and EVENING DRESS for this week consists of a splendid assortment of rich embroidered tarlatan robes, with flounces, at 12s. 6d.; a superb selection of white muslins in tucks and flounces, commencing at 14s. 9d. the dress; embroidered net robes in colours, 8s. 9d. to 12s. 9d.; a few very richly embroidered Swiss muslins in tunics, also with flounces, double skirts, 10s. 6d. to 28s. 6d., very elegant, worth 2½ guineas; white lace, tulle, and blondes, in great variety. The new pentalina robe, worked in gold and silver, 28s. 6d.; a few fresh muslin robes for young ladies, very cheap.—Royal Robe Rooms, 44, 45, 46, Old Compton-street; and 46, 47, Frith-street, Soho, London.

FOOD for INFANTS, Invalids, Ladies who are Suckling, and Persons of Delicate Constitutions.—BULLOCK'S SEMOLA.—This substance is prepared solely from the finest wheat. Its great merit consists in its being rich in gluten, the pure nutritive or staminal principle of that grain. One part being equal in nutritive power to five parts of wheaten flour, it contains absolutely more nourishment than beef or mutton. Semola, while most easy of digestion, supplies nourishment in a highly concentrated form, and not being so stimulating as animal food, is particularly adapted to persons afflicted with a weak stomach, or suffering from debility in any form. As an infant's food it supplies exactly what is needed for the growth of the body, and will be found to agree with a weak stomach. All the usual farinaceous and infant's food consist principally of starch, or often of the farina of the coarser grains. Semola may be given by itself, or added to any other forms of food, to increase their nutritive powers, so that for children accustomed to other food, half or two-thirds of the Semola may be mixed with it with great advantage. It is also applicable in many special cases, where potatoes, puddings, and pastries are prohibited, and where even bread is known to be injurious; but in such cases it can only be duly appreciated by the profesion, and must be given under the direction of the medical attendant. Semola is agreeable and palatable added to every variety of food, custards, cakes, puddings, &c. It is particularly adapted for in addition to soups, broth, beef or mutton tea, in place of vermicelli, rice, or barley; whilst it improves the flavour of these forms of diet, it greatly increases their nutritive powers. Semola may be obtained, wholesale or retail, of LLOYD BULLOCK, 22, Conduit-street, London. Retail price, in packets, 1s., 2s. 6d., and 7s. 6d. And may be ordered of all chemists and druggists. Semola Chocolate, made by FRY and SONS; Semola Biscuits, by HUNTLEY and PALMER.

LONDON TO DUBLIN (*viâ* HOLYHEAD) in THIRTEEN HOURS and a HALF.

Three communications daily on week days; two on Sundays. Sea passage Four Hours and a Half. First class, 3*l.*; second, 2*l.* Return tickets (available for a fortnight), first class, 4*l.* 10*s.*; second, 3*l.* Children under twelve, half-price.

THE MOST APPROVED STOVES.—The demand for the CHUNK and VESTA STOVES (separately patented) still continuing unabated, and numbers having been sold last session (in all upwards of 14,000) through the patronage of families who have had experience of their pre-eminently useful qualities, WILLIAM S. BURTON has renewed confidence in recommending them for their cleanliness, economy, and safety. During the last eleven years they have been found sources of great comfort in the bed-room of the invalid, affording a uniform temperature throughout the day and night, with one supply of fuel, without attention. Particulars sent postage free. Chunk, 30*s.* to 50*s.*; Vesta, from 25*s.*; Stoves for warehouses, &c., from 10*s.* each. Joyce's Patent Fuel, 4*s.* 6*d.* per sealed Bag.

THE PERFECT SUBSTITUTE FOR SILVER.—The REAL NICKEL SILVER, introduced 15 years ago by WILLIAM S. BURTON, when plated by the patent process of Messrs. Elkington and Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

Also of OVERCOATS for BOYS of all ages (at from 25*s.* to 35*s.*) kept for selection, or made to order at same charge, and a day's notice. All are guaranteed to resist any amount of rain, and possess every quality essential to a really respectable and permanently satisfactory article. A SUIT of extra Superfine Cloth for a Boy eight years old, Two Guineas; 3*s.* extra for each additional year. W. BERDOE, TAILOR, 96, NEW BOND STREET, and 69, CORNHILL, only.

PARR'S LIFE PILLS are acknowledged to be the best Medicine in the World. 30,000 boxes sold weekly.—The fine balsamic and invigorating powers of this Medicine are truly wonderful; a trial of a single dose will carry a conviction that they are all that is necessary to invigorate the feeble, restore the invalid to health, and to do good in all cases. The heads of families should always have them in the house, as they may, with the greatest confidence, be resorted to at any time or in any case. BILIOUS DISORDERS.—These Pills are all-powerful in removing the distressing symptoms attendant upon bilious obstructions, disordered state of the stomach and bowels, such as pains in the head, dimness of sight, sickness, oppression of the chest, lowness of spirits, disinclination for active employment, and various other symptoms at all times troublesome, and not unfrequently dangerous. By taking two or three doses of OLD PARR'S LIFE PILLS, the symptoms above described are speedily removed, an unusual degree of serenity pervades the mind, the stomach and bowels are restored to their natural functions, and returning vigour is the result. None are genuine unless the words "PARR'S LIFE PILLS" are in White Letters on a Red Ground, on the Government stamp, pasted round each box; also the fac simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the Directions. Sold in boxes of 1*s.* 1*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each.

HOLLOWAY'S PILLS, AN EXTRAORDINARY REMEDY FOR LIVER COMPLAINTS. Extract of a letter from Mr. Robert James, of Tredegar, dated December 16, 1851. "To Professor Holloway. Sir,—With gratitude I write to inform you of the wonderful cure your Pills have effected on my daughter, who had been suffering from enlargement of the Liver, Palpitation of the Heart, Dropsy, and a troublesome Cough. Her case was given up by the medical attendants as hopeless. At this alarming crisis, I was induced to try your Pills, and after taking them, it was astonishing to see how rapidly she regained her health; she is now perfectly recovered, and, as well as a parent could desire.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

FORD'S EUREKA SHIRTS.—"The Great Exhibition has produced a multitude of novelties which have alternately delighted and astonished the world. How many of these will survive for any practical purpose is a question. It is another question if any one of them will bring half the practical comfort of a good shirt. Mr. FORD, of the Strand, has an invention of this kind, which is a material improvement upon the old plans, and for positive enjoyment is worth nineteen-twentieths of the marvels of the huge building in Hyde-park."—*Atlas.*

FORD'S EUREKA SHIRTS are not sold by any Hosiers or Drapers, and can, therefore, be obtained only at 185, Strand. They are made in two qualities, the first of which is 40*s.* the half dozen, and the second quality 30*s.* the half dozen. List of Prices, containing an illustration, with directions for self-measurement, sent per post free.—RICHARD FORD, 185, Strand.

AN EXCELLENT FAMILY MEDICINE FOR INDIGESTION, BILIOUS AND LIVER COMPLAINTS, &c.—In every instance where a fair trial has been made, NORTON'S CAMOMILE PILLS have invariably given satisfaction, affording permanent relief in all cases of Indigestion, and a speedy cure for Headaches, Bilious and Liver Complaints, Heartburn and Acidity of the Stomach, Depressed Spirits, Disturbed Sleep, Violent Palpitations, Spasms, General Debility, Costiveness, &c. They are mild in their operation, safe under any circumstances, and thousands of persons can now bear testimony to the benefits to be derived from their use.—Sold in bottles, at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* each, in every town in the kingdom.—CAUTION. Be sure to ask for NORTON'S PILLS, and do not be persuaded to purchase an imitation.

HOULSTON and STONEMAN, Paternoster Row, London.

NEW AND CHEAP FLORICULTURAL MAGAZINE.

On the 1st of January, 1852, will be published, price 1*s.* crown 4to, No. I. of

THE ENGLISH FLOWER GARDEN. A Monthly Magazine, of hardy, half-hardy, and window plants, with five beautiful coloured figures on steel, in the best style of art. In this work an attempt has been made to combine the most approved Horticultural practice with the most interesting facts of Botanical science. It contains a larger number of figures than any publication of a similar character.

London: SIMPKIN and MARSHALL; Edinburgh: J. MENZIES; and all Booksellers.

NEW AND IMPROVED SERIES.

THE FLORICULTURAL CABINET, AND FLORIST'S MAGAZINE. Price 6*d.*—The 1st of January, 1852, offers a favourable opportunity to persons wishing to subscribe, as the first number of a new volume will then be published, containing coloured figures of superb new Roses. For many years this Magazine has been the most popular work on Flowers ever published; and the improved manner in which it now appears has greatly increased its value, whilst it is continued at the same low price as hitherto.

PLAN OF PUBLICATION.—Each monthly number comprises 24 pages 8vo, embellished with a finely coloured plate of one or more of the most beautiful new plants; and contains—Practical Articles on the best method of cultivating all kinds of Flowers—Descriptions of newly introduced or rare Plants—Faithful Notes on new Florists' Flowers—Requisite Monthly Operations—Accounts of all Improvements; and, in fact, everything that can tend to increase the pleasure of Gardening in this its most delightful department.—The previous Volumes may also be obtained.

London: WHITTAKER and Co., Ave Maria-lane; and may be had of all Booksellers.

BEAUTIFUL CHRISTMAS AND NEW YEAR'S GIFT.

THE ART-JOURNAL ILLUSTRATED CATALOGUE (price One Guinea) is recommended as a peculiarly appropriate Gift Book for the Christmas of 1851. "It is at once interesting, useful, and beautiful;" "a valuable reminder of the Exhibition to those by whom it was visited, and equally valuable to those to whom the enjoyment was denied;" "a beautiful book for the drawing-room;" and "a useful instructor for all classes." This volume may still be obtained of any Bookseller; but it will be soon out of print.

London: GEORGE VIRTUE, Publisher, 25, Paternoster-row.

MR. CHARLES KNIGHT'S COMPANION LIBRARY, to commence on THURSDAY, the 1st of January, 1852.—London, 90, Fleet-street.

In crown 8vo. with miniature Woodcuts.

THE COMPANION SHAKSPERE, comprehending all needful Commentary. In numbers, twice a month, each containing a single Play, sewed in a handsome wrapper, price 6d., and in monthly parts, price 1s. each. The whole edition forming four portable volumes.
CHARLES KNIGHT, 90, Fleet-street.

In crown 8vo. with Woodcuts,

THE BEST STORY TELLERS. In weekly numbers, price 2d. each, and in monthly parts, price 1s. each. To be completed in 16 monthly parts.

NEW WORKS, Crown Octavo, commenced December 1, 1851. London, 90, Fleet-street.

Part I., price 1s.

TRAVELLING HOURS: a Series of Short Papers on Popular Subjects, to be published occasionally.
CHARLES KNIGHT, 90, Fleet-street.

Part I., price 1s.,

THE COUNTRY HOUSE. To be completed in 12 Parts and to form three volumes. "This the Poultry-yard) is one of a series of useful manuals written in a plain and popular style on the many adjuncts peculiar to a 'Country House.' It is perhaps one of the very best existing treatises on poultry, inasmuch as it discards all the superfluous matter generally introduced in books, and which puzzles, rather than assists, an inquiring reader. The writer evidently understands his subject, and this stamps his observations with a value which otherwise they would not possess."—*Gardeners' Chronicle*, December 20. CHARLES KNIGHT, 90, Fleet-street.

MR. CHARLES KNIGHT'S SERIALS for JANUARY. London, 90, Fleet-street.

In Parts, 1s., and Sections, 2s. 6d.

PRESENT BOOKS FOR YOUNG PERSONS.

1.
LEILA AT HOME.
A Continuation to "Leila in England."
By ANN FRASER TYTLER.
Fcap. 8vo, cloth, 6s.
By the same Author,
LEILA; OR, THE ISLAND.
Fcap., cloth, 5s.
LEILA IN ENGLAND.
A Continuation of "Leila; or, The Island."
Fcap., cloth, 6s.
MARY AND FLORENCE; OR, GRAVE AND GAY.
Fcap., cloth, 5s.
MARY AND FLORENCE AT SIXTEEN.
Fcap., cloth, 6s.
"These works are excellent. Miss Tytler's writings are especially valuable for their religious spirit. She has taken a just position between the Rationalism of the last generation and the Puritanism of the present, while the perfect nature and true art with which she sketches from juvenile life, show powers which might be more ambitiously displayed, but cannot be better bestowed."—*Quarterly Review.*

2
THE WOODEN WALLS OF OLD ENGLAND;
Containing the Lives of Lords Rodney, Howe, St. Vincent, Collingwood, De Saumarez, and Sir Sidney Smith.
By M. FRASER TYTLER.
Fcap., cloth, 5s.
By the same,
TALES OF THE GREAT AND BRAVE;
Containing Memoirs of Wallace, Bruce, the Black Prince, Joan of Arc, Richard Cœur de Lion, Prince Charles Stuart, and Napoleon Buonaparte.
Fcap., cloth, 5s.

3.
FAR OFF;
OR, THE COUNTRIES OF ASIA AND AUSTRALIA DESCRIBED, with Illustrations and Anecdotes.
By the Author of "Peep of Day," &c.
Fcap., cloth, 5s.
By the same Author,
NEAR HOME;
OR, THE COUNTRIES OF EUROPE DESCRIBED TO CHILDREN, with Anecdotes.
By the Author of "Peep of Day," "Light in the Dwelling," &c., Illustrated with numerous Wood Engravings.
Fcap., cloth, 5s.

4.
THE GERMAN TREE.
A Moral for the Young.
By the Rev. T. GOODWIN HATCHARD, M.A., Rector of Havant.
Handsomely printed, square 12mo, price 1s.

5.
HARRY BRIGHTSIDE;
OR, THE YOUNG TRAVELLER IN ITALY.
By AUNT LOUISA.
With Coloured Illustration. 12mo, cloth gilt, 4s. 6d.

6
LETTERS TO YOUNG PEOPLE.
By the late Dr. SHIRLEY, Bishop of SODOR and MAN.
Fcap., cloth, 3s. 6d.
"We like the general tone of them much. They are cheerful, unaffected, kindly, without overweening conceit or laborious condescension. They refer, too, to real incidents and events."—*Athenæum.*

7.
THE MIRROR OF MAIDENS IN THE DAYS OF QUEEN BESS.

EAST INDIAN AND AFRICAN ORCHIDS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY next, 30th December, at 12 o'clock, 50 Plants of VANDA CÆRULEA, many of them in first-rate condition, just received overland; also a small collection of Orchids made by Mr. R. W. Plant in the Zulu country, interior of South Africa.—May be viewed on the morning of sale, and Catalogues had.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market, and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

In Weekly Numbers, price 2d., or stamped for post 3d.: in Monthly Parts, and in Half-yearly Volumes (three of which are published).

HOUSEHOLD WORDS. A WEEKLY JOURNAL. Conducted by CHARLES DICKENS. Designed for the INSTRUCTION AND AMUSEMENT OF ALL CLASSES OF READERS, and to assist in the Discussion of the Social Questions of the time.

Also, published at the end of every month, at the same office, price 2d.,

THE HOUSEHOLD NARRATIVE OF CURRENT EVENTS; which being declared, by the judgment of the Court of Exchequer, a legal publication not coming within the provisions of the Stamp Act, will be regularly continued and much improved.
The First Volume, being a Narrative of the Public Events of 1850, is always on sale, price Three Shillings, neatly bound in cloth. The Second Volume will be published early in January.
Office, No. 16, Wellington Street North. Sold by all Booksellers and Newsmen.

PRICE ONE SHILLING.

TURNER'S (late BECK'S) FLORIST, FRUITIST, AND GARDEN MISCELLANY.—A Monthly Illustrated work, containing Original Articles by the principal Growers—amateur and professional.
The January Number will have coloured Illustrations of FOSTER'S beautiful Pelargonium "OPTIMUM;" a new Pink and Verbena.
London: CHAPMAN and HALL, 193, Piccadilly; and sold by all Booksellers.

Just published, in One Volume, 8vo, price 5s. sewed,

AN IMPROVED SYSTEM OF FARM BOOK-KEEPING: in which will be found Weekly Statements of all the Proceedings of the Year, regarding the Management of the Land; Team and Task Work; Cost of Daily and Yearly Labour; Sale and Purchase of Live Stock, Breeding, and Stall-fed Cattle; Rotations of Crops; Disposal of Farm Produce; Hops, Flax, and Felling of Coppice; the Orchard, Dairy, and Charges of Harvest; Payments and Receipts; Diary of House Expenses; Cash and Running Accounts with Tradesmen, appertaining to the Work in Hand. Containing Separate Accounts for the different Labours of the Farm, from which the Tenant may select whatever especially suits his purpose. Thus enabling the Farmer to ascertain, in a most simple manner, the exact state of his concerns. With an Appendix of Weights and Measures, and Useful Tables for calculating the Expense of Dibbling, Hoeing, Draining, Ditching, Reaping, Mowing, and all sorts of Task Work. By the Author of "BRITISH HUSBANDRY."
*** Paper, headed "Bailiff's Weekly Report of Team Work, Labour, and Stock," ruled on both sides for entries on the improved system of Farm Book-keeping, may be had separately, price 2s. per quire.
London: LONGMAN, BROWN, GREEN, and LONGMANS.
